ὅλκον ἄρα, ὧ̄ γενναῖε, ψυχῆς πρὸς ἀλήθειαν εἴη ἂν  
καὶ ἀπεργαστικὸν φιλοσόφου διανοίας  
πρὸς τὸ ἄνω σχεῖν ἢ νῦν κάτω οὐ δέον ἔχομεν.

PLATO, *Republic* 7, 527b

## **Abstract**

Already as far back as 1934, Peter Hoenen complained that the Scholastics, hardly loyal to Aristotle, had almost entirely neglected the philosophy of mathematics, while several modern schools (logicism, intuitionism, and formalism) vigorously cultivated it. What Hoenen did not know is that the moderns, too, would almost completely abandon this important branch of knowledge in the aftermath of the foundational crisis that was brewing due to the introduction of set theory. Alas, the question is yet to be settled: almost a hundred years after the catastrophe, mathematicians are unable to tell us, with any certainty, what the subject-matter of their discipline is, or what method should be used.

We propose in this dissertation that the metaphysics of Saint Thomas Aquinas is quite capable not only of accounting for the principles of ancient mathematics, but also of pointing out the principles of modern set theory—and even of supporting a thorough and realistic alternative to this problematic theory.

In the first part, we bring to light, in order to dispel entrenched modern fictions, what ancient Greek mathematicians had to say about the principles of their own discipline.

Faithfully following Saint Thomas, we devote the second and major part of this work to establishing what a principle is; what kinds of principles there are; what is required for something to be a first principle; and what should be the first principles of any science or discipline, and specifically those of mathematics.

In the third part we determine, in the light of Saint Thomas's theory, the elusive essence of algebra—the discipline that would later be identified by Descartes with universal mathematics or analysis. We follow its development until the introduction of set theory, whose principles we clarify.

Finally, we propose ancient foundations for modern so-called mathematics.

## **Resumen**

*Ya en 1934, Peter Hoenen se quejaba de que los escolásticos, muy poco fieles a Aristóteles, hubiesen descuidado casi por completo la filosofía de las matemáticas, mientras que varias escuelas modernas (el logicismo, el intuicionismo y el formalismo) la cultivaban vigorosamente. Lo que Hoenen no sabía es que también los modernos abandonarían casi por completo esta importante rama del saber tras la crisis fundacional que en esos mismos momentos se estaba desarrollando a raíz de la introducción de la teoría de conjuntos. Sin embargo, lo más lamentable del asunto es que la cuestión aún no ha sido zanjada: a casi cien años de la catástrofe, los matemáticos son incapaces de decirnos con certeza cuál sea el sujeto que estudia su disciplina, cuál el método que deba emplearse.*

*En esta tesis proponemos que la metafísica de santo Tomás de Aquino es capaz no solamente de dar cuenta de los principios de las matemáticas antiguas, sino también de señalar los principios de la moderna teoría de conjuntos—e incluso de sustentar una alternativa mucho más cabal y realista a esta problemática teoría.*

*En la primera parte, con el fin de disipar arraigadas ficciones, sacamos a la luz lo que los antiguos matemáticos griegos decían acerca de los principios de su propia disciplina.*

*Dedicamos la segunda parte, la mayor de esta obra, a establecer, siguiendo fielmente a santo Tomás, qué sea un principio; qué géneros de principios haya; qué se requiera para que algo sea un primer principio; y cuáles deban ser los primeros principios de cualquier ciencia o disciplina, y específicamente los de las matemáticas.*

*En la tercera parte determinamos, a la luz de la teoría de santo Tomás, qué sea el álgebra, la disciplina que luego sería identificada por Descartes con la matemática universal o análisis. Seguimos su desarrollo hasta la introducción de la teoría de conjuntos, cuyos principios esclarecemos.*

*Finalmente, proponemos antiguos fundamentos para las modernas “matemáticas.”*

## Acknowledgements

This work would have been impossible without the support of many generous people. Above all, I would like to thank my advisors, Prof. Peter A. Redpath, the greatest teacher I have had the honor of following, and Prof. Enrique Martínez, a true and wise friend. I must also express my heartfelt gratitude to another great mentor and friend, Prof. Jesús Manuel Araiza Martínez, renowned Aristotle scholar and fellow researcher at the Interdisciplinary Center for Research on the Humanities of the Autonomous University of the State of Morelos (Mexico), who leads a faithful group of enthusiasts of the language of the ancient Greeks and their philosophy, bringing to life the texts of the masters. During my stay at the University, I also received inestimable support from the Director of the Center, Dr. Armando Villegas Contreras, the noblest promoter of the Humanities in the region. Thanks to both, I also had the memorable opportunity of spending many hours conversing with Prof. Thomas Alexander Szlezák, one of the greatest living Plato scholars, whose humble and judicious guidance would prove invaluable. I express my gratitude also to Prof. Ivonne V. Pallares, who allowed me to audit her course on the Philosophy of Mathematics and provided a copy of her remarkable PhD dissertation *On Mathematical Abstraction*, written under the direction of Barry Smith (SUNY Buffalo), in which she compares the Aristotelian theory to modern category theory. Another indispensable work lent to me by the author is *Aristotle, Aquinas, and the Foundations of Mathematics*, by Prof. Jean W. Rioux, chair of the philosophy department at Benedictine College (Atchison, KS), to whom I am in great debt. I would probably not have begun writing about the subject of this dissertation without the motivation of James Franklin, Honorary Professor at the School of Mathematics and Statistics of the University of New South Wales (Australia), and founder of the Sydney School in the philosophy of mathematics. I received invaluable advice from Prof. Martín Echavarría, an angelic friend and a formidable scholar. Above, all I owe this work to my sister Leticia, who has never relented in her encouragement and patronage. My earnest thanks also go to my friend William McVey; together, we overcame many hurdles and shared the most implausible adventures. I am very grateful to my old friend Gerardo Guinea: without his advice, I would have never enjoyed reading the works of St. Thomas and Aristotle. Indeed, without the backing of family and friends, I would have never come this far. They are too many to enumerate and it would be impossible to make justice to all, so I beg their forgiveness if I have omitted their names on this page—I certainly have them in my heart.

45.3.	Posterior Principles.....	854
45.4.	The Virtue of Prior vs. Posterior Principles .....	855
45.5.	Diversity of Principles .....	856
45.6.	Diversity of First Principles .....	857
45.7.	Unity and Diversity of the <i>Ratios</i> of <i>Origin</i> and <i>Principle</i> .....	859
45.8.	Modes in Which the First Principles of All Beings Are Common.....	859
45.9.	Unity of First Principles.....	860
45.10.	Contraries Are First Principles.....	861
45.11.	First Contrariety in One Genus .....	862
45.12.	The Subject of Contrariety .....	862
45.13.	Neither One nor Infinite Principles .....	862
45.14.	Not Two Principles, but Three .....	864
45.15.	Not More Than Three Principles.....	866
45.16.	Are the Principles and Causes of All Beings the Same? .....	867
45.17.	Modes in Which Principles Are or Are Not the Same for All Things.....	870
45.18.	The Intrinsic Causes of All Beings Are the Same Proportionately .....	871
45.19.	The Four Parts of <i>Principle</i> .....	873
45.20.	The Four Parts of <i>Principle</i> Reduced to Three .....	874
45.21.	The First Principles of All Beings Are Simply the Same Proportionately .....	875
45.22.	The Principles of All Beings Are the Same Proportionately: Act and Potency .....	876
45.23.	The Principles of All Beings Are the Same Universally.....	878
45.24.	Same in Number, in Species, in Genus, and According to Analogy .....	880
<b>46.</b>	<b>First Principles According to Causality.....</b>	<b>881</b>
46.1.	Order of Causes .....	881
46.2.	The First Cause in the Order of Necessity.....	881
46.3.	Reduction to First Principles Common by Causality .....	882
46.4.	The Formality of Being .....	883

46.5.	Being and the Division of Causes.....	883
46.6.	Order among Being, Form, and Matter.....	884
46.7.	The First Matter.....	886
46.8.	The First Matter Is One in Number.....	888
46.9.	The First Form.....	888
46.10.	Corporeity.....	890
46.11.	Corporeity: The First Form Received in the First Matter.....	892
46.12.	The Relation between Matter and Form.....	894
46.13.	The First Extrinsic Principles of All Things.....	894
46.14.	Division of the Efficient Cause.....	896
46.15.	The Principal Agent.....	897
46.16.	The Instrumental Agent.....	897
46.17.	The Virtue of Acting in Principal and in Instrumental Agents.....	900
46.18.	The Instrumental Mode of Intention.....	901
46.19.	Univocal, Equivocal, and Analogical Agent Causes.....	902
46.20.	The First, Common Cause of a Genus.....	903
46.21.	Reduction of the Univocal to the Analogical Agent.....	904
46.22.	Modes of Procession.....	905
46.23.	The Order of the End.....	906
46.24.	First Efficient and Ultimate Final Causes Related.....	907
46.25.	The Last End of a Genus as a First Principle.....	908
46.26.	Intrinsic vs. Extrinsic End.....	908
46.27.	End of Operation vs. End of Intention.....	909
46.28.	The Last End.....	910
46.29.	The Order of Nature.....	911
<b>47.</b>	<b>The Order of Being.....</b>	<b>915</b>
47.1.	Modes of Priority in Being, According to the Natural Order.....	915
47.2.	The Order of Dependence or Community.....	916
47.3.	Community of Thing vs. Community of <i>Ratio</i> .....	917
47.4.	Order between the Common and the Proper.....	919
47.5.	Platonist Use of the Order of Being Refuted.....	919
47.6.	The Order of Substance to Accident.....	922
47.7.	Priority of Act and of Potency: Formally vs. Materially.....	923
47.8.	How Act Is Prior to Potency in Time—and How Not.....	924
47.9.	Act Is Prior to Potency in <i>Ratio</i> .....	925
47.10.	Act Is Prior to Potency According to Substance.....	926
47.11.	Act is the End of Potency.....	927
47.12.	Act Is Prior to Potency Simply, Universally, and Naturally.....	930
47.13.	The First Principle of the Universe.....	932
47.14.	Being: The Most Perfect Act.....	932
47.15.	Immediacy of the Act of Being.....	934
47.16.	The Act of Being Is Participated but Does Not Participate.....	935
47.17.	The First and Pure Act of Being.....	935
47.18.	The Cause of the Act of Being.....	936
47.19.	Reduction of All Modes of Priority to One Mode.....	939
<b>48.</b>	<b>The Order of Motion or Coming-To-Be.....</b>	<b>941</b>
48.1.	Mutation.....	941
48.2.	The Species of Mutation: Generation, Corruption, Motion.....	942
48.3.	No Fourth Species of Mutation.....	942
48.4.	The Four Transmutations.....	943
48.5.	Contrariety and the Subject of Transmutation.....	944
48.6.	The Generation of One Is the Corruption of Another.....	944
48.7.	Things That Are Not Generated.....	945
48.8.	Forms Are Not Generated.....	946
48.9.	Points, Lines, Surfaces Are Not Generated.....	947
48.10.	The Existence of Motion Is to Be Supposed by the Natural Philosopher.....	949
48.11.	Requirements for Motion.....	950
48.12.	Motion.....	951
48.13.	The Subject in the Definition of Motion.....	951
48.14.	The Genus in the Definition of Motion.....	954
48.15.	Motion is an Imperfect Act.....	955
48.16.	Relation of Motion to Mover.....	956
48.17.	<i>Action, Affection</i> Denominated from Motion; <i>Quantity, Where</i> , from Place.....	957

48.18.	The Natural vs. the Mathematical Body .....	957
48.19.	Comparison of Body to Place .....	960
48.20.	Why Multiple Bodies Cannot Be in the Same Place .....	960
48.21.	Every Transmutation Takes Its Species from Its Terminus.....	963
48.22.	Diversification According to the <i>Ratio</i> of End.....	966
48.23.	The Genera in Which There Is Motion .....	966
48.24.	Order Among the Species of Motion.....	967
48.25.	Order of Motions to Each Other .....	968
48.26.	Order between Magnitude, Motion, and Time.....	969
48.27.	The Analogy <i>punctus : linea :: mobile : motus :: nunc : tempus</i> .....	971
48.28.	The Analogy <i>punctus : linea :: factum esse : fieri :: factum : fiens</i> .....	974
48.29.	The Analogy <i>punctus : linea :: factum esse : fieri :: motum esse : moveri</i> .....	976
48.30.	Why Simple Things Cannot Come to Be .....	977
48.31.	Time in Mediated vs. Immediate Mutations .....	978
48.32.	Priority in Generation and Corruption .....	979
48.33.	Priority in Motion.....	979
48.34.	Priority in Continuous Things.....	980
48.35.	Priority in Discrete Things.....	983
<b>49.</b>	<b>The Order of Cognition .....</b>	<b>985</b>
49.1.	Priority in Cognition .....	985
49.2.	Priority According to <i>Ratio</i> vs. According to Sense.....	985
49.3.	The Order of Intellective Cognition .....	986
49.4.	The Order of Sense Cognition .....	988
49.5.	Priority in Determining Principles.....	989
49.6.	How All Philosophers Posited Contraries to Be Principles .....	993
49.7.	The Order of the <i>Ratios</i> of Being, Non-Being, Division, One, and Multitude.....	995
49.8.	Abstraction and the Principles that Respond to the Operations of the Intellect .....	999
49.9.	Requirements for Abstraction .....	1000
49.10.	Abstraction of Form from Matter .....	1002
49.11.	Abstraction of Whole from Parts .....	1006
49.12.	Abstraction vs. Separation.....	1009
49.13.	Correlation between Separation/Abstraction and the Theoretical Sciences .....	1011
49.14.	Abstraction and the Pythagorean and Platonist Errors .....	1012
49.15.	Aristotle's Criticism of Plato .....	1016
49.16.	Abstraction and Science .....	1021
49.17.	Names Transferred from Sense/Imagination into Intellective Cognition .....	1023
49.18.	Procession and Knowledge of Increase in Qualities and Forms.....	1023
<b>50.</b>	<b>The First Principles of Cognition .....</b>	<b>1027</b>
50.1.	The Preexistent Cognitive Potency.....	1027
50.2.	The Cognition of First Principles.....	1028
50.3.	Need for a Possible and an Agent Intellect.....	1029
50.4.	The First Universal .....	1030
50.5.	From Species to Genus .....	1031
50.6.	The Generation of Experience from Memory.....	1032
50.7.	The Generation of Art and Science from Experience .....	1032
50.8.	The Principle of Art and Science .....	1033
50.9.	Preeminence of Art over Experience in Action .....	1034
50.10.	Preeminence of Art and Science over Experience in Cognition.....	1035
50.11.	Proofs of the Preeminence of Art and Science over Experience in Cognition .....	1036
50.12.	Speculative vs. Active Art or Science .....	1039
50.13.	Wisdom is Speculative.....	1040
50.14.	Wisdom-Philosophy .....	1041
50.15.	Ignorance and Wonder as Principles of Philosophy .....	1041
50.16.	Philosophy and Poetry Compared.....	1042
50.17.	The Terminus of Wisdom-Philosophy .....	1043
50.18.	Wisdom-Philosophy is Maximally Free .....	1045
50.19.	Wisdom-Philosophy is Not a Human Science.....	1046
50.20.	Wisdom-Philosophy is the Worthiest Science.....	1048
50.21.	Distinguishing Art, Science, and Wisdom .....	1049
<b>51.</b>	<b>The Intellectual Virtues.....</b>	<b>1051</b>
51.1.	Diverse Divisions of Intellectual Habits.....	1051
51.2.	The Intellectual Virtues Summarized .....	1051

51.3.	Division of the Rational Part of the Soul: Necessary vs. Contingent Objects .....	1052
51.4.	The Scientific and the Ratiocinating Parts of the Soul.....	1053
51.5.	Knowledge of Contingent Beings .....	1054
51.6.	The Intellectual Virtues: Understanding, Science, Wisdom, Prudence, Art .....	1055
51.7.	Science.....	1055
51.8.	Science is About Universals .....	1057

# Introduction

## Background

EUCLID's *Elements*, with some twenty-three centuries of history, is undoubtedly the most celebrated, lasting, and influential textbook of all times. However, in the last hundred years or so, it has been rapidly supplanted in the classroom by an endless succession of short-lived works based on set theory, which is what is used today to explain not only modern mathematics, but even ancient Greek arithmetic and geometry. Indeed, since the late years of the nineteenth century, set theory had promised to become a common ground perhaps not only for all of mathematics, but even for the whole of modern science, which has been profoundly "mathematized." As Herbert B. ENDERTON puts it, "In mathematics these days, essentially everything is a set."<sup>1</sup>

1. Although the introduction of set theory was abrupt, the ground had been prepared along the span of many centuries. Modern mathematics is merely a logical consequence of the progressive dismissal of long-held principles. A famous example is the development of so-called non-Euclidean geometries, which followed upon the elimination of EUCLID's fifth postulate. Likewise, based on his work on infinity, Georg CANTOR—considered the originator of modern set theory—rejected the ancient axiom that every whole is greater than any of its parts. Bertrand RUSSELL explains this fateful episode:

Here Cantor proceeded in the only proper way. He took pairs of contradictory propositions, in which both sides of the contradiction would be usually regarded as demonstrable, and he strictly examined the supposed proofs. He found that all proofs adverse to infinity involved a certain principle, at first sight obviously true, but destructive, in its consequences, of almost all mathematics. The proofs favourable to infinity, on the other hand, involved no principle that had evil consequences. It thus appeared that common sense had allowed itself to be taken in by a specious maxim, and that, when once this maxim was rejected, all went well.

The maxim in question is, that if one collection is part of another, the one which is a part has fewer terms than the one of which it is a part. This maxim is true of finite numbers. For example, Englishmen are only some among Europeans, and there are fewer Englishmen than Europeans. But when we come to infinite numbers, this is no longer true. This breakdown of the maxim gives us the precise definition of infinity. A collection of terms is infinite when it contains as parts other collections which have just as many terms as it has. If you can take away some of the terms of a collection, without diminishing the number of terms, then there are an infinite number of terms in the collection.<sup>2</sup>

---

<sup>1</sup> Herbert Bruce ENDERTON, *Elements of Set Theory* (San Diego: Elsevier Academic Press, 1977), xi.

<sup>2</sup> Bertrand RUSSELL, *Mathematics and the Metaphysicians in Mysticism and Logic, and Other Essays* (London: Longmans, 1918), 85–86. As the preface to this edition states (*ibid.*, v–vi), this essay "was written in 1901, and appeared in an American magazine, *The International Monthly*, under the title 'Recent Work in the Philosophy of Mathematics'."

Thus, what was once held to be a self-evident principle on which to erect the edifice of mathematics had to be discarded, and new foundations had to be laid. It was the dismissal of such time-honored principles that led to the formulation of early set theories. RICHARD DEDEKIND's set theory, for example, arose from the rejection of prior definitions of *number*.

Alas, early set theories were "naïve," and riddled with paradoxes. It was RUSSELL himself who informed Gottlob FREGE of a contradiction derivable from the principles that the famous German mathematician and philosopher had proposed in his *Grundgesetze der Arithmetik*. What has come to be known as *Russell's Paradox* may be formulated as follows. Consider the set of all sets that are not members of themselves. Evidently, this set must be a member of itself if and only if it is not a member of itself. Paradox.

Gladly, there remained at least one ancient principle to which the moderns loyally clung: the principle of non-contradiction. Still, they needed more than that to ensure that set theory would be free of contradictions: they needed the principles of set theory itself, which was already considered to be the underpinnings of mathematics. The brightest minds of the age set out to find them. For half a century they tried—and ultimately failed.

2. Each began from their own presuppositions concerning the nature of mathematics. But at the highpoint of the foundational revolution, they had already become entrenched in three so-called *schools* or *programs*:<sup>3</sup> (1) the *logicism* of FREGE and his followers, who consider mathematics to be a part of logic (where logic is conceived as a set of theorems); (2) the *intuitionism* of Luitzen Egbertus Jan BROUWER and his supporters, for whom mathematics consists in the carrying out, one after the other, of so-called inductive and effective mental constructions, so that—contrary to FREGE—valid logic would be a part of mathematics; and (3) the *formalism* of David HILBERT and his followers, according to whom mathematics is nothing but a syntactically-regulated manipulation of symbols that are in themselves meaningless.

It was Willard van Orman QUINE who indelibly identified these three *schools* with medieval theories of universals: "The three main mediaeval points of view regarding universals are designated by historians as *realism*, *conceptualism*, and *nominalism*. Essentially these same three doctrines reappear in twentieth-century surveys of the philosophy of mathematics under the new names *logicism*, *intuitionism*, and *formalism*."<sup>4</sup> Conspicuously missing, ironically, is the most important realist theory of medieval times: Aristotelianism.

---

<sup>3</sup> We draw our account of the three "schools" from Ernst SNAPPER, "The Three Crises in Mathematics: Logicism, Intuitionism and Formalism," *Mathematics Magazine* 52, no. 4 (1979). For an update on the *status quaestionis*, see Sten LINDSTRÖM et al. (eds.), *Logicism, Intuitionism, and Formalism: What Has Become of Them?* (Dordrecht: Springer, 2010).

<sup>4</sup> Willard van Orman QUINE, "On What There Is," *Review of Metaphysics* 2, no. 5 (1948), 33.

According to QUINE,

*Realism*, as the word is used in connection with the mediaeval controversy over universals, is the Platonic doctrine that universals or abstract entities have being independently of the mind; the mind may discover them but cannot create them. *Logicism*, represented by Frege, Russell, Whitehead, Church, and Carnap, condones the use of bound variables to refer to abstract entities known and unknown, specifiable and unspecifiable, indiscriminately.<sup>5</sup>

However, *logicism* failed not because universals were shown to exist only in dependency of the mind, or not to exist at all, but because this doctrine was unable to account for some of the axioms of modern mathematics. If we consider ZF (the most successful set theory in use, named after Ernst Friedrich Ferdinand ZERMELO and Abraham Halevi FRAENKEL), two out of nine (i.e., more than 20%) of its generally acknowledged axioms are not logical propositions in the sense demanded by *logicism*. In turn,

*Conceptualism* holds that there are universals but they are mind-made. Intuitionism, espoused in modern times in one form or another by Poincaré, Brouwer, Weyl, and others, countenances the use of bound variables to refer to abstract entities only when those entities are capable of being cooked up individually from ingredients specified in advance. As Fraenkel has put it, logicism holds that classes are discovered while intuitionism holds that they are invented—a fair statement indeed of the old opposition between realism and conceptualism. This opposition is no mere quibble; it makes an essential difference in the amount of classical mathematics to which one is willing to subscribe. Logicians, or realists, are able on their assumptions to get Cantor's ascending orders of infinity; intuitionists are compelled to stop with the lowest order of infinity, and, as an indirect consequence, to abandon even some of the classical laws of real numbers. The modern controversy between logicism and intuitionism arose, in fact, from disagreements over infinity.<sup>6</sup>

Yet, mathematicians rejected *intuitionism* not because sets were shown not to be mind-made universals, but because, as QUINE says, the proposed foundations were unable to account for numerous theorems—many of which were discovered by BROUWER himself—that cannot be constructed inductively and effectively, as required by this *school*. Finally,

*Formalism*, associated with the name of Hilbert, echoes intuitionism in deploring the logicist's unbridled recourse to universals. But formalism also finds intuitionism unsatisfactory. This could happen for either of two opposite reasons. The formalist might, like the logicist, object to the crippling of classical mathematics; or he might, like the nominalists of old, object to admitting abstract entities at all, even in the restrained sense of mind-made entities. The upshot is the same: the formalist keeps classical mathematics as a play of insignificant notations. This play of notations can still be of utility—whatever utility it has already shown itself to have as a crutch for physicists and technologists. But utility need not imply significance, in any literal linguistic sense.

---

<sup>5</sup> *Ibid.*, 33.

<sup>6</sup> *Ibid.*, 33–34.

Nor need the marked success of mathematicians in spinning out theorems, and in finding objective bases for agreement with one another's results, imply significance. For an adequate basis for agreement among mathematicians can be found simply in the rules which govern the manipulation of the notations—these syntactical rules being, unlike the notations themselves, quite significant and intelligible.<sup>7</sup>

Alas, Kurt GÖDEL dealt a death blow to *formalism* not by showing that there are indeed abstract entities, but by proving that mathematics—should it be based on a syntactically regulated manipulation of empty symbols—would always include formally undecidable propositions.<sup>8</sup> Consequently, demonstrating whether the discipline is entirely free of contradiction would be impossible—and mathematics would always remain incomplete.

Thus, despite QUINE's account, it is evident that universals had little to do with the downfall of the programs: every one of them failed regardless of their proposed solution to the medieval controversy. And their downfall created a foundational crisis that ultimately shattered confidence in human reason, resulting in a catastrophe that is felt still today.

3. As is only natural, in the aftermath of the foundational revolution, mathematicians have mostly turned their backs on philosophy, which appears to be impotent when it comes to answering the most basic questions concerning their discipline. Since then, the hope of resolving the foundational crisis of modern mathematics—and indeed of modern Western thought—has greatly waned. Today, many have assumed the pragmatist attitude of Hilary W. PUTNAM, who “would like to convince” us that “the various systems of mathematical philosophy, without exception, need not be taken seriously.”<sup>9</sup>

On the surface, the dismissal of philosophy seems to bring no harm to the discipline: what goes today by the name of *mathematics* has seen a vertiginous development in the last century. And, given that the alleged separation of philosophy and science—not unlike that of church and state—is often hailed as a sign of progress, there appears to be no reason for concern. In this light, PUTNAM would seem to be quite right.

However, the deeper reality is that the discipline is in a sorry state. As things stand, contemporary mathematicians are unable to tell us with any certainty what the subject of their discipline is or what method should be used. As Andrew D. IRVINE observes:

One of the most striking features of mathematics is the fact that we are much more certain about what mathematical knowledge we have than about what mathematical knowledge is knowledge

---

<sup>7</sup> Ibid., 34.

<sup>8</sup> Kurt GÖDEL, “Über formal unentscheidbare Sätze der Principia Mathematica und verwandter Systeme,” *Monatshefte für Mathematik und Physik* 38 (1931), 173–198.

<sup>9</sup> Hilary PUTNAM, “Mathematics without foundations,” in *Philosophy of Mathematics: Selected Readings*, ed. Paul Benacerraf and Hilary Putnam, 2nd ed. (Cambridge: Cambridge University Press, 1983), 295.

of. Mathematical knowledge is generally accepted to be more certain than any other branch of knowledge; but unlike other scientific disciplines, the subject matter of mathematics remains controversial. In the sciences we may not be sure our theories are correct, but at least we know what it is we are studying.<sup>10</sup>

Many are quite content with not knowing what it is they are doing. As RUSSELL notoriously put it, “mathematics may be defined as the subject in which we never know what we are talking about, nor whether what we are saying is true.”<sup>11</sup>

Nonetheless, this does not mean that contemporary mathematicians are free from all assumptions: rather, they believe in set theory as a principle, and think from it uncritically. Although set theory is not altogether unreasonable, it certainly lacks due justification. And precisely because it is unfounded, it must be accepted—bizarrely—as a dogma of faith.

4. Even ancient Greek mathematics is taught from the set-theoretical creed. Proportion theory (whose original principles can be found in EUCLID’S *Elements*, Books V and VII) is now explained by resorting to so-called *equivalence classes*—an approach that amounts to indoctrination rather than education, as the reflections of David H. FOWLER (1937–2004) imply:

[T]he general technique of appealing to equivalence classes appeared only around the time of Dedekind, when set theory began to be introduced as a basis for mathematical theory in general, and it took some time to become established. This gives a good example of a piece of mathematics that has been popularised only recently, but which has already been retrospectively written back into the “history” of the subject, even back to Euclid, and all this has happened almost within my own lifetime, in a process that is every bit as efficient and thorough as the work of the thought police in George Orwell’s *Nineteen Eighty-Four*.<sup>12</sup>

The awkward truth is that ancient Greek theory of proportion (ἀναλογία) is not based on the notion of *equivalence class* (an infinite collection of sets representing binary relations that are reflexive, symmetric, and transitive), but on that of *ratio* (λόγος), which cannot be reduced to what any of the failed foundational programs had been proposing: that is, logical propositions, mental constructions, or meaningless symbols.

Quite the opposite, as Kurt VON FRITZ explains, what ancient Greeks ultimately understood by *logos* (λόγος) is the “communication of something essential about a thing.”<sup>13</sup> Ironically, then, rather than elucidating ancient Greek mathematics for us, set theory obfuscates its

---

<sup>10</sup> Andrew D. IRVINE, “Preface” in Andrew D. IRVINE (ed.), *Philosophy of Mathematics* (Burlington; Oxford; Amsterdam: North Holland, Elsevier, 2009), ix; emphasis in the original.

<sup>12</sup> David H. FOWLER, *The Mathematics of Plato’s Academy* (Oxford: Clarendon Press, 1999), 371.

<sup>13</sup> VON FRITZ, *Grundprobleme der Geschichte der antiken Wissenschaft* (Berlin: De Gruyter, 1971), 406.

original principles to the point of rendering the time-honored discipline thoroughly unintelligible.

5. Regrettably, the use of equivalence classes to explain ancient Greek theories of ratio and proportion, whether between numbers (*Elements*, VII) or between magnitudes (ibid., V), is neither the only nor the oldest case of forgery. Even before set theory was imposed in the classroom, it was already common to read that only positive integers (i.e., 1, 2, 3, ...) were called *numbers* by the ancient Greeks; or—paradoxically—that the ancient Greeks discovered *irrational numbers*.

In fact, ancient Greek sages would unanimously disagree with these assertions because: (a) it is impossible to treat scientifically of “whole numbers,” since this expression is but a metaphor, as ARISTOTLE says;<sup>14</sup> (b) *one* is not a number, that is, a measured multitude, but the principle and measure of all numbers;<sup>15</sup> and therefore, (c) there are no *irrational numbers*, but only ratios between incommensurable magnitudes; for *number* is not predicated of that which is incommensurable.<sup>16</sup> If these words sound unsophisticated or even ridiculous to our contemporary ear, it is only because ancient Greek mathematics has long been misrepresented by casting it in new molds.

What is more, for nearly two centuries, historians of mathematics have been presenting ancient Greek mathematical problems and theorems as solutions to algebraic equations. It is not the first time that some ancient Greek mathematical work has been identified with algebra: Qusṭā IBN LŪQĀ, the ninth-century translator of DIOPHANTUS’s *Arithmetica* into Arabic, calls this work just that. But now, it is all of ancient Greek mathematics that is identified with algebra. As early as 1842, Georg Heinrich Ferdinand NESSELMANN (1811–1881) published a work entitled *The Algebra of the Greeks*.<sup>17</sup> Then, celebrated historians, such as Hieronymus G. ZEUTHEN (1839–1920), Paul TANNERY (1843–1904), and Bartel Leendert VAN DER WAERDEN (1903–1996), have contributed to the spread of this modern fabrication. According to VAN DER WAERDEN, “Theaetetus and Apollonius were at bottom algebraists, they thought algebraically even though they put their reasoning in a geometric dress.”<sup>18</sup>

<sup>14</sup> ARISTOTLE, *Metaphysica* Δ.26, 1024a7–8: “ὅλος δ’ ἀριθμὸς [...] οὐ λέγεται, ἂν μὴ μεταφορᾷ.”

<sup>15</sup> Ibid., N.1, 1088a4–8: “σημαίνει γὰρ τὸ ἓν ὅτι μέτρον πλήθους τινός, καὶ ὁ ἀριθμὸς ὅτι πλήθος μεμετρημένον καὶ πλήθος μέτρων. διὸ καὶ εὐλόγως οὐκ ἔστι τὸ ἓν ἀριθμὸς· οὐδὲ γὰρ τὸ μέτρον μέτρα, ἀλλ’ ἀρχὴ καὶ τὸ μέτρον καὶ τὸ ἓν.” Ibid., I.6, 1057a2–4: “τὸ δὲ πλήθος οἷον γένος ἔστι τοῦ ἀριθμοῦ· ἔστι γὰρ ἀριθμὸς πλήθος ἐνὶ μετρητόν.”

<sup>16</sup> Ibid. Δ.15, 1021a5–6: “ὁ γὰρ ἀριθμὸς σύμμετρος, κατὰ μὴ συμμέτρου δὲ ἀριθμὸς οὐ λέγεται.”

<sup>17</sup> Georg Heinrich Ferdinand NESSELMANN, *Versuch einer Kritischen Geschichte der Algebra. Erster Theil: Die Algebra der Griechen* (Berlin: Reimer, 1842). The expected “zweiter Teil” never saw the light.

<sup>18</sup> Bartel Leendert VAN DER WAERDEN, *Science Awakening* (Groningen: P. Noordhoff, 1954), 265; cf. his “Defence of a ‘Shocking’ Point of View,” *Archive for History of Exact Sciences* 15 (1976).

6. While the “ancient Greek algebra” myth is largely believed by the public, among scholars it did stir a controversy (in 1975) concerning the methodological approach that should be used when writing the history of mathematics.<sup>19</sup> The traditional historiographical view, on the one hand, supposed mathematical *form* and *content* to be independent. Thus, the followers of ZEUTHEN held that the *ideas* of ancient and modern mathematicians are really the same, but it is rather the *language* that has changed: ancient Greeks merely happened to use a geometric language. Such opinions are even linked to the author’s position concerning the controversy of universals. As Jesper LÜTZEN explains:

Zeuthen’s geometric research gave him a Platonic view of mathematics that was at the very heart of his historical work. According to Zeuthen, mathematics deals with unchanging ideas which can be expressed in different forms. [...] When doing history of mathematics he wanted to uncover the ideas and motives of the ancient masters. These ideas, he argued, were usually formulated in an unusual language, but since the ideas themselves had not changed over time, it was possible for a modern mathematician to appreciate the work of a colleague 2000 years earlier.<sup>20</sup>

Following such “traditionalist” opinions, the history of mathematics would ostensibly be reduced to an account of *the development of languages expressing immutable ideas*. In contrast, at the other extreme of the controversy, rising critics contended that mathematics is but a product of culture. Thus, Sabetai UNGURU claims:

In a nutshell, the issue between traditionalists, who barge into foreign mathematical worlds through the mathematical door, and the new historians of mathematics, who insinuate themselves into ancient mathematical cultures through what one can call the historical door, is the position of the former that form and content are independent variables in the mathematical domain that can be separated arbitrarily without thereby damaging the identity and wholeness of ancient texts, while the latter question this arbitrary separation, pointing out the errors and distortions to which it necessarily leads and exposing the blatant anachronism that is its inseparable companion.<sup>21</sup>

Since *form* and *content* are—according to their opinion—inextricably entangled in any cultural product, ancient mathematics cannot be faithfully expressed in terms of its modern counterpart. Presumably, the history of mathematics should be reduced, in consequence, to an account of *the heterogeneous mathematical products of diverse cultures*.

7. The question of the relation between ancient Greek and modern mathematics, then, creates a quandary: either by *mathematics* we understand today exactly the same thing that ancient Greeks understood (its development notwithstanding), and yet we cannot

---

<sup>19</sup> The gist of the controversy can be read in a collection of articles gathered by Jean CHRISTIANIDIS (ed.), *Classics in the History of Greek Mathematics* (Dordrecht: Kluwer Academic Publishers, 2004), Part 6.

<sup>20</sup> In Joseph Warren DAUBEN and Christoph J. SCRIBA (eds.), *Writing the History of Mathematics: Its Historical Development, Science Networks Historical Studies* (Basel and Boston: Birkhäuser, 2002), 574.

<sup>21</sup> Sabetai UNGURU, Introduction to Part 6 of *Classics in the History of Greek Mathematics*, 383.

even agree on what that might be; or else *mathematics* means to us something so radically diverse from what it meant to them that there is no common ground, and yet we believe that—somehow—there *has* been an evolution from ancient into modern *mathematics* (equivocally using one name for two entirely diverse things).

Scholars have striven to resolve the problem of how modern mathematics evolved from ancient Greek mathematics. A common solution, hardly faithful to ancient Greek thought, is that mathematical *concepts* have been *extended* over time. As Albert C. LEWIS explains:

Historical accounts have generally taken the extension of the number concept as a key indicator of the growth of the whole of mathematics itself. Thus, the recognition of irrational numbers [sic!] by the Classical Greeks, and the incorporation of complex numbers by European mathematicians by the middle of the nineteenth century, and of the number systems which came out of Georg Cantor's transfinite numbers of the late nineteenth century, are viewed as major signs of progress.<sup>22</sup>

There have been efforts more faithfully to account for the origins of modern mathematics out of ancient Greek arithmetic and geometry. A major work in this direction is that of Jacob KLEIN (1899–1978), *Greek Mathematical Thought and the Origin of Algebra*.<sup>23</sup> According to him, modern algebra stems from reinterpretations of ancient concepts (particularly that of *number*), in which the theories of ratio and proportion play a central role.<sup>24</sup> Many later authors have greatly contributed to further clarifying the question and accounting for the influence of non-European thought as well. For example, to name but one, Chikara SASAKI.<sup>25</sup>

While these scholars carefully consider ancient Greek mathematical thought and compare it to its modern counterpart, they do so from a peculiar modern viewpoint. Indeed, as SASAKI observes, "Klein was under the influence of Edmund Husserl's phenomenological philosophy."<sup>26</sup> But SASAKI himself is, in turn, a disciple of Thomas Samuel KUHN (1922–

We quote from the English translation carried out by Eva Brann, *Greek Mathematical Thought and the Origin of Algebra* (New York: Dover, 1968; reprinted, 1992).

<sup>24</sup> *Ibid.*, 24 (on PLATO), 26–36 (on NICOMACHUS, THEON, and DOMNINUS), 173 (on VIETA), 198 and 208 (on DESCARTES), 220–224 (on WALLIS).

<sup>25</sup> Chikara SASAKI, *Descartes's Mathematical Thought* (Dordrecht: Kluwer Academic Publishers, 2003), 357, characterizes the mathematics of VAN ROOMEN as *Eurasian*, and criticizes the work of his illustrious predecessor: "Klein's discussion has an incomparable philosophical depth, but at the same time it is still narrowly Eurocentric."

<sup>26</sup> *Ibid.*, 256 n. 172. He points to KLEIN, "Phenomenology and the History of Science," in *Philosophical Essays in Memory of Edmund Husserl*, ed. Marvin Farber (Cambridge, Mass.: Harvard University Press, 1940), 143–163. For a detailed analysis of how KLEIN depends on HUSSERL but also departs from him,

1996), a proponent of so-called post-positivism who famously introduced the controversial but very influential “paradigm shift” account of “the structure of scientific revolutions.” One such revolution, according to SASAKI, would be that of René DESCARTES in the early seventeenth century.

It was a new paradigm of mathematics that Descartes successfully constructed by replacing the classical one of Euclid, Apollonius and Pappus. With him together with his comrade mathematicians like Fermat, a revolution certainly occurred in mathematics, and with Newton and Leibniz the revolution was raised to the level of Archimedean mathematics, the highest achievement of classical Greek mathematics and completed. Thus modern mathematics took on a theoretically mature algebraically analytical form. With the mathematicians of the seventeenth century, the age of victorious analysis had begun.<sup>27</sup>

Indeed, DESCARTES identified algebra with analysis, which he claimed to be the universal science of mathematics; a science that—he believed—had been known to the ancients, but somehow lost or forgotten. SASAKI, like other authors, argues that even ARISTOTLE himself had posited just such a universal mathematics—an allegation that had already been debunked by Charles Bonaventure CROWLEY.<sup>28</sup> However, instead of countering CROWLEY with solid philosophical arguments, SASAKI dismisses him with what amounts to a very common modern prejudice:

An essential problem in his insightful interpretation is that he read the texts of Aristotle within the framework of medieval scholastic Aristotelianism, of which a representative philosopher was Thomas Aquinas.<sup>29</sup>

### **Hypothesis**

We posit that the Aristotelian-Thomistic Teaching on Principles (henceforth, ATOP) is perfectly capable of:

1. Accounting for the first principles of ancient Greek mathematics.
2. Accounting for the first principles of modern so-called mathematics, including analysis and set theory, and for the transition from the ancient to the modern discipline.
3. Proposing better, truly scientific principles for mathematical logic and replacing those established in set theory.

## Methodology

We follow the method prescribed by St. Thomas himself. In any inquiry, as he explains, we ought to begin from some principle.<sup>30</sup> And if the principle is prior not only in cognition (*in cognitione*) but also in being (*in esse*), then the method (*processus*) must be synthetic (*compositivus*); for causes are simpler than their effects, and to proceed from cause to effect is to proceed synthetically. But if that which is prior in cognition is posterior in being, then the process must be analytic (*resolutorius*), for we judge about evident effects by resolving them into simple causes.

In our present endeavor, this translates into three stages:

1. Resorting as much as possible to primary sources, we analyze the author's writings to determine the asserted principles.

For example, since we intend to discover *the first principles of mathematics*, we must analyze the author's writings to determine what a *principle* is, what a *first principle* is, what *mathematics* is, and what *the first principles of mathematics* are. Ideally, each of these questions should be determined by some definition, which is composed from other terms. We, therefore, analyze each of the terms in the same way until we exhaust all of them.

2. Having established the principles, we determine how they are related to each other according to the order of being and according to the order of cognition.

For example, from the preceding step, we will have determined what a *principle* is. But we still need to determine what is the first instance of principle that we come to know, and how we come to know other principles from it. Moreover, the first principle that we come to know may not be the first principle in the order of being. Therefore, we must determine the order of principles from the simplest to the more composite.

3. Having determined the principles and their mutual relations in being and in knowing, we present them in the order of teaching.

As St. Thomas says, the order of teaching (*ordo doctrinae*) proceeds from the most common to the less common.<sup>31</sup> Any one thing that is found in many must be considered

---

<sup>30</sup> *STh* I-II, q. 14 a. 5 co.: "in omni inquisitione oportet incipere ab aliquo principio. Quod quidem si, sicut est prius in cognitione, ita etiam sit prius in esse, non est processus resolutorius, sed magis compositivus, procedere enim a causis in effectus, est processus compositivus, nam causae sunt simpliciores effectibus. Si autem id quod est prius in cognitione, sit posterius in esse, est processus resolutorius, utpote cum de effectibus manifestis iudicamus, resolvendo in causas simplices." References to the works of St. Thomas follow the nomenclature established in the Primary Sources section of the Second Part.

<sup>31</sup> *In De anima* 2, c. 9, 60–94: "est autem ordo doctrine, ut a communibus ad minus communia procedatur, sicut ostendit Philosophus in principio Phisicorum." Cf. *In Physic.* 1, l. 12, n. 2: "Et rationem ordinis assignat, quia necesse est primo dicere communia, et postea speculari ea quae propria sunt circa

in common (*in communi*) before descending into its multiple species; otherwise, the same would have to be said multiple times, repeating it for each singular thing.<sup>32</sup> If, in some genus, something first is found that should be the cause of the others, both the genus and that which is first in that genus belongs to its consideration. Since that first is the cause of the whole genus, it is necessary for whomever considers some genus to consider the causes of the whole genus.

*Presentation conventions.* In translations quoted, we insert angled brackets <> to enclose words or phrases that are not present in the original work and are likely to mislead the unsuspecting reader. On the other hand, we add square brackets [] to reproduce technical terms in the original language and to explain or rephrase the reading. Whenever we omit part of the text, we insert ellipses in its place, enclosed in square brackets [...]. If the original text contains brackets, we call this out in a footnote. Cross-references have a ►.

### Structure and Plan

The division of the task at hand results naturally from what has been said. First, we must clarify what ancient Greeks themselves considered mathematics and its principles to be, and to dispel modern fictions: as ARISTOTLE says, “by a fiction I mean a forced statement made to suit a hypothesis.”<sup>33</sup> Thereafter, we intend to present St. Thomas’s teaching on principles. Finally, we will examine, under the light shed by his teachings of principles, a selection of milestone texts that reveal the progressive motion from ancient Greek to modern mathematics. (Every part of this work is preceded by its own source bibliography; secondary literature is listed at the end.) Thus,

1. Part I of this work is devoted primarily to presenting ancient Greek thought as reflected in the mathematics of EUCLID’s *Elements*.
2. Part II concentrates exclusively on the exposition of St. Thomas’s doctrine about principles (what we have named ATOP).

---

unumquodque, sicut in principio libri dictum est.” ARISTOTLE, *Physica* A.7, 189b30–31: “ἔστι γὰρ κατὰ φύσιν τὰ κοινὰ πρῶτον εἰπόντας οὕτω τὰ περὶ ἕκαστον ἴδια θεωρεῖν.” *In Physic.* 3, l. 1, n. 4: “Et rationem ordinis assignat, quia necesse est primo dicere communia, et postea speculari ea quae propria sunt circa unumquodque, sicut in principio libri dictum est.” ARISTOTLE, *Physica* Γ.1, 200b24–25: “ὕστερα γὰρ ἡ περὶ τῶν ἰδίων θεωρία τῆς περὶ τῶν κοινῶν ἐστίν.” References to the works of ARISTOTLE follow conventions established in the Primary Sources section of the First Part.

<sup>32</sup> *In De gen.* 1, pr., n. 2: “Est autem considerandum quod de unoquoque quod in pluribus invenitur, prius est considerandum in communi, quam ad species descendere: alioquin oporteret idem dicere multoties, ita scilicet quod in singulis id quod est commune repeteretur, sicut probat Philosophus in I *de Partibus Animalium*. Et ideo prius oportuit [...] in communi determinare, quam ad partes eius descendere. Similiter etiam considerare oportet quod, si in aliquo genere aliquod primum invenitur quod sit causa aliorum, eiusdem considerationis est commune genus et id quod est primum in genere illo: quia illud primum est causa totius generis, oportet autem eum qui considerat genus aliquod, causas totius generis considerare.” Cf. *In De sensu* 1, pr., 23–37.

<sup>33</sup> ARISTOTLE, *Metaphysica* M.7, 1082b3–4: “λέγω δὲ πλασματώδες τὸ πρὸς ὑπόθεσιν βεβιασμένον.”

3. In Part III, the last part, we examine, in light of the first principles of mathematics already unearthed (i.e., from ATOP), some of the most important works that have given rise to modern mathematics; and we account for any differences or innovations.

### Part I Summary

The first two stages of our established methodology will hardly be necessary in this first part. Being a textbook, EUCLID's *Elements* is already organized according to the order of teaching using a synthetic process, since its principles are prior not only in cognition, but also in being. Starting with definitions, postulates, and common notions, he composes propositions in such a way that the posterior always depends on the prior and more known. Hence, our exposition, which is preceded by an introductory chapter, follows directly the synthetic method.

Whenever a clarification is needed, we give precedence to ancient Greek authors over modern interpreters. These ancient sources include, notably, *A Commentary on the First Book of Euclid's Elements*, written by the Neoplatonist PROCLUS Lycaeus, known as *Diadochus*, "the last systematic philosopher in the history of ancient Greece."<sup>34</sup> And since the *Elements* is primarily a geometry textbook, we supplement this with *Introduction to Arithmetic*, a celebrated work by the Neopythagorean NICOMACHUS of Gerasa. When appropriate, we draw from the works of IAMBlichus, THEON, DIOPHANTUS, PAPPUS, and BOETHIUS; and from other ancient authors represented in fragments preserved in later writings. Finally, whenever the need arises to shed light on ancient Greek mathematics based on metaphysics and logic, we follow ARISTOTLE, the first philosopher to write methodically about these disciplines. When relevant, we moreover resort to ancient Greek commentaries on ARISTOTLE's works, as found in *Commentaria in Aristotelem Graeca* (henceforth, CAG).<sup>35</sup>

Our frame of reference when exposing modern fictions is Sir Thomas Little HEATH (1861–1940). Our intention is not to demean one of the greatest historians of ancient Greek mathematics: as Ivor BULMER-THOMAS says, "Although Heath's work would need some revision if a new edition were brought out today, by and large it still remains the best history in any language."<sup>36</sup> All merits aside, HEATH's works make an excellent model of study when it comes to unearthing modern philosophical and historiographical prejudices

---

<sup>34</sup> Laurence Jay ROSAN, *The Philosophy of Proclus*, 2nd ed. (Dilton Marsh: Prometheus Trust, 2009), preface to the 1949 edition.

<sup>35</sup> *Commentaria in Aristotelem Graeca, edita consilio et auctoritate academiae litterarum Regiae Borussicae*, 23 vols. (Berlin: Reimer, 1882–1909).

<sup>36</sup> In DAUBEN and SCRIBA (eds.), *Writing the History of Mathematics*, 442. Not only that, but HEATH published *Euclid in Greek* "in the vain hope that it might lead to a revival of the teaching of EUCLID in the schools" (ibid., 441). And his, too, is the most commonly used English translation of EUCLID's *Elements*.

that have been projected onto ancient Greek authors.<sup>37</sup> Our purpose, therefore, is only to contrast these misconceptions with what the ancient Greeks actually said.

In presenting ancient Greek mathematics to our modern audience, we will not hesitate to use algebraic notation if deemed convenient, notwithstanding the anachronism. As Benno ARTMANN says, “algebraic translation does make some of Euclid’s geometrical statements more transparent to the modern reader.”<sup>38</sup> However, we do call attention on the danger that algebraic notation poses; for it is incapable of fully capturing the intention of ancient Greek mathematicians, as should become apparent to the reader along the way.

In short, Part I can be considered a continuation of the present Introduction. The objective is more deeply to explore what it was exactly that the ancients Greeks understood mathematics and its principles to be.

## **Part II Summary**

In our second part, we intend to determine, according to St. Thomas AQUINAS: (a) what *principles* are; (b) what *first principles* are; (c) what *mathematics* is; and (d) what *the first principles of mathematics* are. Alas, unlike EUCLID’s *Elements*, there is no monographic work in St. Thomas that would make our task straightforward. Hence, following the stated methodology:

1. As a preparatory analytical stage, we glean the scattered elements of the sought teaching on principles from the multiple places where St. Thomas explains or applies it.

This stage requires a painstaking classification work. It is not, however, merely an analysis of language. We are not seeking the principles of St. Thomas’s language. Nor is it a historical analysis of an alleged heterogenous evolution of the doctrine of St. Thomas (which is presupposed even by some deservedly reputed Thomists in our days). We are not seeking stratigraphic sediments of distinct archaeological contexts.

Our analytical stage is limited by the nature of this work. We cannot claim to have obtained a thorough inventory of the relevant places in the *opera omnia* of St. Thomas (a task that would probably require a lifetime). We believe, however, that due diligence has been attained thanks to the research tools available nowadays: above all, the *Index Thomisticus* created by Roberto BUSA (1913–2011) and made available online by Prof. Enrique ALARCÓN and the Author; but also the other resources that ALARCÓN has added over the

---

<sup>37</sup> As IVOR GRATTAN-GUINNESS says, “Historiographically speaking, his method was anachronistic, for he rewrote the mathematics of several figures in modern notation” (in *ibid.*, 172).

<sup>38</sup> Benno ARTMANN, “Euclid’s *Elements* and Its Prehistory,” in ΠΕΡΙ ΤΩΝ ΜΑΘΗΜΑΤΩΝ (*Peri Tōn Mathēmatōn*), ed. Ian MUELLER (Edmonton: Academic Printing & Publishing, 1991), 46.

years to his *Corpus Thomisticum*, such as the web edition of Ludwig SCHÜTZ's *Thomas-Lexikon*.<sup>39</sup>

2. In the second stage, we set in order all the elements of the doctrine found in the first stage. We determine how these elements depend on each other according to the order of cognition and of being.

3. Our intention in the third stage is to present a synthesis of the thought of St. Thomas that is both faithful and intelligible.

This poses significant challenges. On the one hand, not all of his works have been translated into English. Those that have been are not always faithful to the technical terminology. And very often, the version of one work is lexically inconsistent with that of another. On the other hand, to produce a synthesis, we must seamlessly piece together multiple texts that deal with diverse subjects, span across multiple decades, and transmit the varying terminology that St. Thomas draws from multiple authors (e.g., BOETHIUS talks about *magnitudo*, *proportio*, and *proportionalitas*; but Latin translations of ARISTOTLE or of AVICENNA may call them *mensura*, *ratio*, and *proportio*, respectively).

To overcome these challenges, we have given up the approach of quoting from existing translations, since it proved impossible to harmonize such texts. Instead, we deliver our own version created by assembling the relevant fragments into paraphrases that are as literal as possible without ceasing to be English prose. We insert in parentheses any phrases necessary to make the text more intelligible or to underscore the Latin expression used by St. Thomas at that point (and, when applicable, the underlying Greek or Arabic). References to his works are given in footnotes according to the conventions established at the beginning of this second part, followed by a literal quotation of the pertinent portion of the textual unit.

When St. Thomas gives multiple accounts of the same subject, we try to use as a basis the more thorough account and then merge in the others. Oftentimes, however, it was more reasonable to use the account that was closest to the source of the doctrine, such as the works of ARISTOTLE, BOETHIUS, AVICENNA, or AVERROES.

A synthetic presentation based on a prior analysis poses yet another problem. If we were thoroughly to take apart the textual units and then produce from them a new synthesis, the source would become unrecognizable to the reader. Therefore, we have sacrificed ultimate granularity for source traceability by introducing some unwanted repetition.

---

<sup>39</sup> See <http://www.corpusthomisticum.org/>.

### **Part III Summary**

Unlike the preceding parts, in Part III we must follow a historical order. The method applied is purely analytical, since we must resolve diverse doctrines into their peculiar principles before we can compare them to the teachings of St. Thomas. For each work, we present the source and our commentary based on just that comparison.

In bringing to light the first principles of modern so-called mathematics, we adhere to St. Thomas, who says that the aim of studying philosophy is not to know what men have opined, but to discover the truth of things.<sup>40</sup> Thus, our work cannot end with an account of what thinkers have said: we must moreover show how their judgments are related to the reality of things. In other words, our intent is not merely to produce a history of ideas about the foundations of mathematics, but, as ARISTOTLE typically does, to identify everything that is found to be true in any position, and to expose those claims that turn out to be false—regardless of who holds them.

Our selection of topics is limited to: (1) the introduction of algebra in the West and its ultimate identification (in DESCARTES) with the *universal mathematics* that Renaissance authors had been seeking in ancient Greek texts; (2) the development of the modern definition of *number* until the outbreak of set theory in the time of DEDEKIND; and (3) basic modern set theory as is used today, together with some of its implications.

We, therefore, leave unexamined many other topics of interest, which would overflow the purpose of our work: for example, solutions to the foundational crisis proposed more recently, such as the structuralism of Stewart SHAPIRO; or the use of category theory as a foundational replacement of set theory. As much as we would have liked to address many more topics and sources, the nature of this work allows only for a small selection.

### ***Status Quaestionis***

Although St. Thomas has much to say about principles, Thomistic scholars, occupied with seemingly more important questions, have generally overlooked those of mathematics. Peter HOENEN was the first to call their attention in 1934. He noted that the epistemology of mathematics was “vigorously cultivated by various modern schools of philosophy but neglected almost entirely by the Scholastics (hardly faithful, in this regard, to Aristotle).”<sup>41</sup> Alas, it is not only the epistemology but the whole philosophy of mathematics that has been largely ignored. There are, nonetheless, a few authors that have broken ground.

---

<sup>40</sup> *In De caelo* 1, l. 22, n. 8: “studium philosophiae non est ad hoc quod sciatur quid homines senserint, sed qualiter se habeat veritas rerum.”

<sup>41</sup> Peter HOENEN, “A Field of Research for Scholasticism,” *The Modern Schoolman* (1934), 15. Brackets in the original.

1. In 1941, John F. WHITTAKER published an article entitled “The Position of Mathematics in the Hierarchy of Speculative Science,” in which he points to the “belated recognition” by Thomists of the “legitimate progress of modern mathematics.”<sup>42</sup> According to him, a re-examination by Thomists of “the hitherto unchallenged foundations of classical mathematics” found that many of the “apparent conflicts between traditional and modern concepts” had been eliminated.

WHITTAKER not only acknowledges that “all the progress made within the field of pure mathematics is real progress,” but even claims that it is “consonant with the principles of St. Thomas.” He fails, however, to offer any evidence for the alleged Thomistic re-examination of the foundations; nor does he provide an account of how traditional and modern mathematics agree with “the principles of St. Thomas.” In fact, he even quotes Jacques MARITAIN asserting that “much more preliminary work is still necessary” in relation to the principles of mathematics “before Thomistic philosophy can propound a systematic interpretation in which all the critical problems offered by modern developments in the mathematical sciences find a solution.”<sup>43</sup>

Still, WHITTAKER believes he is contributing to MARITAIN’s program when he turns his attention to what he calls “the central issue”: determining the position of mathematics among the speculative sciences. In his opinion, the only significant problem would be that of recognizing metaphysics as “the supreme regulator of all science,” for “it is in the extension of mathematics to other fields that difficulties arise.” He therefore devotes most of his article to explaining the hierarchy of the speculative sciences by summarizing the fifth and sixth questions of St. Thomas’s commentary on BOETHIUS’s *De Trinitate*.

WHITTAKER concludes that speculative science is divided according to two criteria. Firstly, through *total abstraction*, intelligible being (*esse intelligibile*) is divided into being (*ens*), quantitative being (*ens quantum*), and qualitative being (as he translates *ens mobile*).

Secondly, through *formal abstraction*, knowable being (*esse scibile*) is divided into three formalities: as immutable (*ut immutabile*), as mutable (*ut mutabile*), and as changing (*ut mobile*).

Since there are only six valid combinations of these two criteria, he divides speculative science into: (1) *metaphysics*, which would treat of being as immutable; (2) *philosophy of mathematics*, which would treat of quantitative being as immutable; (3) *philosophy of*

---

<sup>42</sup> John F. WHITTAKER, “The Position of Mathematics in the Hierarchy of Speculative Science,” *The Thomist* 3, no. 3 (1941).

<sup>43</sup> WHITTAKER quotes Jacques MARITAIN, *The Degrees of Knowledge* (New York: 1938), xiii.

*nature*, which would treat of qualitative being as immutable; (4) *mathematics*, which would treat of quantitative being as mutable; (5) *physico-mathematical science*, which would treat of qualitative being as mutable; and (6) *natural science*, which would treat of qualitative being as changing.

WHITTAKER assigns to mathematics the role of “interpreting the data of physical science.” Based on the above division, he concludes that metaphysics would not directly regulate mathematics. Metaphysics would instead serve merely to limit the proper sphere of mathematics: that of quantitative being as quantified. On the other hand, mathematics would regulate philosophy of mathematics, which he calls “the intermediary science (*scientia media*) between mathematics and metaphysics.”

2. In 1952, José ÁLVAREZ LASO published his *Filosofía de las Matemáticas en Santo Tomás*, which is built around AQUINAS’s commentary on ARISTOTLE’s *Posterior Analytics* A.1, 71a11–16.<sup>44</sup> He concludes therein that there are three stages in mathematics:

The *first stage*, according to ÁLVAREZ LASO, deals with *first notions*. Although the mathematical “field of experimentation” is the imagination, “mathematical ideas,” like all ideas, have their ultimate foundation in the external senses, for unit and number, and extension and figure, are among the common sensible objects. Unit and number can be considered the first “arithmetical ideas,” while the continuum is the first “idea of geometry.”

The *second stage* is characteristic of mathematics. In it, the first notions are presupposed, while new ones are sought through demonstration. This demonstration is of the constructive kind found in the first theorem in EUCLID’s *Elements*: “on a given straight line to construct an equilateral triangle.” Mathematical existence is reduced to an “intuited, abstracted, or demonstrated possibility.” But beyond the “ideal existence” of mathematics, there is another, “vital” existence in the sensitive world, which is known through “applied mathematics,” which ÁLVAREZ LASO equates to the “middle sciences” of antiquity (e.g., harmonics and optics).

The *third stage*, that of deductive theorems, is common to all sciences. But mathematics, according to ÁLVAREZ LASO, is distinguished from the other sciences because of the “rigor” of its demonstrations. This rigor, he claims, is why St. Thomas says that mathematics is the most certain of the sciences with respect to us.

ÁLVAREZ LASO does not contrast his findings with modern mathematics, nor does he address any other principles.

---

<sup>44</sup> José ÁLVAREZ LASO, *Filosofía de las Matemáticas en Santo Tomás* (Mexico: Jus, 1952).

3. In 1953, Vincent Edward SMITH delivered an Aquinas Lecture at Marquette University entitled *St. Thomas on the Object of Geometry*, which was published the following year.<sup>45</sup> Therein he confronts one question: “What does the mind envision as the speculable reality which specifies the habit of geometry?” His quest for an answer is divided into “three stages: the nature of mathematical abstraction; an analysis of quantified being first in terms of being and then in terms of quantity; and finally, the problem of the continuum.”

In his *first stage*, SMITH observes that there are two extreme views about the nature of geometry in contemporary philosophy. One, encouraged by Albert EINSTEIN, is “over-empirical.” It assumes that geometry “descends into a branch of physics and submits to experimental test.” The other is “the over-formal view of Hilbert, Russell, and the logical empiricists, where mathematics is raised into a kind of logic.” SMITH goes on to show how there is a third, overlooked position originating in PYTHAGORAS and PLATO, corrected by ARISTOTLE, and continued, clarified, and completed by St. Thomas: the theory of formal abstraction, which he summarizes.

SMITH goes on to analyze, in his *second stage*, the order in which material substance receives its accidents: first, quantity; then, sensible quality through the medium of quantity; and finally, the actions and passions of motion. This order founds the formal abstraction used in mathematics; for, based on it, the first accident to inhere substance—i.e., quantity—can be considered without any subsequent accidents. Thus, “The accidental form of quantity is where the geometer stops in his abstraction after peeling away the sense qualities of the mobile world, and as terminating the sensible matter, it has a right to be called a form and even a mathematical quality.”

In his analysis of quantified being “in terms of being,” SMITH concludes that the form considered by geometry is *sui generis*: it is neither substantial nor accidental, for the geometer does not abstract from intelligible matter, which is substance. Hence, quantity is not simple: it is a “composite form,” that is, a quantified substance. To make quantified substance the object of mathematical science is “to consider an accident defined in the concrete and therefore requiring substance as the genus and not the specifying difference in the definition.” Consequently, substance is necessary in mathematics: “Because of the progressive disregard for substance, post-Cartesian mathematics has descended into a study of predicates and tended to become logic alone.”

SMITH ends his *second stage* by highlighting the central role of imagination in mathematics.

---

<sup>45</sup> Vincent E. SMITH, *St. Thomas on the Object of Geometry* (Milwaukee: Marquette University, 1954).

Finally, in his *third stage*, SMITH discusses the divisibility and measurability of the continuum. He concludes that “the geometer studies a matter-form composite, an essence or species.” This matter is the same as the intelligible matter that St. Thomas identifies with the continuum. Therefore, the object of geometry would be “continuous, quantified substance.”

4. In 1954, HOENEN (who was ÁLVAREZ LASO’s dissertation advisor) published his *De noetica geometriae*.<sup>46</sup> The first four chapters are reeditions of articles published in the *Gregorianum* journal from 1939 through 1943. They deal with the problems of the origin of geometric cognition, of necessity, and of exactness as it relates to the existence of indivisibles. To these, he adds four new chapters on axiomatic, in which he treats of the problem of exactness as it relates to figures and relations, of the modern axiomatic program, of the fundamental subject of geometry, and of extension as intelligible matter.

HOENEN is concerned primarily with cognition as it relates to geometry. He is convinced that in ARISTOTLE, especially in his *Posterior Analytics*, is to be found the light needed to solve the problems of the moderns—and vice-versa, that the problems of the moderns are a means to interpreting ARISTOTLE.<sup>47</sup>

5. In 1966, Thomas C. ANDERSON submitted to Marquette University his dissertation *The Object and Nature of Mathematical Science in Aristotle and St. Thomas Aquinas: A Comparison*.<sup>48</sup>

Briefly to summarize it, ANDERSON concludes that both ARISTOTLE and St. Thomas agree in that “the general object of mathematics is quantity which is an accident.”<sup>49</sup> And “it is a science in the highest sense since it uses definitions as its middle terms.”

As to the differences, “rather than disagreement,” between ARISTOTLE and St. Thomas, ANDERSON points to the distinction, “which is present in Aristotle,” but which St. Thomas gives in greater detail, “between virtual and categorical quantity. He explicitly states that the Stagirite implies, that pure mathematics deals only with categorical quantity.” Besides, “Aquinas has more of a development of the notion of mathematics as in a way *entia rationis*. He stresses that their proximate foundation is in the intellect itself. St Thomas explicitly states that the demonstration of the existence of mathematical objects takes

<sup>49</sup> This and the immediately ensuing quotes are taken from *ibid.*, 311–319.

place by constructing them.” However, “St. Thomas does not agree with Aristotle that the sciences which apply mathematics to physical phenomena are simply mathematical sciences. Rather he refers to them as sciences which are neither just mathematical, nor just physical, but intermediate, between the two, sharing in both.”

ANDERSON gives great importance to a question that is not “explicitly stated” by St Thomas or ARISTOTLE: “the freedom of the mathematician.” As he puts it, “There is no intrinsic reason in Aquinas’s doctrine why the mathematician must restrict himself to mathematical objects which resemble physical quantities.” He does not go into great detail here, but in 1977 he published in *The Thomist* an article entitled *Aristotle and Aquinas on the Freedom of the Mathematician*, where he argues that ARISTOTLE and St. Thomas “considered mathematics to be a science of quantity [...], a quantity not found as such in real things but abstracted from such things.”<sup>50</sup> He concludes that “the mathematician is radically free in his choice of objects, and more specifically he need not consider himself limited to dealing with mathematical quantities which closely correspond to and/or resemble physical quantities.” He implies that St. Thomas would have accepted negatives and zero to be numbers. Indeed, he seems keen “to liberate mathematics from any requirement of dealing with quantities which match real quantities.”

6. In 1990, Jean W. RIOUX submitted to the Center of Thomistic Studies his dissertation *Aristotle, Aquinas, and the Foundations of Arithmetic*.<sup>51</sup> Therein, he offers a new approach to resolving the foundational crisis of mathematics (at least insofar as it affects arithmetic): that of ARISTOTLE and St. Thomas.

In Chapter One, RIOUX describes the positions of each of the three *schools* (formalism, logicism and intuitionism), calling attention to their weaknesses. He then presents the position of ARISTOTLE and St. Thomas, starting with the notions of truth, science, and arithmetic, defending the status of arithmetic as a science. Comparing the proposed approach to each of the three modern schools, he argues for the superiority of the Aristotelian position.

In Chapter Two, which is further divided into sections I–V, RIOUX determines in greater detail what it is that ARISTOTLE and St. Thomas have to say concerning the same questions. In section III(a), he turns to “a reconsideration of the subject of mathematics in general.” However, he observes that, according to St. Thomas, “there is no general

<sup>51</sup> Jean W. RIOUX, *Aristotle, Aquinas, and the Foundations of Arithmetic* (Houston: The Center for Thomistic Studies, 1990).

mathematical science apart from the sciences of arithmetic and geometry (which have their own distinct subjects), no universal mathematics which studies quantity considered in itself.” In view of what these philosophers say, he arrives at “a general notion of what the objects of the mathematical sciences are”:

[T]hey are ultimately in sensible matter, they are not of a single subject-genus (that is, the subject of mathematics is not quantity as such, but one science studies one species of quantity, another another,) and lastly, these objects are considered apart from those things in which they are found. This last attribute is usually expressed in saying that the objects are abstract.<sup>52</sup>

RIoux determines that “numbers might be regarded in a two-fold manner: as physical, and as abstract, in the latter of which they are something which is considered in the science of arithmetic.” However, he does not provide here a definition of the *number* that is the subject of arithmetic.

In section III(b), RIoux considers the distinction of the sciences in respect of the method. He concludes:

In summary, the mathematical sciences demonstrate *propter quid*, and prove by means of the formal cause all that they actually do prove. Further, in addition to their distinction from the other sciences in terms of subject-matter, (which we have discussed and will discuss further,) the truth of mathematical judgments is based either upon first principles or upon the evidence given by the imagination (as opposed to the senses or intellect.)<sup>53</sup>

After examining abstraction in section IV, RIoux turns his attention in section V to the problems that confront the Aristotelian approach itself. Where do physical numbers exist? Thus, he considers the question of the frame of reference when determining the number of “cows in a field.” And following some difficulties raised by FREGE, he asks, “Why should we call the unit a property of a thing when it appears to be interchangeable with being?”

Frege’s difficulty serves to emphasize our own: for if the numerical unit is not a property of existing things (as he finally concludes,) how could the numbers be based in reality? And, as we have attempted to show in our example of the cows in the field, if numbers are not based in reality, what sense does it make to speak of a science of numbers?<sup>54</sup>

Finally, among the “principal difficulties which beset the Aristotelian and Thomistic account of the science of arithmetic,” RIoux counts the fact that “the only numbers which would be admitted by Aristotle and Aquinas would be the whole numbers beginning with one.” Fractional, irrational, infinite, and transfinite “numbers” are “prohibited.”

---

<sup>52</sup> Ibid., 60.

<sup>53</sup> Ibid., 81.

<sup>54</sup> Ibid., 100.

In the remaining chapters, RIOUX delves deeper into these questions: above all, whether numbers exist; for they seem to be the subject of arithmetic. Indeed, St. Thomas says that quantity exists as an accident in material substance. Hence, numbers must exist for arithmetic to be considered the science of number. However, there seems to be a problem, for how can number—an accident—be common to many individual substances?

After a lengthy discussion, RIOUX concludes that the subject of arithmetic is not *number*; for it can neither exist in a single substance, nor can it be common to multiple substances. The subject of arithmetic, according to him, is the unit. Numbers would be mere attributes that can be “constructed” from the unit. Such constructions belong to the “art of arithmetic,” as opposed to the science of the unit. This is not the only problem of the Aristotelian approach that RIOUX resolves by resorting to the distinction between science and art in mathematics: *zero*, *negative*, and *irrational numbers* are merely the subject of logical propositions with no more entity than that of Cyclops.

7. In 1993, Armand A. MAURER published an article entitled “Thomists and Thomas Aquinas on the Foundation of Mathematics,” where he scolds “some modern Thomists,” including Joseph GRETT, MARITAIN, Edward MAZIARZ, Thomas ANDERSON, and SMITH, for saying that “the objects of mathematics are real entities.”<sup>55</sup> Much like RIOUX, MAURER believes that “Numbers themselves originate through an act of our mind.” But unlike RIOUX, who reached a similar conclusion while seeking the subject in which number would have to exist in order to be an accident, MAURER believes to have found textual evidence in St. Thomas.

MAURER bases his claim on a *quaestio disputata* that he had already brought to the fore in an article, originally published in 1959, entitled “A Neglected Thomistic Text on the Foundation of Mathematics.”<sup>56</sup> The text of the *quaestio disputata*, MAURER argues, was so important to St. Thomas, that at some point between 1265 and 1267 he retroactively incorporated it to his commentary on Peter LOMBARD’s *Sentences* (*In Sent.* 1, d. 2 q. 1 a. 3 co.), written a decade earlier (1252–1256).

According to MAURER’s reading of this text, numbers are “concepts” that have their “proximate foundation” in “a constructive act of the mind.” Contrary to what St. Thomas

---

<sup>56</sup> Armand MAURER, “A Neglected Thomistic Text on the Foundation of Mathematics,” *Mediaeval Studies* 21 (1959). Reprinted in Armand MAURER, *Being and Knowing: Studies in Thomas Aquinas and Later Medieval Philosophers* (Toronto: Pontifical Institute of Mediaeval Studies, 1990).

says in other places, “real substance does not play an intrinsic role as the intelligible matter of quantity.” Thus, while RIOUX defends arithmetic as a science, MAURER claims that St. Thomas “placed logic and mathematics in the same order in relation to the real world.” He even makes of St. Thomas a precursor of modern mathematics: “Had he known modern types of mathematics, he would have seen the almost unlimited range of the mind’s mathematical inventiveness.”

8. In 2009, Alberto STRUMIA published *Il problema dei fondamenti: Un’avventurosa navigazione dagli insiemi agli enti passando per Gödel e Tommaso d’Aquino*, where he proposes a return to realism in mathematics: not, however, to the univocal Platonist realism of GÖDEL, but to a realism that is “informed by the Thomistic theory of analogy.”<sup>57</sup>

Based on formal ontology (FO) and inspired by Aristotelian-Thomistic (AT) metaphysics and epistemology, STRUMIA creates an original, analogical interpretation of the “abstract” axiomatic set theory of János (John) Lajos VON NEUMANN (1903–1957), Paul Isaac BERNAYS (1888–1977), and GÖDEL, better known as NBG, a conservative extension of ZFC (i.e., ZF plus the *axiom of choice*) capable of making statements about classes.

Thus, for example, the  $\in$  symbol, which in set-theoretical interpretations of NBG is taken to mean “belongs-to” (indicating that an object is an element or member of a set), receives from STRUMIA the AT-FO interpretation of “is *in act* in,” and is formalized following the eight ways in which “to be in” is said according to ARISTOTLE and St. Thomas.<sup>58</sup> Likewise, *Class* is interpreted as equivalent to the Latin *ens* (being), while the *axiom of replacement* is used to formalize “something more similar to the notion of ‘genus’ (AT).”<sup>59</sup>

STRUMIA also interprets the universal ( $\forall$ ) and existential ( $\exists$ ) quantifiers, giving them an analogical formalization that includes the distinction between logical and real existence, as well as participation.<sup>60</sup>

Overcoming the extensionist flaws of set theory, which treats universals (such as genera and species) as sets of individuals, he moreover formalizes the notions of *form* and *matter*.<sup>61</sup> To this, he adds a formalization of efficient and final causality, as well as of the causal order according to priority.

9. Outside of Thomism, there are some authors who have professedly embraced Aristotelian foundations. Among them is Hippocrates George APOSTLE, who claims that quantity is the unifying subject of mathematics and estimates that “more than ninety percent of modern research in mathematics comes under Aristotle’s definition of mathematics.”<sup>62</sup>

10. Also within the Aristotelian tradition, of the greatest importance is the Sydney School in the Philosophy of Mathematics, whose members aspire to “create a complete philosophy of mathematics based directly on applied mathematics, taking the view that mathematics is not about other-worldly entities like numbers or sets, nor a mere language of science, but a direct science of structural features of the real world like symmetry, continuity and ratios.”<sup>63</sup>

Prominent among its members is James FRANKLIN, who published in 2014 a book entitled *An Aristotelian Realist Philosophy of Mathematics*.<sup>64</sup> He observes that quantity is one of ARISTOTLE’S basic categories, which the Stagirite divides into *discrete*, studied by arithmetic, and *continuous*, studied by geometry. Thus, the study of quantity originates in antiquity. But the study of structure, according to FRANKLIN, would be a completely new subject matter discovered in the eighteenth century and exemplified by Leonhard EULER’S pioneering solution to the problem of the seven bridges of Königsberg. Thus, according to FRANKLIN, mathematics studies the quantitative and structural aspects of things, and roughly speaking, the study of quantity would correspond to elementary mathematics, while that of structure, to higher mathematics.

# 1. The Mathematical Sciences

Unlike their Babylonian and Egyptian predecessors, ancient Greek arithmetic (ἀριθμητική) and geometry (γεωμετρία) are not computational arts, but demonstrative sciences.<sup>1</sup> As HEATH observes, “[the] distinction between ἀριθμητική (the theory of numbers) and λογιστική (the art of [numeric] calculation) was a fundamental one in Greek mathematics.”<sup>2</sup> Similarly, geometry, the theoretical demonstrative science of magnitude, was set apart and opposed to geodesy (γεωδαισία), the art of land-dividing or mensuration (i.e., not the branch of applied mathematics that deals with the determination of the size and the shape of the earth, which is what is commonly understood today by the same name).<sup>3</sup>

By way of comparison, the famous Plimpton 322 Babylonian tablet contains, according to a recent article, “15 rows of arithmetically complicated Pythagorean triples,” i.e., a list of calculated quantities (including some errors!), hailed as “one of the most sophisticated scientific artifacts of the ancient world” that “brings the founding assumptions of our own mathematical culture into perspective.”<sup>4</sup> So much so, that “The discovery of trigonometry is attributed to the ancient Greeks, but this needs to be reconsidered.” Alas, since it does not demonstrate a single property of triangles (let alone the Pythagorean theorem!), ancient Greeks would consider it a mere product of geodesy rather than geometry.

In contrast, EUCLID’s *Elements* does not consist in a list of concrete, calculated quantities, but in universal **propositions** (προτάσεις) that the student must demonstrate. And every single demonstration allows for nothing less than absolute rational certainty.

## 1.1. Principles of Demonstration

The name *proposition* refers specifically to the enunciation of the conclusion that must be reached.<sup>5</sup> The proof follows necessarily from principles. Hence, principles upon which the first propositions depend, such as definitions and common notions, are placed first; and propositions upon whose proof depend other propositions, are placed before the latter. PROCLUS explains this order in his *Commentary on the First Book of Euclid’s Elements*:

---

<sup>1</sup> For an account of Babylonian mathematics see, e.g., JENS HØYRUP, “Babylonian Mathematics,” in *Companion Encyclopedia of the History and Philosophy of the Mathematical Sciences*, ed. IVOR GRATTAN-GUINNESS (New York: Routledge, 1994), 23.

<sup>2</sup> THOMAS LITTLE HEATH, *A History of Greek Mathematics* (Oxford: Clarendon Press, 1921), v. 1, 13–16. However, at first λογιστική may have been a theory of ratios (see FOWLER, *The Mathematics of Plato’s Academy*, 105–13).

<sup>3</sup> ARISTOTLE, *Metaphysica* B.2, 997b26–34. Cf. KLEIN, *Greek Mathematical Thought and the Origin of Algebra*, chapters 2–3, where he provides his phenomenological, more thorough and up-to-date account.

<sup>4</sup> All quotes here are from DANIEL F. MANSFELD and N. J. WILDBERGER, “Plimpton 322 Is Babylonian Exact Sexagesimal Trigonometry,” *Historia Mathematica* (2017), <https://doi.org/10.1016/j.hm.2017.08.001>

<sup>5</sup> For a modern account of the structure of the *Elements*, see IAN MUELLER, *Philosophy of Mathematics and the Deductive Structure of Euclid’s Elements* (Mineola, New York: Dover Publications, 1981).

The general arrangement of its propositions we should explain somewhat, as follows. Since this science of geometry is based, we say, on hypothesis and proves its later propositions from determinate <first> principles—for there is only one unhypothetical [ἀνυπόθετος] science, the other sciences receiving their <first> principles from it—he who prepares an introduction to geometry should present separately the principles of the science and the conclusions that follow from the principles but only for the theorems that are derived from them. For no science demonstrates its own <first> principles or presents a reason [λόγον] for them; rather each holds them as self-<evident>, that is, as more evident than their consequences. The <science> knows them through themselves, and the later <propositions> through them.<sup>6</sup>

Ultimately, all demonstrations depend on first principles. Hence, almost every book in the *Elements* opens with **definitions** (ὅροι). In the first book, these are followed by **postulates** (αἰτήματα) and **common notions** (κοινὰ ἔννοιαι). PROCLUS explains these as well, but his terminology, influenced by ARISTOTLE, differs slightly from that of EUCLID:<sup>7</sup>

First of all then, to repeat what I said, it was incumbent on him [i.e., on EUCLID] to set apart the principles from their consequences; and this is just what Euclid does in practically every book, besides setting forth at the outset of his whole treatise the common <principles> of the science. Next he divides them into hypotheses [ὑπόθεσεις; cf. ὅροι, *definitions* in EUCLID], postulates [αἰτήματα, as in EUCLID], and axioms [ἀξιώματα = κοινὰ ἔννοιαι, *common notions* in EUCLID], for these are all different from each other. Axiom, postulate, and hypothesis are not the same thing, as the inspired Aristotle somewhere says [i.e., in *Posterior Analytics* A.10, 76a31–77a4].<sup>8</sup>

## 1.2. Axioms or Common Notions

What EUCLID calls *common notions*, PROCLUS calls **axioms** (ἀξιώματα). In fact, ARISTOTLE himself often refers to them as **the commons** (τὰ κοινὰ) and explains that they are called *axioms* by mathematicians.<sup>9</sup> He also says that theorizing about axioms belongs neither to geometry nor to arithmetic but metaphysics (which PROCLUS calls *the unhypothetical science*):

We must state whether it belongs to one or to different sciences to inquire into <the truths> which are in mathematics called axioms, and into substance. Evidently, the inquiry into these also belongs to one science, and that the science of the philosopher; for these <truths> hold good for everything that is, and not for some special genus apart from others. And all <men> use them, because they are <true> of being *qua* being and each genus <has> being. But <men> use them just so far as to satisfy their purposes; that is, as far as the genus to which their demonstrations

<sup>6</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 75.6–19.

<sup>7</sup> As KNORR observes, the literature on the Euclidean and Aristotelian divisions of first principles is rather large. For some of the major works, see Wilbur Richard KNORR, “On the Early History of Axiomatics: The Interaction of Mathematics and Philosophy in Greek Antiquity,” in *Classics in the History of Greek Mathematics*, 107 n. 55.

<sup>8</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 75.27–76.8.

<sup>9</sup> See, for example, *Analytica Posteriora* A.10, 76a38; *Metaphysica* K.4, 1061b18.

refer extends. Therefore since these truths clearly hold good for all things *qua* being (for this is what is common [τὸ κοινόν] to them), to him who studies being *qua* being belongs the inquiry [ἡ θεωρία] into these as well. And for this reason no one who is conducting a special [κατὰ μέρος] inquiry tries to say anything about their truth or falsity, neither the geometer nor the arithmetician.<sup>10</sup>

Thus, since axioms do not particularly belong to any genus, ARISTOTLE holds that they are common (to diverse genera) according to **proportion** (κατ' ἀναλογίαν): that is, according to **analogy**. Hence, common principles are applied to each genus particularly, and not in their full commonality:

Of the <basic truths> used in the demonstrative sciences some are peculiar [ἴδια] to each science, and some are common [κοινά], but common <only in the sense of> analogous [κατ' ἀναλογίαν], being of use only in so far as they fall within the genus <constituting the province> of the science <in question> [ἐν τῷ ὑπὸ τὴν ἐπιστήμην γένει].

Peculiar <truths are>, e.g., the definitions of line and straight [γραμμὴν εἶναι τοιαυδί, καὶ τὸ εὐθύ];<sup>11</sup> common <truths are> such as “take equals from equals and equals remain.” Only so much of these <common truths> is required as falls within the genus in question: for <a truth of> this <kind> will have the same force even if not used generally [κατὰ πάντων] but applied <by the geometer> only to magnitudes, or by the arithmetician only to numbers.<sup>12</sup>

The example provided here by ARISTOTLE is contained in the *Elements* as its third common notion: “If equals be subtracted from equals, the remainders are equal.”<sup>13</sup> PROCLUS, again following ARISTOTLE, explains that such axioms (whose study belongs to metaphysics) are accepted by the student because they are evident, and points to EUCLID’s first common notion as an example:

When a proposition that is to be accepted into the rank [τάξιν, *order*] of <first> principles is something both known to the learner and credible in itself, such <a proposition> is an axiom: for example, that things equal to the same thing are equal to each other.<sup>14</sup>

### 1.3. Definitions and Hypotheses

PROCLUS seems to call *hypotheses* what EUCLID calls *definitions*. About the same thing, there can be a definition, a hypothesis, or both. But since hypotheses and definitions are opposites, as PROCLUS undoubtedly knows, his usage requires further explanation. As per ARISTOTLE, a **hypothesis** (ὑπόθεσις = Lat. *suppositio*) is a **thesis** (θέσις = Lat. *positio*)

---

<sup>10</sup> ARISTOTLE, *Metaphysica* Γ.3, 1005a19–31.

<sup>11</sup> ARISTOTLE is not saying that the definition of the line or of the straight is an axiom, but that the affirmation of there being such a thing as a line or a straight (line) is an axiom (i.e., to the geometrician, a hypothesis).

<sup>12</sup> ARISTOTLE, *Analytica Posteriora* A.10, 76a37–b2.

<sup>13</sup> EUCLID, *Opera Omnia*, vol. 1, 2.4–5.

<sup>14</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 76.9–12. Cf. ARISTOTLE, *Analytica Posteriora* A.2, 72a16–17.

that posits either *that* something is, or *that* it is not.<sup>15</sup> A **definition** (ὀρισμός), on the other hand, is a thesis that posits *what* something is;<sup>16</sup> hence, it posits neither *that* something is, nor *that* it is not. For example, the arithmetician posits that the unit (μονάς, the monad) is “the quantitatively indivisible” (τὸ ἀδιαίρετον κατὰ τὸ ποσόν), but this is not a hypothesis: for “*what* a unit is” (τί ἐστὶ μονάς) and “*that* the unit is” (τὸ εἶναι μονάδα) are not the same.<sup>17</sup>

ARISTOTLE explains that definitions and hypotheses are kinds of preexistent knowledge, and that both are necessary in the mathematical sciences.<sup>18</sup> Thus, “as regards ‘unit’ <we have to make> the double <assumption of> the meaning of the word [τί σημαίεν, “*what* it signifies,” i.e., its definition] and the existence of the thing [ὅτι ἔστιν, “*that* it is,” i.e., its hypothesis].”<sup>19</sup>

EUCLID’s definitions only tell us *what* a thing is. For example, “a point is that which has no part,” and “a line is breadthless length.”<sup>20</sup> *That* a point is, or *that* a line is, are *hypotheses*—not indeed in the modern sense of a “working hypothesis,” but in the sense used by PLATO and ARISTOTLE: namely, “an assumption not calling for proof within the sphere of the special science in which it functions.”<sup>21</sup>

When PROCLUS calls such definitions *hypotheses*, he means (in keeping with ARISTOTLE) that the things defined by EUCLID are moreover posited *to be*, and thus received by the student without proof:

When the student does not have a self-evident notion of the assertion proposed but nevertheless posits it and thus concedes the <point> [τῷ λαμβάνοντι] to his teacher, such an assertion is a hypothesis [i.e., relatively to the student, according to ARISTOTLE].<sup>22</sup> That a circle is [τὸ εἶναι τὸν κύκλον] a figure of such-and-such a sort we do not know by a common <notion> [κατὰ κοινήν] in advance of being taught, but upon hearing it we accept it without a demonstration.<sup>23</sup>

EUCLID himself calls some definitions ὑποκείμενα, “those supposed” or “those taken as hypotheses,” when he says, immediately after stating them, “With these hypotheses [τούτων ὑποκειμένων], it is proved that...”<sup>24</sup>

#### 1.4. Postulates

Based again on ARISTOTLE,<sup>25</sup> PROCLUS explains EUCLID's **postulates** (αἰτήματα) thus:

Whenever, on the other hand, the statement is unknown and nevertheless is taken as true without the student conceding it, then, he [i.e., ARISTOTLE] says, we call it a postulate: for example, that all right angles are equal. This characteristic of postulates is evident by the strenuous efforts that have been made to establish one of them, as though nobody could concede it without more ado.<sup>26</sup>

PROCLUS is undoubtedly referring here to EUCLID's notorious fifth postulate, whose obviation centuries later gave rise to so-called non-Euclidian geometries: namely, "That, if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the two straight lines, if produced indefinitely, meet on that side on which are the angles less than the two right angles."<sup>27</sup> PROCLUS himself believes that this is a theorem looking for a proof, rather than a first principle.<sup>28</sup> But EUCLID's other postulates are not quite as contentious. They merely state that a straight line can be drawn from any point to any point; that a finite straight line can be produced (ἐκβαλεῖν) continuously in a straight line; that a circle can be described with any center and interval (διάστημα); and, as PROCLUS points out in this passage, that all right angles are equal to one another.<sup>29</sup>

#### 1.5. Types and Parts of Propositions

PROCLUS divides propositions into two kinds: **problems** and **theorems** (EUCLID himself does not mention—let alone give an account of—this distinction):<sup>30</sup>

[T]he propositions that follow from the <first> principles he divides into problems [προβλήματα] and theorems [θεωρήματα], <the former including> the construction of figures, the division <of them> into sections, subtractions from and additions to them, and in general the characters [παθήματα, *affections*] that result from such <procedures, and the latter concerned with> demonstrating inherent properties [συμβεβηκότα, *accidents*] belonging to each <figure>. Just as the productive sciences have some theory in them, so the theoretical ones take on problems in a way analogous [ἀνάλογον] to production.<sup>31</sup>

Turning to the structure of propositions, PROCLUS provides an analysis of their parts: **enunciation** (πρότασις), **exposition** (ἐκθεσις), **specification** (διορισμός), **construction**

<sup>27</sup> EUCLID, *Opera Omnia*, vol. 1, 8.15–19. See discussion in HEATH, *The Thirteen Books of Euclid's Elements*, vol. 1, 202–220.

<sup>28</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 191.21–22.

<sup>29</sup> EUCLID, *Opera Omnia*, vol. 1, 8.7–14.

<sup>30</sup> AS MUELLER, *Philosophy of Mathematics and the Deductive Structure of Euclid's Elements*, 11, says, "At some point, perhaps after Euclid, the Greeks developed a terminology to mark this distinction."

<sup>31</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 77.7–15.

(κατασκευή), **proof** (ἀπόδειξις), and **conclusion** (συμπέρασμα).<sup>32</sup> With these types and parts in mind, let us analyze a problem and a theorem contained in the *Elements*.

### 1.6. Parts of a Problem

The very first proposition is a problem in which the student is required to demonstrate that an equilateral triangle can be erected (συστήσασθαι) on any given straight line. Thus, the **enunciation** reads, “On a given <finite> straight line to construct an equilateral triangle.”<sup>33</sup>

This is followed by the **exposition**, “Let AB be the given <finite> straight line,”<sup>34</sup> where AB is a symbol that stands for any straight line as defined by its extreme points A and B. Note that geometry, as a theoretical science, deals with universal (as opposed to singular or individual) magnitudes. Likewise, arithmetic demonstrates using universal numbers.

Next, we find the **specification**, which applies the enunciation to the determined line: “Thus it is required to construct an equilateral triangle on the straight line AB.”<sup>35</sup>

This is followed by the **construction**, which begins thus: “With center A and distance [διαστήματι] AB let the circle BCD be described.”<sup>36</sup> This part of the construction, and the next one, “again, with center B and distance BA let the circle ACE be described,”<sup>37</sup> depend on the third postulate: “To describe a circle with any center and distance.”<sup>38</sup> The last part of the construction, “and from the point C, in which the circles cut one another, to the points A, B let the straight lines CA, CB be joined,”<sup>39</sup> depends on the first postulate: “To draw a straight line from any point to any point”<sup>40</sup> (► Figure 1).

Figure 1: Construction required in a problem.

<sup>32</sup> Ibid., 203.1–5.

<sup>33</sup> EUCLID, *Opera Omnia*, vol. 1, 10.14–15. Note that HEATH adds “finite.” As we will see, for the Greeks all lines are finite (sections, in the modern sense).

<sup>34</sup> Ibid., 10.16.

<sup>35</sup> Ibid., 10.17–18.

<sup>36</sup> Ibid., 10.19–12.1.

<sup>37</sup> Ibid., 12.1–2.

<sup>38</sup> Ibid., 8.11–12.

<sup>39</sup> Ibid., 12.2–5.

<sup>40</sup> Ibid., 8.7–8.

All the postulates used above, in turn, depend on definitions such as that of *circle*, *figure*, *surface*, *straight line*, *line*, and *point* (on which there will be more to say below).

The construction is followed by the **proof**, in which the first common notion is used: “Things which are equal to the same <thing> are also equal to one another.”<sup>41</sup>

Now, since the point A is the centre of the circle CDB, AC is equal to AB. Again, since the point B is the centre of the circle CAE, BC is equal to BA. But CA was also proved equal to AB; therefore each of the straight lines CA, CB is equal to AB. And things which are equal to the same thing are also equal to one another; therefore CA is also equal to CB. Therefore the three straight lines CA, AB, BC are equal to one another.<sup>42</sup>

The problem then reaches its **conclusion**: “Therefore the triangle ABC is equilateral; and it has been constructed on the given <finite> straight line AB,” adding the standard ending for a problem, “which is what had to be done” (ὅπερ ἔδει ποιῆσαι = *quod erat faciendum*).<sup>43</sup>

### 1.7. Parts of a Theorem

Let us now turn to the sixth proposition in the first book of EUCLID’s *Elements*, which is a theorem. The **enunciation** reads, “If in a triangle two angles be equal to one another, the sides which subtend the equal angles will also be equal to one another.”<sup>44</sup>

This is followed by the **exposition**, “Let ABC be a triangle having the angle ABC equal to the angle ACB,”<sup>45</sup> where ABC is a symbol that indicates the extreme points of the lines that contain any triangle and ultimately define the triangle itself. Moreover, ABC serves also to indicate the angle formed by lines AB and BC as they meet at point B. Something similar can be said of ACB, which denotes the angle formed by AC and CB.

Next comes the **specification**, which applies the enunciation to the lines of a *determined* triangle: “I say that the side AB is also equal to the side AC.”<sup>46</sup> Note that, instead of requiring a construction, as in the above problem, the specification of a theorem states an assertion: “I say that [λέγω, ὅτι].”

The specification is immediately followed by the **proof**, constructing an additional line DC, thus forming triangle DBC, which is assumed to be smaller than ABC. Using *reductio ad absurdum*, the proof determines that, contrary to the initial assumption, AB is equal to AC:

---

<sup>41</sup> Ibid., 10.2.

<sup>42</sup> Ibid., 12.6–13.

<sup>43</sup> Ibid., 12.14–17.

<sup>44</sup> Ibid., 22.19–21.

<sup>45</sup> Ibid., 22.22–23.

<sup>46</sup> Ibid., 22.23–24.

For, if AB is unequal to AC, one of them is greater. Let AB be greater; and from AB the greater let DB be cut off equal to AC the less; let DC be joined.<sup>47</sup>

Figure 2: Construction created in support of the proof of a theorem.

Then, since DB is equal to AC, and BC is common, the two sides DB, BC are equal to the two sides AC, CB respectively; and the angle DBC is equal to the angle ACB; therefore the base DC is equal to the base AB, and the triangle DBC will be equal to the triangle ACB, the less to the greater: which is absurd. Therefore AB is not unequal to AC; it is therefore equal to it.<sup>48</sup>

Finally, the theorem reaches its **conclusion**, which merely repeats the enunciation: “Therefore if in a triangle two angles be equal to one another, the sides which subtend the equal angles will also be equal to one another,” adding the standard ending for a theorem, “which is what had to be demonstrated” (ὅπερ ἔδει δεῖξαι = *quod erat demonstrandum*).<sup>49</sup>

As HEATH observes commenting on this proposition, “Euclid assumes that, because D is between A and B, the triangle DBC is less than the triangle ABC. Some postulate is necessary to justify this tacit assumption.”<sup>50</sup> True, EUCLID does not always provide all the principles necessary for the demonstration at hand when they are evident. But this is in line with what ARISTOTLE says when he explains the principles of scientific demonstration:

Yet some sciences may very well pass over some of these <elements>; e.g. we might not expressly posit the existence of the genus if its existence were obvious (for instance, the existence of hot and cold is more evident than that of number); or we might omit to assume expressly the meaning of the attributes [πάθη “affections”] if it were well understood. In the way the meaning of axioms, such as “Take equals from equals and equals remain,” is well known and so not expressly assumed. Nevertheless, in the nature <of the case> the essential <elements> of demonstration are three: the subject [ὃ δέικνυσι “that of which something is demonstrated,” i.e., τὸ γένος τὸ ὑποκείμενον, the subject-genus: e.g., *number*], the attributes [ἃ δέικνυσι “those that are demonstrated,” i.e., the affections πάθη of the subject: e.g., odd or even], and the basic premises [ἐξ ὧν “(those) from which (demonstration proceeds),” i.e., the ἀξιώματα or κοινά].<sup>51</sup>

## 2. Multitude (πλήθος) vs. Magnitude (μέγεθος)

As noted above, ancient Greek mathematics comprises two distinct but closely related disciplines: arithmetic, the science of *measurable multitude* (ordinarily called ἀριθμός, *number*); and geometry, the science of *measurable magnitude*. (The plurality of these sciences is somehow preserved in the English name of *mathematics*.)

The basis for distinguishing between **multitude** (also called **plurality**) and **magnitude** is quite simple. As cognitivists have rediscovered, *many* has to do with “a large number of similar items,” while *much* has to do with “a large quantity of substance.”<sup>1</sup> Evidently, being many or few is not the same as being great or small. While both pairs of opposites are **affections** (πάθη = Lat. *passiones*), that is, **properties** or **per se accidents** of quantity, nonetheless, the former pair pertains only to multitude, while the latter belongs only to magnitude. In fact, multitude and magnitude were named after their most prominent affections: *many* and *great*, respectively. Thus, just as our *multitude* comes from the Latin *multus* (many), and *magnitude* derives from *magnus* (great, large), so the Greek πλήθος (multitude) originally had the sense of *great number*, while μέγεθος (magnitude) was derived from μέγας (big, large).<sup>2</sup>

### 2.1. Number (ἀριθμός) and Unit (μονάς)

EUCLID defines *unit* and *number* at the beginning of Book VII of his *Elements*. He says **number** (ἀριθμός) is “a multitude [πλήθος] composed of units”; and **unit** (μονάς, *monad*), “that by virtue of which each of the things that exist is called *one*.”<sup>3</sup> For his part, IAMBlichus reports that EUDOXUS, whom he calls “the Pythagorean,” defined it as a “determinate multitude [πλήθος ὠρισμένον].”<sup>4</sup> And ARISTOTLE registers that some other philosophers defined *number* as a “composition of units [σύνθεσις μονάδων].”<sup>5</sup>

Ancient Greeks agree, then, in defining *number* in terms of a determinate or measured multitude of units.<sup>6</sup> ARISTOTLE himself defines it as a “determinate multitude [πλήθος πεπερασμένον]”;<sup>7</sup> a “multitude of units [πλήθος μονάδων]”;<sup>8</sup> and a “multitude of

<sup>7</sup> ARISTOTLE, *Metaphysica* Δ.13, 1020a13.

<sup>8</sup> *Ibid.*, I.1, 1053a30.

indivisibles [πληθος ἀδιαιρέτων];<sup>9</sup> but, above all, as a “multitude measurable by one [πληθος ἐνὶ μετρητόν],” for *multitude* (πληθος) is, as it were, *the genus of number*.<sup>10</sup>

As will be further discussed, the unit is a measure for all numbers. However, ARISTOTLE carefully distinguishes between the *one* that is the principle of number and the *one* that is convertible with being. According to the former sense, every *being* is a *one* and every *one* is a *being*. According to the latter, however, not every *being* is a measure for numbers.<sup>11</sup>

It is not difficult to realize, then, that *one* is not a number because, simply put, it is not a multitude, as ARISTOTLE explains:

“The one” [τὸ ἓν] means [σημαίνει] the measure [μέτρον] of some plurality [πλήθους], and “number” [ἀριθμός] <means> a measured plurality [πλήθος μεμετρημένον] and a plurality of measures. (Thus it is natural [εὐλόγως, *reasonable*] that one is not a number; for the measure is not measures, but both the measure and the one are starting-points [ἀρχή, *a principle*].)<sup>12</sup>

For the puzzled modern reader of the *Elements*, this also explains why EUCLID repeats a proof applied to a single unit when he has sufficiently demonstrated a (seemingly) identical proposition that applies only to *number*.<sup>13</sup>

## 2.2. Magnitude

A search for a definition of *magnitude* in the *Elements* would prove quite disappointing, as it could only yield the unsuitable one with which Book v opens. The name, having never been used in the preceding books, appears there suddenly: “A magnitude is a part of a magnitude, the less of the greater, when it measures the greater.”<sup>14</sup> If this definition seems intricate, it is essentially because the noun *magnitude* is used both in the definition and in the definiendum. Indeed, EUCLID is not defining here *magnitude* as such. Nor is he even defining *part of a magnitude* in the general sense of *that into which something is* (in any way) *divisible or divided*.<sup>15</sup> What he *is* defining here, as discussed below, is rather an *aliquot part* of a magnitude: that is, a part that measures the whole magnitude exactly.<sup>16</sup>

In determining what EUCLID means by *magnitude*, it is misleading to read Book v of the *Elements* under the spell of illustrations that accompany many editions (both old and new);

<sup>9</sup> Ibid., M.9, 1085b22.

<sup>10</sup> Ibid., I.6, 1057a2–4.

<sup>11</sup> Ibid., 6–7.

<sup>12</sup> Ibid., N.1, 1088a4–8.

<sup>13</sup> See Proposition VII.15 in EUCLID, *Opera Omnia*, vol. 2, 220.5–222.8; cf. VII.9 in idem, 210.6–212.9.

<sup>14</sup> Ibid., 2.2–3.

<sup>15</sup> See ARISTOTLE, *Metaphysica* Δ.25, 1023b12–15; cf. Δ.13, 1020a7–12.

<sup>16</sup> See Ibid., Δ.25, 1023b15–17.

for one could inadvertently be induced into identifying it with a *straight line*. Nowhere in this book is there any mention of a straight line or a line, even though they are clearly defined at the outset of the *Elements*. Only a thorough examination of the whole work will reveal that whenever EUCLID explicitly identifies something as a **magnitude**, it is always a **line**, a **surface**, a **solid** (which we will call **body** elsewhere), or an **angle**.<sup>17</sup>

As far as EUCLID is concerned, a magnitude is neither a multitude nor a number nor a unit. In the *Elements*, as in the whole of ancient Greek mathematics, again, the distinction between multitude and magnitude is an essential one. Thus, for example, the definition of *equal and similar solid figures* in Book XI would be unintelligible without it, for such figures are described as contained by similar planes “equal in multitude and in magnitude.”<sup>18</sup> Therefore, numbers cannot be reduced to magnitudes, nor the latter to the former. Alas, modern authors have claimed (falsely, as we will show; ►7.3) that *number* was subsumed under *magnitude*.

Although *magnitude* in general is never defined in the *Elements*, the definitions of the first three species of magnitude (line, surface, and solid) are stated in the first and eleventh books. Thus, at the very outset of the *Elements* we learn that a **line** is “breadth-less length,”<sup>19</sup> and that a **surface** is “that which has length and breadth only,”<sup>20</sup> while in the beginning of Book XI we find that a **solid** is “that which has length, breadth, and depth.”<sup>21</sup>

EUCLID does not provide a definition of *angle* (as such) either. From the definitions of plane and solid angles, however, we can infer with certainty that **angle** is *the inclination* (κλίσις) *to one another of two lines*.<sup>22</sup>

The angle, being a property of related lines, is evidently heterogeneous or diverse from the other species of magnitude. But that certainly does not make it “a social construct originating from the needs of Seleucid astronomy rather than a necessary and intrinsic aspect of geometry,” as the authors of the recent Plimpton 322 article suggest.<sup>23</sup> Such assertions tell us more about postmodern thought than about ancient Greek mathematics.

---

<sup>17</sup> See Ivor GRATTAN-GUINNESS, “Numbers, Magnitudes, Ratios, and Proportions in Euclid’s *Elements*: How Did He Handle Them?”, *Historia Mathematica*, no. 23 (1996). Note, however, that GRATTAN-GUINNESS adds to this list *region*, which is not distinguished as a species of magnitude in the *Elements*. In fact, EUCLID does not even have a distinct name for it.

<sup>18</sup> EUCLID, *Opera Omnia*, vol. 4, 4.7–9.

<sup>19</sup> *Ibid.*, vol. 1, 2.2. EUCLID immediately adds that a straight line is “a line which lies evenly with the points on itself” in 2.4–5.

<sup>20</sup> *Ibid.*, 2.6–7.

<sup>22</sup> See *ibid.*, vol. 1, 2.11–3.

<sup>23</sup> MANSFELD and WILDBERGER, “Plimpton 322 Is Babylonian Exact Sexagesimal Trigonometry,” 2.

### 2.3. Priority of Arithmetic Over Geometry

At some point in history, arithmetic and geometry came jointly to be called *disciplines* (μαθηματική, Lat. *disciplinae*),<sup>24</sup> whence the originally plural English noun *mathematics*.<sup>25</sup> As HEATH reports, “According to Anatolius, the followers of Pythagoras are said to have applied the term μαθηματική more particularly to the two subjects of geometry and arithmetic, which had previously been known by their own separate names only and not by any common designation covering both.”<sup>26</sup>

The name *mathematics* was extended also to the so-called subaltern, or middle, physical sciences. These are, for example, harmonics (also known as *music*), which takes its principles from arithmetic; perspective, which takes its principles from geometry; and astronomy (then called ἀστρολογία, literally, *astrology*), which takes its principles from both. As explained in the next part, these sciences study things that, unlike number and magnitude abstractly considered, involve sensible matter and motion. Thus, harmonics studies arithmetic relations between sounds; perspective applies to visual lines what is demonstrated in geometry concerning abstract lines; and astronomy treats of the motion of visible celestial bodies. This clearly contrasts with abstract arithmetic and geometry.

ARISTOTLE and other authors refer to multitude and magnitude as being the first species of a *category* or highest genus: namely, **quantity** or **quantum** (ποσόν).<sup>27</sup> Motion, time, and place are considered *quanta* by extension, insofar as they are measurable. For reasons explained in the last chapter of this part (►7.4), ancient Greeks did not develop a universal mathematical science (i.e., above and beyond arithmetic and geometry) that would demonstrate propositions about the quantum in general. Nor did they have any art of calculation that would use quantities that are neither multitudes nor magnitudes. There is, nonetheless, a prevailing modern fiction claiming that ARISTOTLE (and other ancient Greeks) did possess a mathematical science of quantity as such. We will deal with this myth after discussing proportion theory, which is what underpins most of the assumptions. For now, let us examine the relationship between arithmetic and geometry according to NICOMACHUS, the most influential arithmetician of antiquity.

---

<sup>24</sup> Armand A. MAURER notes in his translation of Thomas AQUINAS, *The Divisions and Methods of the Sciences: Questions V and VI of his Commentary on the De Trinitate of Boethius* (Toronto: The Pontifical Institute of Mediaeval Studies, 1953), 49, n. 11: “the English word ‘mathematics’ is derived from the Greek *mathēma*, which means knowledge in general, and in particular mathematical knowledge. The corresponding Latin word is *disciplina*.”

<sup>25</sup> See *Merriam-Webster Dictionary* (2017 ed.), entry for *mathematics*.

<sup>26</sup> HEATH, *A History of Greek Mathematics*, v.1, 11. HEATH is referring here to a passage collected from an anonymous source and published in Friedrich Otto HULTSCH (ed.), *Heronis Alexandrini Geometricorum et stereometricorum reliquiae* (Berlin: Weidmann, 1864), 277.4–8.

<sup>27</sup> See, for example, *Metaphysics* Δ.13, 1020a7–32.

NICOMACHUS raises the question of which of the following four mathematical *methods* should be learned first: arithmetic, music, geometry, or astronomy (the Platonic group of sciences that in the Latin West would be called *quadrivium*, and which flourished under the influence of BOETHIUS). He answers that arithmetic should be learned first. Being the Neoplatonist that he is, NICOMACHUS justifies his answer firstly by resorting to the Platonic Demiurge, who fashions the sensible world in the likeness of eternal, archetypal ideas by impressing them in matter:

Which then of these four methods must we first learn? Evidently, the one which naturally exists before them all, is superior and takes the place of origin and root and, as it were, of mother to the others. And this is arithmetic, not solely because we said that it existed before all the others in the mind of the creating God like some universal and exemplary plan, relying upon which as a design and archetypal example the creator of the universe sets in order his material creations and makes them attain to their proper ends.<sup>28</sup>

However, NICOMACHUS immediately adds another Platonic reason—a natural and logical order of dependence, which he painstakingly explains. Thus, the posterior depends on the prior according to an order that is both logical and natural or ontological:

But also because it is naturally prior in birth, inasmuch as it abolishes other sciences with itself, but is not abolished together with them. For example, “animal” is naturally antecedent to “man,” for abolish “animal” and “man” is abolished; but if “man” be abolished, it no longer follows that “animal” is abolished at the same time. And again, “man” is antecedent to “schoolteacher,” for if “man” does not exist, neither does “schoolteacher,” but if “schoolteacher” is nonexistent, it is still possible for “man” to be. Thus since it has the property of abolishing the other ideas with itself, it is likewise the older.

Conversely, that is called younger and posterior which implies the other thing with itself, but is not implied by it, like “musician,” for this always implies “man.” Again, take “horse”; “animal” is always implied along with “horse,” but not the reverse; for if “animal” exists, it is not necessary that “horse” should exist, nor if “man” exists, must “musician” also be implied.<sup>29</sup>

Platonists and Peripatetics, despite their differences concerning the ontological status of ideas, would agree in that individual men subsist; and that some of them are musicians; and that there would be no musicians if there were no men. They would moreover agree in that *animal* is not only logically but also naturally prior to horse: for horses would not subsist if they were not animals. They would, of course, disagree on whether *animal itself* (that is, the immaterial form) subsists. Still, Peripatetics would avow an intrinsic, natural order of dependence that is reflected in our rational understanding of reality.

---

<sup>28</sup> NICOMACHUS, *Introductio arithmeticae*, I.4.1–2, 9.5–15.

<sup>29</sup> *Ibid.*, I.4.2–3, 9.15–10.9.

NICOMACHUS next shows how arithmetic is prior to geometry; for the latter depends on the former, since without numbers there would be neither ratios nor figures:

So it is with the foregoing sciences; if geometry exists, arithmetic must also needs be implied, for it is with the help of this latter that we can speak of triangle, quadrilateral, octahedron, icosahedron, double, eightfold, or one and one-half times, or anything else of the sort which is used as a term by geometry, and such things cannot be conceived of without the numbers that are implied with each one. For how can “triple” exist, or be spoken of, unless the number 3 exists beforehand, or “eightfold” without 8? But on the contrary 3, 4, and the rest might be without the figures existing to which they give names. Hence arithmetic abolishes geometry along with itself, but is not abolished by it, and while it is implied by geometry, it does not itself imply geometry.<sup>30</sup>

Hence, geometry takes some of its principles from arithmetic, and therefore depends upon it—but the opposite is not true. Thus, a line has two points, and two is a number: if we remove two, we remove the line. And the same thing can be said of the other figures contained by a measurable multitude of boundaries.

Conversely, we can treat of numbers without dealing with magnitude or figure. Thus, being great or small, or being configured according to a certain positional pattern, is extrinsic and accidental to numbers and units. Likewise, commensurable and incommensurable magnitudes are defined in dependence of numerical ratios; for, as we will show, the former have to one another the ratio which a number has to a number. Therefore, ratios between numbers have priority over ratios between magnitudes. To know about ratios between magnitudes, we must first know about ratios between numbers.

Finally, NICOMACHUS shows that so-called subaltern, or middle, physical sciences also depend on arithmetic:

And once more is this true in the case of music; not only because the absolute is prior to the relative, as “great” to “greater” and “rich” to “richer” and “man” to “father,” but also because the musical harmonies, diatessaron, diapente, and diapason, are named for numbers; similarly all of their harmonic ratios are arithmetical ones, for the diatessaron is the ratio of 4 : 3, the diapente that of 3 : 2, and the diapason the double ratio; and the most perfect, the di-diapason, is the quadruple ratio.

More evidently still astronomy attains through arithmetic the investigations that pertain to it, not alone because it is later than geometry in origin—for motion naturally comes after rest—nor because the motions of the stars have a perfectly melodious harmony, but also because risings, settings, progressions, retrogressions, increases, and all sorts of phases are governed by numerical cycles and quantities.<sup>31</sup>

---

<sup>30</sup> Ibid., I.4.4-5, 10.9-22.

<sup>31</sup> Ibid., I.5.1-2, 10.22-11.18.

#### **2.4. Fiction: “Ancient Greeks gave precedence to geometry over arithmetic”**

From what has been said, it is evident that ancient Greeks considered arithmetic to be more foundational than geometry. Therefore, we should not be misled by the famous report that a motto over the entrance to the Academy read, “Let no one untrained in geometry enter” (ἀγεωμέτρητος μηδεὶς εἰσίτω).<sup>32</sup> PLATO himself speaks of the importance of arithmetic in order to come to know the One itself through numbers; and he reduces magnitudes to numbers.<sup>33</sup>

---

<sup>32</sup> CAG 18.1, 118.18–19.

<sup>33</sup> See, for example, PLATO, *Republic* 7, 525d–e.

### 3. Divisibility and Measurability

As hinted above, we tend to call *part* anything into which something is divisible. However, not everything into which something is divisible is its part in a *proper* sense. In the *Elements*, *part* is always a *proper* or *aliquot* part; and a proper part of a number or of a magnitude is that which measures it exactly: for example, one half, one third, or one fifth.

As already noted, EUCLID defines **part of a magnitude** in the opening words of Book V: “A magnitude is a part of a magnitude, the less of the greater, when it measures the greater.”<sup>1</sup> Immediately after this definition, he offers its correlative, that is, the definition of **multiple of a magnitude**: “and the greater [magnitude] is a multiple of the less when it is measured by the less.”<sup>2</sup>

Similarly, after defining *number* in Book VII, EUCLID defines its *numerical part* by stating that “a number is a **part of a number**, the less of the greater, when it measures the greater; but **parts** when it does not measure it.”<sup>3</sup> Again, he also defines the correlative of a numerical part of a number, that is, the **multiple of a number**: “the greater number is a multiple of the less when it is measured by the less.”<sup>4</sup>

What EUCLID means by *part of a magnitude* should be clear. For example, a greater line is measured by its half, which is the less; and the former (i.e., the greater) is a multiple of the latter (i.e., the less): its double. The same can be said of the proper parts of any other species of magnitude: a surface (e.g., a circle: ► Figure 3), a solid, or an angle.

Figure 3: Half parts of a circle (semicircles).

Likewise, what EUCLID means by a numerical *part of a number* should be apparent from what has been said so far. Thus, the number two (the less) is a part of the number four (the greater) because two measures exactly one half of four; and the number four (the greater) is a multiple of the number two (the less) because four is twice two. Similarly, two

---

<sup>1</sup> EUCLID, *Opera Omnia*, vol. 1, 2.2–3.

<sup>2</sup> *Ibid.*, 2.4–5.

<sup>3</sup> *Ibid.*, vol. 2, 184.6–8.

<sup>4</sup> *Ibid.*, 184.9–10.

is a part of six because two measures exactly one third of six; and six is a multiple of two because thrice two makes six (► Figure 4).

**Figure 4: Two is a part (one half) of four, and a part (one third) of six. Four is a multiple (double) of two; and six is a multiple (triple) of two.**

More puzzling to the modern mind is exactly what EUCLID means by *parts* of a number. There is a fiction that would make *parts of a number* the equivalent of a proper fraction. We will deal with it at the end of this chapter (► 3.5). Meanwhile, we will show how taking EUCLID’S words at face value makes the expression *parts of a number* sufficiently clear.

As EUCLID says, “A number is said to multiply a number when that which is multiplied is added to itself as many times as there are units in the other, and thus some number is produced.”<sup>5</sup> Thus, twice four makes eight, which is less than nine; and thrice four makes twelve, which exceeds nine (► Figure 5). But there is no multitude between two and three by which we could multiply four in order exactly to produce the number nine.

**Figure 5: Twice four makes eight, which is less than nine. Thrice four makes twelve, which exceeds nine.**

Hence, if we faithfully apply EUCLID’S definitions, we must conclude that the number four is *parts* of the number nine. Indeed, four (the less) does not measure nine (the greater), nor is nine (the greater) a multiple of four (the less). Still, what does it mean for the number four to be *parts* of the number nine?

Manifestly, *parts* is the plural of *part*, and the grammatical plural signifies a plurality or multitude of things. Thus, *parts* signifies a *multitude* of parts, as opposed to *one part*. Now, each of the things that come into the composition of the multitude that we call *parts of a number* is evidently *one part* of a number. Hence, each of these parts is either a *unit*; for the unit measures every number-multitude; or else it is a *numerical part* of the number; for every numerical part of a number measures the number as a multitude.

Thus, absolutely speaking, the parts of the number four are the unit and the number two. Indeed, the unit is a (non-numerical) part of any number; and it measures the number four because the unit is exactly one fourth of four (► Figure 6). Likewise, the number two measures the number four because two is exactly one half of four. And the parts of the number nine are the unit and the number three, each of which measures the number nine. Indeed, one is one ninth of nine; and three is one third of nine.

<sup>5</sup> Ibid., 186.14–16.

**Figure 6: The parts of the number four are the unit and the number two.  
The unit is one fourth of four. Two is one half of four.  
One measures four. Two measures four.**

It is in this sense that EUCLID defines **perfect number** in Book VII as “that which is equal to its own *parts*.”<sup>6</sup> For example, the parts of the number six are the unit, the number two, and the number three. Hence, six is a perfect number because it is a number composed by adding these parts (i.e., the unit, which is one sixth of six; the number two, which is one third of six; and the number three, which is one half of six). And the same can be said of the perfect number twenty-eight: for the parts of twenty-eight are the unit, and the numbers two, four, seven, and fourteen, each of which measures the number twenty-eight; and together they add up to twenty-eight.

On the other hand, relatively speaking (that is, in the sense that a number is parts of another number), to say that the number four is *parts* of the number nine is to say that some of the parts into which the number four is divisible are also parts of the number nine. Thus, in Proposition 4 of Book VII, EUCLID demonstrates that “any number is either a part or parts of any number, the less of the greater.”<sup>7</sup> And he does so by showing that there are only three possible cases:

1. Either there is no common number that measures both numbers, in which case the less is *parts* of the greater; for if the less be divided into the units in it, each unit of those in it will be some part of the greater. This is the case posed in our example; for there is no common number that measures the numbers four and nine: the only numerical part of four is two, and the only numerical part of nine is three. However, each of the units that compose the number four is a measure for the number nine; for each unit is one fourth of four and one ninth of nine; therefore, four is four *parts* of nine (►Figure 7).

**Figure 7: Four is four *parts* of nine. Each of the fourth parts of four is one ninth of nine.**

2. Or else the less measures the greater, in which case it is *a part* of the greater. Thus, for example, the number two (the less) measures the number six (the greater); for two is one third of six. Therefore, two is *a part* of six (►Figure 8).

**Figure 8: Two is *a part* of six.**

<sup>6</sup> Ibid., 188.10–11; emphasis added to HEATH’s English version.

<sup>7</sup> Ibid., 198.15–200.15.

3. Or else there is a number that measures both the greater and the less, in which case the less is *parts* of the greater; for if the less be divided into numbers equal to the common measure, then each of the numbers resulting from the division, being a part of the less, is also a part of the greater. For example, the number that measures both six and eight is two; for two is one third of six and one fourth of eight. If we divide the number six (the less) into numbers equal to two (i.e., equal to the common measure), then each of the three twos resulting from this division is a fourth part of the number eight (the greater). Therefore, six is three *parts* of eight (► Figure 9).

Figure 9: Six is three *parts* of eight.

### 3.1. The Even and the Odd

Having defined *part* and *parts* of a number based on its measurability, EUCLID then proceeds in Book VII to define the first properties that numbers have in respect of their compared divisibility. Thus, he says that **even number** (ἄρτιος ἀριθμός) is “that which is divisible in (equal) halves;” and its opposite, **odd number** (περισσός [ἀριθμός]), is “that which is *not* divisible in halves,” or “that which differs by a unit from an even number.”<sup>8</sup>

Evidently, since a number is a multitude *composed* of units, it is also *divisible* into its components. And the first possible division is bisection, the result of which is two—equal or unequal—portions, each of which is either a lesser number or a unit.

Let us apply these definitions to the smallest four numbers. Thus, since the least number is *two* (for it is a multitude composed of the fewest possible units), and it is divisible in two halves (i.e., into two singular units, each of which is neither more nor less than the other), then two is an *even* number. In contrast, no matter how we bisect *three*, we will always be left with a multitude of two units and an individual unit. Since any multitude is unequal to the unit (for it exceeds the unit), then three is an odd number; and it is an odd number also because it differs by a unit from two. *Four* can be divided into two equal halves, each of which is a multitude composed of two units. Hence, four is an even number. Finally, *five*, which is the fourth number, can be divided into either a multitude of four units and a single unit, or else a multitude of three units and another multitude of two units. In either case the halves are unequal; therefore, five is an odd number. We would reach the same conclusion by noting that five differs by a unit from four, which is an even number. Evidently, it is mathematically certain that the same properties hold true of any number

<sup>8</sup> Ibid., 184.11–13. We depart here from HEATH’s translation of δίχα διαιρούμενος as “divisible into two equal parts,” for EUCLID does not explicitly use the name *parts*, which is a technical term. See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for δίχα.

greater than these without having to turn to sensible things for confirmation: again, mathematics abstracts from sensible matter and motion.

Combining the properties of intrinsic measurability and divisibility used above, EUCLID also provides definitions of numbers that are measured by even or odd numbers, which come into their composition even- or odd- times. Thus, he defines the **even-times even number** as “that which is measured by an even number according to an even number”; the **even-times odd number** as “that which is measured by an even number according to an odd number”; and the **odd-times odd number** as “that which is measured by an odd number according to an odd number.”<sup>9</sup>

Note that if an even number is added to an even number, the result is even; but if an odd number is added to an even number, the result is odd; and if a unit is added to an even number, the result is odd too. As THEON reports, some concluded from these observations that the unit is odd.<sup>10</sup> Clearly, however, the unit is neither even nor odd. Indeed, not only is it not divisible in halves but—as will be abundantly established—it is not divisible at all. Hence, according to THEON, ARISTOTLE explains (in *The Pythagorean*, a work lost to us)<sup>11</sup> that the unit “participates in both natures, namely odd and even”; for adding it to an even number produces an odd number; but adding it to an odd number produces an even number.<sup>12</sup> THEON says, then, that the unit is “odd-even” (ἄρτιοπέριπτον).<sup>13</sup> Be that as it may, odd and even are contrary affections of number; and the unit is the principle of number but not a number itself. Nonetheless, when ARISTOTLE opposes ratios to one another, he assumes that the unit can be taken as odd.<sup>14</sup>

### 3.2. Divisibility of Number and of Magnitude Compared

The properties of magnitude patently differ from those of number in respect of divisibility. Thus, there is no opposition between odd and even in magnitude; for every magnitude is divisible into two equal halves.

And there is no such thing as an *odd-times odd magnitude*: not only are all magnitudes exactly divisible in halves, but—more fundamentally—they are not composed of indivisible units. The same can be said of an *even-times odd* or *even-times even* magnitude; for, strictly speaking, there is no even or odd in magnitude, as has been established.

<sup>13</sup> Ibid., 22.9.

<sup>14</sup> ARISTOTLE, *De sensu* 7, 448a8–13 (cf. AQUINAS, *In De sensu* 1, c. 17, 6–62).

### 3.3. Prime and Composite Numbers

In Book VII, EUCLID defines **prime number** (πρῶτος ἀριθμός) as “that which is measured by a unit alone,” while **composite number** (σύνθετος ἀριθμός) is “that which is measured by some number.”<sup>15</sup>

The adjective *prime* (πρῶτος) means *first* or *prior*.<sup>16</sup> Prime numbers are prior in the order of measure and in the order of composition. NICOMACHUS explains how prime numbers are first in these two ways:

It has received this name [i.e., πρῶτος ἀριθμός “prime number”] because it can be measured only by that which is first and common to all number, unity, and by nothing else;<sup>17</sup> moreover, because it is produced by no other number combined with itself, but by unity alone; for 5 is  $5 \times 1$ , and 7 is  $7 \times 1$ , and the others in accordance with their own quantity [προσότητα, i.e., *delimited multitude*]. To be sure, when combined [συντεθέντων] with them, other numbers are produced [γενέσθαι], springing from them as from a root [ρίζης], wherefore they are called “prime,” because they exist beforehand as the beginnings [ἀρχαί, *principles*] of the others. For every origin [ἀρχή, *principle*] is elementary and incomposite, into which everything is resolved and out of which everything is made, but the origin itself cannot be resolved into anything or constituted out of anything.<sup>18</sup>

In turn, numbers **prime to one another** (πρὸς ἀλλήλους) are “those which are measured by the unit alone as a common measure.”<sup>19</sup> And numbers **composite to one another** are “those which are measured by some number as a common measure.”<sup>20</sup>

### 3.4. Measurability of Number and of Magnitude Compared

Clearly, EUCLID’s definition of *numerical part of a number* is virtually identical, *mutatis mutandis*, to that of *part of a magnitude*: both numbers and magnitudes are measurable by their proper, aliquot parts. And something similar can be said of the definition of *multiple of a number* when compared to that of *multiple of a magnitude*. Despite these manifest similarities, a careful comparison of the respective properties of number and magnitude reveals profound differences.

---

<sup>15</sup> EUCLID, *Opera Omnia*, vol. 2, 186.6–7; 10–11. It should be noted that “composite” here translates σύνθετος, while in the definition of number “composed” translates συγκείμενον. This distinction will be kept when discussing the *Elements*.

<sup>16</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entries for πρῶτος, πρότερος.

<sup>17</sup> We have altered D’OUGE’s translation because it thoroughly obscures what NICOMACHUS is saying here. D’OUGE renders “τῷ κοινῷ πάντων ἀριθμῷ καὶ πρωτίστῳ μονάδι μόνῃ δύναται μετρεῖσθαι” as “it can be measured only by the number which is first and common to all, unity.” However, as NICOMACHUS explains immediately after, a prime number is first because it is produced by no other number. Indeed, the monad is the principle of number and therefore not a number. Hence, the unit is not the first number, but prior to all numbers; and prime numbers are therefore the first numbers, as the name indicates.

<sup>18</sup> NICOMACHUS, *Introductio arithmeticae*, I.11.3, 26.20–27.11.

<sup>19</sup> EUCLID, *Opera Omnia*, vol. 2, 186.8–9.

<sup>20</sup> *Ibid.*, 12–13.

Thus, the unit is always *some part* of every number: it is *one half* of two, *one third* of three, and *one fifth* of five. But there is no such thing as a *prime magnitude*; for magnitudes are not composed of indivisible units (again, there is no such thing as a magnitude that can measure all magnitudes, as we will see; ►5.5). Conversely, we could say that all magnitudes are, in a sense, *composite*, for every part of a magnitude (e.g., one third of a line, or one half of a surface) is itself a magnitude. However, not every part of a number is a number. Indeed, none of the parts of a prime number is itself a number; for a prime number is measured by the unit alone. On the other hand, the unit, despite being some part of every number, is not itself a number, for it is not a multitude—as has been abundantly noted.

### 3.5. Fiction: “*Parts of a number means proper fraction*”

According to HEATH,

By the expression *parts* (μέρη, the plural of μέρος) Euclid denotes what we should call *proper fraction*. That is, a *part* being a submultiple, the rather inconvenient term *parts* means any number of such submultiples making up a fraction less than unity.<sup>21</sup>

What HEATH understands by fraction is any “number” of parts of “unity,” all of them presumably equal in magnitude. For example, let us imagine that our “unity” is a circle. And, since it is divisible it into four parts equal in size, let us further imagine that we sever one of them. Thus, the remainder is the fraction  $\frac{3}{4}$ , and the part removed is  $\frac{1}{4}$  (► Figure 10). Fractions such as  $\frac{3}{4}$  and  $\frac{1}{4}$  are moreover called “proper” because every one of them is less than “unity,” which is also to say that in each of them the *numerator* (that is, the 3 in  $\frac{3}{4}$ , and the 1 in  $\frac{1}{4}$ ) is less than the *denominator* (the 4 in  $\frac{3}{4}$  and  $\frac{1}{4}$ ).

Figure 10: So-called fractions.

There should be no need to say that EUCLID would certainly object to the “1” in “ $\frac{1}{4}$ ” being called a *number*. But HEATH’s misrepresentation of ancient Greek mathematics is even more problematic for other reasons. Indeed, what is “rather inconvenient” is not EUCLID’s term *parts*, as HEATH would have us believe, but the claim that “unity” (that is, the unit)

<sup>21</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 280.

can in any way be “fractioned,” for the notion of fractioning the arithmetical unit—properly or otherwise—is completely foreign to ancient Greek arithmetic.<sup>22</sup>

HEATH does acknowledge being unable to find the noun *parts* used anywhere else in the special sense of a proper fraction, “except in one place in Theon,” referring us to THEON’s *Mathematics Useful for Understanding Plato*.<sup>23</sup> But in the place in question THEON treats of ratios. Ratios, as we will see below (►5), are relations—not “proper fractions.” And, ironically, in the very work where HEATH claims to see fractions, THEON unambiguously explains that the unit is altogether without parts and indivisible:

As for the unit, it is the terminating quantity [the principle and element of numbers],<sup>24</sup> which once decreased in multitude by subtraction and deprived of all number, remains firm and fixed: for it is impossible to further the division. If the sensible *one* [τὸ ἓν ἐν αἰσθητοῖς] is divided into parts, that which was *one* becomes a multitude; and the subtraction of each of its parts would terminate in *one*; and if this is divided again into parts, a multitude is produced; and removing each part returns us to *one*, so the one—insofar as it is one—is without parts and indivisible.<sup>25</sup>

What is worse, as PLATO reports through the persona of Socrates, the mere mention of “fractions” would have sounded laughable to ancient Greek arithmeticians:

I mean, as I was saying, that arithmetic has a very great and elevating effect, compelling the soul to reason [διαλέγεσθαι] about <abstract> number [περὶ αὐτῶν τῶν ἀριθμῶν, *about numbers themselves*], and rebelling against the introduction of visible or tangible [ὄρατὰ ἢ ἀπτά] objects [σώματα, *bodies*] into the argument. You know how steadily the masters of this <art> repel and ridicule anyone who attempts to divide <absolute> unity [αὐτὸ τὸ ἓν, *the one itself*] when he is calculating, and if you divide, they multiply, taking care that *one* shall continue *one* and not become lost in fractions [μὴ ποτε φανῆ τὸ ἓν μὴ ἓν ἀλλὰ πολλὰ μόρια, i.e., to prevent *the one* from appearing to be, instead of *one*, many parts].<sup>26</sup>

From these quotes, we should observe the distinction between the *sensible* one or number (e.g., visible or tangible bodies) and the one or the number *itself* (i.e., the abstract one or number). Ancient Greek mathematics does treat of numbers or magnitudes that exist in

<sup>24</sup> Brackets in the original.

<sup>25</sup> THEON, *Expositio rerum mathematicarum*..., 18.5–15: “μονὰς δὲ ἐστὶ περαίνουσα ποσότης [ἀρχὴ καὶ στοιχεῖον τῶν ἀριθμῶν], ἥτις μειουμένου τοῦ πλήθους κατὰ τὴν ὑφαίρεσιν τοῦ παντὸς ἀριθμοῦ στερηθεῖσα μονὴν τε καὶ στάσιν λαμβάνειν. οὐ γὰρ οἶόν τε περαιτέρω γενέσθαι τὴν τομὴν· καὶ γὰρ ἓάν εἰς μόρια διαιρῶμεν τὸ ἓν ἐν αἰσθητοῖς, ἔμπαλιν πλήθος γενήσεται τὸ ἓν καὶ πολλὰ, καὶ καταλήξει εἰς ἓν κατὰ τὴν ὑφαίρεσιν ἐκάστον τῶν μορίων· κἄν ἐκεῖνο πάλιν εἰς μόρια διαιρῶμεν, πλήθος τε τὰ μόρια γενήσεται καὶ ἡ κατάληξις καθ’ ὑφαίρεσιν ἐκάστου τῶν μορίων εἰς ἓν. ὥστε ἀμέριστον καὶ ἀδιαίρετον τὸ ἓν ὡς ἓν.” The translation is ours; cf. Jean DUPUIS, *Théon de Smyrne, Philosophe Platonicien: Exposition des Connaissances Mathématiques Utiles pour la Lecture de Platon* (Paris: Librairie Hachette, 1892), 29.

<sup>26</sup> PLATO, *Republic* 7, 525d–e.

nature, but only insofar as they are understood without sensible matter and motion. Thus, the geometrician is not interested in whether a surface is black or white, but, for example, in whether it is triangular, or whether its sides are equal in length.

Likewise, the arithmetician deals with numbers not as they appear to our senses but as they are understood by our intellect. Such abstract numbers are not long or short (in magnitude), black or white, fast or slow, heavy or light, rough or smooth. Whether many or few, they are simply and always a multitude measurable by the unit. In the mind of the arithmetician, all units are the same; for—abstractly speaking—they are all indivisible. It is this abstraction to which PLATO is referring when he says that “arithmetic has a very great and elevating effect.” And because of the failure to think abstractly, master arithmeticians would ridicule those who, like HEATH, attempt to divide *the one itself*.

Pace HEATH, then, EUCLID’s arithmetic has nothing to do with “proper fractions” involving the alleged division of the unit; for, as far as the arithmetician is concerned, a unit is altogether indivisible. In contrast, HEATH’s “unity” is really a magnitude, which is always divisible by the geometer—but never by the arithmetician.

It is tempting to suppose that what HEATH calls “proper fraction” could perhaps be better expressed as “parts of a magnitude,” the study of which would presumably belong more to geometry than to arithmetic. However, unlike numbers (all of which have a common measure, since the unit is some part of every number), magnitudes do not have a universally common measure. Thus, EUCLID never says, for example, that a magnitude is “parts” of a magnitude, the less of the greater, when it does not measure the greater.

Finally, that ratios are not fractions will shortly become evident because, unlike a “proper fraction,” a ratio is a *relation* that a number or unit has *to another* number or unit (►5).

## 4. Terminus (πέρας, ὄρος) and Figure (σχῆμα)

EUCLID specifies the **termini** (πέρατα, or **extremities, extremes, terms**) of the first three species of magnitude in close connection with their respective definitions. Thus, we learn in the first book that “the extremities of a line are points,” and that “the extremities of a surface are lines”; and, in Book XI, that “an extremity [πέρας] of a solid is a surface.”<sup>1</sup>

The termini of surfaces and solids, then, are magnitudes of a prior species: the line is simpler than the surface in that it lacks width; and the surface, lacking depth, is simpler than the solid. Strictly speaking, however, the termini of the line (that is, the extremities of the simplest species of magnitude) are not magnitudes: every magnitude is divisible because it has parts; but, as EUCLID’s definition clearly states, the **point** (σημεῖον) is “that which has no part.”<sup>2</sup>

### 4.1. Unit and Point Compared

The point and the unit are alike in that neither of them is divisible or measurable, and in that both are principles of measuring. Likewise, both the point and the unit terminate a quantity. Thus, EUCLID symbolizes both numbers and magnitudes using either a single letter or two letters, ostensibly indicating one or both termini of the quantity.<sup>3</sup>

On the other hand, there are fundamental differences between the point and the unit. While a unit is a part of every number, a point is not a part of any line; for it does not measure it (yet, a line is measured from a point to a point; whence, it is somehow a principle of measuring). Moreover, ARISTOTLE demonstrates that lines are not composed of points, nor surfaces of lines, nor solids of surfaces.<sup>4</sup> Finally, the point has a position, while the unit does not. It was apparently the Pythagoreans, or at least their followers, who first defined the point as a “unit having position.”<sup>5</sup>

### 4.2. The Infinite

We should carefully distinguish the ancient Greek notion of *infinite* from the modern use of the same name.<sup>6</sup> It is said today that there are (actually) infinite—and even transfinite—so-called *numbers*. Likewise, an (actually) infinite length is modernly called *line*, while a finite one is considered merely a *segment* of it.

---

<sup>1</sup> EUCLID, *Opera Omnia*, vol. 1, 2.3.

<sup>2</sup> *Ibid.*, 2.1.

<sup>3</sup> Compare, for example, Proposition 4 of Book VII to Proposition 1 of Book V in *ibid.*, vol. 2, 200; 6.

<sup>4</sup> ARISTOTLE, *Physica* Z.6, 231a21–b18.

<sup>5</sup> See ARISTOTLE, *Metaphysica* Δ.1, 1016b24–31. Rather inconveniently, the unit itself was defined by some as a “point without position,” as ARISTOTLE says in *Metaphysica* M.8, 1084b26–27.

<sup>6</sup> See Norman KRETZMANN (ed.), *Infinity and Continuity in Ancient and Medieval Thought* (Ithaca and London: Cornell University Press, 1982).

According to the ancient Greek understanding, something is infinite if it does not have a terminus: that is, if it is *indeterminate*. ARISTOTLE distinguishes between *multitude*, which is quantitatively indefinite, from *number*, which is a finite multitude; between *length*, which is indefinite in size, from *line*, which is a finite length; between *breadth* and *surface*, and *depth* and *body* (i.e., solid), setting them apart in precisely the same way.<sup>7</sup> Likewise, NICOMACHUS reserves the name ποσόν (which in ARISTOTLE signifies the quantum in general) for the finite multitude, and the name πηλίκον for the finite magnitude.<sup>8</sup>

The distinction between determinate and indeterminate is essential to ancient Greek wisdom, for there is no science of the indeterminate or infinite (τὸ ἄπειρον). Thus, as PROCLUS relates, the mathematical sciences, according to the Pythagoreans, exclude the infinite from multitude and magnitude.<sup>9</sup> NICOMACHUS explains this thus:

Wisdom [τὴν σοφίαν], then, must be considered to be the knowledge [ἐπιστήμην = Lat. *scientia*] of these two forms [i.e., multitude and magnitude]. Since, however, all multitude and magnitude are by their own nature of necessity infinite [ἄπειρα, i.e., indefinite]—for multitude starts from a definite root and never ceases increasing; and magnitude, when division beginning with a limited whole is carried on, cannot bring the dividing process to an end, but proceeds therefore to infinity—and since sciences are always sciences of limited things, and never of infinities, it is accordingly evident that a science dealing either with magnitude, per se, or with multitude, per se, could never be formulated, for each of them is limitless in itself, multitude in the direction of the more, and magnitude in the direction of the less. A science, however, would arise to deal with something separated from each of them, with quantity [ποσόν, i.e., finite multitude], set off from multitude, and size [πηλίκον, i.e., finite magnitude], set off from magnitude.<sup>10</sup>

As PROCLUS observes, although numbers are susceptible of never-ending increase, yet any given number is delimited (πεπερασται).<sup>11</sup> Likewise, magnitudes are divisible indefinitely (ἐπ' ἄπειρον); yet, all divided magnitudes have boundaries (ὠρισται); and the actual parts of the whole are delimited (πεπερασται).

The importance of having limited quantities in science becomes evident in the act of measuring. We come to know the quantity of a line by measuring it from one point to the other. Likewise, the quantity of a number is known by counting, which begins in a unit and ends in a unit. It is impossible to come perfectly to know the quantity of a number that has no ending unit; or of a straight line that has no limiting point. For what is indeterminate cannot be perfectly known.

<sup>9</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 37.11–16.

<sup>10</sup> NICOMACHUS, *Introductio arithmeticae*, I.2.5, 4.20–5.12.

<sup>11</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 6.15–19.

Whenever we find the adjective *infinite* in the *Elements*, EUCLID is invariably referring to something indeterminate, whether it is the indefinite length of a line, or its indefinite augmentation or division, or the indefinite measurement of a number.<sup>12</sup> For example, when he requires the student to draw a perpendicular straight line to a given *infinite straight line* (εὐθεῖα ἄπειρος), the latter is specified by the symbol AB, which ostensibly indicates the indeterminate but limiting points.<sup>13</sup> Likewise, he defines **parallel straight lines** as “straight lines which, being in the same plane and being produced *infinitely* [εἰς ἄπειρον] in both directions, do not meet one another in either direction.”<sup>14</sup> And he demonstrates that “from a medial straight line are produced infinite [ἄπειροι] irrational straight lines [in multitude],<sup>15</sup> and none of them is the same as any of the preceding.”<sup>16</sup>

On the other hand, ancient Greeks sometimes call magnitudes “infinite.” For example, the circumference of a circle is said to be infinite because it has no end—nor does it have a beginning. Clearly, the quantity of such magnitudes is not actually infinite, and can be known based on its relation to another magnitude (e.g., the circumference and the radius); but this relation is not a number, as we shall see (► 5.6).

### 4.3. Figure

A **figure** (σχήμα) is “that which is contained by any boundary or boundaries,”<sup>17</sup> where a **boundary** (ὄρος, also called **term** in other contexts) is “that which is an extremity [πέρας] of anything.”<sup>18</sup> Clearly, having termini is what makes geometrical figures possible. But it should be further observed that, since a figure is first specified by its boundaries, ultimately the boundaries of a figure enter its definition.

Note also that the verb *to define* comes from the Latin *definire*, from *de-* + *finire*, to limit, from *finis*, boundary, end.<sup>19</sup> The same happens with the Greek ὀρισμένον, *definition*, from the verb ὀρίζω “to divide, separate from, as a border or boundary.” To define, then, is to *delimit*, to *determine* the principles that make a thing what it is, distinguishing it from others. It should not be surprising, then, that EUCLID defines figures in terms of their boundaries first; and thereafter, he distinguishes them by other intrinsic characteristics.

<sup>12</sup> See Wilbur Richard KNORR, “Infinity and Continuity: The Interaction of Mathematics and Philosophy in Antiquity,” in *Infinity and Continuity in Ancient and Medieval Thought*, ed. Norman KRETZMANN (Ithaca and London: Cornell University Press, 1982).

<sup>13</sup> Proposition 12 in EUCLID, *Opera Omnia*, vol. 1, 34.5.

<sup>14</sup> *Ibid.*, 8.3–5.

<sup>15</sup> HEATH adds “in number,” which is not in the Greek.

<sup>16</sup> The last Proposition (115) of Book x in *ibid.*, vol. 3, 370.6–7. Replacing HEATH’s “there arise” with “are produced,” for γίνονται.

<sup>17</sup> *Ibid.*, vol. 1, 4.7–8.

<sup>18</sup> *Ibid.*, 4.6.

<sup>19</sup> See *Merriam-Webster Dictionary*, entry for *define*.

From the above definition, it is evident that a line is a figure; for “the extremities of a line are points.”<sup>20</sup> But besides lines, there are also superficial and solid figures.

#### 4.4. Plane Figures

1. Among the superficial figures, it is plane figures that are primarily considered by EUCLID. They consist in plane surfaces with linear boundaries: for example, the triangle and the circle. A **plane surface** is “a surface which lies evenly with the straight lines on itself,” just as a **straight line** is “a line which lies evenly with the points on itself.”<sup>21</sup>

2. EUCLID defines the **circle** as “a plane figure contained by one line [called **circumference**]<sup>22</sup> such that all the straight lines falling upon it from one point amongst those lying within the figure are equal to one another. And the point is called the **center** of the circle.”<sup>23</sup>

3. A **diameter of the circle** is “any straight line drawn through the centre and terminated in both directions by the circumference of the circle, and such a straight line also bisects the circle.”<sup>24</sup> A **semicircle** is “the figure contained by the diameter and the circumference cut off by it. And the centre of the semicircle is the same as that of the circle.”<sup>25</sup> Note that the semicircle is defined in terms of the circle, and not the other way around.

4. Based on their boundaries, **rectilinear figures** are “those which are contained by straight lines, **trilateral figures** being those contained by three, **quadrilateral** those contained by four, and **multilateral** those contained by more than four straight lines.”<sup>26</sup> Thus, a triangle is first defined as a *trilateral* (τρίπλευρα) figure based on the species (i.e., line), quality (i.e., straight), and number (i.e., three) of its boundaries, and only later distinguished by its internal angles insofar as it is *triangular* (τρίγωνον).

5. The species of triangle are first distinguished by the comparative size of their sides: “an **equilateral triangle** is that which has its three sides equal, an **isosceles triangle** that which has two of its sides alone equal, and a **scalene triangle** that which has its three sides unequal.”<sup>27</sup>

6. Then, triangles are distinguished by their internal angles: “a **right-angled triangle** is that which has a right angle, an **obtuse-angled triangle** that which has an obtuse angle,

---

<sup>20</sup> EUCLID, *Opera Omnia*, vol. 1, 2.3.

<sup>21</sup> Ibid., 2.9–10.

<sup>22</sup> Bracketed text in HEIBERG’s critical edition; omitted by HEATH.

<sup>23</sup> Ibid., 4.9–14.

<sup>24</sup> Ibid., 4.15–18.

<sup>25</sup> Ibid., 4.19–6.2.

<sup>26</sup> Ibid., 6.3–6.

<sup>27</sup> Ibid., 6.7–10.

and an **acute-angled triangle** that which has its three angles acute.”<sup>28</sup> Angles are defined by comparison to the right angle, which constitutes the unit for their measurement.

7. In turn, the **right angle** is defined based on the *equality* found in a perpendicular line: “When a straight line set up on a straight line makes the adjacent angles equal to one another, each of the equal angles is right, and the straight line standing on the other is called a perpendicular to that on which it stands.”<sup>29</sup> Thus, an **obtuse angle** is “an angle greater than a right angle,” and an **acute angle** is “an angle less than a right angle.”<sup>30</sup>

8. Finally, some plane figures with equal number of boundaries are further specified by both the relative equality or inequality of their boundaries and the angles that their contiguous boundaries (i.e., sides) make. Thus, of **quadrilateral figures**, “a **square** is that which is both equilateral and right-angled; an **oblong** that which is right-angled but not equilateral; a **rhombus** that which is equilateral but not right-angled; and a **rhomboid** that which has its opposite sides and angles equal to one another but is neither equilateral nor right-angled. And let quadrilaterals other than these be called **trapezia**.”<sup>31</sup>

#### 4.5. Solid Figures

Solid figures are solids that have surface boundaries. This includes the pyramid and the sphere. Although all solid figures are determined by surface boundaries, not all are defined in the same way; for only some solid figures are directly definable by their boundaries.

Among those that can be defined directly by their boundaries, a **pyramid** is “a solid figure, contained by planes, which is constructed from one plane to one point.”<sup>32</sup> A **prism** is “a solid figure contained by planes two of which, namely those which are opposite, are equal, similar and parallel, while the rest are parallelograms.”<sup>33</sup> A **cube** is “a solid figure contained by six equal squares.”<sup>34</sup> An **octahedron** is “a solid figure contained by eight equal and equilateral triangles.”<sup>35</sup> An **icosahedron** is “a solid figure contained by twenty equal and equilateral triangles.”<sup>36</sup> And a **dodecahedron** is “a solid figure contained by twelve equal, equilateral, and equiangular pentagons.”<sup>37</sup>

<sup>28</sup> Ibid., 6.15–8.2.

<sup>29</sup> Ibid., 2.16–4.3.

<sup>30</sup> Ibid., 4.4–5.

<sup>31</sup> Ibid., 6.15–8.2.

<sup>32</sup> Ibid., vol. 4, 4.16–17.

<sup>33</sup> Ibid., 4.18–20.

<sup>34</sup> Ibid., 8.1–2.

<sup>35</sup> Ibid., 8.3–4.

<sup>36</sup> Ibid., 8.5–6.

<sup>37</sup> Ibid., 8.7–9.

#### 4.6. Constructive Definitions

Sometimes the boundaries must be somehow constructed for the figure to be defined. In such cases, what is constructed is not the figure itself, but a solid that “comprehends” it (the verb used is περιλαμβάνω). For example, a sphere does not have a beginning or an end. Therefore, properly speaking, it cannot be generated. But its container can be constructed thus: “when, the diameter of a semicircle remaining fixed, the semicircle is carried round and restored again to the same position from which it began to be moved,” the figure so comprehended [τὸ περιληφθὲν σχῆμα] is a **sphere**.<sup>38</sup>

Likewise, “when, one side of those about the right angle in a right-angled triangle remaining fixed, the triangle is carried round and restored again to the same position from which it began to be moved,” the figure so comprehended is a **cone**.<sup>39</sup> And similarly, “When, one side of those about the right angle in a rectangular parallelogram remaining fixed, the parallelogram is carried round and restored again to the same position from which it began to be moved,” the figure so comprehended is a **cylinder**.<sup>40</sup>

#### 4.7. Magnitude and Number Figures Compared

Unlike magnitudes, numbers do not as such constitute figures, even if they are limited, because their units have no position, as underscored above. Thus, the number three is always the number three regardless of whether its units are arranged in succession, like a line, or one on top of the others, like a triangle. Evidently, for units to constitute a specific figure, they must be extrinsically arranged in some configuration that is determined by their relative position, which is not essential to them.

However, depending on the properties of a number, the units that constitute it may or may not be extrinsically positioned in a way such that they resemble a geometrical figure: for example, a square or a triangle. Thus, all numbers can be arranged linearly, but not every number is susceptible of being configured in such a way that its units describe a square or a rectangle. Each number has specific properties that determine the geometric-like configurations it can take when its units are positioned relative to each other. Thus, numbers can in a way have *sides* (analogous to what we nowadays call *roots*, which is how BOETHIUS, based on PLATO, translated δυνάμεις).<sup>41</sup> For example, the side of the cubically arranged number twenty-seven is the linearly arranged number three; and the side of sixteen configured as a square is four (in linear disposition).

---

<sup>38</sup> Ibid., 4.21–23.

<sup>39</sup> Ibid., 6.4–7.

<sup>40</sup> Ibid., 6.16–20.

<sup>41</sup> See Wilbur Richard KNORR, *The Evolution of Euclidean Mathematics* (Dordrecht: Reidel, 1975), 222.

In the *Elements* we read that “when two numbers having multiplied one another make some number, the number so produced is called **plane**, and its **sides** are the numbers which have multiplied one another.”<sup>42</sup> Likewise, “when three numbers having multiplied one another make some number, the number so produced is **solid**, and its **sides** are the numbers which have multiplied one another.”<sup>43</sup>

Such numbers have “boundaries” in which they are said to be “contained.” Thus, EUCLID defines **square number** as “equal multiplied by equal, or a number which is contained by two equal numbers.”<sup>44</sup> And the **cube number** is defined as “equal [number] multiplied by equal and again by equal, or a number which is contained by three equal numbers.”<sup>45</sup>

In NICOMACHUS we moreover read:

The point, then, is the beginning [ἀρχή “principle”] of dimension, but not itself a dimension [διδόστημα], and likewise the beginning of a line, but not itself a line; the line is the beginning of surface, but not surface; and the beginning of the two-dimensional, but not itself extended in two directions. Naturally, too, surface is the beginning of body, but not itself body, and likewise the beginning of the three-dimensional, but not itself extended in three directions. Exactly the same in numbers, unity [μονάς “monad”] is the beginning of all number that advances unit by unit in one direction; linear number is the beginning of plane number, which spreads out like a plane in one more dimension; and plane number is the beginning of solid number, which possesses a depth in the third dimension, besides the original ones.<sup>46</sup>

It was the Pythagoreans who first studied the properties that determine what figures a number can take, as Walter BURKERT explains:

[T]here is one remarkable type of arithmetic that appears exclusively in the Pythagorean tradition, in which numbers are represented by figures made with counters or pebbles, ψηφοί. [...] Aristotle knows the ψηφοί numbers, which reappear in Nicomachus and Theo[n]; [...] Aristotle speaks of triangular numbers, Euclid only of “plane” (that is, rectangular) and “solid” numbers.<sup>47</sup>

Observing the different dispositions of such pebbles is undoubtedly what allowed the Pythagoreans to research not only the quantitative properties of numbers, such as their measurability and divisibility, but also their *qualitative* properties, such as whether they are odd or even, square or rectangular.

<sup>43</sup> *Ibid.*, 186.21–24.

<sup>44</sup> *Ibid.*, 188.1–2.

<sup>45</sup> *Ibid.*, 188.3–4.

<sup>46</sup> NICOMACHUS, *Introductio arithmeticae*, II.7.1–3, 86.9–21.

<sup>47</sup> Walter BURKERT, *Lore and Science in Ancient Pythagoreanism* (Cambridge, Massachusetts: Harvard University Press, 1972), 427. THEON devotes several chapters to all sorts of polygonal numbers, including pyramidal ones: see *Expositio rerum mathematicarum...*, 26.14ff.

Beyond the intrinsic properties of numbers, these observations also enabled them and their successors to study *quantitative relations* between numbers (►5), as well as their *qualitative similarities* or proportions (►Figure 11; 6).

**Figure 11: Three geometrically proportional “rectangular numbers” (6, 24, and 54) expressed as multitudes of pebbles (ψηφοί) according to the Pythagorean practice.**

Eventually, through the application of principles that are analogically common to both number and magnitude, a geometric theory of relation and proportion would emerge. Such relations will be treated in the next two chapters (►5; 6).

#### **4.8. Figure and Infinity**

Evidently, since a figure is determined by its boundaries, there is no such thing as an (actually) infinite figure. Thus, an “infinite circle” is an oxymoron: it would have to be a magnitude at once *unlimited* (i.e., without a boundary), since it is (actually) infinite, and limited (bounded) by a line having the characteristics required by the definition of the circle. Such an “infinite circle” could not even have a center.

On the other hand, a figure can be infinite in the sense of being indeterminate: that is, susceptible of never-ending production or division. Thus, a line can be made indefinitely longer, or it can be divided indefinitely.

Finally, we should observe that the circumference, unlike the circle, is not a figure; for it has no boundaries. In this sense, as already noted, the circumference was often called *infinite*.

## 5. Ratio (λόγος)

As explained above, every number has specific properties arising from the different intrinsic relations it holds to its own parts, whether such parts are numbers or units: for example, absolutely speaking, a perfect number is equal to its parts added together. But beyond the examination of its properties in isolation, a number can moreover be found to be related in specific ways to other numbers or to the unit: for example, we have already considered how a number can be a part or parts of *another* number.

The relation of one number or unit to *another* number or unit, or of one magnitude to *another* of the same kind, is called λόγος by the Greeks. In Latin, this *logos* would at first be rendered as *ratio*, which the English language borrowed *literatim ca.* 1660.<sup>1</sup> However, BOETHIUS introduced a different translation that became dominant for many centuries: *proportio*, which is at the origin of the English *proportion*, first used in the fourteenth century—that is, about three centuries before *ratio*.<sup>2</sup> In English, as in Latin, the names *ratio* and *proportion* have been used interchangeably, albeit with varying prevalence.

As VON FRITZ explains, originally λόγος was not a technical term in Greek. Long before acquiring the restricted meaning of some “relation of one number or unit to another,” it had the general sense of “that which is meant in the discourse,” or the “communication of something essential about a thing.”<sup>3</sup> Hence, λόγος often refers also to the communicating verbal expression itself, which could run from a single word to a whole speech (e.g., a treatise).<sup>4</sup> However, in ancient times λόγος was rarely used in the sense of a *single word*. In fact, as BURKERT points out, “the sense ‘calculation’ comes from the basic meaning of the root λεγ- almost more directly than the sense ‘word’.”<sup>5</sup>

As BURKERT further observes, ancient Greeks used the noun λόγος, qualifying it with adjectives, to express specific interest rates in the loaning business. Thus, if the loaner expected back a payment of the principal plus a third part, the interest was called ἐπίτριτος

---

<sup>1</sup> See *Merriam-Webster Dictionary*, entry for *ratio*.

<sup>2</sup> *Ibid.*, entry for *proportion*. See BOETHIUS, *De institutione arithmetica*, II.40, 137.

<sup>3</sup> VON FRITZ, *Grundprobleme der Geschichte der antiken Wissenschaft*, 406: “Der Sinn des Gesagten ist in dem, der es sagt und meint; aber sofern das, was er meint, sich doch auch auf etwas außerhalb dessen, der es meint, bezieht, ist der Sinn des Gesagten doch auch wiederum diese Sache oder deren Struktur oder Wesen selbst. [...] Von dieser Bedeutung des Wortes λόγος als *einer Mitteilung von etwas Wesentlichem an einem Gegenstand* ist die Übertragung auf das Zahlenverhältnis in seiner Funktion in der Musik nicht allzuschwer begreiflich.” The emphasis is ours; “communication of something essential about a thing” is the English rendering of the emphasized words, taken from BURKERT, *Lore and Science in Ancient Pythagoreanism*, 438.

<sup>4</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for λόγος.

<sup>5</sup> BURKERT, *Lore and Science in Ancient Pythagoreanism*, 440 and n. 79. Cf. LEWIS and SHORT, *A Latin Dictionary*, entry for *ratio*.

λόγος, literally “a ratio of one third over,” which is equivalent to a relation of four-to-three: that is, for every three of anything loaned, four are to be paid back. It was an ἐπίτεμπος λόγος “a ratio of one fifth over,” or a relation of six-to-five, if only a fifth part was expected to be added. Even interest calculation itself was called λόγος;<sup>6</sup> and the officials who calculated the interest on temple loans, λογισταί.<sup>7</sup> As BURKERT adds,

It is certain that the practice of loaning money at interest went back before the time of Solon [ca. 638–558 BC]; and, though there is no direct evidence, it can hardly be doubted that the expressions mentioned were in use that early—long before the day of Pythagoras. Thus when terms like this turn up in a musicological context—ἐπίτριτον and ἐπόδοον in Philolaus (fr. 6) and the general ἐπιμόριος λόγος in Archytas (A19)—they are borrowed from everyday speech.<sup>8</sup>

The names of such ratios would have been borrowed by the Pythagoreans to signify the numerical relations that correspond to musical intervals in the science of harmonics; for ratio and proportion were found—quite literally—to *account for* not only musical harmony but even astronomy (whence, the “harmony” or “music” of the spheres).

Both senses of λόγος converge in what most scholars, following ARISTOTLE, take to be a fundamental tenet of the Pythagoreans: that all things are numbers.<sup>9</sup> According to IAMBlichus, who is very likely reading from a now-lost work on the doctrines of the Pythagoreans written by ARISTOTLE, they believed that “Whoever wishes to contemplate the causes of beings should turn his attention to these things, the numbers and ratios [λόγων], because it is by them that everything is made clear.”<sup>10</sup> In other words, the ratios of numbers express the nature of things; and proportion, the order of the universe.

---

<sup>6</sup> See BURKERT, *Lore and Science in Ancient Pythagoreanism*, 439.

<sup>7</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for λογιστής, where the function is explained as “auditor, esp. at Athens, in pl., a board which audited the accounts of magistrates going out of office = Lat. *curator rei publicae*, an Imperial commissioner and inspector of accounts.”

<sup>8</sup> BURKERT, *Lore and Science in Ancient Pythagoreanism*, 439.

<sup>9</sup> Some modern scholars, however, having unsuccessfully sought indisputable confirmation of this tenet in the extremely scarce, unquestionably Pythagorean sources at our disposal, believe that the consideration of numbers as principles of things is “the fruit of Aristotle’s tendentious interpretation,” his own “retrospective projection.” E.g., Leonid ZHMUD, *Pythagoras and the Early Pythagoreans* (Oxford: University Press, 2012), §11.2; Carl A. HUFFMAN, *Philolaus of Croton: Pythagorean and Presocratic* (Cambridge: Cambridge University Press, 1993), 63, and especially n. 12. In a personal communication, Prof. Thomas A. SZLEZÁK pointed me to the unfounded rejection of PLATO’s esoteric doctrines as the root cause of this preposterous belief. Indeed, not only ARISTOTLE possessed sources now lost to us, but, more importantly, the greatest philosopher of antiquity undoubtedly had a better understanding of what the tenets of those called *Pythagoreans* (οἱ καλούμενοι Πυθαγόρειοι: ARISTOTLE, *Metaphysica* A.5, 985b23) really were and what they implied—certainly much better than any historian, two and a half millennia later, can presume to have attained. By the same token, there are no sources confirming ARISTOTLE’s alleged distortion of this Pythagorean doctrine. On the contrary, ancient Greeks—including those who considered themselves to be the rightful successors of the Pythagoreans—generally follow him without objection: and they too had more sources at their disposal than we can begin to enumerate.

<sup>10</sup> BURKERT, *Lore and Science in Ancient Pythagoreanism*, 50; see especially n. 112, where BURKERT explains how he reconstructed what he takes to be ARISTOTLE’s text from IAMBlichus, *De communi mathematica scientia*, 78.8–21.

As Andrew BARKER explains, Pythagoreans of different ages and persuasions endorsed, at least for the most part, precisely the same common metaphysical conviction:

[I]n the majority of “Pythagorean” writers, the study of harmonics is part of a much larger enterprise, designed to show how the same principles govern “harmonious” relations between the elements of all significant structures in the cosmos. The universe and its parts are all subject to the same perfect patterns of intelligible mathematical order. This programme was pursued in many different ways and with different preconceptions about the nature and source of that order, but the projects undertaken by Philolaus, Archytas, Plato, Theon, Nicomachus, Ptolemy and Aristides Quintilianus all stem from a similar aspiration. In mathematics, and especially in mathematical harmonics, lies the key to the rational organisation of the universe.<sup>11</sup>

It is not difficult to see how someone impressed by the explanatory power of mathematics could place it on the pedestal of the highest science. Indeed, as ARISTOTLE implies, those who were called *Pythagoreans* would have turned mathematics into metaphysics, the science that studies the principles common to all beings:

[T]he <so->called Pythagoreans, who were the first to take up mathematics, not only advanced this study, but also having been brought up in it they thought its principles were the principles of all things [τῶν ὄντων ἀρχὰς... πάντων]. Since of these principles numbers are by nature the first, and in numbers they seemed to see many resemblances to the things that exist and come into being [...]; since, again, they saw that the modifications [πράθη “affections”] and the ratios [λόγους] of the [musical] harmonies were expressible in numbers; since, then, all other things seemed in their whole nature to be modelled on numbers, and numbers seemed to be the first things in the whole of nature, they supposed the elements of numbers to be the elements of all things, and the whole heaven to be a harmony and a number.<sup>12</sup>

To summarize: the λόγος or *ratio* of a thing was understood by the ancient Greeks to be an expression of its nature. The Pythagoreans then discovered that some relations between numbers express the nature of musical intervals, and unsurprisingly called such relations λόγους. They then proceeded to mathematically research such relations.

### 5.1. Ratio of a Number or Unit to Another

In arithmetic, λόγος must have originally been understood as “any kind of relation between two numbers,” as Árpád SZABÓ suggests.<sup>13</sup> Only later would its use have been narrowed down “by a process of specialization” to a specific type of relation. To be more precise, λόγος originally denoted the “relation of a number or unit to another number or unit”; but,

---

<sup>11</sup> Andrew BARKER, *Greek Musical Writings: II Harmonic and Acoustic Theory* (Cambridge: Univ. Press, 1989), 8.

<sup>12</sup> ARISTOTLE, *Metaphysica* A.5, 985b23–986a3; replacing “musical scale” with “harmony” for ἁρμονία.

<sup>13</sup> Árpád SZABÓ, *The Beginnings of Greek Mathematics*, trans. A. M. UNGAR (Dordrecht: Reidel, 1978), 167. SZABÓ fails, however, to discover the true reasons for what he calls the “specialization” of λόγος, which will be extricated below.

as we shall see, it was later narrowed down to only one kind: namely, the ratio that founds geometric proportion; for this relation was discerned to be naturally more fundamental than the others, and therefore absolutely prior and more deserving of the name λόγος. This narrowed-down understanding of λόγος is what we find in the *Elements*.

EUCLID does not define *numerical ratio*, but he does define **proportional numbers**: “Numbers are [geometrically] proportional when the first is the same multiple, or the same part, or the same parts, of the second that the third is of the fourth.”<sup>14</sup> Hence, **numerical ratio** (according to geometric proportion) is, certainly, “the relation of a number or unit to another number or unit such that one of them is a part or parts of the other.”<sup>15</sup>

Note that the greater term of a ratio is called πρόλογος, *antecedent*, by the ancient Greeks; and the less, υπόλογος, *consequent*.<sup>16</sup> We will use these names in the ensuing discussion. BOETHIUS, on the other hand, calls them *duces* and *comites*, respectively.<sup>17</sup>

## 5.2. Species of Numerical Ratio

The relation between two numerical terms can be of different species. But the first, fundamental distinction, according to NICOMACHUS (along with the other ancient authors known to us), is that between the equal and the unequal:

Of relative quantity [τοῦ πρὸς τι ποσοῦ], then, the highest generic divisions are two, equality and inequality; for everything viewed [θεωρούμενον] in comparison with another thing is either equal or unequal, and there is no third <thing> besides these.<sup>18</sup>

NICOMACHUS is not the first to highlight the importance of *the ratio of equality*, nor is this an exclusively Pythagorean theme. It is found in PLATO and ARISTOTLE.<sup>19</sup> THEON mentions it under the authority of the Peripatetic ADRASTUS:

[ADRASTUS] shows that the ratio of equality [ὁ τῆς ἰσότητος λόγος] is fundamental [ἀρχηγὸς] and first [πρώτος], and is the element of the aforesaid ratios [i.e., the ones that give rise to arithmetic, geometric, and harmonic proportions], and of the proportions that fall under them, for from it are first composed [συνίσταται], and in it are resolved [ἀναλύεται], all ratios and proportions.<sup>20</sup>

<sup>14</sup> EUCLID, *Opera Omnia*, vol. 2, 188.5–7.

<sup>15</sup> Confront EUCLID, *Opera Omnia*, vol. 2, 2.6–7, where a ratio between magnitudes is defined, with *ibid.*, 296.19–23, where a unit is said to be in continued proportion and is compared in the same way that a number is to a number in any ratio. Therefore, every term in a relation is either a number or a unit.

<sup>16</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entries for πρόλογος and υπόλογος.

<sup>17</sup> See MASI, *Boethian Number Theory*, 103 n. 45.

<sup>18</sup> NICOMACHUS, *Introductio arithmeticae*, I.17.2, 44.10–13.

<sup>19</sup> See, for example, ARISTOTLE, *Metaphysica* Γ.2, 1004b10–13.

<sup>20</sup> THEON, *Expositio rerum mathematicarum...*, 107.10–14: “δείκνυσι δὲ [ὁ Ἄδραστος] ὅτι ὁ τῆς ἰσότητος λόγος ἀρχηγὸς καὶ πρώτος ἐστὶ καὶ στοιχεῖον πάντων τῶν εἰρημένων λόγων καὶ τῶν κατ’ αὐτοὺς ἀναλογιῶν· ἐκ πρώτου γὰρ τούτου πάντα συνίσταται εἰς τοῦτον ἀναλύεται τὰ τε τῶν λόγων καὶ τὰ τῶν

While equality is of one species only, there are multiple species of the unequal, which is first divided into *the greater* and *the less*. NICOMACHUS offers the following division of *ratio* (i.e., the ratio found in geometric proportion) into its first species (this division, as Frank E. ROBBINS and Louis C. KARPINSKI observe, “was no doubt the ordinary scientific one”):<sup>21</sup>

[T]here is no such thing as this kind of equality and that kind, but the equal exists in one and the same manner. [...] The unequal, on the other hand, is split up by subdivisions, and one part of it is the greater, the other the less, which have opposite names and are antithetical to one another in their quantity and relation. For the greater is greater than some other thing, and the less again is less than another thing in comparison, and their names are not the same, but they each have different ones [...]. Moreover, of the greater, separated by a second subdivision into five species, one kind is the multiple [πολλαπλάσιον], another the superparticular [ἐπιμόριον], another the superpartient [ἐπιμερές], another the multiple superparticular [πολλαπλασιεπιμόριον], and another the multiple superpartient [πολλαπλασιεπιμερές]. And of its opposite, the less, there arise similarly by subdivision five species, opposed to the foregoing five varieties of the greater, the submultiple [ὑποπολλαπλάσιον], subsuperparticular [ὑπεπιμόριον], subsuperpartient [ὑπεπιμερές], submultiple-superparticular [ὑποπολλαπλασιεπιμόριον], and submultiple-superpartient [ὑποπολλαπλασιεπιμερές]; for as whole answers to whole, smaller to greater, so also the varieties correspond, each to each, in the aforesaid order, with the prefix sub- [ὑπο-].<sup>22</sup>

1. NICOMACHUS goes on to present an account of each of these ten species of the unequal, i.e., five of the greater, and the corresponding five of the less. Thus, the **multiple** (πολλαπλάσιον), which by nature is the first species of the greater, occurs when a number contains the whole of another number multiple times.<sup>23</sup> For example, four is the *double* (διπλάσιος) of two; for it contains the whole of two twice. And six is the *triple* (τριπλάσιος) of two; for it contains the whole of two thrice. To this ratio of the greater corresponds the first species of ratio of the less, called **submultiple** (ὑποπολλαπλάσιον), in which a number completely measures multiple times a greater number (or, in other words, a number is wholly contained in another number multiple times). For example, two is *half* (ὑποδιπλάσιος “subdouble,” as he calls it here)<sup>24</sup> of four; for it measures four twice. And it is also a *third* (ὑποτριπλάσιος “subtriple”) of six; for two measures six thrice (► Figure 12).

---

ἀναλογιών.” The translation is ours; cf. Jean DUPUIS (tr.), *Théon de Smyrne, Philosophe Platonicien: Exposition des Connaissances Mathématiques Utiles pour la Lecture de Platon* (Paris: Librairie Hachette, 1892), 177: “Adraste montre que la raison d’égalité est la première en ordre, et que c’est l’élément de toutes les raisons dont nous avons parlé précédemment et de toutes les proportions qu’elles donnent. Car c’est d’elle que naissent toutes les autres et c’est en elle qu’elles se résolvent toutes.”

<sup>21</sup> In NICOMACHUS, *Introduction to Arithmetic*, trans. Martin Luther D’OOGÉ, 213 n. 1.

<sup>22</sup> NICOMACHUS, *Introductio arithmeticae*, I.17.4–8, 45.3–46.8.

<sup>23</sup> *Ibid.*, I.18, 46.9ff. Most of the English terms used here have fallen in disuse. They come from the Latin tradition that originated in BOETHIUS, *De institutione musica*, I.4, 191–2.

<sup>24</sup> Elsewhere, NICOMACHUS instead uses ἡμισυς (half), τρίτος (third), etc., as observed in D’OOGÉ’s version. It should be noted, however, that D’OOGÉ (or his posthumous editors, ROBBINS and KARPINSKI) calls these ratios “fractions,” following the widespread fiction already noted.

Figure 12: Multiple and submultiple.  
Six is a multiple (the triple) of two.  
Two is a submultiple (the third) of six.

2. The second species of the greater, “both naturally and in order,” is the **superparticular** (ἐπιμόριος), which occurs when a number contains within itself the whole of the number compared with it, and one part of it.<sup>25</sup> It takes different names according to the part that is added. For example, three is the *sesquialter* (ἡμιόλιος) of two; for three contains within itself the whole of two and one half of two. And nine is the sesquialter of six because nine contains within itself the whole of six and one half of six. Likewise, four is the *sesquitercian* (ἐπίτριτος) of three because four contains within itself the whole of three and one third of three. Corresponding to this species of the greater, is the second species of the less, called **subparticular** (ὑπεπιμόριος; in IAMBlichus, ὑποεπιμόριος), which occurs when the less and one part of it is contained by the greater. Thus, two is the *subsesquialter* (ὑφημιόλιος) of three because two and one half of two are contained in three. And three is the *subsesquitercian* (ὑπεπίτριτος) of four because three and one third of three are contained in four (► Figure 13).

Figure 13: Superparticular and subparticular.  
Three is a superparticular (the sesquialter) of two.  
Two is a subparticular (the subsesquialter) of three.

3. The **superpartient** (ἐπιμερής), which is the third species of the greater, occurs when a number contains within itself the whole of the number compared and in addition more than one part of it.<sup>26</sup> It takes different names according to the parts added. Thus, five is the *superbipartient* (ἐπιδιμερής) of three because five contains within itself the whole of three and two thirds of three. And ten is the *supertripartient* (ἐπιτριμερής) of six because ten contains within itself the whole of six and in addition two thirds of six. To this species of the greater relates the **subsuperpartient** (ὑπεπιμερής), the third species of the less (► Figure 14).

Figure 14: Superpartient and subsuperpartient.  
Five is a superpartient (the superbipartient) of three.  
Three is a subsuperpartient (the subsuperbipartient) of five.

4. The fourth species of the greater is the **multiple superparticular** (πολλαπλασι-επιμόριος), which occurs when the greater of the compared terms contains within itself

<sup>25</sup> NICOMACHUS, *Introductio arithmeticae*, I.19, 49.1ff.

<sup>26</sup> *Ibid.*, I.20, 55.12ff.

the lesser term more than once and in addition some one part of it.<sup>27</sup> Being a compound (σύνθετος), this species “is doubly diversified after the peculiarities of nomenclature of its components on either side; for inasmuch as the multiple superparticular is composed of the multiple and superparticular generically, it will have in its subdivisions according to species a sort of diversification and change of names proper both to the first part of the name and to the second.”<sup>28</sup> For example, five is the *double sesquialter* (διπλασιεφήμισυς) of two because five contains two twice within itself and, in addition, one half of two. And seven is the *triple sesquialter* (τριπλασιεφήμισυς) of two because seven contains two thrice within itself and, in addition, one half of two. Corresponding to this species of greater is the fourth species of less, called **submultiple subparticular** (► Figure 15).

**Figure 15: Multiple subparticular and submultiple subparticular.**  
**Five is a multiple superparticular (the double sesquialter) of two.**  
**Two is a submultiple subparticular (the subdouble subsesquialter) of three.**

5. The final species of the greater is the **multiple superpartient** (πολλαπλασιεπιμερής), which occurs when a number contains the whole of the number compared more than once (that is, twice, thrice, or any number of times) and some parts of it.<sup>29</sup> Thus, for example, eight is the *double superbipartient* (διπλασιεπιδιμερής) of three because eight contains the whole of three twice and two thirds of three. To this species of the greater corresponds the fifth species of the less, the **submultiple subsuperpartient** (► Figure 16).

**Figure 16: Multiple superpartient and submultiple subsuperpartient.**  
**Eight is a multiple superpartient (the double superbipartient) of three.**  
**Three is a submultiple subsuperpartient (the subdouble subsuperbipartient) of eight.**

◀ All the above ratios are defined in terms of the antecedent containing the consequent, or of the consequent being contained in the antecedent. But even more importantly, these ratios are defined also in terms of *part* or *parts* of a whole, which are technical terms, as discussed above (► 3). Therefore, properly to understand these species of ratios, we should be careful not let ourselves be carried away by useful but oversimplified algebraic and set-theoretic explanations, such as the following one offered by ROBBINS and KARPINSKI:

The fundamental relations of number, as the Greek *arithmetica* states, are equality and inequality, and the latter is further divided into two classes, the greater and the less. Furthermore, each of these latter has five subdivisions, those of the greater being multiples, as,  $mn : n$ ;

<sup>27</sup> Ibid., I.22, 59.7ff.

<sup>28</sup> Ibid., I.22.2, 59.10ff.

<sup>29</sup> Ibid., I.23, 63.22ff.

superparticulars, as  $n + 1 : n$ ; superpartients, as  $n + k : n, k > 1$ ; multiple superparticulars, as  $mn + 1 : n, m > 1$ ; multiple superpartients, as  $mn + k : n$ , both  $m$  and  $k$  being greater than 1.<sup>30</sup>

NICOMACHUS not only provides an exhaustive division of the genus of numerical ratio, but also explains how all ratios are generated from the “logos of equality.” He does so by applying the so-called “method of the three rules,” which is capable of “proving that all the complex species of inequality and the varieties of these species are produced [γεννᾶσθαι] out of equality, first and alone [μονωτέτης καὶ πρωτίστης], as from a mother and root.”<sup>31</sup> A discussion of this method is beyond our scope, but its importance, at least from a viewpoint inspired by the Pythagoreans, should not be neglected, as we learn from NICOMACHUS:

There is, however, a method [ἔφοδος] very exact and necessary for all discussion of the nature of the universe which very clearly and indisputably presents to us the fact that that which is fair and limited, and which subjects itself to knowledge, is naturally prior to the unlimited, incomprehensible, and ugly, and furthermore that the parts and varieties of the infinite and unlimited are given shape and boundaries by the former, and through it attain to their fitting order and sequence, and like objects brought beneath some seal or measure all gain a share of likeness to it and similarity of name when they fall under its influence. For thus it is reasonable that the rational part of the soul will be the agent which puts in order the irrational part, and passion and appetite, which find their places in the two forms of inequality, will be regulated by the reasoning faculty as though by a kind of equality and sameness. And from this equalizing process there will properly result for us the so-called ethical virtues, sobriety, courage, gentleness, self-control, fortitude, and the like.<sup>32</sup>

### 5.3. Ratio of a Magnitude to Another

There are two definitions of λόγος in the *Elements*. Both occur in Book V and apply only to magnitudes. The first one states that a **ratio** is “a sort of relation [σχέσις] in respect of size [κατὰ πηλικότητα] between two homogeneous magnitudes.”<sup>33</sup> Thus, according to this definition, a ratio is any relation in respect of size of a line to another line; or, of a surface to another surface; or, of a solid to another solid; or, of an angle to another angle.

The second definition of **ratio** found in the *Elements* is more specific. It states that “magnitudes are said to have a ratio to one another which are capable, when multiplied, of exceeding one another.”<sup>34</sup> Although, like the first one, this definition applies exclusively to magnitudes, it is moreover delimited to only one kind of relation between magnitudes: that found in geometric proportion, which is the most fundamental kind of λόγος, as we

---

<sup>30</sup> NICOMACHUS, *Introduction to Arithmetic*, trans. Martin Luther D’Ooge, 52.

<sup>31</sup> NICOMACHUS, *Introductio arithmeticae*, I.23.6, 65.18–21.

<sup>32</sup> *Ibid.*, I.23.4–5, 64.23–65.16.

<sup>33</sup> EUCLID, *Opera Omnia*, vol. 2, 2.6–7.

<sup>34</sup> *Ibid.*, 8–9.

shall see. Provided we correctly understand what is meant by *number* and *magnitude*, we can express this definition in modern algebraic notation thus: a magnitude  $a$  has a ratio to a homogeneous magnitude  $b$  if  $ma > b$  and  $nb > a$ , for some numbers  $m$  and  $n$ .

#### 5.4. Ratios of Numbers and of Magnitudes Compared

Number and magnitude agree in that each is measured by its homogeneous parts. Thus, every number—even a prime one—is measured by the homogeneous unit-parts of which it is composed; and composite numbers are measured by their homogeneous number-parts. Likewise, a line is measured by its half, which is homogeneous; for every part of a line is a line. A surface is measured by its third, which is homogeneous; for every part of a surface is a surface. Likewise, a solid is measured by any of its parts, each of which is also a solid—that is, a homogeneous magnitude. And the same can be said, of course, of angles, even if they are not *magnitudes* in the same sense as the other three species.

On the other hand, two magnitudes do not necessarily have a common measure. For example, it is impossible to find a line that can measure both the side and the diameter of a square, as the ancients discovered (►5.5). Likewise, there is no common measure of the circumference of the circle and its diameter. Indeed, EUCLID scientifically demonstrates in Propositions 5–8 of Book x that “commensurable magnitudes have to one another the ratio which a number has to a number,” but incommensurable magnitudes do not.<sup>35</sup>

Thus, the commensurability of magnitudes can only be known by comparison to that of numbers. This comes to show that ratio is, in a way, prior in numbers than in magnitudes (►2.3; 2.4).

#### 5.5. Rationality and Irrationality

Commensurability and incommensurability of magnitudes is at the basis of rationality and irrationality in geometry. EUCLID defines these terms in the beginning of Book x:

Those magnitudes are said to be commensurable [σύμμετρα] which are measured by the same measure, and those incommensurable [ἄσύμμετρα] which cannot have any common measure.

Straight lines are commensurable in square [δυνάμει, lit., *virtually, in potency*; cf. Lat. *potentiā*] when the squares [τετράγωνα] on them are measured by the same area, and incommensurable in square when the squares on them cannot possibly have any area as a common measure.

With these hypotheses, it is proved that there exist straight lines infinite in multitude [πλήθει ἄπειροι] which are commensurable and incommensurable respectively, some in length [μήκει] only, and others in square [δυνάμει] also, with an assigned straight line. Let then the assigned straight line be called rational [ῥητή], and those straight lines which are commensurable with it,

<sup>35</sup> EUCLID, *Opera Omnia*, vol. 3, 16.11–12.

whether in length and in square or in square only, rational, but those which are incommensurable with it irrational [ἄλογοι].

And let the square on the assigned straight line be called rational and those areas which are commensurable with it rational, but those which are incommensurable with it irrational, and the straight lines which produce [δυνάμεναι] them irrational, that is, in case the areas are squares, the sides themselves, but in case they are any other rectilinear figures, the straight lines on which are described squares equal to them.<sup>36</sup>

### 5.6. Fiction: “Classical Greeks recognized irrational numbers”

From the last quote, we can readily observe that it is not to denote *numbers* but *ratios between magnitudes* that the names *rational* and *irrational* were first used. Properly speaking, then,  $\sqrt{2}$  does not signify a number (i.e., a measurable multitude), but *the relation of one magnitude to another*: that is, *the ratio of the diameter to the side of the square*. Likewise,  $\pi$  is not properly the symbol of a number, but of *the ratio of the circumference to the diameter of the circle*.

To use the name *number*, as we do today, to signify both a *measurable multitude* and *the relation of one magnitude to another*, is to equivocate. This equivocation does have—quite literally—some rational grounds; for it is by analogy that we call ratios *numbers*. But this analogy, as we will see (► 68.1), does not belong itself to mathematics as understood by the ancient Greeks; for their mathematics strictly speaking consist in two distinct sciences: one dealing with number, called *arithmetic*; and another, with magnitude, called *geometry*. And, in this sense, there is no other mathematical science above or apart from these two (► 7.4).

### 5.7. Fiction: “The discovery of incommensurability led to a foundational crisis”

As Wilbur Richard KNORR explains, Heinrich SCHOLZ and Helmut HASSE created a “modern fiction” when they claimed that there had been a “foundational crisis” in the wake of the discovery of incommensurability by the Pythagoreans in the fifth century BC.<sup>37</sup>

The notion of “foundational crisis” was already present in TANNERY’s study of Greek geometry but was developed and extended by SCHOLZ and HASSE.<sup>38</sup> KNORR’s assessment should be enough to dispel this myth:

---

<sup>36</sup> Ibid., 2.2–4.3.

<sup>37</sup> See Helmut HASSE and Heinrich SCHOLZ, *Die Grundlagenkrisis der griechischen Mathematik* (Berlin: Pan-Verlag, 1928). On the dating and known impact of the discovery of incommensurability, see KNORR, *The Evolution of Euclidean Mathematics*, 36–49.

<sup>38</sup> See Paul TANNERY, *La Géométrie Grecque* (Paris: Gauthier-Villars, 1887), 98: “La découverte de l’incommensurabilité par Pythagore dut donc causer, en Géométrie, un véritable scandale logique, et, pour y échapper, on dut tendre à restreindre autant que possible l’emploi du principe de similitude, en attendant qu’on fût arrivé à l’établir sur une théorie de la proportionnalité indépendante de l’hypothèse de la commensurabilité.”

To be sure, this discovery [i.e., the discovery of incommensurability] was held to be significant: late writers suggest it was maintained as a secret of the school—but was it a challenge? Consider that the Pythagoreans based their natural philosophy on the conception of the world in terms of number and other mathematical categories, that is, in terms of certain abstract, rather than material principles.<sup>39</sup> The discovery of incommensurability might well *support* this view: for there is a property of certain lines, for instance, the side and the diameter of the square, which we can appreciate through a sequence of deductions to be necessarily true of these lines: yet no effort of practical measurement, no perception or procedure of an empirical character, could bring us to an awareness of this fact or of its certainty. Thus, the Pythagorean insistence on number as a fundamental principle could be *affirmed*: and we should note that the school never did relinquish its adherence to this principle.

When Tannery and Hasse and Scholz jump to the conclusion that the incommensurable was a counter-example to Pythagorean geometric method, they are thus already assuming the thesis of the foundations crisis.<sup>40</sup>

### 5.8. Fiction: “Euclid’s first definition of *ratio* is metaphysical”

Because of its perceived “logical uselessness,” some moderns have concluded that EUCLID’S first definition of *ratio* (λόγος), “a sort of relation in respect of size between two homogeneous magnitudes,” despite being attested unanimously by the manuscript tradition, must be an interpolation.<sup>41</sup> Alas, this definition cannot be so easily dismissed based only on logical utility. Such an argument is less revealing of ancient science than of modern beliefs, which can be illustrated by quoting HEATH’S romantically inspired opinion (which is based on BARROW’S):

The true explanation of its presence would appear to be substantially that given by [Isaac] Barrow (*Lectiones Cantabrig.*, London, 1684, Lect. III. of 1666), namely that Euclid inserted it for completeness’ sake, more for ornament than for use, intending to give the learner a general notion of ratio by means of a metaphysical, rather than a mathematical definition; “for metaphysical it is and not, properly speaking, mathematical, since nothing depends on it or is deduced from it by mathematicians, nor, as I think, can anything be deduced.”<sup>42</sup>

According to HEATH and BARROW, then, EUCLID’S first definition of λόγος is metaphysical. But this claim is contradictory: for if the definition were metaphysical, it would apply, as do all common notions, not only to the genus of magnitude but to every genus analogically (► 1.2).

---

<sup>39</sup> Although KNORR’S wording seems closer to Platonic rather than Pythagorean tenets, the conclusion is the same: magnitudes can only be determined to be incommensurable by comparing their ratios to those of numbers; therefore, numbers are first and most fundamental.

<sup>40</sup> Wilbur Richard KNORR, “The Impact of Modern Mathematics on Ancient Mathematics,” in *Classics in the History of Greek Mathematics*, 245–253; italics in the source. This paper was originally delivered as a lecture at the Annual Convention of the History of Science Society in Atlanta on December 28, 1975.

<sup>41</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 117.

<sup>42</sup> *Ibid.*

Ironically, on the other hand, HEATH and BARROW do not seem to object to common notions being clearly metaphysical. Indeed, their sole concern with this definition is rather its impracticality from a logician's point of view. In other words, they view mathematics as a logical deductive system, rather than as a science in the ancient Greek sense: and if something fails to serve the purpose of logical deduction, they see no place for it in mathematics. Yet, the purpose of including a λόγος that expresses the nature of another λόγος is evidently not the mere ornamentation of a work—not, certainly, to an ancient Greek scientist.

## 6. Proportion (ἀναλογία)

As observed above (►5), the English *proportion* originates in the Latin *proportio*, which was used by BOETHIUS to render λόγος, *ratio*. However, *proportio* already had in classical Latin an established use with a different but closely related meaning. Five centuries before BOETHIUS, Marcus Tullius CICERO (106–43 BC) introduced *proportio* as a substitute for *analogia*, a noun that had been borrowed literatim from the Greek ἀναλογία.<sup>1</sup> But by then, *analogia* had long been “admitted to citizen rank by Latin scholars,” as SENECA the Younger (4 BC–AD 65) remarks,<sup>2</sup> and would remain the prevalent term until BOETHIUS.

BOETHIUS, in turn, uses *proportionalitas* (proportionality) to translate ἀναλογία. Since his texts on arithmetic, music, and geometry (the latter, for the most part, by attribution) were the “standard” in the middle ages, this use became widespread.<sup>3</sup> Even versions of Arabic manuscripts that began flowing into the Latin West since the eleventh century (notably, all translations of EUCLID’s *Elements*)<sup>4</sup> follow the same convention. As an effect of this choice, the English *proportion* suffers from the same ambiguity: it means either *ratio* or *analogy* (the noun *analogy* itself having been introduced in the fifteenth century).<sup>5</sup>

### 6.1. Etymology

The Greek ἀναλογία derives from ἀνάλογον, which in English is generally rendered as *proportional* or *proportionate* (these forms were introduced in the fourteenth century, while *analogous* has been in use since 1646).<sup>6</sup> The derivation of ἀναλογία from ἀνάλογον

---

<sup>1</sup> Marcus Tullius CICERO, *Opera rhetorica et philosophica*, vol. IV (London: Rodwell and Martin, et al., 1820), *Timaeus sive De universitate*, IV in fine, 433: “Id optime assequitur, quae Graece Αναλογία, Latine (audendum est enim, quoniam haec primum a nobis novantur), *comparatio*, *proportio*-ve, dici potest.”

<sup>2</sup> SENECA, *Ad Lucilium epistulae morales*, trans. Richard M. GUMMERE, 3 vols., vol. 3 (Cambridge, Massachusetts: Harvard University Press, 1971), CXX.4, 382: “Nobis videtur observatio collegisse et rerum saepe factarum inter se conlatio, per analogian nostri intellectum et honestum et bonum indicant. Hoc verbum cum Latini grammatici civitate donaverint, ego damnandum non puto, puto in civitatem suam redigendum. Utar ergo illo non tantum tamquam recepto, sed tamquam usitato.”

<sup>5</sup> See *Merriam-Webster Dictionary*, entries for *analogy* and *proportion*.

<sup>6</sup> See *ibid.*, entries for *proportionate*, *proportional*, and *analogous*.

follows a regular procedure in Greek: by the addition of the suffix -ία, abstract nouns that signify qualities, such as σοφ-ία (wisdom), are formed from adjectives, such as σοφ-ός (wise).<sup>7</sup> Thus, ἀναλογία is an abstract noun that denotes the quality of being ἀνάλογον: just as wisdom is that which makes someone wise, so ἀναλογία (*analogy, proportion*) is that which makes something ἀνάλογον (*analogous, proportional, proportionate*).

In turn, ἀνάλογον originates in the prepositional phrase ἀνά λόγον. In its most general sense, this phrase is taken to mean “according to a [due] λόγος,”<sup>8</sup> that is, according to some specific *ratio* (or “in accordance with an intelligible structure,” as some would say today). Better to understand why this would be the general sense, we will analyze the different uses of the preposition ἀνά, and how λόγος was utilized in other prepositional phrases in a way that is somewhat akin to ἀνά λόγον.

Like most other Greek prepositions, ἀνά was originally an adverb.<sup>9</sup> It meant *up*, as opposed to κατά, *down*, although it also acquired other derived senses.<sup>10</sup> As an adverb, it commonly appears in composition with verbs, sometimes adding the nuance of repetition, as in ἀναβίωσις, *re-surrection*, and ἀνάγνωσις, *re-cognition*.<sup>11</sup> But when ἀνά functions as a preposition, it is used as an independent word to connect nouns with other parts of the sentence: then, it usually governs the noun in the accusative case and implies motion upwards (as opposed to κατά, downwards).<sup>12</sup> It has other senses too, but before we examine more of its peculiarities, it is convenient to consider how other prepositions are used in conjunction with λόγος to signify something similar to ἀνά λόγον.

When the prepositions εἰς, κατά, and πρὸς govern λόγος (and it seems they did so long before ἀνά; ►6.2), they may convey a meaning akin to ἀνά λόγον. Thus, we read in HERACLITUS, “[Earth] is liquefied as sea and measured into the same proportion it had before it became earth,” where “into the same proportion [i.e., ratio]” is a translation of εἰς τὸν αὐτὸν λόγον.<sup>13</sup> Similarly, we read in HERODOTUS, “she bricked with baked bricks, like

---

<sup>7</sup> See William Watson GOODWIN, *A Greek Grammar* (London: St. Martin's Press, 1991), n. 842. These derivations are also underlined by SZABÓ, *The Beginnings of Greek Mathematics*, 148. See Marcus Terentius VARRO, *De lingua latina*, ed. Leonard Spengel (Berlin: Weidmann, 1885), X.37, 248.19–249.2.

<sup>8</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ἀνάλογος. SZABÓ argues instead that this is “both erroneous and widely accepted,” and suggests the translation “(taken) *in logoi*,” just like ἀνά μέρος is “(taken) *in parts*” (*The Beginnings of Greek Mathematics*, 151).

<sup>9</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ἀνά, which is used throughout the ensuing discussion; GOODWIN, *A Greek Grammar*, n. 1199.

<sup>10</sup> *Ibid.*, n. 1203.

<sup>11</sup> See *ibid.*, 882.1. Most of these examples are taken from RAMÍREZ, *De analogia*, 56, reference below.

<sup>12</sup> Only in epic and lyric texts does ἀνά govern a noun in the dative. See GOODWIN, *A Greek Grammar*, n. 1203.1–2.

<sup>13</sup> Daniel W. GRAHAM, *The Texts of Early Greek Philosophy: The Complete Fragments and Selected Testimonies of the Major Presocratics* (Cambridge: Cambridge University Press, 2010), I, 155. Cf. SZABÓ, *The Beginnings of Greek Mathematics*, 154.

those of the wall,” where “like those” is a rendering of κατὰ τὸν αὐτὸν λόγον.<sup>14</sup> And in AESCHYLUS we read, “according to their blazon,” where “according to” translates πρὸς λόγον.<sup>15</sup>

For its part, the preposition ἀνά is peculiar in that it can also take a distributive sense. We find this in expressions such as ἀνὰ πᾶσαν ἡμέρην, “day by day.”<sup>16</sup> And this is especially manifest when used with numerals, being akin to the preposition *at* in expressions such as κρέα εἴκοσιν ἀν’ ἡμιωβολιαῖα, “20 pieces of meat at half an obol [each]”;<sup>17</sup> and ἀνὰ πέντε παρασάγγας τῆς ἡμέρας, “[they marched] at [the rate of] five parasangs a day.”<sup>18</sup> Similarly, we find its distributive sense in the New Testament’s ἐλαβον ἀνὰ δηνάριον, “[each workman] received a denarius” (Mt. 20:9), and χωροῦσαι ἀνὰ μετρητὰς δύο ἢ τρεῖς, “holding [each water jar] two or three measures” (Jn. 2:6). Finally, it is also used in the expression ἀνὰ μέρος “in turn(s).”<sup>19</sup>

Considering that other prepositions were already in use for a similar purpose, RAMÍREZ concludes that the coinage of ἀνά λόγον and ἀναλογία would find its most likely explanation in the intention to add the nuance of a comparison with the aim of distributing portions (*pro-portio*) according to some rule, measure or law.<sup>20</sup>

## 6.2. Historical Origins of the Theory

According to SZABÓ, the form ἀνάλογον would be “archaic,” having its origin in the sixth century BC.<sup>21</sup> However, as he readily acknowledges, there is no textual evidence to support this claim (the fiction that Pythagoras discovered the “theory of proportionals” is exposed below; ► 6.13). And SZABÓ’s reconstructions are sometimes built on shaky ground. For example, to show that “ἀνάλογον was at one time written as two words (ἀνὰ λόγον),” he points to a crucial document for the history of ancient Greek mathematics:

<sup>19</sup> Gilbert MURRAY (ed.), *Euripidis Fabulae* (Oxford: Clarendon, 1937), 99, 486. Cf. SZABÓ, *The Beginnings of Greek Mathematics*, 153.

<sup>20</sup> RAMÍREZ, *De analogia*, 56: “Praepositio enim ἀνά, cum in compositionem venit prout revera accidit in verbo ἀνα-λογία, iterationem quamdam et quasi duplicationem importat aliquando; et quidem per modum collationis seu comparationis ut in aequa distributione contingit, ita ut una pars pro alia vel sicut alia haberi possit. [...] Nimirum ἀνὰ importat comparationem in ordine ad aequam distributionem, ita ut tantumdem sit una portio sicut alia.”

<sup>21</sup> SZABÓ, *The Beginnings of Greek Mathematics*, 105; 153; 158.

ARCHYTAS's Fragment B2.<sup>22</sup> This is not only the oldest extant witness to the use of ἀναλογία and ἀνάλογον (or ἀνὰ λόγον), but as TÖPLITZ affirms, it “represents perhaps the only surviving, authentic mathematical text from the time before Autolycus and Euclid.”<sup>23</sup> Thus, this text is of great importance when it comes to tracing the origins of the theory and terminology of proportion.

Alas, ARCHYTAS's Fragment B2 brings no value to SZABÓ's argument when it comes to showing that in the most ancient texts ἀνάλογον was written as two words (ἀνὰ λόγον). Indeed, it is no secret that from the earliest times down to at least the seventh century AD, characters in Greek manuscripts were very rarely grouped into individual words, and that diacritical marks were usually not indicated.<sup>24</sup> The separation in printed editions of ΑΝΑΛΟΓΟΝ into ΑΝΑ ΛΟΓΟΝ, and the addition of diacritical marks to render ἀνάλογον or ἀνὰ λόγον, are evidently the work of editors. Not surprisingly, the available editions of ARCHYTAS's Fragment B2 fluctuate between ἀνάλογον and ἀνὰ λόγον.<sup>25</sup>

The remnant textual evidence seems in fact to militate against SZABÓ's claim that the term ἀνάλογον is archaic. PLATO, our next reliable source after ARCHYTAS, uses ἀνάλογον, ἀνὰ λόγον, and ἀναλογία only in works that belong to either a middle or a late period of his life, and in any case, after his purported first journey to Magna Graecia, where he would have personally met ARCHYTAS.<sup>26</sup> Thus, his *Timaeus* contains the form ἀνάλογα, which is

---

<sup>22</sup> The designation “Fragment B2” comes from the classification used in the celebrated collection of Pre-Socratic fragments edited by DIELS and KRANZ, *Die Fragmente der Vorsokratiker*. The editions examined by us are Carl A. HUFFMAN, *Archytas of Tarentum: Pythagorean, Philosopher and Mathematician King* (Cambridge: Cambridge University Press, 2005), 162; Hermann Alexander DIELS and Walther KRANZ, *Die Fragmente der Vorsokratiker* (Berlin: Weidmann, 1951), ARCHYTAS, B2; Friedrich Wilhelm August MULLACH, *Fragmenta philosophorum graecorum* (Paris: Didot, 1860–1861), II, 119; Friedrich Wilhelm BLASS, “De Archytae Tarentini fragmentis mathematicis,” in *Mélanges Graux*, ed. Ernest THORIN (Paris: Librairie du Collège de France, de l'École Normale Supérieure des Écoles Françaises d'Athènes et de Rome, 1884), 162; Ingemar DÜRING, *Kommentar zur Harmonielehre des Ptolemaios* (Göteborg: Elanders, 1932). See also the emendations made to DÜRING's edition by Bengt ALEXANDERSON, *Textual Remarks on Ptolemy's Harmonica and Porphyry's Commentary* (Göteborg: *Studia Graeca et Latina Gothoburgensia*, 27, 1969).

<sup>23</sup> Quoted in SZABÓ, *The Beginnings of Greek Mathematics*, 148. The consensus on the authenticity of Fragment B2 is practically unanimous.

<sup>24</sup> See Edward Maunde THOMPSON, *An Introduction to Greek and Latin Palaeography* (Oxford: Clarendon, 1912), 55ff.; 66ff.

<sup>25</sup> Thus, at least three editions have ἀνάλογον: HUFFMAN's, BLASS's, and DÜRING's; while at least two others have ἀνὰ λόγον: MULLACH's and that of DIELS and KRANZ. In a similar case, HEATH claims that ἀνάλογον is “usually written in one word” (*The Thirteen Books of Euclid's Elements*, vol. 2, 129). And he concludes thence that ἀνάλογον “comes however in Greek mathematics to be used practically as an indeclinable adjective,” pointing to definition 6 of Book V in EUCLID's *Elements* as a sample; see EUCLID, *Opera Omnia*, vol. 2, 2.17–18: “Τὰ δὲ τὸν αὐτὸν ἔχοντα λόγον μεγέθη ἀνάλογον καλεῖσθω.” Others follow him uncritically; for example, HUFFMAN, *Archytas of Tarentum*, 179: “ἀνάλογον – This word has its origin in the phrase ἀνὰ λόγον (‘according to a due λόγος’) but comes to be written as one word and to be used ‘practically as an indeclinable adjective.’”

<sup>26</sup> See *Phaedo* (ἀνὰ λόγον: 110d3, 5); *Republic* (ἀνάλογον: 508b13; ἀνὰ λόγον: 509d7, 511e2; ἀναλογίαν: 534a6); *Epinomis* (ἀναλογίαν: 990e4), which is of doubtful authenticity; *Statesman* (ἀναλογίαν: 257b3); *Timaeus* (ἀνὰ λόγον: 29c2, 37a4, 53e4, 56c7, 82b3; ἀνὰ τὸν αὐτὸν λόγον: 32b6–7; ἀνάλογα: 69b6; ἀναλογία: 31c3; ἀναλογίας: 32c2; ἀναλογιών: 56c3); and *Laws* (ἀνὰ λόγον: 893d1).

unquestionably the plural form of the adjective ἀνάλογον, and seemingly of more recent coinage.<sup>27</sup> But a few pages earlier the presumably archaic prepositional phrase ἀνά λόγον is certainly found in the expression ἀνά τὸν αὐτὸν λόγον, “according to the same ratio.”<sup>28</sup>

ARCHYTAS, the last of the three most important philosophers in the Pythagorean tradition (after PYTHAGORAS himself and PHILOLAUS of Croton) was a friend of PLATO, whose life he is reported to have saved (at least according to the *Seventh Letter*).<sup>29</sup> He was not only an accomplished geometrician (the first to resolve the notorious problem of doubling the cube), but also contributed notably to the development of harmonics. In fact, fragment B2 consists of an excerpt on *means* taken from his *On Music* (or possibly *On Harmonics*) preserved by PORPHYRY in his work *On Ptolemy’s Harmonics*.<sup>30</sup> ARCHYTAS was almost certainly a disciple of PHILOLAUS and a teacher to EUDOXUS, who is commonly credited with the theory of proportion reflected in Book V of EUCLID’s *Elements*. In turn, EUDOXUS is reported to have studied not only under ARCHYTAS but also under PLATO.

All these facts align well with the conclusion drawn by Reviel NETZ from his investigation into the structure of the *Elements*, as well as into social, political, and cultural aspects of ancient Greek life: that the characteristically Greek mathematical form emerged “in the period roughly corresponding to Plato’s lifetime.”<sup>31</sup> It would seem, then, that the theory of analogy was born to Pythagorean philosophers and grew in Athens. But it would very soon be applied beyond the scope of mathematics (►7).

### 6.3. Proportion in Numerical Means

Ancient Greeks used forms such as μεταξύ, μεσότης, μέσος, μέση, and μέσον to convey the sense of being “in the midst, the middle, in the middle, a middle term, a mean.”<sup>32</sup> In music, μέση was used strictly to denote the middle string of the seven-string (or of an earlier three-stringed) lyre.<sup>33</sup> It came to be considered, more generally, the middle of the three strings that formed the framework of the musical scale, standing between νεάτη (or νήτη), the lowest of the three strings (but the highest in pitch), and ὑπάτη, the highest of them (but the lowest in pitch), thus giving their names to the standard notes in Greek scales. This use is already attested in a fragment by PHILOLAUS (who, as noted above,

<sup>33</sup> See *ibid.*, entries for μέση, ὑπάτη, and νεάτη.

almost certainly was ARCHYTAS's teacher) from the second half of the fifth century BC, where μέση is shown to be a mean within the octave.<sup>34</sup>

As Carl A. HUFFMAN observes, ARCHYTAS's Fragment B2 may well be the first text in which the arithmetic, geometric, and harmonic means were "set out as a group and defined carefully."<sup>35</sup> These are the same means that ARCHYTAS's predecessors had discovered while researching the ratios that bring about musical harmony.<sup>36</sup> HUFFMAN, who personally carried out an improved collation of the challenging "hodgepodge of Attic, Doric and even Lesbian or Epic forms"<sup>37</sup> in the manuscript tradition, translates the fragment thus:

There are three means [μέσαι] in music: one is the arithmetic, the second geometric and the third sub-contrary [, which they call "harmonic"].<sup>38</sup> The mean is arithmetic, whenever three terms [ῥοι] are in proportion [ἀνάλογον or ἀνὰ λόγον] by exceeding one another in the following way: by that which the first exceeds the second, by this the second exceeds the third. And in this proportion [ἐν ταύτῃ <τῷ><sup>39</sup> ἀναλογίᾳ] it turns out that the interval [διάστημα] of the greater terms is smaller and that of the smaller greater. The mean is geometric, whenever they [the terms]<sup>40</sup> are such that as the first is to the second so the second is to the third. Of these [terms]<sup>41</sup> the greater and the lesser make an equal interval. The mean is sub-contrary, which we call harmonic, whenever they [the terms]<sup>42</sup> are such that, by which part of itself the first term [ῥος] exceeds the second, by this part of the third the middle [ὁ μέσος] exceeds the third. It turns out [γίνεται] that, in this proportion [ἐν ταύτῃ τῇ ἀναλογίᾳ], the interval of the greater terms is greater and that of the lesser is less.

According to ARCHYTAS, then, in every mean the first term (let us call it  $a$ ) exceeds the second or **middle term** ( $b$ ), which in turn exceeds the third ( $c$ ): i.e.,  $a > b > c$ .<sup>43</sup> Now let us consider each of the three means specifically in respect of its corresponding ἀναλογία.

In the case of the **arithmetic mean**,  $a$  exceeds  $b$  by some unit or number (say,  $N$ ), which is the same unit or number by which  $b$  exceeds  $c$ .<sup>44</sup> Thus, the terms are in proportion (ἀνάλογον) because just as  $a$  exceeds  $b$  by  $N$ , so  $b$  exceeds  $c$  by  $N$ . In other words,  $a$  has

<sup>39</sup> Angular brackets in HUFFMAN's Greek text.

<sup>40</sup> Bracketed in HUFFMAN's translation.

<sup>41</sup> Idem.

<sup>42</sup> Idem.

<sup>43</sup> Some later authors list proportional terms from the less to the greater. All the terms are numbers (i.e., measurable multitudes), although, based on its use in later sources, the least can be a unit.

<sup>44</sup> THEON explains that the arithmetic proportion is that which exceeds and is exceeded according to the same number: see *Expositio rerum mathematicarum...*, 85.10–11.

the same λόγος (in the generic sense of *relation*) to  $b$  as  $b$  has to  $c$ , for in either case the antecedent exceeds the consequent by some number or unit  $N$ :

$$a = b + N$$

$$b = c + N$$

In the **geometric mean**, however, the terms “are such that as the first is to the second so the second is to the third.” Thus, the proportion of the geometric mean  $a : b :: b : c$  is based on the **sameness of the λόγοι**  $a : b$  and  $b : c$ , in the sense of *equivalence of ratios* as found specifically in geometric proportion.

Note, again, that later Greek authors usually reserve the name λόγος exclusively for the relation found in geometric proportion. Thus, as NICOMACHUS explains:

It is an arithmetic proportion [μεσότης “mean”], then, whenever three or more terms are set forth in succession [ἐφεξῆς, *consequently*; ►39.4], or are so conceived, and the same quantitative [κατὰ ποσότητα, i.e., *according to multitude*] difference is found to exist between the successive <numbers>, but not the same ratio [λόγος] among the terms, one to another.<sup>45</sup>

Quoting THRASYLLUS, THEON explains this kind of mean by saying that the geometric proportion is that in which the middle term “exceeds and is exceeded: like twice or thrice.”<sup>46</sup>

However, we should not understand by this that the geometric mean is reduced to the first species of the greater: that is, the multiple (►5.2). In fact, THEON adds that “the geometric mean [μεσότης], and proportion properly said [ἡ ἀναλογία κυρίως λεγομένη], is that which exceeds and is exceeded according to the same ratio [τῷ αὐτῷ λόγῳ]: for example [οἶον], multiple or superparticular.”<sup>47</sup> In other words, it is *a relation of whole to part or parts*.

Similarly, NICOMACHUS explains that “the continuous geometric mean [μεσότης] is the only one [μόνη] in the strict sense of the word [κυρίως] to be called a proportion [ἀναλογία], because its terms are seen to be in the same ratio [ἀνὰ τὸν αὐτὸν λόγον]”; and he adds that “geometric proportions come about not only among the multiples, but also among all

<sup>45</sup> NICOMACHUS, *Introductio arithmeticae*, II.23.1, 124.1–5.

<sup>46</sup> THEON, *Expositio rerum mathematicarum...*, 85.11–12: “<[...] γεωμετρικὴν δὲ τὴν ταύτῳ λόγῳ ὑπερέχουσαν καὶ ὑπερεχομένην,> οἶον διπλασίῳ ἢ τριπλασίῳ, ὡς γ' ἑβ'.” The translation is ours. Cf. DUPUIS, *Théon de Smyrne*, 139: “la proportion géométrique est celle dont le terme moyen contient autant de fois un terme extrême qu’il est contenu dans l’autre, comme 2 fois, 3 fois, telle est la proportion 3, 6, 12.”

<sup>47</sup> THEON, *Expositio rerum mathematicarum...*, 114.1–3: “γεωμετρικὴ δὲ ἐστὶ μεσότης ἢ καὶ ἀναλογία κυρίως λεγομένη ἢ τῷ αὐτῷ λόγῳ ὑπερέχουσα καὶ ὑπερεχομένη, οἶον πολλαπλασίῳ ἢ ἐπιμορίῳ.” The translation is ours. Cf. DUPUIS, *Théon de Smyrne*, 189: “La médiété géométrique, appelée aussi proprement proportion, est celle dont le moyen terme surpasse un extrême et est surpassé par l’autre dans la raison, multiple ou superpartielle (du premier terme au second ou du second au troisième).”

the superparticular, superpartient, and mixed <forms>.”<sup>48</sup> These are, of course, the proper species into which the ratio found in geometric proportion is scientifically divided (►5.2).

Finally, in the **harmonic mean** (originally called *sub-contrary*),  $a$  exceeds  $b$  by some part (say,  $\frac{1}{q}$ ) of  $a$ ; and  $b$  exceeds  $c$  by the same part ( $\frac{1}{q}$ ) of  $c$ ; or:

$$a = b + a \cdot \frac{1}{q}$$

$$b = c + c \cdot \frac{1}{q}$$

Clearly, in the ἀναλογία of the harmonic mean, the relation (λόγος in its generic sense) that  $a$  has to  $b$  is not the same relation that  $b$  has to  $c$ . In fact, the relation that  $a$  has to  $b$  is not any of the species into which the ratio found in geometric proportion is scientifically divided (i.e., a relation of whole to part or parts; ►5.2), while the relation that  $b$  has to  $c$  is specifically one of them: the superparticular. There is, however, a **similarity of λόγοι**: for in either case the antecedent exceeds the consequent by the same part, even though the part by which the antecedent exceeds the consequent belongs in the former case to the antecedent itself ( $a$ ), while in the latter, it belongs to the consequent ( $c$ ).

#### 6.4. The Means Compared

ARCHYTAS compares these proportions to one another in respect of the intervals they produce: in the ἀναλογία of the arithmetic mean, “the interval of the greater terms is smaller and that of the smaller greater”; in the geometric mean, “the greater and the lesser [terms] make an equal interval”; and in the ἀναλογία of the harmonic mean, “the interval of the greater terms is greater and that of the lesser is less.”

Later authors, such as NICOMACHUS and PORPHYRY, tend to identify διάστημα (interval) and λόγος (ratio).<sup>49</sup> NICOMACHUS, for example, explains the comparison between the different means thus:

[A] thing which all previous writers also have noted [is that in the arithmetic mean] the ratios [λόγοι] between the smaller terms are larger, as compared to those between the greater terms. It will be shown that in the harmonic [mean], on the contrary, the ratios between the greater terms are greater than those between the smaller; for this reason, the harmonic proportion [μεσότης “mean”] is sub-contrary to the arithmetic, and the geometric is midway between them, as it were, between

<sup>48</sup> NICOMACHUS, *Introductio arithmeticae*, II.24.1, 126.12–15; 24.4, 128.12–14.

<sup>49</sup> For a discussion of how PORPHYRY justifies the identification of διάστημα and λόγος, see HUFFMAN, *Archytas of Tarentum*, 166–7. Note that διάστημα is used by EUCLID in his third postulate, “that a circle can be described with any center and interval,” to refer to the distance between the center of the circle and the circumference; see EUCLID, *Opera Omnia*, vol. 1, 8.11–12: “Καὶ παντὶ κέντρῳ καὶ διαστήματι κύκλον γράφεσθαι.”

extremes, for this [mean] has the ratios [λόγους] between the greater terms and those between the smaller equal, and we have seen that the equal is in the middle between the greater and the less.<sup>50</sup>

Modern historians, too, tend to identify διάστημα and λόγος. For example, HUFFMAN explains thus that the geometric mean is like a “mean” between the others:

In the arithmetic mean the ratio of the second and third terms is excessively big, in the harmonic mean it is the ratio between the first and second terms that is excessively big. The arithmetic and harmonic means are thus the “reversal” of each other and the geometric mean is in the middle. Archytas’s presentation underlines this point, insofar as he discusses the geometric mean second, between the arithmetic and harmonic mean.<sup>51</sup>

However, as BARKER observes, διάστημα refers most probably to the sensible musical interval we *hear*, as opposed to the intelligible numerical λόγος we *understand*.<sup>52</sup> Indeed, as is well known, our perception of musical intervals is approximately logarithmic with respect to fundamental frequency. For example, according to sense, the octave between  $A_4$  and  $A_3$  is an interval equal to the octave between  $A_3$  and  $A_2$ . And this is so because just as the frequency of  $A_4$  (set by convention to 440 Hz) is twice the frequency of  $A_3$  (220 Hz), so the latter is twice the frequency of  $A_2$  (110 Hz). Hence, what we *sense* as equal (or unequal) *intervals* we *understand* as equal (or unequal) *geometric ratios*. This means that numerical ratios are compared—and therefore measured—in geometric proportion.

### 6.5. Priority of the Geometric Mean

We find, from our preceding remark, that in the geometric mean the ratio that  $a$  has to  $b$  is not only the same that  $b$  has to  $c$ , but is also the same ratio that the difference between the greater terms ( $a - b$ ) has to the difference between the lesser terms ( $b - c$ ), or:

$$a - b : b - c :: a : b :: b : c$$

Thus, the ἀναλογία found in the geometric mean has a special place in that it is more perfect because there is no excess or defect in it. This explains why the geometric ἀναλογία and its λόγος are considered to be (and indeed are) prior to—and therefore the measure of—all others.

NICOMACHUS explains that in the geometric mean the terms do not differ from one another “by the same quantity [πρoσότητι, *by the same multitude*], but rather “by the same quality of ratio [λόγου ποιότητι], the opposite of what is seen to be the case with the arithmetic

<sup>50</sup> NICOMACHUS, *Introductio arithmeticae*, II.23.1, 124.1–5.

<sup>51</sup> HUFFMAN, *Archytas of Tarentum*, 170.

<sup>52</sup> This suggestion was personally transmitted by BARKER to HUFFMAN (*ibid.*, 181).

proportion.”<sup>53</sup> Indeed, according to EUCLID, numbers that are (geometrically) proportional are *similar* according to figure; for, “similar plane and solid numbers are those which have their sides proportional.”<sup>54</sup>

### 6.6. Priority of the Arithmetic Mean

The ἀναλογία of the arithmetic mean is peculiar in that the middle term exceeds and is exceeded by the same number or unit, and its terms are not similar in quality (i.e., figure). Nonetheless, NICOMACHUS considers this mean to be first insofar as arithmetic precedes geometry in the order of natural dependence (► 2.3):

Now, however, we must treat from the beginning, first, that form of proportion which by quantity [κατὰ τὸ ποσόν, i.e., *according to multitude*] reconciles and binds together the comparison of the terms, which is a quantitative [κατὰ τὸ ποσόν, i.e., *according to multitude*] equality as regards the difference of the several terms to one another. This would be the arithmetic <proportion>, for it was previously reported that quantity [τὸ ποσόν, i.e. *multitude*] is its peculiar belonging. What, then, is the reason that we shall treat of this first, and not another? Is it not clear that Nature shows it forth before the rest? For in the natural series of simple numbers [τοῦ ἀπλοῦ ἀριθμοῦ], beginning with one, with no term passed over or omitted, the definition [λόγος, *ratio*] of this proportion alone is preserved; moreover, in our previous statements, we demonstrated that the *Arithmetical Introduction* itself is antecedent to all the others, because it abolishes them together with itself, but is not abolished together with them, and because it is implied by them, but does not imply them. Thus it is natural that the mean which shares the name of arithmetic will not unreasonably [ἀλόγως] take precedence of the means which are named for the other sciences, the geometric [i.e., *geometry*] and harmonic [i.e., *harmonics, music*]; for it is plain that all the more will it take precedence over the subcontraries, over which the first three hold the leadership. As the first and original, therefore, since it is most deserving of the honor, let the arithmetic proportion have its discussion at our hands before the others.<sup>55</sup>

Indeed, the relation that the difference between the greater terms ( $a - b$ ) has to the difference of the lesser terms ( $b - c$ ) in the arithmetic ἀναλογία is none other than the λόγος of equality, which is the root of all ratios and proportions, as noted above:

$$a - b : b - c :: a : a :: b : b :: c : c$$

### 6.7. Priority of the Harmonic Mean

NICOMACHUS does not explicitly say in what way the harmonic mean may be prior to the others. However, as quoted above, he does claim that it is named after the science of harmonics. This, of course, would be of great importance to the Pythagorean thinkers who

<sup>53</sup> NICOMACHUS, *Introductio arithmeticae*, II.24.1, 126.19–21.

<sup>54</sup> EUCLID, *Opera Omnia*, vol. 2, 188.8–9 (Book VII, definition 21).

<sup>55</sup> NICOMACHUS, *Introductio arithmeticae*, II.22.2–4, 123.3–26.

believed that the whole universe was harmony and number;<sup>56</sup> but even PLATO himself devotes part of his *Timaeus* to the “harmony” of the World-Soul.<sup>57</sup>

The ἀναλογία of the harmonic mean is diverse from the others in two ways. On the one hand, the relation of the greater term to the middle term is not the same as the relation of the middle term to the less, though these relations are somewhat similar, as already noted. This results in a rather peculiar interval, as NICOMACHUS explains:

The mean [μεσότης] that is placed in the third order is one called the harmonic, which exists whenever among three terms the mean on examination is observed to be neither in the same ratio [ἐν λόγῳ τῷ αὐτῷ] to the extremes, antecedent of one and consequent of the other, as in the geometric proportion, nor with equal intervals [ἐν διατήμασι ἴσοις], but an inequality of ratios [ἐν λόγων ἐτερότητι, *in heterogeneity of ratios*], as in the arithmetic, but on the contrary, as the greatest term is to the smallest, so the difference between greatest and mean terms is to the difference between mean and smallest term. For example, take 3, 4, 6, or 2, 3, 6. For 6 exceeds 4 by one third of itself, since 2 is one third of 6, and 3 falls short of 4 by one third of itself, for 1 is one third of 3. In the first example, the extremes are in double ratio and their differences with the mean term are again in the same double ratio to one another; but in the second they are each in the triple ratio.<sup>58</sup>

Thus, according to the ἀναλογία of the harmonic mean, the relation that the difference between the greater terms ( $a - b$ ) has to the difference between the lesser terms ( $b - c$ ) is the same ratio (according to geometrical proportion) that the greatest term has to the least, or:

$$a - b : b - c :: a : c$$

On the other hand, having a middle term is essential to the harmonic proportion, which, therefore, cannot be divided to constitute what the ancients called *discrete*—as opposed to *continuous*—*proportion*. Since this peculiarity of the harmonic mean is not explained by NICOMACHUS, we will add our own observations after explaining the latter opposition.

### 6.8. Continuous and Discrete Proportion

A proportion in the form “ $a$  is to  $b$  as  $b$  is to  $c$ ,” where the consequent ( $b$ ) of the first relation ( $a$ -to- $b$ ) is the antecedent ( $b$ ) of the second relation ( $b$ -to- $c$ ), was called συνεχής, i.e., *continuous* (or συνημμένη, *continued*), ἀναλογία, *proportion*. In contrast, a proportion in the form “ $a$  is to  $b$  as  $c$  is to  $d$ ,” in which the two relations do not share a common middle

---

<sup>57</sup> PLATO, *Timaeus*, 35b–36b. See FRANCIS M. CORNFORD, *Plato's Cosmology, the Timaeus of Plato* (London: Routledge, 1937), 66ff.

<sup>58</sup> NICOMACHUS, *Introductio arithmeticae*, II.25.1, 131.13–132.10.

term, was called διηρημένη, *discrete*, *discontinuous* (or διεξευγμένη, *disjoint*, *disjunct*).<sup>59</sup>

As THEON explains,

Proportion [ἀναλογία] is a similarity [ὁμοιότης] or identity [ταυτότης] of multiple ratios [πλειόνων λόγων], that is, a similarity of ratios in multiple terms, such that the ratio that the first has to the second is the same that the second has to the third, or any others to any others. The former is called continuous proportion; the latter, discrete: the continuous is of at least three terms; the discrete, of at least four.<sup>60</sup>

Thus, arithmetic and geometric proportions can be either continuous or discrete. For example, the continuous proportion  $7 : 5 :: 5 : 3$  and the discrete proportion  $7 : 5 :: 4 : 2$  share a relation in which the antecedent exceeds the consequent by the number two and are therefore *arithmetic* proportions.

Likewise, the continuous proportion  $16 : 8 :: 8 : 4$  and the discrete  $16 : 8 :: 4 : 2$  have in common a relation in which the antecedent is twice the consequent and are therefore *geometric*.

In contrast, the harmonic proportion does not involve the same relation but two different yet similar ones. Thus, while in the arithmetic and geometric proportions the antecedent is identically defined in relation to the consequent (or the consequent, in terms of the antecedent), in the harmonic proportion the common middle term is more readily defined as having diverse but determined relations to the extreme terms—or, indeed, the extreme terms, as having diverse but determined relations to the middle term (*ab uno vel ad unum*).

This is so because in the harmonic mean the common middle term is exceeded by one extreme, and exceeds the other, by the same part of an extreme term.<sup>61</sup> Thus,

$$b = a \cdot \left(1 - \frac{1}{q}\right)$$

$$b = c \cdot \left(1 + \frac{1}{q}\right)$$

---

<sup>59</sup> See *ibid.*, II.21.5–6, 121.15; THEON, *Expositio rerum mathematicarum...*, 82.10.

<sup>60</sup> *Ibid.*, 82.6–12: “ἀναλογία δ’ ἐστὶ πλειόνων λόγων ὁμοιότης ἢ ταυτότης, τουτέστιν ἐν πλείοσιν ὄροις λόγων ὁμοιότης, ὅταν ὄν ἔχει λόγον ὁ πρῶτος πρὸς τὸν δεύτερον, τοῦτον ὁ δεύτερος πρὸς τὸν τρίτον ἢ ἄλλος τις πρὸς ἄλλον. λέγεται δὲ ἡ μὲν συνεχῆς ἀναλογία, ἡ δὲ διηρημένη, συνεχῆς μὲν ἡ ἐν ἐλαχίστοις τρισὶν ὄροις, διηρημένη δὲ ἡ ἐν ἐλαχίστοις τέσσαρσιν.” The translation is ours. Cf. DUPUIS, *Théon de Smyrne*, 133: “La proportion est une similitude ou identité de plusieurs rapports, c’est-à-dire une similitude des raisons dans plusieurs termes, ce qui a lieu quand le rapport du premier terme au second est égal au rapport du second au troisième ou au rapport de deux autres termes. La première proportion est appelée continue et la seconde discontinue. Il faut trois termes au moins pour une proportion continue, la discontinue suppose au moins quatre termes.”

<sup>61</sup> Paraphrasing *ibid.*, 114.21–23: “συμβέβηκε δὲ ταύτη τῇ ἀναλογίᾳ, τὸν μέσον ὄρον τῷ αὐτῷ μέρει κατὰ τοὺς ἄκρους ὑπερέχειν τε καὶ ὑπερέχεσθαι.” Cf. DUPUIS, *Théon de Smyrne*, 189: “Cette proportion jouit de la propriété, que le moyen terme surpasse un extrême et est surpassé par l’autre de la même partie des extrêmes.”

Although the antecedent-to-consequent pairs of the harmonic proportion do not hold the same relation, yet they necessarily share a common middle term—a mean—to which they are related similarly. In this sense, the harmonic mean is more a mean than the others.

### 6.9. The Ten (or Eleven) Means

Apart from the arithmetic, geometric, and harmonic, other specific means would be distinguished later in antiquity, building up the traditional Pythagorean list to ten—or, strictly speaking, eleven—in all.<sup>62</sup> Late authors do not define the means by comparing *the relation that the greater term has to the middle term* with *the relation that the middle term has to the lesser term*. Instead, they define them by determining the ratio of the intervals: that is, the λόγος (according to geometric proportion) that the difference between two terms has to the difference between two terms. This is then compared to the relation that the single terms have among themselves, as shown below (► Table 1).

Based on this scientific division, the total number of species of numerical means comes to eleven rather than ten. Apparently, both PAPPUS and NICOMACHUS intended the list to be of exactly ten means because ten is to the Pythagoreans a *perfect number* for reasons other than those given by EUCLID (► 3).<sup>63</sup>

No.	Nicomachus	Pappus	Proportion	
1	1	1	$a - b : b - c :: a : a :: b : b :: c : c$	<i>arithmetic</i>
2	2	2	$a - b : b - c :: a : b :: b : c$	<i>geometric</i>
3	3	3	$a - b : b - c :: a : c$	<i>harmonic</i>
4	4	4	$a - b : b - c :: c : a$	
5	5	5	$a - b : b - c :: c : b$	
6	6	6	$a - b : b - c :: b : a$	
7	7	-	$a - c : b - c :: a : c$	
8	8	9	$a - c : a - b :: a : c$	
9	9	10	$a - c : b - c :: b : c$	
10	10	7	$a - c : a - b :: b : c$	
11	-	8	$a - c : a - b :: a : b$	

**Table 1: The numerical means discovered by the ancient Greeks**

<sup>62</sup> See NICOMACHUS, *Introductio arithmeticae*, II.28. After the sixth mean, there is a slight inconsistency in the tradition, where PAPPUS omits one, and NICOMACHUS, another. See HEATH, *A History of Greek Mathematics*, v.1, 86ff.

<sup>63</sup> See ARISTOTLE, *Metaphysica* A.5, 986a8–12 (cf. AQUINAS, *In Metaph.* 1, l. 7, §123).

## 6.10. Proportion Summarized

Let us summarize some of the most important points already noted concerning proportion by resorting to NICOMACHUS:

After this it would be the proper time to incorporate the nature of proportions, a thing most essential for speculation [θεωρήματα] about the nature of the universe and for the propositions of music, astronomy, and geometry, and not least for the study of the works of the ancients; and thus to bring the *Introduction to Arithmetic* to the end that is at once suitable and fitting. A proportion [ἀναλογία], then, is in the proper sense [κυρίως], the combination [σύλληψις] of two or more ratios [λόγων], but by the more general definition the combination of two or more relations [σχέσεων], even if they are not brought under the same ratio [λόγω τῷ αὐτῷ], but rather a difference, or something else. Now a ratio [λόγος] is the relation [σχέσις] of two terms [ὄρων] to one another, and the combination [σύνθεσις] of such is a proportion [ἀναλογία], so that three is the smallest number of terms of which the latter is composed, although it can be a series of more, subject to the same ratio [κατὰ τὸν αὐτὸν λόγον] or the same difference [κατὰ τὸ αὐτὸ διάστημα]. [...] Now if the same term [ὄρος], one and unchanging, is compared to those on either side of it, to the greater as consequent [ὑπόλογος] and to the lesser as antecedent [πρόλογος], such a proportion [ἀναλογία] is called continued [συνημμένη]. [...] If, however, one term answers to the lesser term, and becomes its antecedent and a greater term, and another, not the same, takes the place of consequent and lesser term with reference to the greater, such a mean [μεσότης] and such a proportion is called no longer continued, but disjunct [διεξευγμένη].<sup>64</sup>

## 6.11. Magnitudes in Proportion

The mathematical discoveries that would lead to the formulation of the *arithmetical* theory of proportion reflected in Book VII of the *Elements* should most likely be associated with THEAETETUS, the main character in the eponymous dialogue by PLATO and contemporary with ARCHYTAS.<sup>65</sup> EUCLID treats only of the discrete numerical proportions found in the definition we have already quoted. These are used primarily to demonstrate theorems in geometry (notably those related to incommensurability). As explained earlier, there is no definition of numerical λόγος in the *Elements*. However, EUCLID supposes its definition; for he often makes use of numerical ratios. Thus, Proposition 17 in the same book requires the student to prove the theorem that “If a number by multiplying two numbers make certain numbers, the numbers so produced will have the same ratio [τὸν αὐτὸν λόγον] as the numbers multiplied.”<sup>66</sup>

In turn, the mathematical discoveries that would lead to the formulation of the *geometrical* theory of proportion reflected in Book V are often attributed to EUDOXUS. KNORR postulates the following stages of groundwork before such a theory could be developed:

<sup>64</sup> NICOMACHUS, *Introductio arithmeticae*, II.21.1–3.5–6, 119.19–120.10; 120.20–121.1; 121.11–16.

<sup>65</sup> KNORR, *The Evolution of Euclidean Mathematics*, 238–244. Others ascribe them to the Pythagoreans.

<sup>66</sup> EUCLID, *Opera Omnia*, vol. 2, 224.4–6.

(1) [THEAETETUS] provided a formal structure for number theory, prefiguring Elements VII, from which the theorems on relative primes could be drawn to establish the arithmetic criteria of incommensurability. (2) Generalizing to geometry the arithmetic procedure of *anthyphairesis*,<sup>67</sup> Theaetetus was able to develop the theorems on the proportions of lines and rectangular planes and solids which he required for constructions of incommensurable lines. (3) From the definitions of the means (geometric, arithmetic and harmonic) he formulated three classes of irrational lines, corresponding to the Euclidian medial, binomial and apotome, and began the investigation of their properties.<sup>68</sup>

1. In Book v, EUCLID offers more definitions concerning ratios between magnitudes set in proportion. Thus, he explains that the expression **corresponding magnitudes** (ὁμόλογα μεγέθη, *homologous magnitudes*) is said “of antecedents in relation to antecedents, and of consequents in relation to consequents.”<sup>69</sup> Hence, in  $a : b :: c : d$ , magnitudes  $a$  and  $c$  are homologous; for  $a$  corresponds to  $c$ ; and so are  $b$  and  $d$ . Therefrom, **alternate ratio** (ἐναλλάξ λόγος) is “taking the antecedent in relation to the antecedent and the consequent in relation to the consequent.”<sup>70</sup> Thus, if  $a : b :: c : d$ , then, by alternation  $a : c :: b : d$ .
2. An **inverse ratio** (ἀνάπαλιν λόγος) is “taking the consequent as antecedent in relation to the antecedent as consequent.”<sup>71</sup> Thus, if  $a : b :: c : d$ , then, by inversion,  $b : a :: d : c$ .
3. The **composition of a ratio** (σύνθεσις λόγου) is “taking the antecedent together with the consequent as one in relation to the consequent by itself.”<sup>72</sup> Thus, if  $a : b :: c : d$ , then, by composition,  $a + b : b :: c + d : d$ .
4. The **separation of a ratio** (διαίρεσις λόγου) is “taking the excess by which the antecedent exceeds the consequent in relation to the consequent by itself.”<sup>73</sup> Thus, if  $a : b :: c : d$ , then, by separation,  $a - b : b :: c - d : d$ .
5. The **conversion of a ratio** (ἀναστροφή λόγου) is “taking the antecedent in relation to the excess by which the antecedent exceeds the consequent.”<sup>74</sup> Thus, if  $a : b :: c : d$ , then, by conversion,  $a : a - b :: c : c - d$ .

---

<sup>67</sup> *Anthyphairesis* is a primitive procedure to determine the relation between two numbers by reciprocal subtraction. It received great attention after Oskar BECKER pointed in 1933 to a passage in ARISTOTLE where *antanairesis* (identical with *anthyphairesis* according to ALEXANDER of Aphrodisias) is mentioned as the definition of ratio. See FOWLER, *The Mathematics of Plato's Academy*, 30ff.

<sup>68</sup> KNORR, *The Evolution of Euclidean Mathematics*, 273.

<sup>69</sup> EUCLID, *Opera Omnia*, vol. 2, 4.15–16.

<sup>70</sup> *Ibid.*, 17–18.

<sup>71</sup> *Ibid.*, 19–20.

<sup>72</sup> *Ibid.*, 21–22.

<sup>73</sup> *Ibid.*, 6.1–3.

<sup>74</sup> *Ibid.*, 4–6.

6. A **ratio ex aequo** or **ex aequali** (δι' ἴσου) happens “when, there being several magnitudes and another <set> equal to them in multitude which taken two and two are in the same proportion, as the first is to the last among the first magnitudes, so is the first to the last among the second magnitudes.”<sup>75</sup> That is, “taking the extreme terms by virtue of the removal of the intermediate terms.”<sup>76</sup> Thus, if  $a_1 : a_2 :: b_1 : b_2$ , and  $a_2 : a_3 :: b_2 : b_3$ , and  $a_3 : a_4 :: b_3 : b_4$ , and ...  $a_{n-1} : a_n :: b_{n-1} : b_n$ , then, *ex aequo*,  $a_1 : a_n :: b_1 : b_n$ .

7. Finally, a **perturbed proportion** (τεταραγμένη ἀναλογία) occurs “when, there being three magnitudes and another <set> equal to them in multitude, as antecedent is to consequent among the first magnitudes, so is antecedent to consequent among the second magnitudes, while, as the consequent is to a third among the first magnitudes, so is a third to the antecedent among the second magnitudes.”<sup>77</sup> Thus, there is a perturbed proportion if  $a_1 : a_2 :: b_2 : b_3$  and  $a_2 : a_3 :: b_1 : b_2$ .

### 6.12. Proportion of Numbers and of Magnitudes Compared

Even a superficial comparison of the arithmetical theory of proportion in Book VII in EUCLID'S *Elements* to the geometrical theory in Book V immediately reveals that there is much in common between them. Many of the definitions provided for magnitudes seem straightforwardly applicable to numbers.

In fact, sometimes a definition equivalent to one found in Book V is presupposed in the arithmetical books, where an equivalent definition is not provided specifically for numbers. For example, Proposition 13 in Book VII is a theorem that states, “If four numbers be proportional, they will also be proportional alternately [ἐναλλάξ ἀνάλογον].”<sup>78</sup>

What is more, in Book X we find multitudes and magnitudes being compared together in proportion. Thus, as per Proposition 9, “The squares on straight lines commensurable in length have to one another the ratio which a square number has to a square number; and squares which have to one another the ratio which a square number has to a square number will also have their sides commensurable in length.”<sup>79</sup>

Moderns are typically puzzled as to why EUCLID would not come up with a unified theory of mathematical proportion. We shall deal with this question in the next chapter (►7.3). For now, let us point out that their particular principles (►Table 2) are not the same, and that this has implications.

<sup>79</sup> Ibid., vol. 3, 24.2–7.

---

<p>7.1. A unit is that by virtue of which each of the things that exist is called <i>one</i>.</p> <p>7.2. A number is a multitude composed of units.</p> <p>7.3. A number is a part of a number, the less of the greater, when it measures the greater;</p> <p>7.4. But parts when it does not measure it.</p> <p>7.5. The greater number is a multiple of the less when it is measured by the less.</p> <p>7.11. A prime number is that which is measured by a unit alone.</p> <p>7.12. Numbers prime to one another are those which are measured by a unit alone as a common measure.</p> <p>7.13. A composite number is that which is measured by some number.</p> <p>7.20. Numbers are proportional when the first is the same multiple, or the same part, or the same parts, of the second that the third is of the fourth.</p>	<p>5.1. A magnitude is a part of a magnitude, the less of the greater, when it measures the greater.</p> <p>5.2. The greater [magnitude] is a multiple of the less when it is measured by the less.</p> <p>10.1. Those magnitudes are said to be commensurable which are measured by the same measure, and those incommensurable which cannot have any common measure.</p> <p>5.3. A ratio is a sort of relation in respect of size between two magnitudes of the same kind.</p> <p>5.4. Magnitudes are said to have a ratio to one another which are capable, when multiplied, of exceeding one another.</p> <p>5.5. Magnitudes are said to be in the same ratio, the first to the second and the third to the fourth, when, if any equimultiples whatever be taken of the first and third, and any equimultiples whatever of the second and fourth, the former equimultiples alike exceed, are alike equal to, or alike fall short of, the latter equimultiples respectively taken in corresponding order.</p> <p>5.6. Let magnitudes which have the same ratio be called proportional.</p>
--	---

**Table 2: Comparison of proportion theory definitions in EUCLID's *Elements*.**

Indeed, as already noted (► 2.3), geometry depends on arithmetic in many ways. Whence, it would be impossible for a geometer to demonstrate without measurable multitudes. For example, EUCLID proves in his *Elements* (x.5) that commensurable magnitudes have to one another *the ratio which a number has to a number*. Such a demonstration necessarily depends on the use of *parts of numbers* (that is, parts of measurable *multitudes*), which are always commensurable because they are composed of indivisible units:

Let A, B be commensurable magnitudes; I say that A has to B the ratio which a number has to a number. For, since A, B are commensurable, some magnitude will measure them. Let it measure them, and let it be C. And, as many times as C measures A, so many units let there be in D [i.e., a number]; and, as many times as C measures B, so many units let there be in E [another number]. Since then C measures A according to the units in D, while the unit also measures D according to the units in it, therefore the unit measures the number D the same number of times as the magnitude C measures A; therefore, as C is to A, so is the unit to D [as per 7.20, 7.4, and 7.3 in **Table 2**]; therefore, inversely, as A is to C, so is D to the unit. Again, since C measures B

according to the units in E, while the unit also measures E according to the units in it, therefore the unit measures E the same number of times as C measures B; therefore, as C is to B, so is the unit to E. But it was also proved that, as A is to C, so is D to the unit; therefore, ex aequali, as A is to B, so is the number D to E. Therefore the commensurable magnitudes A, B have to one another the ratio which the number D has to the number E. Q.E.D.<sup>80</sup>

### 6.13. Fiction: “Pythagoras discovered the theory of proportionals”

A modern edition of PROCLUS’s *Commentary on the First Book of Euclid’s Elements* would have PYTHAGORAS himself be the discoverer of the “theory of proportionals”:

Following these men [namely, THALES, MAMERCUS, and HIPPIAS of Ellis], Pythagoras transformed mathematical philosophy into a scheme of liberal education, surveying its principles from the highest downwards and investigating its theorems in an immaterial and intellectual manner. He it was who discovered the doctrine of proportionals [ἀναλόγων] and the structure of the cosmic figures.<sup>81</sup>

According to the best manuscript tradition, however, what PROCLUS would be saying here is that PYTHAGORAS discovered the theory ἀλόγων, of *irrationals*—not ἀναλόγων, of *proportionals*. But ever since Gustav JUNGE and Heinrich VOGT subjected the “geometry of Pythagoras” to a “critical examination” early in the twentieth century, “the attribution of this discovery to Pythagoras himself, made by Proclus, has not been seriously defended.”<sup>82</sup> Therefore, HEATH and others “corrected” the text by resorting to an extremely weakly attested variant that more closely matched their preconceptions. Thus, they came to attribute directly to PYTHAGORAS the theory “of proportionals” because they assumed that the word in question was an integral part of the so-called *Catalogue of Geometers* (a neighboring, authentic fragment that PROCLUS extracted from a history of mathematics written by EUDEMUS, one of ARISTOTLE’s disciples).

Ironically, both PROCLUS and HEATH were subsequently proven wrong. As BURKERT has shown, the evidence in favor of preserving the unreasonable but better attested reading ἀλόγων, of *irrationals*, is irrefutable: “the sentence in question is taken word for word from Iamblichus’s *De communi mathematica scientia*—a work that Proclus copies sometimes by the page in his commentary on Euclid.”<sup>83</sup> And so, “There is no occasion to reject the

---

<sup>80</sup> Ibid., 16.13–18.9.

<sup>81</sup> PROCLUS, *A Commentary on the First Book of Euclid’s Elements*, 52–3; cf. PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 65.15–21: “ἐπὶ δὲ τούτοις Πυθαγόρας τὴν περὶ αὐτὴν φιλοσοφίαν εἰς σχῆμα παιδείας ἐλευθέρου μετέστησεν, ἄνωθεν τὰς ἀρχὰς αὐτῆς ἐπισκοπούμενος καὶ αὐλῶς καὶ νοερῶς τὰ θεωρήματα διερευνώμενος, ὃς δὴ καὶ τὴν τῶν ἀλόγων [\*] πραγματείαν καὶ τὴν τῶν κοσμικῶν σχημάτων σύστασιν ἀνεῦρεν.” The critical apparatus has: “[\*] ‘alii ἀναλόγων’ A.” The “A.” refers us to Ernest Ferdinand AUGUST, *Εὐκλείδου Στοιχεῖα: Euclidis Elementa ex optimis libris* (Berlin: Trautwein, 1826), 290.4. See HEATH, *A History of Greek Mathematics*, v.1, 84–5, who fails cite his sources.

<sup>82</sup> BURKERT, *Lore and Science in Ancient Pythagoreanism*, 404.

<sup>83</sup> Ibid., 409–12.

reading ἀλόγων in favor of the weakly attested ἀναλόγων.”<sup>84</sup> Still, the damage was done—and the error has been repeatedly cloned until our days.

FOWLER describes this case as “a good and clear illustration of how history can sometimes be manufactured by commentators, late and modern, who may adjust a text to fit with their own interpretations.”<sup>85</sup> Indeed, Neoplatonic writers are not only celebrated for having preserved precious fragments of ancient Greek works now lost to us, but also notorious for retrofitting their own ideas into the history of mathematics—a practice that, shamefully, is just as common in our days.

#### 6.14. Fiction: “Originally only geometric proportion was called ἀναλογία”

Another widespread fiction, initiated by NESSELMANN and reiterated by HEATH, states that “Originally [only] the geometric proportion was called ἀναλογία, the others, the arithmetic, the harmonic, etc., μεσότητες; but later usage had obliterated the distinction.”<sup>86</sup>

1. The starting point for NESSELMANN is his observation that, in its modern use, ἀναλογία designates proportion in general, while the Greek μεσότης (mean) denotes continuous proportion.<sup>87</sup> But he is surprised to find no confirmation that the ancients used the words in this way. After examining many testimonies from antiquity, including those bequeathed by EUCLID, NICOMACHUS, THEON, PAPPUS, IAMBlichUS, and BOETHIUS, but not ARCHYTAS, he claims that ancient Greeks used ἀναλογία and μεσότης in the way described above, although the terminology seemed not to be completely fixed (yet another myth; ► 6.15).<sup>88</sup>

---

<sup>84</sup> Ibid.

<sup>85</sup> FOWLER, *The Mathematics of Plato's Academy*, 361.

<sup>86</sup> NESSELMANN, *Die Algebra der Griechen*, 212 n. 49: “Ursprünglich hieß die geometrische Proportion ἀναλογία, die übrigen, die arithmetische, die harmonische u. s. w. μεσότητες; aber der spätere Sprachgebrauch hat diesen Unterschied beider Termini verwischt.” Translation quoted from HEATH, *The Thirteen Books of Euclid's Elements*, vol. 2, 293.

<sup>87</sup> *The Algebra of the Greeks*, 210 n. 49.

<sup>88</sup> In *ibid.*, 210–2 n. 49, a footnote that spans more pages than this one, NESSELMANN begins researching the question in NICOMACHUS, his most ancient source after EUCLID. However, observing that NICOMACHUS defines ἀναλογία but not μεσότης, he immediately passes on to his next source in chronological order. Thus, he calls upon THEON as his first witness, noting that μεσότης seems to be used by him in the general sense of a *middle term* in *Expositio rerum mathematicarum...*, 84.15–18: “A mean differs from a proportion, since if something is a proportion [ἀναλογία], it is a mean [μεσότης]; but if something is a mean, it is not straightaway a proportion. For it is possible for something that is a middle term [μέσον] according to an order [κατὰ τάξιν] not to be in proportion [ἀναλόγως] with respect to the extremities [πρὸς τὰ ἄκρα].” NESSELMANN argues from this that μεσότης must have originally been a generic term; and ἀναλογία, a specific kind of μεσότης: “Es scheint, als wenn Theon den Ausdruck μεσότης ganz allgemein von dem Dazwischenliegen gebraucht wissen will. [...] Demnach ist μεσότης der allgemeinere, ἀναλογία der speciellere Begriff, wie es auch aus den ersten Worten Theon's einleuchtet.” He believes to have found support for his opinion in PAPPUS, who says (quoting the translation from HEATH, *The Thirteen Books of Euclid's Elements*, vol. 2, 293), “A mean [μεσότης] differs from a proportion [ἀναλογία] in this respect that, if anything is a proportion, it is also a mean, but not conversely; for there are three means, of which one is arithmetic, one geometric and one harmonic.” In fact, NESSELMANN quotes PAPPUS in Latin: “Differt autem medietas (μεσότης) ab analogia, nam si quid est analogia, hoc et medietas est; sed non contra. Medietates enim tres sunt, arithmetica, geometrica, et harmonica, etc.” Cf. the critical edition from the Greek in Friedrich Otto HULTSCH (ed.), *Pappi Alexandrini Collectionis quae supersunt*, 3 vols.

2. HEATH arrives at the same conclusion via a different route. Unlike NESSELMANN, who is concerned with the relation between μεσότης and ἀναλογία, he turns his attention to the relation between ἀναλογία and λόγος. Having observed that THEON, NICOMACHUS, and

---

(Berlin: Weidmann, 1877–1878), Γ.30, vol. 1, 70.17–20. Not only that, NESSELMANN argues, but the geometric proportion was the only one originally called ἀναλογία, while all proportions, “the geometric not excluded,” were called “means.” He trusts there is support for this opinion in IAMBlichUS, who says, “It is to be premised that it was the geometrical (proportion) which the ancients called proportion *par excellence* [κυρίως], but in common all the remaining ones means [μεσότητος] generically [γενικῶς],” adapting the translation of HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 292, who follows Ermenegildo PISTELLI, *Iamblichi in Nicomachi Arithmeticae introductionem* (Leipzig: Teubner, 1894), 100.15–17. NESSELMANN quotes instead from a text identical to that of Samuel TENNULIUS, *Jamblichus Chalcidensis In Nicomachi Geraseni Arithmeticae introductionem, et De fato* (Arnhem: Wier, 1668), 141c, which we use to adapt HEATH’s reading. Returning to NICOMACHUS, NESSELMANN addresses a potential objection to his claim, for the more ancient author seems to use ἀναλογία as a generic term. Says NICOMACHUS, *Introductio arithmeticae*, II.22.1, 122.11–14: “The first three proportions [ἀναλογίαι], then, which are acknowledged by all the ancients, [...] are the arithmetic, geometric, and harmonic.” NESSELMANN quotes instead from the slightly different text of Friedrich AST, *Theologumena arithmeticae* (Leipzig: Weidmann, 1817), 138.21–24. However, as NESSELMANN observes, “in the same chapter [NICOMACHUS] uses the term μεσότητες in exactly the same sense [as ἀναλογία] for all three [means].” Moreover, he notes that NICOMACHUS thereafter uses exclusively μεσότης, instead of ἀναλογία, when writing about means. On the other hand, as NESSELMANN observes, NICOMACHUS says in *Introductio arithmeticae*, II.24.1, 26.12–15: “the geometric [proportion] is the only one [μόνη] properly [κυρίως] to be called a proportion [ἀναλογία], because its terms are seen to be according to the same ratio [ἀνά τὸν αὐτὸν λόγον].” NESSELMANN quotes from AST, *Theologumena arithmeticae*, 141.13–17. And IAMBlichUS “almost literally” says the same thing: “The second, the geometric, mean is the only one [μόνωσ] that has been called proportion because the similars [ὄμοιοι] contain the same ratio, being separated according to the same proportion [ἀνά τὸν αὐτὸν λόγον],” adapting the translation of HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 293. NESSELMANN quotes from TENNULIUS, *In Nicomachi Geraseni Arithmeticae introductionem*, 147b. That IAMBlichUS sounds exactly like NICOMACHUS should not come as a surprise to us, for he often copies literally or paraphrases him (no less than other authors, as pointed out above). Incidentally, the major differences between IAMBlichUS and NICOMACHUS could be accounted for by the fact that NESSELMANN is reading from a flawed text. In the edition of the *Codex Florentinus* used by HEATH, IAMBlichUS comes even closer to NICOMACHUS: “The second, the geometric, mean has been called proportion *par excellence* [κυρίως] because the terms [ὄροι] contain the same ratio, being separated according to the same proportion (ἀνά τὸν αὐτὸν λόγον διεστῶτες).” NESSELMANN also calls upon BOETHIUS, who had “long been the only source for the study of mathematics,” and from whom “these false notions” could not have been derived: “Aus Boethius, der allerdings lange einzige Quelle für das mathematische Studium gewesen ist, können diese falschen Begriffe nicht hergeleitet sein.” He finds two neighboring places that are almost literal translations of Nicomachus, “Beide Stellen sind fast wörtlich aus Nikomachus übersetzt.” In these we read that “if three terms come into consideration, this is called a continuous proportion [*continua proportionalitas*]; if, however, this [term] precedes one [term], and another follows, and one and the other are here different, this is called a disjunctive mean. [...] The geometric mean is extricated, which alone is most aptly called a proportion.” The translation is ours. NESSELMANN quotes from Samuel TENNULIUS, *Notae in Arithmeticae Jamblichi Chalcidensis* (Deventer: Wilhem Wier, 1667), 198c–d: “Si igitur in tribus terminis consideratio sit, continua proportionalitas dicitur. Sin vero hic alius dux & alius comes, illic vero utriusque sint alii, vocabitur disjuncta medietas. [...] Geometrica medietas expediatur, quae sola vel maxime proportionalitas appellari potest.” Cf. MASI, *Boethian Number Theory*, 166: “If one considers three terms, a continual proportion may be remarked; yet one of these is the leader and another the follower. Here indeed are two terms in relation to a middle one, and this is called a disjunct medial proportion”; *ibid.*, 169: “the geometric medial proportion is set straight, which alone is most able to be called proportionality.” See BOETHIUS, *De institutione arithmetica*, II.43, 140.29–141.3; II.44, 144.26–28. Observing that EUCLID, too, uses ἀναλογία only in the sense of geometric proportion, he gives his notorious final sentence: “Originally [only] the geometric proportion was called ἀναλογία, the others, the arithmetic, the harmonic, etc., μεσότητες; but later usage had obliterated the distinction.” Finally, NESSELMANN brings his arguments to a close by pointing to other places in NICOMACHUS and IAMBlichUS where he thinks additional evidence—reliable albeit inconclusive—can be found: “Sichere Belege aber dafür, daß μεσότης nicht ausschließlich die stetige Proportion bedeute, finden wir bei Nikomachus z. B. noch Kap. 21, worüber weiter unten im Text, und Kap. 29, wo die immer aus vier Gliedern bestehende vollkommenste Proportion dennoch, ebenso wie bei Jamblichus stets μεσότης heißt.”

EUCLID do not give “any substantially different definition of a ratio between numbers,” HEATH finds discord only when it comes to defining ἀναλογία.<sup>89</sup> First, he quotes THEON’s definition: “similarity or sameness of more ratios than one,”<sup>90</sup> and calls it “unobjectionable if it is previously understood what a ratio is.” But he blames “people like Thrasyllus” for introducing confusion (presumably due to their misunderstanding of what a ratio is) by using *proportion* when referring to *means*. Hence, according to HEATH, it is necessary to explain, as did ADRASTUS, that the geometric mean was called *proportion* “*par excellence* [κυρίως] and *primary* [πρώτην],” although the other means were also commonly called *proportions* “by some writers.”<sup>91</sup>

HEATH then criticizes NICOMACHUS’s definition of ἀναλογία (which NESSELMANN neglects to quote), according to which “Proportion, *par excellence* (κυρίως), is the bringing together (σύλληψις) to the same (point) of two or more ratios; or, more generally, (the bringing together) of two or more relations (σχέσεων), even though they be subjected not to the same ratio but to a difference or some other (law).”<sup>92</sup> He objects to this definition arguing that NICOMACHUS is “trying to extend the term ‘proportion’ to cover the various means as well as a proportion in three or four terms in the ordinary sense.”<sup>93</sup> HEATH finally counters NICOMACHUS by bringing up the same places used by NESSELMANN. Believing that these establish “plainly enough” that “there is only one proportion in the proper sense,” namely geometric proportion, he agrees with NESSELMANN, and quotes the latter’s conclusion.

**3.** Even a cursory examination of ARCHYTAS’s Fragment B2 will straightway show that the conclusion drawn by NESSELMANN and HEATH is unreasonable. Our oldest and most reliable source clearly states that, in both the arithmetic and the harmonic means, the three terms are proportional (ἀνάλογον), and that in every proportion (ἐν ταύτα τῶ ἀναλογίᾳ) the interval has characteristics peculiar to it. Ironically, on the other hand, ARCHYTAS uses neither ἀνάλογον nor ἀναλογία when referring to the geometric mean. Of course, it is not as though ARCHYTAS altogether denies that the geometric mean is in some proportion. Far from it, every one of the means he discusses is found to be in some kind of ἀναλογία. But ARCHYTAS’s omission certainly demolishes this modern myth.

The errors of NESSELMANN and HEATH are easily disentangled, for these authors fail to distinguish two kinds of priority. On the one hand, there is an order of eminence, according

<sup>89</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 292.

<sup>90</sup> *Ibid.*

<sup>91</sup> *Ibid.* Cf. THEON, *Expositio rerum mathematicarum...*, 106.15.

<sup>92</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 292. See NICOMACHUS, *Introductio arithmeticae*, II.21.2, 120.2.

<sup>93</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, vol. 2, 292.

to which only some relations and proportions are respectively called λόγος and ἀναλογία “par excellence,” as HEATH translates the Greek κυρίως. On the other hand, there is an order of discovery and naming, according to which, at first, any relation was called λόγος (as explained above), and any kind of unity of relations was called ἀναλογία. Depending on the order, we can either affirm or deny that the same relations constitute a proportion.

4. NESSELMANN erroneously believes that, in the same way that a horse is a kind of animal, either a mean is a kind of proportion or else a proportion is a kind of mean. And he concludes that in ancient times an ἀναλογία was considered a kind of μεσότης. But by *mean* we can understand either a middle term (whether it is in proportion or not, as THEON and PAPPUS observe) or a proportion in which there is a middle term: and if we understand by *mean* a proportion in which there is a middle term, then the proportion can be either geometric (which is called ἀναλογία first in the order of eminence because it is thoroughly based on the relation of whole to part or parts), or else it can be a proportion based on some other relations affecting the three terms, as NICOMACHUS observes.

5. HEATH rightly points out that an accurate understanding of ἀναλογία depends on a correct understanding of λόγος. But, blinded by Augustus DE MORGAN’s articles on *proportion* and *ratio* published in the *Penny Cyclopaedia of the Society for the Diffusion of Useful Knowledge*,<sup>94</sup> he retrofits the ancient λόγος with a modern construct.

It should not come as a surprise, then, that HEATH fails to call ARCHYTAS to the stand. In fact, when he does excerpt from Fragment B2 in his *A history of Greek mathematics*, HEATH expunges from the key source every reference to ἀνάλογον and ἀναλογία:

A fragment of Archytas’s work On Music actually defines the three [means]; we have the *arithmetic* mean when, of three terms, the first exceeds the second by the same amount as the second exceeds the third; the *geometric* mean when, of the three terms, the first is to the second as the second is to the third; the “*subcontrary*, which we call *harmonic*,” when the three terms are such that “by whatever part of itself the first exceeds the second, the second exceeds the third by the same part of the third.”<sup>95</sup>

Thus, HEATH conceals the most important piece of evidence against his own prejudices. Ironically, what he conceals is most revealing—revealing of “a forced statement made to suit a hypothesis,” or of “how history can be manufactured by commentators who may adjust a text to fit with their own interpretations,” as ARISTOTLE and FOWLER would say.

---

<sup>94</sup> Ibid., 116: “The best explanation of the definitions of *ratio* and *proportion* that I have seen is that of De Morgan, which will be found in the articles under those titles in the *Penny Cyclopaedia*, Vol. XIX. ([London: Charles Knight,] 1841).”

<sup>95</sup> HEATH, *A History of Greek Mathematics*, v.1, 85.

### 6.15. Fiction: “The terminology (ἀναλογία, μεσότης) was not fixed”

Another widespread myth is that the use of ἀναλογία and μεσότης was not completely fixed in ancient times. This is, however, an assumption made by NESSELMANN to justify why NICOMACHUS (his earliest source after EUCLID) and IAMBlichus (his latest source before BOETHIUS) sometimes call the three means *proportions*. NESSELMANN argues that the terminology *seems* not to have been quite fixed (as late as the fourth century AD!): “Jedoch scheint der Sprachgebrauch darin nicht ganz fest gewesen zu sein.”<sup>96</sup>

This assumption is thereafter repeated as a definite fact by TANNERY and many others.<sup>97</sup> Thus, Michael MASI wonders why BOETHIUS would say that “A proportion [*proportio*] is a certain relationship [*habitus*] to each other of two terms, as it were, that are contained on one <concept>, and that which their joining together will produce is a proportion [*proportionale est*].”<sup>98</sup> He answers his own question thus:

It is clear that at this point Boethius is not going to speak of a proportion between two terms, or what is normally called a ratio, but of a relation between three and, later, four elements. This inconsistency of terminology derives from an uncertainty in the terminology of Nicomachus. Boethius uses the terms *proportionalitas* and *medium* interchangeably here, as his Greek source did the comparable terms ἀναλογία and μεσότης.<sup>99</sup>

On the contrary, if we examine our oldest testimony, we will see that, from the beginning, proportion has been spoken of in terms practically identical to those of BOETHIUS and NICOMACHUS. In the three means analyzed by ARCHYTAS, something *one* is produced—an analogy or proportion—from multiple ratios. And, although the ratios that constitute each kind of analogy are not necessarily identical, in such ratios one term (the antecedent) always contains another (the consequent) in a certain way that is specific to that kind of proportion.

---

<sup>96</sup> *The Algebra of the Greeks*, 211 n. 49.

<sup>97</sup> For example, DUPUIS, *Théon de Smyrne*, 137, translates “διαφέρει ἀναλογίας μεσότης” as “Un nombre moyen diffère du moyen proportionnel” instead of “Une médiété diffère d’une analogie,” and justifies his decision in a footnote in *ibid.*, n. 23: “La langue mathématique n’est pas encore fixée. Nous croyons que, par μεσότης, il faut entendre, dans ce paragraphe, non pas une médiété, mais un nombre moyen compris entre deux autres, et que, par ἀναλογία il faut entendre, non pas une analogie, c’est-à-dire une proportion continue, mais un terme moyen proportionnel. Cela paraît résulter de l’explication de Théon et des deux exemples qu’il donne.”

<sup>98</sup> MASI, *Boethian Number Theory*, 164. Cf. BOETHIUS, *De institutione arithmetica*, II.40, 137.8: “Est igitur proportionalitas duarum vel trium vel quotlibet proportionum adsumptio ad unum atque collectio. Ut etiam communiter definiamus: proportionalitas est duarum vel plurium proportionum similis habitudo, etiamsi non eisdem quantitibus et differentiis constitutae sint. Differentia vero est inter numeros quantitas. Proportio est duorum terminorum ad se invicem quaedam habitudo et quasi quodammodo continentia, quorum compositio quod efficit, proportionale est. Ex iunctis enim proportionibus proportionalitas fit.”

<sup>99</sup> MASI, *Boethian Number Theory*, 164 n. 40.

## 7. From Mathematics to Metaphysics and Logic

As already noted, ARISTOTLE distinguishes between the *one* that is convertible with *being* (for every *one* is a *being* and every *being* is a *one*) from the *one* that is the principle of number (i.e., the arithmetical unit or monad; ►2.1). Let us examine each of them in turn.

The *one* that is convertible with *being* adds the notion of *non-division* to *being*. In this sense, *one*—like *being*—is said in multiple ways, for whatever is indivisible or undivided is said to be *one*. Thus, ARISTOTLE says that the λόγος of *one* is *to be undivided*.<sup>1</sup> Now, things can be said to be *one* for different reasons:

[S]ome things are one in number [κατ' ἀριθμόν], others in species [κατ' εἶδος], others in genus [κατὰ γένος], others by analogy [κατ' ἀναλογίαν]; in number those whose matter is one, in species those whose definition is one, in genus those to which the same figure of predication applies, by analogy those which are related as a third thing is to a fourth. The latter kinds of unity are always found when the former are; e.g. things that are one in number are also one in species, while things that are one in species are not all one in number; but things that are one in species are all one in genus, while things that are so in genus are not all one in species but are all one by analogy; while things that are one by analogy are not all one in genus.<sup>2</sup>

For example, Socrates is **one in number** because his matter is one (and this triangle is one in number because its surface is one). Socrates and Plato are **one in species** because both are rational animals (and the isosceles and the scalene are one in species because both are triangles). Socrates and Bucephalus are **one in genus** because both are animals (and the triangle and the square are one in genus because both are plane figures). And all these things (including animals and plane figures) are **one by analogy**.

It should not surprise us, then, to find that multiple things are often given a common name: whether they are the same or they are diverse, they are always *one by analogy*. Even the name *analogy* itself was used initially in the science of arithmetic, but was thereafter transferred to geometry, metaphysics, logic, and every science and art. Although it was discovered while researching numerical ratios in musical harmony, it soon became manifest that analogy is common (κοινά) not only to arithmetic but to all sciences and arts. For example, just as there is a middle-term (mean) in numbers, there is also a middle-term in syllogisms. Hence, we find analogy applied in PLATO, and throughout ARISTOTLE's works, to diverse, non-mathematical subjects.<sup>3</sup>

---

<sup>1</sup> ARISTOTLE, *Metaphysica* Δ.6, 1015b16–1016b31; I.1, 1052a15–b18.

<sup>2</sup> *Ibid.*, Δ.6, 1016b31–1017a3.

<sup>3</sup> For example, ARISTOTLE, *Poetics* 21, 1457b16; *Nicomachean Ethics* E.6, 1131a31; *Meteorology* A.3, 340a4.

In turn, the *one* that is the principle of number adds the λόγος of *measure* to the *one* that is convertible with *being*. Thereafter, the λόγος of *measure* is analogically transferred to all the other genera because of a similarity in knowledge-based relations:

<[“One”] means> especially [μάλιστα] “to be the first measure of a kind” [ἐκάστου γένους, of each *genus*], and most strictly of quantity [ποσοῦ]; for it is from this that it has been extended <to the other categories>.<sup>4</sup> For measure [μέτρον] is that by which quantity is known; and quantity *qua* quantity [τὸ ποσὸν ἢ ποσόν] is known either by a “one” [ἐνί] or by a number [ἀριθμῶ], and all number is known by a “one.” Therefore all quantity *qua* quantity is known by the one [τῷ ἐνί], and that by which quantities are primarily [πρῶτω, *first*] known is the one itself [τοῦτο αὐτὸ ἔν]; and so the one is the starting-point [ἀρχή, *principle*] of number *qua* number. And hence in the other <classes> too measure means [λέγεται] that by which each is first known, and the measure of each is a unit [ἔν, *one*]*—*in length, in breadth, in depth, in weight, in speed. [...] In all these, then, the measure and starting-point [ἀρχή, *principle*] is something one and indivisible, since even in lines we treat as indivisible the line a foot long. For everywhere we seek as the measure something one and indivisible; and this is that which is simple [τὸ ἀπλοῦν] either in quality [τῷ ποιῶ] or in quantity [τῷ ποσῶ]. Now where it is thought impossible to take away or to add, there the measure is exact [ἀκριβές] (hence that of number is most exact; for we posit the unit as indivisible in every respect); but in all other cases we imitate [μιμοῦνται] this sort of measure.<sup>5</sup>

Thus, the first measure of quantity (ποσόν) is the numerical unit. And the measure of magnitude imitates the measure of number. Thereafter, likewise, that by which things are first known, in every genus, is the measure and principle of everything in that genus.

Since ARISTOTLE considers multitude and magnitude to be the first species in the genus of quantity (►2.3), this raises a fundamental question: if arithmetic demonstrates the properties of measurable multitude; and geometry, those of measurable magnitude; and both multitude and magnitude are species of quantity; it would therefore seem that there is a higher mathematical science that demonstrates the properties of quantity in general. Indeed, ARISTOTLE even states (above) that quantity *qua* quantity (τὸ ποσὸν ἢ ποσόν) is ultimately known by *the one*, and that all quantities are first known by the one itself, which is the principle of number—and number (i.e., measurable multitude) is what arithmetic considers. However, he rejects the possibility of proving geometrical truths by arithmetic:

[W]e cannot <in demonstrating> pass from one genus to another. We cannot, for instance, prove geometrical <truths> by arithmetic. For there are three <elements> in demonstration: (1) what is proved, the conclusion an attribute inhering [τὸ ὑπάρχον] essentially [καθ’ αὐτό, *per se*] in a genus [γένει τι]; (2) the axioms, i.e. axioms which are premises [ἐξ ὧν] <of demonstration>; (3) the subject-genus [τὸ γένος τὸ ὑποκείμενον] whose attributes [πάθη, *affections*], <i.e.> essential

<sup>4</sup> As will be clear soon enough, ARISTOTLE is not at all talking about categories but about subject-genera.

<sup>5</sup> ARISTOTLE, *Metaphysica* I.1, 1052b18–27; b31–1053a2.

properties [καὶ τὰ καθ' αὐτὰ συμβεβηκότα, *and the per se accidents*], are revealed by the demonstration. <The axioms which are> premises [ἐξ ὧν] of demonstration may be identical [τὰ αὐτὰ, *the same*] <in two or more sciences>: but in the case of <two> different [ἕτερον, *diverse*] genera such as arithmetic and geometry you cannot apply arithmetical demonstration to the properties [συμβεβηκότα] of magnitudes unless the magnitudes <in question> are numbers.<sup>6</sup>

Again, the properties of multitude and magnitude are diverse, as noted throughout the preceding chapters. Therefore, the only way in which arithmetical demonstration can be applied to magnitudes is if magnitudes are numbers: that is, if multiple magnitudes are measured insofar as they make up multitudes, rather than insofar as they are magnitudes.

Still, could not the properties that are common to quantity *qua* quantity be applied in mathematical demonstration to all quantities regardless of whether they are multitudes or magnitudes, since both are species of the same genus? To answer this question, we must note that *genus* is predicated equivocally.<sup>7</sup> ARISTOTLE explains the multiple ways in which *genus* is said:

<The term “race” or “genus” [γένος] is used [λέγεται] (1) if generation [ἡ γένεσις] of <things> which have the same form [εἶδος] is continuous [συνεχῆς], e.g. “while the race [γένος] of men lasts” means “while the generation of them goes on continuously.” (2) It is used with reference to that which first brought things into existence; for it is thus that some are called Hellenes <by> race [γένος] and others Ionians, because the former proceed from Hellen and the latter from Ion as their first begetter. [...] (3) <There is genus in the sense> in which “plane” [τὸ ἐπίπεδον] is the genus of plane figures and “solid” of solids; for each of the figures is in the one case a plane of such and such a kind [τοιονδί], and in the other a solid of such and such a kind; and this is what underlies [τὸ ὑποκείμενον] the differentiae. Again (4), in definitions [ἐν τοῖς λόγοις] the first constituent <element> [ἐνυπάρχον, the subject of a quality],<sup>8</sup> which is included in the what [ἐν τῷ τί ἐστι, *in the quiddity, essence*], is the genus, whose differentiae the qualities are said to be.<sup>9</sup>

Evidently, from these four modes in which *genus* is said, only the third one, τὸ ὑποκείμενον “that which underlies,” is τὸ γένος τὸ ὑποκείμενον, the *subject-genus* that ARISTOTLE includes among the requirements of demonstration. Thus, the plane surface is the proper subject of all plane figures, which in turn are differentiated by their boundaries: a square is a plane surface that is delimited by four straight lines, while a triangle is a plane surface that is delimited by three straight lines. What both square and triangle have in common is the underlying plane surface, which is their subject-genus; and the difference between them is given by the difference of boundaries. Such linear boundaries *per se* belong to

<sup>6</sup> ARISTOTLE, *Analytica Posteriora* A.7, 75a38–75b6.

<sup>7</sup> For its important implications, see REDPATH, *A Not-So-Elementary Christian Metaphysics*, vol. 2, Ch. 3.

<sup>8</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ὑπάρχω, III.3.

<sup>9</sup> ARISTOTLE, *Metaphysica* Δ.28, 1024a28–34; 36–b6.

surface figures (►4.3). Similarly, demonstrations in geometry involve the affections and *per se* accidents of magnitude; and demonstrations in arithmetic, those of number. In this sense, number and magnitude do not belong to the same genus: for multitude, as pointed out earlier, is the genus of number; and a magnitude is not made out of a multitude. Consequently, the affections and *per se* accidents of multitude are not those of magnitude. Again, the units in a number are not *per se* positioned; and magnitude can be neither even nor odd. To summarize, then, this *genus* refers to a subject-genus; and multitude and magnitude do not have a common underlying subject-genus; for a magnitude is not composed of indivisible units, while a multitude is not made up of continuous quantities.

According to the fourth mode, *genus* refers to the generic term of a definition (λόγος). For example, *man* is defined in terms of *animal*; for *man* is a *rational animal*. Thus, *animal* is the genus of *man* (but *animal* is not the subject in which rationality exists as an affection or *per se* accident). In this sense, *quantity* is the genus of measurable multitude and of measurable magnitude; for *number* is defined in terms of *quantity* as *discrete quantity*, and *magnitude*, as *continuous quantity*. Thus, just as *animal* is the genus of *man*, so is *quantity* the genus of *number* and *magnitude*. And *rationality* or *irrationality* is to *animal* what *continuity* or *discontinuity* is to *quantity* (but *quantity* is not the subject in which *discreteness*—i.e., *discontinuity*—and *continuity* exist as affections or *per se* accidents).

Hence, *quantity* is univocal to the logician (who is concerned only with the λόγος), but analogical to the scientist-philosopher (who is concerned with a subject-genus). The definition of *measurable multitude* and of *measurable magnitude* can be univocally subsumed under the definition of *quantity* because both have in common a λόγος: that of *measurable*. Such definitions are sufficient to *reason* tentatively regardless of the subject-genus, but not enough to *demonstrate* anything concerning a subject-genus; for defining the measurable (and reasoning about it) is not the same as measuring it. The scientist-philosopher, who seeks to make known the necessary properties of things, “measures,” as it were, those very things using the principle and measure of their corresponding subject-genus. Thus, that by which number is first made known (that is, the unit, which is the measure and principle of everything in the genus of measurable multitude) is not the same as that by which magnitude is first known. The measure of multitude is, of its own nature, altogether indivisible; that of magnitude is only *used* as indivisible, in imitation of the arithmetical unit. Thus, just as a multitude is measured by a unit-one, so is a magnitude measured by a magnitude-one. Therefore, these two subject-genera are analogous.

It turns out, then, that the principles of all things are one by analogy. ARISTOTLE says as much: “The causes and the principles of different [ἄλλων, *diverse*] <things> are in a sense

different [ἄλλα, *diverse*], but in a sense, if one speaks universally [καθόλου < καθ' ὅλου] and analogically [κατ' ἀναλογίαν], they are the same for all."<sup>10</sup>

One question remains unanswered. If the principles of harmonics are not the principles of arithmetic, how can arithmetic be used to demonstrate the properties of sound intervals? Or, more generally, how is it that the principles that belong *primo et per se* to one subject-genus can be used to demonstrate the properties of another subject-genus? For, indeed, the same question could be asked of geometry with respect to optics; and of arithmetic and geometry with respect to astronomy. This question will be answered more fully in the next part (►64). For now, let us consider the following quote from ARISTOTLE:

[T]here is another way too in which the fact [τὸ ὄτι = *quia*] and the reasoned fact [τὸ διότι = *propter quid*] differ, and that is when they are investigated [θεωρεῖν] respectively by different sciences. This occurs in the <case of problems> related to one another as subordinate and superior, as when optical <problems> are subordinated to geometry, mechanical <problems> to stereometry, harmonic <problems> to arithmetic, the data of observation [φαινόμενα] to astronomy. (Some of these sciences bear almost the same name; e.g. mathematical and nautical astronomy, mathematical and acoustical harmonics.) Here it is the business of the empirical observers to know the fact, of the mathematicians to know the reasoned fact; for the latter are in possession of the demonstrations giving the causes, and are often ignorant of the fact: just as we have often a clear insight into a universal, but through lack of observation are ignorant of some of its particular instances. These connexions have a perceptible existence though they are manifestations of forms. For the mathematical sciences concern forms: they do not demonstrate properties of a substratum [καθ' ὑποκειμένου τινός], since, even though the geometrical subjects are <predicable as properties of> a perceptible substratum, it is not as thus <predicable> that the mathematician demonstrates properties of them. As optics is related to geometry, so another <science> is related to optics, namely the theory of the rainbow. Here knowledge of the fact is within <the province of> the natural <philosopher>, knowledge of the reasoned fact within that of the optician, either <qua optician> or qua mathematical optician. Many sciences not standing in this mutual relation enter into it at points; e.g. medicine and geometry: it is the physician's business to know that circular wounds heal more slowly, the geometer's to know the reason why.<sup>11</sup>

Thus, there is a subordination such that the principles of a more abstract science are used by—but not demonstrated in—a more concrete one. This happens even in geometry; for geometry uses the principles of arithmetic when defining figures (which have a delimited *multitude* of termini) and when measuring a *multitude* of parts of a magnitude. And the measure of multitude has priority over the measure of magnitude insofar as the latter imitates the former. In this sense, there is also a kind of analogy, for every measure is somehow related to the first measure of number. While relations vary depending on the

---

<sup>10</sup> ARISTOTLE, *Metaphysica* Λ.4, 1070a31–33.

<sup>11</sup> ARISTOTLE, *Analytica Posteriora* A.13, 78b34–79a16.

subject-genus, the *relatum* is always *the one*. And this is, in a way, what happens in the proportions of numerical means—and more so in the ἀναλογία of the harmonic mean—where the extremes are related to the middle-term in diverse ways, as already noted.

### 7.1. Mathematics, Metaphysics, and Logic Related

To bring the first part of this work to its logical conclusion, there is one last question we must introduce: that of the relation between ancient Greek mathematics, metaphysics, and logic.

Let us first consider how ARISTOTLE compares mathematics to metaphysics:

[N]umber *qua* number [ἀριθμοῦ ἢ ἀριθμὸς] has peculiar [ἴδια] attributes [πάθη, *affections*], such as oddness and evenness, commensurability and equality, excess and defect, and these belong to numbers either in themselves [καθ' αὐτούς] or in relation to one another [πρὸς ἀλλήλους]. And similarly the solid and the motionless and that which is in motion and the weightless and that which has weight have other [ἕτερα, *diverse*] peculiar <properties>. So too there are certain <properties> peculiar [ἴδια] to being as such [τῷ ὄντι ἢ ὄν], and it is about these that the [first] philosopher has to investigate [ἐπισκέψασθαι] the truth.<sup>12</sup>

Thus, just as number *qua number* (ὁ ἀριθμὸς ἢ ἀριθμός) has peculiar affections, such as oddness and evenness; and, in respect to another, excess and defect, commensurability and equality; and different kinds of means and discrete proportions (all of which are studied by the arithmetician); so, too, magnitude *qua magnitude* has affections peculiar to its genus (which are studied by the geometrician); and so, too, being *qua being* (τὸ ὄν ἢ ὄν) has peculiar affections (which are studied by the metaphysician).

Hence, being (τὸ ὄν) *per se* (καθ' αὐτό) may be one or multiple, actual or potential. And in respect to another (πρὸς ἀλλήλους), it may be prior or posterior; or opposite in any of four modes: contradiction, possession-privation, contrariety, or relation. Finally, beings are proportional (ἀνάλογον) if their multiple relations somehow constitute something one; and this can happen in one of two ways: either multiple beings are diversely related to the one itself (αὐτὸ τὸ ἓν), as quantity and quality are related to substance; or else, one being is related to another in the same way that a third is related to a fourth—analogously.

Immediately after analogically comparing the mathematical sciences to metaphysics, ARISTOTLE distinguishes metaphysics from sophistic and dialectic:

An indication [σημείον, *sign*] <of this may be mentioned>: dialecticians and sophists assume the same guise as the philosopher, for sophistic is Wisdom which exists only in semblance, and dialecticians embrace all <things> in their dialectic, and being [τὸ ὄν] is common to all things; but

---

<sup>12</sup> ARISTOTLE, *Metaphysica* Γ.2, 1004b10–17.

evidently their dialectic embraces these subjects because these are proper to philosophy. For sophistic and dialectic turn on the same class [γένος] <of things> as [first] philosophy, but this differs from dialectic in the nature [τρόπῳ, *in the mode*] of the faculty [δυνάμει] required and from sophistic in respect of the purpose of the philosophic life. Dialectic is merely critical [πειραστική] where [first] philosophy claims to know [γνωριστική], and sophistic is what appears to be <philosophy> but is not.<sup>13</sup>

Leaving aside sophistic, which is wisdom only in appearance, let us examine the relation between metaphysics and dialectic. Thus, ARISTOTLE says first that metaphysics and dialectic deal with the same genus: τὸ ὄν, *being*. Of course, he is not saying here that *being* is a logical genus (a πρῶτον ἐνυπάρχον, the generic part of a λόγος or definition).<sup>14</sup> In fact, as is well known, ARISTOTLE emphatically denies that *being* is a genus in this sense.<sup>15</sup> He is therefore saying that being is like a subject-genus (γένος ὑποκείμενον). To clarify, then, metaphysics and dialectic agree in the subject-genus: *being*.

Secondly, according to ARISTOTLE, metaphysics and dialectic differ in the method of the faculty. Thus, dialectic is merely πειραστική, *fitted for trying or testing*;<sup>16</sup> while metaphysics is γνωριστική, *capable of apprehending, of knowing*.<sup>17</sup> While dialecticians try to inquire about the affections of being, beginning their investigation “from probable premises only,”<sup>18</sup> metaphysicians already know the principles of being with certainty.

Thirdly, as ARISTOTLE also says, although metaphysics and dialectic have the same (subject) genus (for they both treat of *being*), only metaphysics theorizes of being *qua being*. Dialectic, in turn, treats of contingent accidents rather than proper affections. In this respect, metaphysics is like geometry; for geometry treats of magnitude *qua magnitude*, and of the proper affections of magnitude as such:

As the mathematician investigates [τὴν θεωρίαν ποιῆται] abstractions [ἐξ ἀφαιρέσεως, *by abstraction*] (for <before beginning his investigation> he strips off [περιελών] all the sensible qualities, e.g. weight and lightness, hardness and its contrary, and also heat and cold and the other sensible contraries, and leaves only the quantitative and continuous, sometimes in one, sometimes in two, sometimes in three <dimensions>, and the attributes [πάθη, *affections*] of these <*qua*> quantitative and continuous [τὸ ποσὸν καὶ συνεχές, *the quantum and continuum*], and does not consider them in any other respect, and examines the relative positions [τάς πρὸς ἄλληλα θέσεις, *the positions one in respect of another*] of some and the attributes [ὑπάρχοντα, *the intrinsic*

<sup>18</sup> ARISTOTLE, *Metaphysica* B.1, 995b20–25.

*qualities in the subject*<sup>19</sup> of these, and the commensurabilities and incommensurabilities of others, and the ratios of others; but yet we posit one and the same science of all these things—geometry), the same is true with regard to being. For the attributes [συμβεβηκότα, *accidents*] of this in so far as it is being, and the contrarities in it *qua* being, it is the business of no other science than philosophy to investigate [θεωρησαι]; for to physics one would assign the study of things not *qua* being, but rather *qua* sharing in movement; while dialectic and sophistic deal with the attributes [συμβεβηκότων, *accidents*]<sup>20</sup> of things that are [i.e., *of beings*], but not <of things> *qua* being, and not with being itself in so far as it is being; therefore it remains that it is the philosopher who studies [θεωρητικόν] the things we have named, in so far as they are being.<sup>21</sup>

As to the relation between mathematics and dialectic, PROCLUS, nonetheless, considers dialectic, which he calls “the purest part of philosophy” (he is, after all a Neoplatonic), to be “the capstone of the mathematical sciences”:<sup>22</sup>

[D]ialectic [ἡ διαλεκτική], the purest part of philosophy, hovers attentively over mathematics, encompasses its whole development, and of itself contributes to the special sciences their various perfecting, critical, and intellectual powers—the procedures, I mean, of analysis, division, definition, and demonstration. Being thus endowed and led towards perfection, mathematics reaches some of its results by analysis, others by synthesis, expounds some matters by division, others by definition, and some of its discoveries binds fast by demonstration, adapting these methods to its subjects and employing each of them for gaining insight into mediating ideas [τῶν μέσων λόγων]. Thus, its analyses are under <the control of> dialectic, and its definitions, divisions, and demonstrations are of the same family and unfold in conformity with the way of mathematical understanding [γνώσεως]. It is reasonable, then, to say that dialectic is the capstone [θριγκός] of the mathematical sciences [τῶν μαθημάτων].<sup>23</sup>

Indeed, no science can exist without trying or testing. Without logic (of which dialectic is a part), there would be no demonstration in mathematics—or in metaphysics. On the other hand, the only science that can establish the principles of logic is metaphysics, as ARISTOTLE says: “it belongs to the [first] philosopher, i.e. to him who is studying the nature of all substance, to inquire also into the principles of syllogism.”<sup>24</sup>

Dialectic, then, has a very important role to play in mathematical research: especially when it uses the analytic and synthetic methods, which are like tools or instruments that logicians use to carry out their investigations by trying possible solutions. But that does not mean that mathematics is the same as dialectic or logic—at least not ancient Greek

<sup>19</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ὑπάρχω.

<sup>20</sup> Ibid., entry for συμβαίνω.

<sup>21</sup> ARISTOTLE, *Metaphysica* K.3, 1061a28–b11.

<sup>22</sup> In calling dialectic “the capstone of the mathematical sciences” he follows PLATO, *Republic* VII, 534e.

<sup>23</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 42.15–43.11.

<sup>24</sup> ARISTOTLE, *Metaphysica* Γ.3, 1005b5–8.

mathematics. As Jaako HINTIKKA and Unto REMES say, “[dialectical] analysis is after all a method of discovery, not one of proof.”<sup>25</sup> Regrettably, as they moreover add:

In spite of the importance of the method of analysis and synthesis for Greek geometry, ancient mathematicians are remarkably reticent about its nature. [...] Although the method was known already to Aristotle—some sources ascribe its discovery to Plato—the only extensive explanation of the concepts of analysis and synthesis is due to as late a writer as Pappus. Fortunately Pappus can be considered a reliable witness. Besides being a competent mathematician in general, he was an accomplished practitioner of the analytical method in particular and also had a thorough knowledge of the history of the method, as his *Collectio* shows.

Let us, therefore, resort to PAPPUS, who provides, in Book 7 of *Collectio*, a description of the methods of analysis and synthesis:

Now analysis [ἀνάλυσις] is <the> way [ὁδός, *method*] from what is sought [ζητούμενου], as if it were admitted [ὀμολογουμένου, *granted*], through its concomitants [ἀκολουθῶν, *consequents*]<sup>26</sup> <in order> to something [ἐπί τι] admitted [ὀμολογούμενον] in synthesis. For in analysis we suppose that which is sought to be already done, and we inquire from what it results, and again what is the antecedent of the latter, until we on our backward way [ἀναποδίζοντες] light upon something already known and <being> first in order [τάξιν ἀρχῆς, *an order of a principle*]. And we call such a method analysis, as being a solution [λύσιν] backwards [ἔφοδον, *method of reasoning*]. In synthesis, on the other hand, we suppose that which was reached last in analysis to be already done, and arranging in their natural [κατὰ φύσιν] order as consequents the former antecedents and linking them one with another, we in the end arrive at the construction [κατασκευῆς] of the thing sought. And this we call synthesis.<sup>27</sup>

PAPPUS then goes on to explain that the methods of analysis and synthesis apply to theorems and problems (the same distinction that PROCLUS makes; ► 1.5). Thus, analysis and synthesis are either θεωρητικόν, *theoretical*, or προβληματικόν, *problematical*. And he gives a list of ancient Greek works that use these methods.<sup>28</sup> We will, therefore, examine a basic sample of mathematical dialectic at work. But instead of drawing from a book on geometry, we will resort to the arithmetic of DIOPHANTUS, who is (inaccurately) said to be the first to have recognized fractions as numbers (► 7.2), and to have been “the father of [modern] algebra” (a claim that we shall disprove; ► 67.3).<sup>29</sup>

<sup>29</sup> See KLEIN, *Greek Mathematical Thought and the Origin of Algebra*, 130ff.

First, we should observe that DIOPHANTUS uses a symbology that is more developed than that of EUCLID. Thus, the unit, which DIOPHANTUS calls τὸ ἀμετάθετον τῶν ὠρισμένων, “the immutable of the determinates,” is signified by  $\acute{\mu}$  (after the first two letters in μονάς, *monad, unit*).<sup>30</sup> (TANNERY’s critical edition renders ἀμετάθετον using the Latin *constans*, which means *constant*, rather than *unalterable, immutable*, inducing a modern reading.)<sup>31</sup>

In turn, that which has a πλήθος μονάδων ἀόριστον, *indeterminate multitude of units*, DIOPHANTUS calls ἀριθμός, *number*, and assigns to it the symbol ζ (in modern notation typically denoted using an  $x$ ).<sup>32</sup> This is the number being sought in analysis. Next, an indeterminate square number ( $x^2$ ) is signified by Δ<sup>Υ</sup> (after the first two letters in δύναμις, *power; square*);<sup>33</sup> likewise, Κ<sup>Υ</sup> (for κύβος, *cube*) signifies a cubic number ( $x^3$ );<sup>34</sup> and in the same fashion are assigned the symbols Δ<sup>Υ</sup>Δ ( $x^4$ ), ΔΚ<sup>Υ</sup> ( $x^5$ ), and Κ<sup>Υ</sup>Κ ( $x^6$ ).<sup>35</sup>

DIOPHANTUS also specifies the names of determinate μόρια, *parts* of numbers (TANNERY reinterprets this technical term as *fractiones*, i.e., *fractions*: more on this, below; ►7.2). The names of such parts, DIOPHANTUS explains, are derived from the name of the number that has as many unit-parts.<sup>36</sup> Thus, τρίτον, *third* (1/3) from τρία, *triad, three* (3); τέταρτον, *fourth* (1/4) from τέσσαρα, *four* (4); and so on.<sup>37</sup> But he moreover introduces analogously derived names for indeterminate parts of numbers. Thus, ἀριθμοστόν, *numberth* (1/ $x$ ) from ἀριθμός, *number* ( $x$ ); δυναμοστόν, *squareth* (1/ $x^2$ ) from δύναμις, *square* ( $x^2$ ); and so on.<sup>38</sup> And he provides a superscript sign <sup>x</sup> that indicates such parts.<sup>39</sup> For example, γ<sup>x</sup> signifies *third* (1/3), where the letter γ is the Greek sign for 3. Likewise, Δ<sup>Υx</sup> signifies *squareth* (1/ $x^2$ ). Thus, the names of such parts are also derived from the homonymous indeterminate numbers (TANNERY names such numbers using the Latin *denominator*, even though there is nothing in the original Greek that corresponds to this word).

DIOPHANTUS then observes that multiplying a number by its homonymous part makes a unit (again, TANNERY reinterprets this as fractions of a unit).<sup>40</sup> He also says that, since the unit is immutable and always fixed (ἔστωσα), any species (εἶδος) that is multiplied by it

<sup>30</sup> DIOPHANTUS, *Arithmetica* A, 6.6–8.

<sup>31</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ἀμετάθετος.

<sup>32</sup> DIOPHANTUS, *Arithmetica* A, 6.3–5.

<sup>33</sup> *Ibid.*, 4.12–16.

<sup>34</sup> *Ibid.*, 17–18.

<sup>35</sup> *Ibid.*, 19–26; 6.1–2.

<sup>36</sup> *Ibid.*, 6.9–10.

<sup>37</sup> *Ibid.*, 10–13.

<sup>38</sup> *Ibid.*, 14–19.

<sup>39</sup> *Ibid.*, 20–21.

<sup>40</sup> *Ibid.*, 8.11–12.

remains the same.<sup>41</sup> And that homonymous parts multiplied make a part homonymous to the numbers multiplied: for example, ἀριθμοστόν, *numberth* ( $1/x$ ) multiplied by itself makes a δύνάμοστόν, *squareth* ( $1/x^2$ ). On the other hand, a *numberth* ( $1/x$ ) multiplied by its *square* ( $x^2$ ) makes a *number* ( $x$ ), and so on.<sup>42</sup>

Finally, DIOPHANTUS also says that λείψις, *lack* (whose sign is Ϸ, an inverted and truncated Ψ) multiplied by λείψις, *lack*, makes ὑπαρξις, *existence in a subject* (TANNERY reinterprets these as the Latin *minus*, i.e., *negative*, and *plus*, i.e., *positive* numbers respectively).<sup>43</sup>

These symbols are put to work in the concrete problems that DIOPHANTUS proposes, which he resolves using problematical analysis. Thus, the very first proposition requires, “To divide a given number into two having a given difference.”<sup>44</sup> DIOPHANTUS begins by supposing that which is sought to be already done. Hence, he poses a lesser number ζ ( $x$ ); a greater number having the given difference of 40; and the given number 100 as being equal to the sum of the greater and the less. He then proceeds to inquire by working his way backward, applying common notions (e.g., subtracting equals to equals), until he finds that the lesser number is equal to 30; and the greater, equal to 70. These are the concrete principles sought. The demonstration then becomes corroborated by synthesis; for the difference between 70 and 30 is 40; and their addition gives 100.

DIOPHANTUS also tackles complex problems in which the reduction to first principles fails. He then backtracks and attempts something else.<sup>45</sup> This is how dialectic works. In the end, the proof always consists in synthesizing, *solely from first principles known in arithmetic’s subject-genus of multitude*, that which was resolved through the method of analysis.

As noted above, DIOPHANTUS is characterized as being “the father of algebra.”<sup>46</sup> HEATH even wrote a work entitled *Diophantus of Alexandria: A Study in the History of Greek Algebra*.<sup>47</sup> We cannot examine this claim before discussing AL-KHWARIZMI’s algebra, but we will dispel some other myths presently. For now, let us consider what KLEIN has to say:

With respect to the “latent algebraic component in classical Greek mathematics” and the incisive difference between external structure and internal motivation which is implied by this, Neugebauer himself emphasized the “necessity of formulating the question in terms which might almost be

said to belong to stylistic history.” Such a formulation presupposes a certain independence of the material mathematical content from the “external” form, which amounts, in the final analysis, to taking for granted that the content is to be understood “algebraically.” But our task consists precisely in bringing the content of Greek mathematics to light not by externally transporting it into another mode of presentation but rather by comprehending it in the one way which seemed comprehensible to the Greeks. Only then can we determine what kind of conceptual means Greek, in distinction from modern, mathematics employs.<sup>48</sup>

## 7.2. Fiction: “Diophantus was the first to recognize fractions as numbers”

As noted above, DIOPHANTUS says that multiplying a number by its homonymous part makes a unit (i.e.,  $x \cdot \frac{1}{x} = 1$ ). Hence, the underlying assumption is, clearly, that—contrary to what has been established—the unit is not only multipliable, but also divisible. In fact, turning to propositions in DIOPHANTUS’s *Arithmetic*, we find multiple cases in which the unit is explicitly said to be divided.<sup>49</sup> Thus, problem 30 in the fourth book requires, “To divide [διελείν] the unit [τὴν μονάδα] into two numbers, to add to each a given number, and to make a square of them.”<sup>50</sup> The exposition even uses the symbol  $\dot{M}$  to refer to the unit that is to be divided. It therefore seems that DIOPHANTUS, as TANNERY and others would have it, treats fractions of the unit as numbers.

However, at closer inspection this illusion quickly vanishes; for the division of the unit does not result in a “number” less than the unit. In fact, what is produced is a number—i.e., a *multitude*—greater than the unit. And the resulting units are then used in the same way that any indivisible unit would be used. This corresponds precisely to what THEON says, i.e., that the unit—as such—is altogether without parts and indivisible (► 3.5):

If the sensible *one* [τὸ ἐν ἐν αἰσθητοῖς, *in sensible (things)*] is divided [διαίρωμεν] into parts [μύρια], that which was *one* becomes a multitude [πλήθος]; and the subtraction of each of its parts would terminate in *one*; and if this is divided again into parts, a multitude is produced; and removing each part returns us to *one*, so the one—insofar as it is one—is without parts and indivisible.<sup>51</sup>

Thus, in DIOPHANTUS as in THEON, the one—insofar as it is one—is without parts and indivisible. And if something one is divided, what is produced is not a fraction of the unit, but a multitude of units. As PLATO says (► 3.5), if you divide, the masters of arithmetic multiply. This explains why DIOPHANTUS characterizes the unit as immutable and fixed.

That DIOPHANTUS applies his analysis only to the subject-genus of *measurable multitude* is evident from his rejection of incommensurable quantities. For example, in proposition

<sup>48</sup> KLEIN, *Greek Mathematical Thought and the Origin of Algebra*, 127–8.

<sup>49</sup> Most are in Book 5, Prop. 9–12: DIOPHANTUS, *Arithmetica* A, 332.15; 336.12; 342.13; 346.14.

<sup>50</sup> *Ibid.*, 266.7–9.

<sup>51</sup> THEON, *Expositio rerum mathematicarum...*, 18.9–15.

10 of Book 4, he reaches an apparent solution of the form  $35x^2 = 5$ , where  $x$  would be what we modernly call an *irrational number*.<sup>52</sup> However, he rejects the solution because “ $x$  is not rational” (ὁ ζ οὐ ρητός). This is as close as he gets to calling a number *irrational*; but he evidently rejects the solution because all numbers are commensurable multitudes; and, therefore, that which is signified by ζ cannot possibly be a number in this case.

Evidently, what we call *negative numbers* and *irrational numbers* result from dialectical analysis. Again, this is merely a method of discovering the principles from which a thing, which is supposed to belong to a genus, could be synthesized. Thus, *lacking multitudes*, and *incommensurable multitudes*, even if they are useful, rational tools of dialectical analysis, cannot be principles of any demonstration in arithmetic’s subject-genus; for they are contradictory. Every science treats of a subject-genus *as such* (e.g., arithmetic, of number *qua number*). Dialectic, on the other hand, treats of any being indistinctly; and it, therefore, assumes both ends of a contradictory choice as probable.

### 7.3. Fiction: “Ancient Greeks understood number to be a kind of magnitude”

1. Deceived by numerical figures such as linear or square numbers, and misled by diagrams found in some ancient works, many modern authors believe that Greek mathematicians understood numbers to be magnitudes.<sup>53</sup> HEATH, for his part, claims that PLATO and EUCLID signify numbers “by straight lines proportional in length to the numbers they represent.”<sup>54</sup> But this is demonstrably absurd. Thus, in EUCLID’s *Sectio canonis*, lines (whether they were included in the autograph or not) are used merely to depict the string of a monochord and its potential division in ratios of numbers.<sup>55</sup> Length and position are—absolutely speaking—irrelevant. What matters is that the string (as a continuum) is divided into parts *in accordance with numerical ratios*, so that concordant intervals may be produced. Thus, we read in the introduction to *Sectio canonis* that musical notes “are composed of parts,” and that “all things that are composed of parts are spoken of in a ratio of number [ἀριθμοῦ λόγῳ] with respect to one another, so that notes, too, must be spoken of in a ratio of number with respect to one another.”<sup>56</sup> Clearly, this is not always true of magnitudes—but it is always true of measurable multitudes (► 5.4; 6.12).

2. The issue is that having separate theories of proportion for numbers (*Elements*, VII) and for magnitudes (V) seems superfluous to the modern mind. Thus, HEATH contends

<sup>52</sup> DIOPHANTUS, *Arithmetica* Δ, 208.7.

<sup>53</sup> For a criticism of such claims, see KNORR, *The Evolution of Euclidean Mathematics*, 171–4.

<sup>54</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, v.2, 288. See EUCLID, *Opera Omnia*, vol. 8, 158ff.

<sup>55</sup> See Andrew BARKER, “Three Approaches to Canonic Division,” in *ΠΕΡΙ ΤΩΝ ΜΑΘΗΜΑΤΩΝ (Peri Tōn Mathēmatōn)*, ed. Ian MUELLER (Edmonton: Academic Printing & Publishing, 1991).

<sup>56</sup> EUCLID, *Opera Omnia*, vol. 8, 158.18–20.

that EUCLID could “save himself so much repetition and treat numbers merely as a particular case of magnitude” simply by “referring back to the corresponding more general propositions of Book V instead of proving the same propositions over again for numbers.”<sup>57</sup>

To the ancient Greek mathematician, in contrast, there is no scientific demonstration without a common subject-genus—and arithmetic and geometry simply do not have one. Evidently, metaphysics, which studies analogy universally insofar as it belongs to *being as such*, would consider all proportions to be in a way the same—that is, analogically. But mathematical theories of proportion are not metaphysical; and mathematicians do not need to be metaphysicians to develop their theories. As MAURER explains:

Of course the other sciences have their own proper principles, which can be known without an explicit knowledge of the principles of metaphysics. Hence these sciences do not directly depend on metaphysics; they are autonomous in their own spheres. Yet the principles of metaphysics are the absolutely universal and primary principles. All the others can be resolved into them. It is in this sense that all the other sciences are said to take their principles from metaphysics, and that this science is said to explain the principles of all the sciences.<sup>58</sup>

Nonetheless, disdain for metaphysics often leads to sophistry. Thus, after rebuking EUCLID for not treating *number* as “a particular case of magnitude,” HEATH contradicts himself by appealing to precisely the opposite proposition: namely, that magnitudes are “evidently” numbers.<sup>59</sup> This is like arguing that all men are animals because—evidently—all animals are men. And he attempts to support this paradoxical claim by referring us to ARISTOTLE’S saying, quoted above, that we cannot prove geometrical truths by arithmetic “unless the magnitudes in question are numbers.” HEATH evidently takes this to mean that ARISTOTLE *does* grant that magnitudes *are* numbers. But here, again, ARISTOTLE is merely implying that any *multitude* of magnitudes (for example, two lines) is a number (see, for example, *Physica* Δ.12, 220a27–32).<sup>60</sup> The only explanation that HEATH can come up with to justify EUCLID’S decision to keep the arithmetical and geometrical theories of proportion separate, is that the author of the *Elements* was “following tradition” out of “fairness to others and his readiness to give them credit for their work.”<sup>61</sup> Ironically, HEATH’S sentimentalist justification would undoubtedly seem not only unscientific to ancient Greeks, but also ludicrous; for EUCLID does not even attribute either theory of proportion to anyone.

---

<sup>57</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, v.2, 113.

<sup>58</sup> AQUINAS, *The Divisions and Methods of the Sciences*, 8, n. 21.

<sup>59</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, v.2, 113.

<sup>60</sup> For a refutation of similar places that would seem to support such a reduction, see KNORR, *The Evolution of Euclidean Mathematics*, 310.

<sup>61</sup> HEATH, *The Thirteen Books of Euclid’s Elements*, v.2, 113. HEATH contrives this explanation based on a vague reference to EUCLID’S character in PAPPUS, *Collectio* Z.35, vol. 2, 678.8–15.

3. According to Ian MUELLER, “Euclid’s failure to establish a correlation between his two treatments of proportionality before developing the material in Book x is probably the greatest foundational flaw in the *Elements*.”<sup>62</sup> His criticism is based on mixed proportions:

We have seen that, although Euclid presupposes some definitions from Book v in the arithmetic books, he proves laws of proportion separately for numbers, and he does not appear to intend to apply any laws from Book v to numbers. [...] Thus, it seems quite certain that, for Euclid, magnitudes do not include numbers. Certainty would seem to me complete if Euclid did not introduce proportionalities involving magnitudes and numbers together in Book x.<sup>63</sup>

Therefrom, all evidence to the contrary notwithstanding, and despite any remaining doubts, MUELLER and others “assume that at least by the time of Book x Euclid includes numbers among magnitudes.”<sup>64</sup> This assumption is based, as MUELLER himself indicates, upon cases in Book x where EUCLID uses proportions involving both ratios between magnitudes and ratios between numbers. Thus, the argument goes, if both magnitudes and numbers can be mixed in the same proportion, does that not mean that number is indeed subsumed under magnitude?

MUELLER’s assumption is perfectly logical. Indeed, as explained above, dialectic concerns itself with *being*—and so does logic, of which dialectic is a part. In this sense, logic extends to as many things as metaphysics. But when logic is not applied to a subject-genus as such (e.g., being *qua being*, number *qua number*), it is on its own. And on its own, logic cannot deal with anything beyond indistinct reasons. It is not by accident that modern logic is characterized as “mathematical”; for it ultimately imitates the way in which ancient Greek mathematicians reasoned—except when it comes to applying metaphysical principles to a subject-genus. We should not be surprised, then, when the modern mind, confined to its logical cave, casts its own shadows onto ancient Greek mathematics. Thus, MUELLER resorts to purely logical reasons when claiming that EUCLID “overlooked the shortcoming” he believes to have found in the *Elements*, its “greatest foundational flaw”:

I suggest that a major reason why he did so lies in his conception of definitions as characterizations of independently understood notions. For us a definition gives a term its sense, so that the same term can be given two definitions only if those definitions are proved equivalent. For Euclid proportionality is an independently understood concept of which he gives two characterizations for two different kinds of objects. The fact that both of those characterizations enable one to prove the ordinary laws of proportionality is a sufficient indication of their correctness. Although Euclid

<sup>62</sup> MUELLER, *Philosophy of Mathematics and the Deductive Structure of Euclid’s Elements*, 138.

<sup>63</sup> *Ibid.*, 136.

<sup>64</sup> MUELLER, “Greek Arithmetic, Geometry and Harmonics: Thales to Plato,” in *From the Beginning to Plato*, ed. C.C.W. Taylor (London: Routledge, 2008), 285; ARTMANN, “Euclid’s *Elements* and Its Prehistory,” 6.

characterizes proportionality when applied to geometric magnitudes and proportionality applied to numbers, he overlooks his failure to characterize it for proportionalities involving numbers and magnitudes together.<sup>65</sup>

The truth of the matter is much simpler. What is peculiar to proportion is that, through it, relations can be directly compared even if the terms of one relation are not directly comparable to those of another. Indeed, analogy is classically defined as identity, equality, or similarity of relations. For example, the relation *double*, considered *in se*, is the same whether we are speaking of numbers or of lines. Hence, it is legitimate for the geometrician to compare a ratio between magnitudes to a ratio between numbers, as EUCLID does (► 6.12). And this is so even if we cannot directly compare a multitude to a magnitude, since the principle-measure of each subject-genus is diverse. Evidently, when the terms of such relations are heterogenous, alternation can only be applied to them *qua beings*.

Again, a relation of incommensurability can exist only between magnitudes. And that is precisely how we can define and distinguish incommensurable magnitudes: because their relation is comparable to that between numbers. PROCLUS explains this plainly:

The theory of commensurable <magnitudes> [τῶν συμμέτρων, *of commensurables*] is developed [θεωρεῖ, i.e., *theorized*] primarily [πρῶτως, *firstly*] by arithmetic and then by geometry in imitation [μιμουμένη] <of it>. This is why both sciences define commensurable <magnitudes> [σύμμετρα, *commensurables*] as those which have to one another the ratio of a number to a number, and this implies that commensurability exists primarily in numbers. For where there is number there also is commensurability, and where commensurability, there also number.<sup>66</sup>

4. Be that as it may, let us consider a scholium to Book V of EUCLID's *Elements* that would ostensibly support this fiction better than any other ancient source. This unattributed marginal note, or rather its source, is probably what ultimately misled medieval Arab translators of the *Elements* into believing that number is but a specific kind of magnitude. Explicit references to this text are so infrequent today—and so persistent the influence of the fiction it represents—that we are compelled to reproduce the relevant section here:

The purpose of the fifth Book is the treatment of proportions; and this book is common to geometry, arithmetic, music, and all mathematical sciences simply [ἀπλῶς = *simpliciter*], for in it are demonstrated theorems applicable not only to the geometrical but even to all the mathematical sciences, as has been said. This is, thus, its purpose. And some say that this book is the discovery of Eudoxus, Plato's teacher.<sup>67</sup>

---

<sup>65</sup> MUELLER, *Philosophy of Mathematics and the Deductive Structure of Euclid's Elements*, 138.

<sup>66</sup> PROCLUS, *In Primum Euclidis Elementorum Librum Commentarii*, 60.26–61.5.

<sup>67</sup> EUCLID, *Opera Omnia*, vol. 5, 280.1–9: “Σκοπὸς τῷ πέμτῳ βιβλίῳ περὶ ἀναλογιῶν διαλαβεῖν κοινὸν γὰρ τοῦτο τὸ βιβλίον γεωμετρίας τε καὶ ἀριθμητικῆς καὶ μουσικῆς καὶ πάσης ἀπλῶς τῆς μαθηματικῆς

This scholium, incidentally, is a key document for ascribing to EUDOXUS the discoveries reflected in Book V, despite the vague reference.<sup>68</sup> In terms of its trustworthiness, it is problematic for two reasons. On the one hand, the most reliable traditions relate that EUDOXUS was PLATO's student—not his teacher.<sup>69</sup> And more crucially, on the other hand, it contradicts the incontestable fact that there is no universal magnitude in EUCLID, as KNORR has exhaustively shown; for “number theory was always recognized as a discipline entirely separate from geometry.”<sup>70</sup>

HEATH names PROCLUS as the probable author of the scholium (though he does not cite any sources or provide a reasoned account).<sup>71</sup> But this conclusion is clearly untenable; for PROCLUS explicitly rejects the opinion of ERATOSTHENES that would make proportion (ἀναλογία) the unifying bond of “all the mathematical sciences.”<sup>72</sup> And the reason for this rejection is that “proportion is said to be, and is, to the mathematical [sciences] one of the commons [τῶν κοινῶν].”<sup>73</sup> In other words, proportion is *common to all the sciences*.

As mentioned above, theorizing about the commons (i.e., about the common notions or axioms) belongs neither to geometry nor to arithmetic, but to metaphysics. Thus, PROCLUS distinguishes, beneath the whole and all-inclusive mathematics (discussed in the next section; ► 7.4, ¶4), two species of mathematical science: one that treats of the *how-much* (ποσόν), that is, arithmetic; and another one that treats of the *how-great* (πηλίκον), that is, geometry.<sup>74</sup> Yet, as PROCLUS explains, each of these sciences applies proportion particularly; that is, in accordance with its own principles:

---

ἐπιστήμης. τὰ γὰρ ἐν αὐτῷ ἀποδεικνύμενα οὐ μόνον γεωμετρικοῖς ἀρμόζει θεωρήμασιν, ἀλλὰ καὶ πᾶσι τοῖς ὑπὸ μαθηματικῆν τεταγμένοις, ὡς προείρηται, ἐπιστήμην. ὁ μὲν οὖν σκοπὸς οὗτος, τὸ δὲ βιβλίον Εὐδόξου τινὲς εὑρεσιν εἶναι λέγουσι τοῦ Πλάτωνος διδασκάλου.” The translation is ours.

<sup>68</sup> KNORR thinks that there are good reasons for doubting this ascription. See KNORR, “On the Early History of Axiomatics...,” 98. His reconstruction of the theory can be found in KNORR, “Archimedes and the Pre-Euclidean Proportion Theory,” *Archives internationales d'histoire des sciences* 28 (1978).

<sup>69</sup> See DIOGENES LAËRTIUS, who follows the (now lost) *Successions* of SOTION of Alexandria (fl. ca. 200–170 BC) in *De vitis, dogmatis et apophthegmatis clarorum philosophorum*, 2 vols. (Leipzig: Karl Francis Koehler, 1831), v. 2, 318. English version in *The Lives and Opinions of Eminent Philosophers*, trans. C. D. Yonge (London: G. Bell and Sons, 1915), 373.

<sup>70</sup> KNORR, *The Evolution of Euclidean Mathematics*, 308–10.

<sup>71</sup> HEATH, *The Thirteen Books of Euclid's Elements*, vol. 2, 112. The only known ascription to PROCLUS of a scholium to EUCLID's *Elements* (in this case, to Book X, Proposition 9) is found in an entirely different manuscript. See Johan Ludvig HEIBERG, “Paralipomena zu Euklid,” *Hermes* 38, no. 3–5 (1903), 341, no. 17: “Σχόλιον εἰς τὸ θ' θεωρήμα σχόλιον τοῦ Πρόκλου πρὸς τὸ τέλος.” The discussion is found in idem, 345–6. On these scholia, see Jaap MANSFELD, *Prolegomena Mathematica: From Apollonius of Perga to Late Neoplatonism*, Philosophia Antiqua (Leiden, Boston, Köln: Brill, 1998), 26ff.

<sup>72</sup> See PAPPUS, *Collectio* Γ.47, v.1, 86.19–88.2: “λέγει γὰρ [ὁ Πλάτων] ἓνα δεσμὸν εἶναι τῶν μαθημάτων ἀπάντων, αἰτία δὲ γενέσεως καὶ δεσμὸς πᾶσι τοῖς γενομένοις ἢ τῆς ἀναλογίας θεία φύσις.” These is what ERATOSTHENES (as quoted by PAPPUS) puts in PLATO's mouth, undoubtedly inspired in the *Timaeus* (31b–32c). An excerpt in English can be found in VAN DER WAERDEN, *Science Awakening*, 231–32.

<sup>73</sup> PROCLUS, *In Primum Euclidis Elementorum Librum Commentarii*, 43.22–25: “ἢ γὰρ ἀναλογία τῶν κοινῶν τοῖς μαθήμασιν ἐν τι καὶ λέγεται εἶναι καὶ ἔστιν.” The translation is ours.

<sup>74</sup> *Ibid.*, 35.17ff.

Let the geometer state that if four magnitudes are proportional [ἀνάλογον] they will also be proportional alternately and prove it by its own principles, which the arithmetician would not use; and again let the arithmetician lay it down that if four numbers are proportional they will also be proportional alternately and establish this from the principles of his own science.<sup>75</sup>

That PROCLUS, like ARISTOTLE, considers proportion to be common to all sciences (and therefore a metaphysical principle) is certain; for he also includes the study of its nature (along with that of *sameness* and *otherness*, and of the *essential* and the *accidental*, which clearly are metaphysical) as a requisite for judging properly of mathematical reasoning; and he states, with ARISTOTLE, that it is not the office of the mathematician to make distinctions concerning these.<sup>76</sup> Hence, the mathematician can legitimately *use* or *apply* proportion theory to compare diverse ratios of homogeneous quantities, but it is not a competence of the mathematician to *theorize* about proportion *as such*.

In fact, a more likely author of the scholium would be MARINUS (PROCLUS's successor), who says, in a commentary on the *Data*, that EUCLID therein applies *common* ratios to magnitudes *peculiarly*, adding that Book v (of the *Elements*) treats of such *universal* ratios.<sup>77</sup> Unfortunately, MARINUS does not delve any deeper on the subject.

5. Be that as it may, among the Arabs, as hinted above, there is a tradition that subsumes عدد *'adad*, *number*, under مقدار *miqdār*, *magnitude*, even though the names كمية *kammīyah*, *quantity*, and كم *kamm*, *quantum*, already signified in Arabic what ARISTOTLE calls ποσόν, *quantity* (the genus of which multitude and magnitude are the first species).<sup>78</sup> Explaining EUCLID's notion of ratio, AL-JAYYĀNĪ (989–1079) writes:

The things that come under the quantity [الكمية *al-kammīyah*] used in the art of geometry are five, viz. the number [العدد *al-'adad*], which is the first and simplest of them, the line, the surface, the angle and the solid. Let us use the term "magnitude" [المقدار *al-miqdār*] in general to denote any of these things, to which it is a name for the species [الجنس *al-jins*] comprising all of them.<sup>79</sup>

<sup>75</sup> Ibid., 9.2–8.

<sup>76</sup> Ibid., 34.20–35.6; cf. ARISTOTLE, *Metaphysica* Γ.2, 1005a11–13.

<sup>77</sup> EUCLID, *Opera Omnia*, vol. 6, 254.23–27: "γεωμετρικός δὲ ὢν ὁ ἀνὴρ διαφερόντως τοὺς κοινούς περὶ τοῦ δεδομένου λόγους τοῖς μεγέθεσιν ἰδίως ἐφήρμοσεν, ὃν τρόπον ἐποίησε καὶ ἐπὶ τῶν καθόλου λόγων ὡς ἐπὶ μεγεθῶν ἰδίως αὐτοὺς πραγματευσάμενος ἐν τῷ πέμπτῳ βιβλίῳ τῆς ἐπιπέδου."

<sup>78</sup> Thus, the Arabic translation of ARISTOTLE's *Categories* (6, 4b20) from the Syriac carried out between 865 and 910 by Ishāq IBN HUNAYN renders the original Greek ποσόν as الكم (*al-kamm*), of which one species is منفصل (*munfaṣil* = διωρισμένον), and another, متصل (*muttaṣil* = συνεχής). See 'Abd al-Rahmān BADAWĪ, *Manṭiq Aristū, al-ḡuz' al-awwal* (Cairo: Maṭba'at Dār al-kutub al-miṣrīya, 1948), 14. Likewise, the Arabic translation of NICOMACHUS's *Introductio arithmeticae* (I.2.5, 4.21–22; I.3.2, 5.13) from the Greek carried out between 860 and 901 by Ṭābit IBN QURRA renders πλήθος as العدد (*al-'adad*), μέγεθος as المقدار (*al-miqdār*), and ποσόν as الكمية. See Wilhelm KUTSCH, *Ṭābit b. Qurra's arabische Übersetzung der Αριθμητική Εισαγωγή des Nikomachos von Gerasa* (Beirut: Imprimerie Catholique, 1959), 13.

<sup>79</sup> Edward Bernard PLOOIJ, *Euclid's conception of ratio and his definition of proportional magnitudes as criticized by Arabian commentators (including the text in facsimile with translation of the commentary on ratio of Abū 'Abd Allāh Muḥammad ibn Mu'ādh al-Djajjānī)* (Rotterdam: W. J. van Hengel, 1950), A25–

This tradition accounts for a peculiarity found in extant medieval Latin versions of EUCLID'S *Elements* assembled from Arabic manuscripts, beginning with that of ADELARD of Bath (1116–1142): they all render مقدار *miqdār*, *magnitude*, as *quantitas*, *quantity*.<sup>80</sup> According to a commentary on EUCLID'S *Elements* by ANARITIUS, this *quantitas* would include not only lines, surfaces, and bodies, but also numbers, discourses, times, and places.<sup>81</sup>

However, when ANARITIUS explains that a ratio (*proportio* < نسبة *nisbah* < λόγος) is a relation of one quantity (*quantitas* < مقدار *miqdār* < μέγεθος) to another quantity, he adds that both quantities “are of one genus: namely, a relation of line to line, or a relation of surface to surface, or of body to body, or of number to number...”<sup>82</sup> This agrees with EUCLID in that a ratio is defined as a relation μεγεθῶν ὁμογενῶν, of *homogeneous magnitudes*.<sup>83</sup> Thus, even if Latin versions of Arabic manuscripts wrongly render the original μέγεθος as *quantitas*, it was clear enough to medieval scholars—as it was to ancient Greeks—that numbers do not have the same subject-genus as magnitudes. In this sense, MUELLER comes closer to the truth (without fully grasping it) when he says:

Presumably Euclid thinks of a proposition of the theory of proportion as a unified formulation of a number of analogous propositions concerning various particular kinds of magnitudes, straight lines, plane figures, etc. rather than as a single proposition about more abstract objects called magnitudes.<sup>84</sup>

---

B2. The truth, again, is of course that “Neither Euclid nor any other Greek mathematician would have considered ‘number’ as a geometrical magnitude,” as, commenting on this text, say J. J. O’CONNOR and E. F. ROBERTSON, “Abu Abd Allah Muhammad Ibn Muadh Al-Jayyani,” *MacTutor History of Mathematics* (1999), <http://www-history.mcs.st-andrews.ac.uk/Biographies/Al-Jayyani.html>.

<sup>80</sup> See ANARITIUS, *In decem libros priores Elementorum Euclidis commentarii*, 156; BUSARD, *The First Translation of Euclid’s Elements Commonly Ascribed to Adelard of Bath*, 145; *The Translation of the Elements of Euclid from the Arabic into Latin by Hermann of Carinthia (?)*, 95; BUSARD and FOLKERTS, *Robert of Chester’s (?) Redaction of Euclid’s Elements, the So-Called Adelard II Version*, 161; *Johannes de Tinemue’s Redaction of Euclid’s Elements, the So-Called Adelard III Version*, 127; BUSARD, *Campanus of Novara and Euclid’s Elements*, 160. See Gregg DE YOUNG, “The Latin Translation of Euclid’s Elements Attributed to Gerard of Cremona in Relation to the Arabic Transmission,” *Suhayl*, no. 4 (2004): “there are at least two traditions (Ḥajjāj and Iṣḥāq-Thābit) that constitute the primary Arabic transmission of the Elements. [...] The currently known manuscripts of the Arabic primary transmission all fall within the broadly defined Iṣḥāq-Thābit tradition.” The IṢHĀQ-THĀBIT tradition consistently renders μέγεθος as مقدار (ibid., 370), which is the term used by mathematicians such as Ibn AL-HAYTHAM, *Kitāb Fī Ḥall Ṣukūk Kitāb Uqlīdis Fīl-Uṣūl Waṣarḥ Ma’Ānīhi* (on the Resolution of Doubts in Euclid’s Elements and Interpretation of Its Special Meanings), Facsimile Editions (Frankfurt am Main: Institute for the History of Arabic Islamic Science at the Johann Wolfgang Goethe University, 1985), and the Pseudo-Nasir al-Din Tusi, *kitāb taḥrīr ‘uṣūl li’uqlīdis (Euclidis Elementorum geometricorum libri tredecim)* (Rome, 1594). See also Gregg DE YOUNG, “The Arabic Textual Traditions of Euclid’s Elements,” *Historia Mathematica* 11 (1984). In his translation of EUCLID’S *Elements* (ca. AD 500), BOETHIUS uses *magnitudo* instead.

<sup>81</sup> ANARITIUS, *In decem libros priores Elementorum Euclidis commentarii*, 156. Angles are not mentioned.

<sup>82</sup> Ibid.: “Et cum dicit ‘inter duas quantitates’ voluit [EUCLIDES] intelligi instantiam [i.e., *relationem*], quam una duarum quantitatum habet ad aliam, quia proportio est instantia unius quantitatis ad aliam quantitatem, que sunt unius generis; scilicet instantia lineae ad lineam, aut instantia superficiei ad superficiem, aut corporis ad corpus, aut numeri ad numerum, <aut> orationis ad orationem, aut temporis ad tempus, aut loci ad locum.” Angled brackets in the original. The translation is ours.

<sup>84</sup> MUELLER, *Philosophy of Mathematics and the Deductive Structure of Euclid’s Elements*, 136.

#### 7.4. Fiction: “Aristotle posited a universal mathematics”

1. Instead of arguing that ancient Greeks considered *number* to be a kind of *magnitude*, as the preceding fiction would have it, many modern authors claim that ARISTOTLE posited a single science, called *universal mathematics*, that treats of *quantity* as such (i.e., an alleged generic quantity that is neither continuous nor discrete).

This fiction seems to have had its first manifestation in a translation of ARISTOTLE’s works carried out early in the twentieth century under the editorship of Sir William David ROSS. His celebrated edition, which we are using throughout this work, contains two instances of the expression *universal mathematics*. In one place, ARISTOTLE is made to say that “geometry and astronomy deal with a certain particular kind of thing, while universal mathematics applies alike to all.”<sup>85</sup> And in another place, the Stagirite would say that “Each of the mathematical sciences deals with some one determinate class of things, but universal mathematics applies alike to all.”<sup>86</sup>

Alas, the expression *universal mathematics* is never found in ARISTOTLE’s works—at least not in Greek. And this is not the only peculiarity of ROSS’s edition that raises eyebrows; for it also renders γένος very often as *class* instead of *genus*, suggesting to the modern reader that what ARISTOTLE really meant by γένος is a *set* or a *collection of sets*. Ironically, in the place where ARISTOTLE does explain precisely the diverse ways in which γένος is said (i.e., the passage quoted above), ROSS’s edition renders it as *race* or *genus*, instead of *class*, preventing the unsuspecting reader from making any sense of ARISTOTLE’s words. And as if things were not bad enough, ROSS’s edition often inserts the words “concept of” (inexistent in the Greek), suggesting a logical reading.

Seemingly, ROSS and his team are more content retrofitting ARISTOTLE’s words with modern dogma than unravelling the principles of ancient Greek mathematics. As the Stagirite himself would put it, “they state hypotheses peculiar <to themselves> and not those of mathematics.”<sup>87</sup> In their misguided love for the greatest philosopher of antiquity, they seem to endeavor to turn him into a precursor of modern mathematics.

2. The fiction of *universal mathematics* is subsequently found in many authors, including HEATH, APOSTLE, John J. CLEARY, Zev BECHLER, and FRANKLIN.<sup>88</sup> It should have been

---

<sup>85</sup> *The Works of Aristotle*, v. 8, *Metaphysics* E.1, 1026a26–27.

<sup>86</sup> *Ibid.*, *Metaphysics* K.7, 1064b8–9.

<sup>87</sup> ARISTOTLE, *Metaphysica* M.9, 1086a10–11: “ἰδίᾳς γὰρ καὶ οὐ μαθηματικὰς ὑποθέσεις λέγουσιν.”

<sup>88</sup> See HEATH, *Mathematics in Aristotle*, 222–224; Hippocrates George APOSTLE, *Aristotle’s Philosophy of Mathematics* (Chicago: The University of Chicago Press, 1952), chapter I; *Mathematics as a Science of Quantities* (Grinnell: The Peripatetic Press, 1991), 79; John J. CLEARY, *Aristotle & Mathematics: Aporetic Method in Cosmology & Metaphysics* (Leiden: Brill, 1995), 290; Zev BECHLER, *Aristotle’s Theory*

abandoned at least since 1980, when CROWLEY thoroughly debunked the leading modern interpretations of ARISTOTLE's texts relative to "universal mathematics."<sup>89</sup> Alas, inattentive scholars still believe in it.<sup>90</sup> Undoubtedly, the quest for a mythical *mathesis universalis*, which humanist celebrities thought to have found in ancient Greek authors (a fiction examined below; ►67.5; 67.6), plays a significant role in modern interpretations. Realists should heed the words of Henry MENDELL, who points to the fact that an *Aristotelian universal mathematics* does not square at all with the available evidence:

Ironically, extant Greek mathematics shows no traces of an Aristotelian universal mathematics. The theory of ratio for magnitudes in EUCLID, *Elements* v is completely separate from the treatment of ratio for number in *Elements* vii and parts of viii, none of which appeals to v, even though almost all of the proofs of v could apply straightforwardly to numbers. For example, EUCLID provides separate definitions of proportion (v def. 5, and vii def. 20). Compare the rule above (*alternando*), which is proved at v.16, while the rule follows trivially for numbers from the commutivity of multiplication and vii.19:  $ad = bc \Leftrightarrow a : b :: c : d$ .<sup>91</sup>

3. On the other hand, it is true that some places in ARISTOTLE are difficult to interpret when read in isolation. One of them, often quoted in support of a *universal mathematics*, would seem to suggest that mathematics (i.e., neither arithmetic nor geometry, but some generic science of quantity as such) is apt to carry out demonstrations on both numbers and magnitudes indistinctly:

Alternation [τὸ ἀνάλογον ὅτι ἐναλλάξ, *the proportional in alternando*] used to be demonstrated separately of [ἢ, *qua*] numbers, lines, solids, and durations, though it could have been proved of them all by a single demonstration. Because there was no single name <to denote> that in which numbers, lengths, durations, and solids are identical [πάντα ταῦτα ἔν], and because they differed specifically [εἶδει, *as to form, species*] from one another, <this property> was proved <of each of them> separately. To-day, however, the proof is <commensurately> universal [καθόλου], for they

---

*of Actuality* (Albany: State University of New York Press, 1995), 186–9; James FRANKLIN, *An Aristotelian Realist Philosophy of Mathematics* (London and New York: Palgrave Macmillan, 2014), Ch. 3.

<sup>89</sup> Charles Bonaventure CROWLEY, *Universal Mathematics in Aristotelian-Thomistic Philosophy: The Hermeneutics of Aristotelian Texts Relative to Universal Mathematics* (Washington, D.C.: University Press of America, 1980).

<sup>90</sup> For example, SASAKI devotes the second part of his *Descartes's Mathematical Thought* (Dordrecht: Kluwer Academic Publishers, 2003), to a historical perspective of the concept of *mathesis universalis*. Therein he includes a whole chapter (6) on "universal mathematics" in ARISTOTLE, where he examines the interpretations given by ancient, medieval and Renaissance translators and commentators to the first two passages quoted above, in which modern authors read "universal mathematics." Disregarding the evidence, however, and based primarily on the merit of a doubtful interpretation of ASCLEPIUS's *Commentary* on ARISTOTLE's *Metaphysics* (CAG vol. 6.2, 364.11–19), SASAKI finds more probable the opinion that there is in ARISTOTLE a "universal mathematics." He dismisses CROWLEY because "he read the texts of Aristotle within the framework of medieval scholastic Aristotelianism, of which a representative philosopher was Thomas Aquinas." However, SASAKI does not provide an account to justify why CROWLEY's would be, from a philosophical perspective, an interpretation that is not entirely based on ARISTOTLE's metaphysical principles (which SASAKI does not even examine).

<sup>91</sup> Henry MENDELL, "Aristotle and Mathematics," *The Stanford Encyclopedia of Philosophy* (Spring 2017 Edition), <https://plato.stanford.edu/archives/spr2017/entries/aristotle-mathematics/>.

do not possess this attribute *qua* lines or *qua* numbers, but *qua* manifesting this <generic character> which they are postulated [ὑποτίθενται] as possessing universally.<sup>92</sup>

From this text alone, one could easily rush to the conclusion that the “generic character” of “numbers, lengths, durations, and solids” is that they all are quantities. ARISTOTLE is not, however, speaking here of quantities as such. He is speaking of quantities that are proportional. Indeed, alternation does not belong to numbers, lengths, durations, or solids insofar as they are quantities, but insofar as they are in proportion. Stating the opposite is like saying that the number three is a random number; for it does not *per se* belong to the number three to be random—it is said to be random in (lack of) relation to other numbers.

On the other hand, being proportional (ἀνάλογον, *analogous*) does not belong only to quantities such as numbers, lengths, and durations. As explained above, the principles of diverse things are, universally and analogically speaking, the same for all. Hence, all finite beings can—in a sense—be called *quantities*; for they are “measured” by the principle of their respective genus. Therefore, the property of alternation is common to all beings insofar as they are analogous. And it belongs to the science of being *qua being* (not to a fictional *universal mathematics*) to theorize about alternation from non-hypothetical (i.e., evident) principles. Alternation, universally considered, is based on relations between opposites (e.g., the antecedent and the consequent), and, as ARISTOTLE says:

<It belongs> to one science to examine [θεωρῆσαι, *to theorize*] being *qua* being [τὸ ὄν ἢ ὅν]. For all <things> are either contraries or <composed> of contraries, and unity [τὸ ἓν, *the one*] and plurality [πλήθος, *multitude*] are the starting-points [ἀρχαί, *principles*] of all contraries. And these <belong> to one science. [...] And for this <reason> it does not <belong> to the geometer to inquire [θεωρῆσαι] what is contrariety or completeness [τέλειον, *perfect*] or unity [ἓν, *one*] or being [ὄν]<sup>93</sup> or the same [ταυτόν] or the other [ἕτερον], but only to presuppose [ἀλλ’ ἢ ἐξ ὑποθέσεως] <these concepts and reason from this starting-point>. Obviously then it is <the work> of one science to examine [θεωρῆσαι, *theorize*] being *qua* being, and the attributes [ὑπάρχοντα] which <belong> to it *qua* being, and the same science will examine not only substances [τῶν οὐσιῶν] but also their attributes [τῶν ὑπαρχόντων], both those above named and <the concepts> “prior” and “posterior,” “genus” and “species,” “whole” and “part,” and the others of this sort.<sup>94</sup>

Believers in the fiction of *universal mathematics* fail to contrast their cherrypicked texts against the professed metaphysical principles of ARISTOTLE, who states plainly enough that it belongs to metaphysics to theorize about the first principles of mathematics—those that are common to all kinds of quantity (and therefore, to being *qua being*):

<sup>92</sup> ARISTOTLE, *Analytica Posteriora* A.5, 74a17–25; cf. AQUINAS, *In Post. an.* 1, l. 12, n. 4; n. 8.

<sup>93</sup> Note that BEKKER’s edition has the order reversed: “ἢ ὄν ἢ ἓν.”

<sup>94</sup> ARISTOTLE, *Metaphysica* Γ.2, 1005a2–5; 11–18.

Since even the mathematician uses the common <axioms> [τοῖς κοινοῖς] <only> in a special [ἰδίως] <application>, it <must> be <the business> of first philosophy to examine [θεωρῆσαι] the principles of mathematics also. That when equals are taken from equals the remainders are equal, is common to all quantities [ποσῶν], but mathematics studies [πιοιῖται τὴν θεωρίαν] a part [μέρος] of its proper matter [τῆς οἰκείας ὕλης] which it has detached [ἀπολαβοῦσα, *cut off*], e.g. lines or angles or numbers or some other <kind of> quantity not, however, *qua* being but in so far as each of them is continuous in one or two or three <dimensions>; but [first] philosophy does not inquire [σκοπεῖ] <about> particular [ἐν μέρει, *in particular*] <subjects> in so far as each of them has some attribute [τι συμβέβηκεν] <or other> but speculates [θεωρεῖ] about being [περὶ τὸ ὄν], in so far as each <particular thing> *is*. Physics is in the same position as mathematics; for physics studies [θεωρεῖ] the attributes [τὰ συμβεβηκότα] and the principles of the <things> that are, *qua* moving and not *qua* being (whereas the primary [πρώτην] science, we have said, deals with these, only in so far as the underlying <subjects> [τὰ ὑποκείμενά] are existent [ὄντα ἔστιν, *are beings*], and not in virtue of any other <character>); and so both physics and mathematics must be classed as [θετέον, *counted as*] parts [μέρη] of Wisdom.<sup>95</sup>

Hence, each of the mathematical sciences cuts off a part of being to theorize about it. And there is no quantitative part of being that is neither a multitude nor a magnitude. That is why axioms cannot be applied in their full commonness to quantity *qua* quantity unless we understand by *quantity* some *being*. Otherwise, ARISTOTLE would say that the axioms of mathematics, including “when equals are taken from equals the remainders are equal,” are studied by the alleged *universal mathematics* rather than by metaphysics.

This comes to show, again, that the category-genus of *quantity* is univocal to logic; but the diverse, quantifiable subject-genera are analogical to metaphysics. The modern mind, having forgotten the metaphysical principles that originally founded mathematics, fails to make this distinction. The more metaphysical principles are removed from mathematics, the more logic remains. But the ancient Greek masters would not have any of that.

**4.** PROCLUS, who (like his precursor IAMBlichus) does write at great length about ἡ μία καὶ ὅλη μαθηματική, *the single and whole mathematics*,<sup>96</sup> shows that common principles apply particularly to each subject-genus, even if they belong to the same logical category:

[T]here are many things that have the same name [κατηγορίαν, *category*] yet <whose> common [κοινόν] <character> differs in different [ἐφ’ ἐκάστων] species [κατ’ εἶδος]; for example, similarity in figures and in numbers. We should not therefore demand of the mathematician a single demonstration in such cases, for the principles of figures and numbers are not the same but vary with the underlying genera [κατὰ τὸ ὑποκείμενον γένος, *according to the subject-genus*].<sup>97</sup>

<sup>95</sup> ARISTOTLE, *Metaphysica* K.4, 1061b17–33.

<sup>96</sup> PROCLUS, *In primum Euclidis Elementorum librum commentarii*, 43.22–44.23.

<sup>97</sup> *Ibid.*, 33.4–10.

As PROCLUS says, “Differences in subject-matter [τὰ ὑποκείμενα] at once produce differences in the sciences and arts that are concerned with them.”<sup>98</sup> In contrast, “the single and whole mathematics” he writes about “embraces alike all forms of mathematical knowledge.”<sup>99</sup> And, like ARISTOTLE’s metaphysics, knowledge of its theorems “takes precedence over the particular sciences and furnishes to them their principles; that is, these several sciences are based upon this prior science and refer back to it.”<sup>100</sup>

Therefore, the science that PROCLUS calls “the single and whole mathematics” can be no other than metaphysics or one of its parts. Granted, he does describe it as being somehow between the particular sciences and metaphysics, as his Neoplatonism demands. Perhaps all he means by *the single and whole mathematics* is arithmetic and geometry taken together. After all, PROCLUS describes the ascent from the particular sciences to what ARISTOTLE calls *first philosophy* (i.e., the science of being *qua* being) without delimiting precisely where *the single and whole mathematics* would begin or end:<sup>101</sup>

Then whose <function> is it to know [γνωρίζων, *make known*] <the principle of> alternation alike in magnitudes and in numbers and the principles governing the division of compound magnitudes or numbers and the compounding of separate ones? It cannot be that we have sciences of particular <areas> of being and knowledge <of them> but have no single science of the immaterial objects that stand much closer to intellectual inspection [τῆς νοεῖας θεωρίας, *to intellectual theories*]. Knowledge of these <objects> is by far the prior science, and from it the several sciences get their common propositions [τοὺς κοινούς λόγους], our knowledge ascending from the more partial [ἀπὸ τῶν μερικωτέρων] to the more general [ἐπὶ τὰς ὀλικωτέρας] until at last we reach the science of being as being. This <science> does not consider it its province to study the properties that belong intrinsically [ὑπάρχοντα] to numbers, nor those that are common to all quantities; rather it contemplates that single form [οὐσίαν, *substance*] of being <or existence> [ὑπαρξιν] that belongs to all things [τῶν ὄντων ἀπάντων], and for this reason it is the most inclusive of the sciences, all of which derive [λαμβάνουσι] their principles from it. [...] One science [...] must stand above [προτετάχθω] the many sciences [ἐπιστημῶν] and branches of knowledge [μαθημάτων, *mathematical disciplines*], that <science> which knows the common <principles> [τὰ κοινὰ] that pervade all kinds [γενῶν, *genera*] <of being> and furnishes to all the mathematical sciences <their> starting-points [τὰς ἀρχάς, *the principles*].<sup>102</sup>

Whatever is made of PROCLUS’s *single and whole mathematics*, clearly, if we faithfully follow ARISTOTLE’s metaphysics, there has never been nor can there ever be such thing as an *Aristotelian universal mathematics* distinct from metaphysics itself (or a part of it).

## 8. Principle

*Drawing directly from the works of St. Thomas, in this chapter we begin our inquiry to determine what principles are, what kinds of principles there are, what constitutes first principles, and how they are related both among themselves and, particularly, to mathematics. But before we establish what it is that St. Thomas understands by principle, it is convenient to introduce the notion of ratio, which he frequently uses.*

*As noted in the first part, ratio is one of the Latin equivalents of the Greek λόγος (logos), which originally had the general sense of “that which is meant in the discourse,” the “communication of something essential about a thing,” as VON FRITZ observes (► 5). Many authors prefer to use nature, idea, or other terms to translate the Latin ratio, or resort to explanatory expressions such as intelligible structure. For the sake of clarity and brevity, we will instead use ratio (customarily reserved in English for mathematical relations) as the literatim equivalent of its Latin precursor. Thus, to state the ratio of  $x$  is to express what is meant by  $x$ —that is, to communicate something essential about  $x$ .*

### 8.1. Ratio

By **ratio** we understand here *that which the intellect apprehends from the signification of a name*.<sup>1</sup> The name *ratio* does not signify the conception of the intellect itself, for this is signified by the name of the thing (for example, the name *quantity* signifies the intellectual conception of quantity). Rather, *ratio* signifies the intention (*intentio*) of that conception (e.g., the *ratio of quantity* signifies the intention of the intellectual conception of quantity), as also happens with the name *definition* and other such second-imposition names.

The *ratio* of a thing is taken from its principles.<sup>2</sup> Therefore, those things that agree only in name but differ in their *ratio* cannot have common principles. It is impossible to find the principles of something that is said in multiple modes unless the multiplicity is divided (► 20.12); it is impossible to assign distinct principles to those things that have in common only the name, unless principles are assigned necessarily to the things that are diverse.

---

<sup>1</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Quantum ad primum pertinet [sc., *quid sit ratio secundum quam dicimus attributa ratione differre*], sciendum est, quod ratio, prout hic sumitur, nihil aliud est quam id quod apprehendit intellectus de significatione alicujus nominis [...]. Nec tamen hoc nomen ratio significat ipsam conceptionem, quia hoc significatur per nomen sapientiae vel per aliud nomen rei; sed significat intentionem hujus conceptionis, sicut et hoc nomen definitio, et alia nomina secundae impositionis.” This textual unit (i.e., the whole of *In Sent.* 1, d. 2 q. 1 a. 3 co.) is the same place from which MAURER draws his peculiar conclusions in “Thomists and Thomas Aquinas on the Foundation of Mathematics” and “A Neglected Thomistic Text on the Foundation of Mathematics,” as discussed in our Introduction.

<sup>2</sup> *In Metaph.* 1, l. 17, §265: “Impossibile est invenire principia alicuius multipliciter dicti, nisi multiplicitas dividatur. Ea enim quae solo nomine convenientia sunt et differunt ratione, non possunt habere principia communia, quia sic haberent rationem eandem, cum rei cuiuscumque ratio ex suis principiis sumatur. Distincta autem principia his, quibus solum nomen commune est, assignari impossibile est, nisi his quorum principia sunt assignanda adinvicem diversis.”

In things that have a definition, the definition itself is their *ratio*, “for the definition is the *ratio* that the name signifies,” as ARISTOTLE says.<sup>3</sup> Properly speaking, what is signified by the definition is the essence or quiddity of the thing (*quidditas rei, essentia, substantia* = οὐσία, *quod quid erat esse* = τὸ τί ἦν εἶναι, i.e., the *what* that the thing is, its “whatness”; ►16).<sup>4</sup> However, the definition comprehends only the principles of the species—not the individual principles (e.g., not the principles of *this triangle* but of the universal *triangle*).<sup>5</sup> A definition is said (to be) a *terminus* (►8.8) because it includes the totality of the thing in such a way that nothing of the thing is outside the definition, and nothing else is under the definition: that is, it excludes anything with which the definition should not agree (*non conveniat*), and includes only those things with which the definition does agree.<sup>6</sup> However, diverse definitions may be given of the same thing when taken from diverse principles—that is, unless all the thing’s principles are comprehended in the definition.<sup>7</sup> This is called the *definitive ratio* (*ratio definitiva*), which signifies what is said *according to itself* (►17).<sup>8</sup>

There are, however, some things that properly speaking cannot be defined (notably, first principles; ►45): for example, *quantity* and *quality* do not have a definition because they are among the highest genera.<sup>9</sup> Yet, it has no bearing whether those things that are said to have a *ratio* do or do not have a definition: the *ratio of quantity*, for example, is simply *that which is signified* by the name *quantity*, which is what makes quantity what it is (*hoc est illud ex quo <quantitas> habet quod sit <quantitas>*).<sup>10</sup>

<sup>3</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “et hoc [sc., *ratio*] in his quae habent definitionem, est ipsa rei definitio, secundum quod Philosophus dicit: ratio quam significat nomen est definitio.” Cf. ARISTOTLE, *Metaphysica* Γ.7, 1012a23–24: “ὁ γὰρ λόγος οὗ τὸ ὄνομα σημεῖον ὀρισμὸς ἔσται.”

<sup>4</sup> *STh* I, q. 29 a. 2 ad 3: “essentia proprie est id quod significatur per definitionem.” *Ibid.*, co.: “Uno modo dicitur substantia quidditas rei, quam significat definitio, secundum quod dicimus quod definitio significat substantiam rei, quam quidem substantiam Graeci usiam vocant, quod nos essentiam dicere possumus.”

<sup>5</sup> *Ibid.*, ad 3: “Definitio autem complectitur principia speciei, non autem principia individualia.”

<sup>6</sup> *In Peri.* 1, l. 4, 27–32: “diffinitio ideo dicitur terminus quia includit totaliter rem, ita scilicet quod nichil rei est extra diffinitionem, cui scilicet diffinitio non conueniat, nec aliquid aliud est infra diffinitionem, cui scilicet diffinitio conueniat.”

<sup>7</sup> *In Sent.* 3, d. 23 q. 2 a. 1 ad 8: “si definitio de re aliqua daretur quae complete comprehenderet omnia principia rei, non esset unius rei nisi una definitio. Sed quia in quibusdam definitionibus ponuntur quaedam principia sine aliis, ideo contingit variari definitiones de una et eadem re.” *In Post. an.* 1, l. 16, 62–63: “contingit diffinitiones diuersas dari eiusdem rei, sumptas ex diuersis causis.”

<sup>8</sup> *In Metaph.* 7, l. 3, §§1324–5 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a6–9): “quod quid erat esse non est omnium quae habent qualemcumque rationem notificantem nomen, sed eorum solum, quorum ratio est definitio [*< τὸ τί ἦν εἶναι ἔστιν ὅσων ὁ λόγος ἔστιν ὀρισμὸς >*]. Ratio autem alicuius definitiva non est solum, si sit talis ratio, quae significat idem cum nomine; [...] quia sic sequeretur, quod omnes rationes essent termini [*< ὀρισμὸς >*], idest definitiones. [...] sed solum est definitio [...] si significet aliquid per se dictum.”

<sup>9</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “quaedam dicuntur habere rationem sic dictam, quae non definiuntur, sicut quantitas et qualitas et huiusmodi, quae non definiuntur, quia sunt genera generalissima.” Since a thing’s ratio is taken from its principles, the ratio of a *first* principle cannot be taken from others. Thus, a perfect definition requires both a proximate genus and a specific difference (see *In Metaph.* 5, l. 4, §805; cf. *ScG* 1, 25 n. 7); but this is impossible in the case of the highest genera, such as quantity and quality.

<sup>10</sup> *Ibid.*: “non refert, utrum illa quae dicuntur habere rationem, habeant vel non habeant definitionem.” We mention here *quantity* instead of *quality* because of its relevance to our purpose. St. Thomas (*ibid.*), on

## 8.2. Principle

The name **principle** (*principium* = ἀρχή, *beginning, origin*)<sup>11</sup> is imposed to signify that from which something is, proceeds, originates, begins (*illud a quo est aliquid, id a quo aliquid procedit, ex quo incipit aliquid*).<sup>12</sup> It is a common name, which—unlike special names—signifies something indefinitely, and therefore does not express the species of a thing in a definite way: anything from which (*a quo*) something proceeds in whatever mode is said to be its principle; and conversely.<sup>13</sup>

What the name *principle* indefinitely conveys (*dicit, importat*) in absolute, not determining some (specific) mode, is an *order of origin*.<sup>14</sup> And order is a relation.<sup>15</sup> Thus, *principle* names (*nominat*) only a relation.<sup>16</sup> Whence, the *ratio* of *principle* is in the genus of *relation*, and the name *principle* is said relatively (*relative dicitur*).<sup>17</sup>

*Principle* is said relatively *to that which is from the principle (relative ad principiatum)*.<sup>18</sup> Everything that is not a principle must be from principles.<sup>19</sup> Hence, it is necessary to understand some relation between a principle and the things that are from the principle: and not only a relation of origin—insofar as those things that are from a principle originate from the principle—but also a relation of diversity, for it is necessary to distinguish the former from the latter, since nothing is a principle of itself.<sup>20</sup>

---

the other hand, speaks of *quality* rather than *quantity* because he is resolving the question of how the name *wisdom* can be said of God, for wisdom is a quality, and yet in God there are no accidents (such as quantity and quality). Thus, he explains that the ratio of *wisdom* that is said of God is simply that which is conceived from the signification of the name *wisdom* when it is said of God, even if divine wisdom cannot be defined: “Et tamen ratio qualitatis est id quod significatur nomine qualitatis; et hoc est illud ex quo qualitas habet quod sit qualitas. [...] Et sic patet quod ratio sapientiae quae de Deo dicitur, est id quod concipitur de significatione hujus nominis, quamvis ipsa sapientia divina definiri non possit.” Unlike quantity and quality, divine wisdom cannot be defined because it is identical with God, and God, transcending all genera, cannot be defined (see, e.g., *Comp. th.* 1, c. 26, 8–10).

<sup>11</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ἀρχή.

<sup>12</sup> *In Sent.* 1, d. 29 q. 1 a. 1 ad 1: “nomen principii [...] imponitur ad significandum illud a quo est aliquid.” *Ibid.*, d. 12 q. 1 a. 2 ad 1: “principium importat originem quamdam, secundum quod dicitur principium, ex quo incipit aliquid.” *STh I*, q. 33 a. 1 ad 1: “hoc nomen principium nihil aliud significat quam id a quo aliquid procedit.”

<sup>13</sup> *STh I*, q. 33 a. 1 ad 1: “omne enim a quo aliquid procedit quocumque modo, dicimus esse principium; et e converso.” *De potentia*, q. 10 a. 1 ad 9: “nomina communia [...] indefinite aliquid significant, [...] nomina specialia [...] definite rei species exprimunt.”

<sup>14</sup> *In Sent.* 3, d. 11 q. 1 a. 1 ad 5: “nomen principii importat relationem originis absolute.” *In Sent.* 1, d. 29 q. 1 a. 1 co.: “principium dicit ordinem originis absolute, non determinando aliquem modum [...]”

<sup>15</sup> *In Physic.* 5, l. 3, n. 3: “ordo vero relatio est.” From this, St. Thomas shows (in *ibid.*; cf. ARISTOTLE, *Physica* E.2, 225b10–11) that there is no motion in the category of *position* because the latter involves an order that is reduced to the category of relation: “Situs autem ordinem quendam partium demonstrat.”

<sup>16</sup> *In Sent.* 1, d. 11 q. 1 a. 4 ad 3: “principium [...] nominat [...] tantum relationem.”

<sup>17</sup> *De potentia*, q. 2 a. 2 co.: “principium [...] relative dicitur [...]; ratio principii [...] in genere relationis est.”

<sup>18</sup> *ScG 2*, 11 n. 1: “principium autem relative ad principiatum dicitur.”

<sup>19</sup> *In Physic.* 1, l. 11, n. 11: “Omne quod non est principium, oportet esse ex principiiis.”

<sup>20</sup> *De potentia*, q. 7 a. 8 co.: “Oportet autem intelligi aliquam relationem inter principium et ea quae a principio sunt, non solum quidem relationem originis, secundum quod principiatum oriuntur a principio, sed

Because the *ratio* of *principle* conveys *some order to other things (ordinem quemdam ad alia)*, a principle is necessarily found in all those things in which there is an order (► 8.4).<sup>21</sup> Whereby, the name *principle* is said in multiple modes (i.e., analogically; ► 20.12, ¶3).<sup>22</sup>

For example, order is found in quantities; and, according to this, there is a principle in numbers (i.e., the unit), and (another principle) in longitudes (i.e., the point).<sup>23</sup> Likewise, order is found in time; and, according to this, there is a principle in time and in duration. Also, a twofold order is found in the disciplines: according to nature, and with respect to us; hence, there is a principle according to each. Order is also found in the production of a thing according to: (1) the thing generated, i.e., the first part itself of the thing generated or produced, as the foundation is said to be the principle of a house; and (2) the agent that produces it, in which the principle is threefold: (2a) the principle of intention (*intentionis*), which is the end that moves the agent; (2b) the principle of *ratio* (*rationis*), which is the form itself (of the thing to be generated or produced, as found) in the mind of the artificer; and (2c) the principle of execution (*executionis*), which is the operating potency (*potentia operans*, i.e., the operating power).

When used indefinitely, in absolute, and hence *according only to some order*, the name *principle* is more common than *cause*, as *cause* is more common than *element*; for no differences are included in its *ratio*: differences such as diversity of substance (essence), dependence of one upon another, or distance according to some perfection or virtue.<sup>24</sup>

---

etiam relationem diversitatis: quia oportet effectum a causa distingui, cum nihil sit causa sui ipsius." *In Metaph.* 1, l. 16, §253: "unum et idem non est sui ipsius principium: nisi forte dicatur quod unum multipliciter dicitur, ut distincto uno ponantur omnia esse unum genere, et non specie vel numero." *ScG* 2, 10 n. 1: "nihil est sui ipsius principium." *STh* I, q. 41 a. 4 ad 3: "Principium autem distinctionem importat ab eo cuius est principium."

<sup>21</sup> *In Metaph.* 5, l. 1, §751: "hoc nomen principium ordinem quemdam importat." *Super Io.* 1, l. 1: "Cum enim principium importet ordinem quemdam ad alia, necesse est invenire principium in omnibus, in quibus est ordo."

<sup>22</sup> *Super Io.* 1, l. 1: "principium, secundum Origenem, multis modis dicitur." This observation is probably drawn from ORIGEN's *De principiis*. We were unable to find an explicit quote in Paul KOETSCHAU (ed.), *Origenes Werke*, vol. 5 (Leipzig: J.C. Hinrich'sche Buchhandlung, 1913).

<sup>23</sup> *Super Io.* 1, l. 1: "Invenitur autem ordo in quantitibus; et secundum hoc dicitur principium in numeris et longitudine, puta lineae. Invenitur etiam ordo in tempore; et secundum hoc dicitur principium temporis, vel durationis. Invenitur ordo in disciplinis, et hic est duplex: secundum naturam, et quoad nos; et utroque modo dicitur principium. [...] Invenitur etiam ordo in productione rei; et secundum hoc principium dicitur ex parte generati, scilicet ipsa prima pars generati seu facti: sicut fundamentum dicitur principium domus. Vel ex parte facientis: et sic est triplex principium, scilicet intentionis, quod est finis, quod movet agentem; rationis, quod est ipsa forma in mente artificis; et executionis, quod est potentia operans."

<sup>24</sup> *In Metaph.* 5, l. 1, §750: "hoc nomen principium communius est quam causa: aliquid enim est principium, quod non est causa; sicut principium motus dicitur terminus a quo. Et iterum causa est in plus quam elementum. Sola enim causa intrinseca potest dici elementum." *Contra err. Gr.* 1, c. 1, 63–64: "Sicut autem causa est communius quam elementum, ita et principium quam causa." *De potentia*, q. 10 a. 1 ad 9: "causa communior est quam elementum, quod significat aliquid primum et simplex in genere causae materialis, ita etiam principium est communius quam causa." *STh* I, q. 33 a. 1 ad 1: "principium communius est quam causa, sicut causa communius quam elementum [...]. Unde hoc nomen causa videtur importare diversitatem substantiae, et dependentiam alicuius ab altero; quam non importat

Hence, some principles are consubstantial with—i.e., not outside the essence of—that which is from them: for example, a point is consubstantial with the line that flows from it (that is, if we imagine, as geometers do, that a moved point produces a line);<sup>25</sup> and the foundation is of a house's essence.<sup>26</sup>

Also, a principle need not have an influence towards the being of the thing that is from it (*aliquam influentiam ad esse principiati*): for example, morning is said to be a principle of night (and yet—to be—night does not depend on morning).<sup>27</sup> Likewise, the point is said to be the principle of the line, but not its cause.<sup>28</sup> Moreover, the *terminus a quo* (whence motion begins: e.g., the first terminus of a length; or a privation or a contrary, such as non-white or black) is said to be a principle of motion.<sup>29</sup> And not only the first terminus of a thing is said to be its principle, but so is its first part, insofar only as there is some order: for example, the point (i.e., the first terminus of a line, which *is not* itself a line) is said to be the principle of the line; and the first part of the line (which *is* itself a line) is also said to be its principle.<sup>30</sup>

A principle can be considered in two ways: (1) (in regard to) *that which is a principle (id quod est principium; ►8.3)*; and (2) *according to the relation of principle (secundum relationem principii; ►8.7)*.<sup>31</sup> Considered in the latter mode, the *ratio* of *principle*, which is in the genus of *relation*, befits (*convenit*) any principle, and some relation befalls (*accidit*) every principle; but considered in the former mode, not everything that is a principle is in

---

nomen principii. In omnibus enim causae generibus, semper invenitur distantia inter causam et id cuius est causa, secundum aliquam perfectionem aut virtutem. Sed nomine principii utimur etiam in his quae nullam huiusmodi differentiam habent, sed solum secundum quendam ordinem.”

<sup>25</sup> See, for example, *In Physic.* 4, l. 18, n. 4 (cf. ARISTOTLE, *Physica* Δ.11, 219b15–28): “Imaginemur igitur secundum geometras, quod punctus motus faciat lineam”; *In De caelo* 1, l. 15, n. 8 (cf. ARISTOTLE, *De caelo* A.1, 268a30–b3): “Et utitur modo loquendi quo utuntur geometrae, imaginantes quod punctus motus facit lineam, linea vero mota facit superficiem, superficies autem corpus.”

<sup>26</sup> St. Thomas often adds to these the ancient example of the heart—or brain—of an animal. *In Sent.* 1, d. 12 q. 1 a. 2 ad 1: “principium aliquod a quo aliquid fluit, est consubstantiale rei cuius est principium; sicut dicimus, quod punctum est principium lineae, et cor principium animalis, et fundamentum domus.” *In Sent.* 1, d. 29 q. 1 a. 1 co.: “Invenitur enim aliquod principium quod non est extra essentiam principiati, sicut punctus a quo fluit linea.”

<sup>27</sup> *In Sent.* 1, d. 29 q. 1 a. 1 co.: “Invenitur enim aliquod principium [...] quod non habet aliquam influentiam ad esse principiati, [...] sicut mane dicitur principium diei.”

<sup>28</sup> *Contra err. Gr.* 1, c. 1, 64–65: “dicitur enim punctum principium lineae sed non causa.”

<sup>29</sup> *De potentia*, q. 10 a. 1 ad 9: “prima pars motus vel lineae dicitur principium sed non causa. In quo patet quod principium potest dici aliquid quod non est secundum essentiam distinctum, ut punctum lineae; non autem causa, maxime si loquamur de causa originante, quae est causa efficiens.” *In Sent.* 1, d. 29 q. 1 a. 1 co.: “Invenitur enim aliquod principium [...] quod non habet aliquam influentiam ad esse principiati, sicut terminus a quo dicitur principium motus.”

<sup>30</sup> *STh* I, q. 33 a. 1 ad 1: “primus enim terminus, vel etiam prima pars rei dicitur principium [...] solum secundum quendam ordinem, sicut cum dicimus punctum esse principium lineae, vel etiam cum dicimus primam partem lineae esse principium lineae.”

<sup>31</sup> *In Sent.* 1, d. 9 q. 2 a. 1 ad 3: “principium potest dupliciter considerari: vel id quod est principium [...]; vel secundum relationem principii [...].” Cf. *De potentia*, q. 1 a. 1 ad 3.

the genus of *relation*: for example, potency (*potentia*, i.e., power) and science (*scientia*) are principles in the genus of *quality*,<sup>32</sup> while matter (i.e., the matter that corresponds to a substantial form) is a principle in the genus of *substance*.<sup>33</sup> In this way, the name *principle* signifies—through the mode of a noun—a *property*.<sup>34</sup>

The **end** or **terminus** (*finis vel terminus*; ► 8.8) is the opposite or contrary of a *principle*.<sup>35</sup> Thus, *principle* and *end* have opposite *ratios*: if a principle and an end were the same in respect of the same, opposites would be in the same (subject) according to the same (which is impossible; e.g., the same number cannot be both even and odd).

### 8.3. First

The *ratio* of **first** is *that before which there is nothing* (*primum est ante quod nihil*).<sup>36</sup> Thus, it consists in a removal—i.e., *not to be from a principle* belongs to the *ratio* of *first*—which is best established by negation, as happens with *blindness* (i.e., the privation of sight).

Since *that which is a principle* is naturally prior to *that of which it is a principle* (*id quod est principium est prius naturaliter eo cuius est principium*),<sup>37</sup> *first* and *principle* seem to be

---

<sup>32</sup> *De potentia*, q. 2 a. 2 co.: “potentia secundum suam rationem est principium quoddam [...]. Sed [...] licet potentiae conveniat ratio principii, quod in genere relationis est, tamen id quod est principium actionis vel passionis, non est relatio, sed aliqua forma absoluta; et id est essentia potentiae; et inde est quod Philosophus ponit potentiam non in genere relationis, sed qualitatis, sicut et scientiam, quamvis utrique aliqua relatio accidat.”

<sup>33</sup> *In Sent.* 1, d. 3 q. 4 a. 2 ad 4: “si per potentiam passivam intelligatur relatio vel ordo materiae ad formam, tunc materia non est sua potentia, quia essentia materiae non est relatio. Si autem intelligatur potentia, secundum quod est principium in genere substantiae, secundum quod potentia et actus sunt principia in quolibet genere, ut dicitur, in 12 *Metaph.*, sic dico, quod materia est ipsa sua potentia.”

<sup>34</sup> *STh* I, q. 36 a. 4 co.: “licet hoc nomen principium significet proprietatem, tamen significat eam per modum substantivi, sicut hoc nomen pater vel filius etiam in rebus creatis.”

<sup>35</sup> *In Physic.* 4, l. 21, n. 6 (cf. ARISTOTLE, *Physica* Δ.13, 222b5–7): “Principium enim et finis habent oppositas rationes: si ergo idem esset principium et finis respectu eiusdem, opposita inessent eidem secundum idem.” Cf. *In Metaph.* 5, l. 1, §751: “Ex parte vero opposita sive contraria, est diversum vel alterum, idest finis vel terminus,” where St. Thomas is commenting the phrase “ex opposito autem alterum,” corresponding to the last four words in ARISTOTLE, *Metaphysica* Δ.1, 1012b34–1013a1: “Ἀρχὴ λέγεται ἢ μὲν ὅθεν ἂν τις τοῦ πράγματος κινηθεῖ πρῶτον, οἷον τοῦ μήκους καὶ ὁδοῦ ἐντεῦθεν μὲν αὕτη ἀρχή, ἐξ ἐναντίας δ' ἑτέρα.” The ROSS edition translates this text as “‘Beginning’ means (1) that part of a thing from which one would start first, e.g., a line or a road has a beginning in either of the contrary directions.” Thus, ARISTOTLE seems not to be referring to the terminus *ad quem* but to another principle. However, a careful reading of the commentary will show that St. Thomas is correlating this text with ARISTOTLE, *Metaphysica* Δ.17, 1022a10–13: “ὥστε φανερόν ὅτι ὁσαυτῶς τε ἡ ἀρχὴ λέγεται, τοσαυτῶς καὶ τὸ πέρασ, καὶ ἐπι πλεοναχῶς: ἢ μὲν γὰρ ἀρχὴ πέρασ τι, τὸ δὲ πέρασ οὐ πᾶν ἀρχή,” which the ROSS edition renders thus: “Evidently, therefore, ‘limit’ has as many senses as ‘beginning’, and yet more; for the beginning is a limit, but not every limit is a beginning.” Therefore, St. Thomas is clearly not misrepresenting ARISTOTLE: the contrary principle is not only a principle, as the Stagirite points out, but also a terminus, which is what St. Thomas is highlighting here.

<sup>36</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 1: “illud cuius ratio consistit in remotione, optime per negationem certificatur, sicut caecitas et hujusmodi: et hujusmodi est ratio primi, vel ejus quod est non de principio esse, quia primum est ante quod nihil.”

<sup>37</sup> *In Sent.* 1, d. 9 q. 2 a. 1 ad 3: “principium potest [...] considerari [...] id quod est principium, et hoc est prius naturaliter eo cuius est principium.” *Ibid.*, d. 12 q. 1 a. 1 ad 1: “principium, secundum relationem principii non est eo prius cuius est principium aliquo modo; sed id quod est principium, naturaliter est prius.” Cf. *In Metaph.* 12, l. 4 §2459 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b2–3, referring to στοιχείον).

the same (*idem enim videtur esse primum et principium* < ταὐτὸ γὰρ λέγω πρῶτον καὶ ἀρχήν); for *the first and maximum* (in virtue) *in each genus* (►27) *is the cause* (►9) *of those things that are posterior*, as ARISTOTLE says.<sup>38</sup>

Whence, ARISTOTLE reduces to something common the diverse modes in which *principle* is said; for, in each of them, **principle** is *the first whence* (*primum unde* = τὸ πρῶτον ὅθεν) something proceeds: whether in respect of the being of the thing (*in esse rei* < ἔστιν), as the first part of a thing is said to be its principle; or in respect of the coming-to-be of the thing (*in fieri rei* < γίγνεται), as the first mover is said to be its principle; or in respect of the cognition of the thing (*in rei cognitione* < γινώσκειται).<sup>39</sup>

#### 8.4. Intrinsic and Extrinsic Principles

Although principles (generically) agree in that any of them is *that which is first*, they differ in that some are **intrinsic** (*inexistens, idest intrinsecum* = ἐνυπάρχοντος), that is, *existing within*, while others are **extrinsic** (*non inexistens, idest extrinsecum* = μὴ ἐνυπάρχοντος; i.e., *extra rem*, not existing within the thing of which they are principles).<sup>40</sup>

For example, nature and element are *intrinsic* principles (►12).<sup>41</sup> Nature is a principle as that from which motion begins; element, as the first part in the generation of a thing.

<sup>38</sup> *In Post. an.* 1, l. 4, 319–322: “*idem enim videtur esse primum et principium: nam primum in unoquoque genere et maximum, est causa eorum que sunt post, ut dicitur in II Methaphisice.*” Cf. ARISTOTLE, *Analytica Posteriora* A.2, 72a5–7: “ἐκ πρώτων δ’ ἐστὶ τὸ ἐξ ἀρχῶν οἰκείων: ταὐτὸ γὰρ λέγω πρῶτον καὶ ἀρχήν.” The reference is to ARISTOTLE, *Metaphysica* α.1, 993b23–31: “οὐκ ἴσμεν δὲ τὸ ἀληθές ἄνευ τῆς αἰτίας. ἕκαστον δὲ μάλιστα αὐτὸ τῶν ἄλλων καθ’ ὃ καὶ τοῖς ἄλλοις ὑπάρχει τὸ συνώνυμον, οἷον τὸ πῦρ θερμότατον: καὶ γὰρ τοῖς ἄλλοις τὸ αἴτιον τοῦτο τῆς θερμότητος: ὥστε καὶ ἀληθέστατον τὸ τοῖς ὑστέροις αἴτιον τοῦ ἀληθέσιν εἶναι. διὸ τὰς τῶν αἰδὸντων ἀρχὰς ἀναγκαῖον αἰε εἶναι ἀληθεστάτας: οὐ γὰρ ποτε ἀληθεῖς, οὐδ’ ἐκείναις αἰτιότις ἐστὶ τοῦ εἶναι, ἀλλ’ ἐκείναις τοῖς ἄλλοις, ὡσθ’ ἕκαστον ὡς ἔχει τοῦ εἶναι, οὕτω καὶ τῆς ἀληθείας.” The Ross edition renders this passage thus: “we do not know a truth without its cause; and <a> [each] thing has <a quality> in a higher degree than other things if in virtue of it the <similar quality> [univocal] belongs to the other things as well (e.g. fire is the hottest of things; for it is the cause of the heat of all other things); so that that which causes <derivative> [posterior] <truths> to be true is most true. Hence the principles of eternal things must be always most true (for they are not merely sometimes true, nor is there any cause of their being, but they themselves <are the cause of the being> of other things), so that as each thing is in respect of being, so is it in respect of truth.”

<sup>39</sup> *In Metaph.* 5, l. 1, §761 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a17–20): “reducit [Philosophus] omnes praedictos modos ad aliquid commune; et dicit quod commune in omnibus dictis modis est, ut dicatur principium illud, quod est primum, aut in esse rei, sicut prima pars rei dicitur principium, aut in fieri rei, sicut primum movens dicitur principium, aut in rei cognitione.”

<sup>40</sup> *In Metaph.* 5, l. 1, §§761–2 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a17–19): “reducit [Philosophus] omnes praedictos modos ad aliquid commune; et dicit quod commune in omnibus dictis modis est, ut dicatur principium illud, quod est primum [...]. Sed quamvis omnia principia in hoc, ut dictum est, convenient, differunt tamen, quia quaedam sunt intrinseca, quaedam extrinseca.” Ibid., §754 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a4; 7): “Quod quidem principium [sc., *in generatione vel fieri rerum*] dupliciter se habet. Aut enim est *inexistens*, idest intrinsecum; vel *non est inexistens*, idest extrinsecum.” Ibid., §763: “*inexistens*, idest intus existens.”

<sup>41</sup> *In Metaph.* 5, l. 1, §762 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a19–24): “natura potest esse principium et elementum, quae sunt intrinseca. Natura quidem, sicut illud a quo incipit motus: elementum autem sicut pars prima in generatione rei. [...] Et iterum quasi intrinsecum dicitur principium substantia rei, idest forma quae est principium in essendo, cum secundum eam res sit in esse.”

Likewise, the substantial form (*substantia* = οὐσία; ► 15.12) that is a principle in being (*in essendo*) is said to be a principle as intrinsic; for the thing has being (*esse*) through it. Also, the foundation is a principle of a house according to (the mode of) matter (► 9.3); and *animal* (is a principle) of *man* (i.e., human being) according to form (► 9.5).<sup>42</sup>

On the other hand, the mind or intellect (*mens* = διάνοια), and the purpose (*praevoluntas* = προαίρεσις), are said to be principles as *extrinsic*.<sup>43</sup> Hence, the end (► 9.8) for the sake of which something comes to be, is also said to be a principle; for the good, which has the *ratio* of *end* in pursuing, and the bad in avoiding, are principles of cognition and of motion in many things; and such are all those that are done for the sake of an end.

### 8.5. Order

The *ratio* of **order** (*ordo* = τάξις) includes three (*ratios*):<sup>44</sup> (1) the *ratio* of **prior and posterior** (► 8.6); (2) (the *ratio* of) **distinction** (► 40.7); for there is no order except among distinct things, although the name *order* presupposes distinction rather than signifying it; and (3) the *ratio* of the order whence the species of order is derived (i.e., the *ratio* of a specific difference in the genus of order according to prior and posterior):<sup>45</sup> thus, there is an order *according to place*; another, *according to dignity*; another, *according to origin*, etc.

If multiple things are to have an order, it is necessary for each of them to be: (1) a being (*ens*); (2) distinct (*distinctum*), for there is no order of the same to itself; and (3) susceptible of being ordered to the other (*ordinabile ad aliud*).<sup>46</sup> Hence, together with distinction, *order*

<sup>42</sup> *In Metaph.* 12, l. 4, §2469: “Sunt enim quaedam principia intrinseca [...]. Sicut fundamentum est principium domus secundum materiam, et animal hominis secundum formam.”

<sup>43</sup> *Ibid.*: “mens, idest intellectus, et praevoluntas, idest propositum, dicuntur principia quasi extrinseca. [...] Et secundum etiam praedicta, finis cuius causa fit aliquid, dicitur etiam esse principium. Bonum enim, quod habet rationem finis in prosequendo, et malum in vitando, in multis sunt principia cognitionis et motus, sicut in omnibus quae aguntur propter finem. In naturalibus enim, et moralibus et artificialibus, praecipue demonstrationes ex fine sumuntur.”

<sup>44</sup> *In Sent.* 1, d. 20 q. 1 a. 3 qc. 1 co.: “ordo in ratione sua includit tria, scilicet rationem prioris et posterioris; [...] Includit etiam distinctionem, quia non est ordo aliquorum nisi distinctorum. Sed hoc magis praesupponit nomen ordinis quam significet. Includit etiam tertio rationem ordinis, ex qua etiam ordo in speciem trahitur. Unde unus est ordo secundum locum, alius secundum dignitatem, alius secundum originem, et sic de aliis.”

<sup>45</sup> This becomes clearer if we consider what St. Thomas immediately adds about divine order (in the same passage of *In Sent.* 1, d. 20 q. 1 a. 3 qc. 1 co.), explaining that the species of order *of origin* is the one that befits the order *of nature* found therein, but only with respect to the ratio of the specific difference (i.e., *according to origin*) and not with respect to the ratio of the genus (i.e., [order of] *priority and posteriority*). Cf. *ibid.*, ad 3: “Ad tertium [sc., *ubicumque est ordo, est aliquis gradus*] dicendum, quod illa ratio procedit de ordine quantum ad rationem generis, prout ponit prius et posterius, quod nullo modo divinis competit.”

<sup>46</sup> *De potentia*, q. 7 a. 11 co.: “Ad hoc autem quod aliqua habeant ordinem, oportet quod utrumque sit ens, et utrumque distinctum (quia eiusdem ad seipsum non est ordo) et utrumque ordinabile ad aliud.” *In De div. nom.*, c. 4, l. 1: “Dico autem distinctionem cum convenientia, quia ubi non est distinctio, ordo locum non habet; si autem quae distinguuntur in nullo convenient, unius ordinis non essent.” *Ibid.*, c. 5

includes **agreement** (*convenientia*), which is also called **harmony** (*harmonia*); for if those things that are distinct were to agree in nothing, there would be no order.

Because *order* includes some mode of *prior and posterior*, there necessarily is an order wherever there is a principle.<sup>47</sup> Whence, there are as many modes in which there can be said to be an order among things as there are modes in which one thing can be said to be prior to another: according to place, by comparison to the principle of place; in the disciplines, by comparison to the principle of a discipline; likewise, in time, etc.<sup>48</sup>

Since the name *order* is always said by comparison to some principle, just as *principle* is said in multiple modes, so *order* is said in multiple modes: for example, *according to site* (*secundum situm*), as the point is the principle of the line; *according to what is understood* (*secundum intellectum*), as an axiom is a principle of demonstration; or according to each of the individual causes (i.e., formal, material, efficient, and final).<sup>49</sup>

## 8.6. Prior and Posterior

**Prior** (*prius* = πρότερον) and **posterior** (*posterius* = ὕστερον) are names that signify an order.<sup>50</sup> They are—in whatever order—said by comparison to (*per comparisonem ad*), according to a relation to (*secundum relationem ad*) the principle of that order.<sup>51</sup> Whence, *prior* and *posterior* are said in multiple modes.<sup>52</sup> **Prior** is *that which is nearer some determinate principle* (*quod est propinquius alicui determinato principio*; and **posterior**, *what is farther from it*).<sup>53</sup> The signification of *prior* depends on the signification of *principle* because *the principle in every genus is that which is first in the genus* (► 27).

---

I. 1: “ponit [Dionysius] ea quae pertinent ad sapientiam; et dicit quod ex Deo est *omnis sapientia*. Et quia sapientis est ordinare, subiungit: et *omnis ordo* et *omnis harmonia*, quae est convenientia ordinis.”

<sup>47</sup> *STh* II-II, q. 26 a. 1 co.: “Ordo autem includit in se aliquem modum prioris et posterioris. Unde oportet quod ubicumque est aliquod principium, sit etiam aliquis ordo.” *Quodlibet* 5, q. 10 a. 1 co.: “prius et posterius dicuntur in quolibet ordine per comparisonem ad principium illius ordinis; sicut in loco per comparisonem ad principium loci, in disciplinis per comparisonem ad principium disciplinae.” *STh* II-II, q. 26 a. 6 co.: “in omnibus in quibus invenitur aliquod principium, ordo attenditur secundum comparisonem ad illud principium.”

<sup>48</sup> *In Sent.* 1, d. 20 q. 1 a. 3 qc. 1 co.: “unde secundum omnes illos modos potest dici esse ordo aliquorum, secundum quos aliquis altero prius dicitur et secundum locum et secundum tempus et secundum omnia huiusmodi.”

<sup>49</sup> *STh* I, q. 42 a. 3 co.: “ordo semper dicitur per comparisonem ad aliquod principium. Unde sicut dicitur principium multipliciter, scilicet secundum situm, ut punctus, secundum intellectum, ut principium demonstrationis, et secundum causas singulas; ita etiam dicitur ordo.”

<sup>50</sup> *In Metaph.* 5, l. 13, §936: “hic [sc., *Metaphysica* Δ.11, 1018b9–1019a14] distinguit [Philosophus] nomina significantia ordinem, scilicet prius et posterius.”

<sup>51</sup> *STh* II-II, q. 26 a. 1 co.: “sicut Philosophus dicit, in V *Metaphys.* prius et posterius dicitur secundum relationem ad aliquod principium.” *Quodlibet* 5, q. 10 a. 1 co.: “secundum Philosophum in V *Met.* prius et posterius dicuntur in quolibet ordine per comparisonem ad principium illius ordinis.”

<sup>52</sup> *In Sent.* 4, d. 2 q. 1 a. 3 co.: “prius et posterius multipliciter dicitur.”

<sup>53</sup> *In Metaph.* 5, l. 13, §936: “significatio prioris dependet a significatione principii. Nam principium in unoquoque genere est id, quod est primum in genere. Prius autem dicitur, quod est propinquius alicui

Something is said (to be) *prior* either according to the *ratio* of some principle (*secundum rationem alicuius principii*) or because it is nearer a principle (*principio propinquius est*).<sup>54</sup> The mode of order of a principle and of that which is near a principle can be considered in multiple ways: either (1) something is a principle and a first (*principium et primum*) simply and according to nature (*simpliciter et secundum naturam*), as the father is the principle of the son; or (2) it is a principle in relation to something (*principium ad aliquid*): that is, because of an order (*per ordinem*) to something *extrinsic*.<sup>55</sup> In the latter mode, something that is according to itself (*secundum se*) posterior, is said to be prior in respect to something (*quantum ad aliquid*): whether in respect of cognition, perfection, dignity, or something of this sort; whether it is said to be a principle and prior in respect of where (*quantum ad ubi*), or in some other way. On the other hand, something can be taken as prior to something (else) in one comparison, and as posterior in respect to another thing in another comparison.<sup>56</sup> And thus, something diversely taken is prior and posterior in some comparison.

(The *ratios* of) *prior* and *posterior* follow upon the *ratio* of *one* (► 38.1), because *one* conveys (*importat*) some order; for to be one is to be a principle (► 27).<sup>57</sup>

### 8.7. Simultaneous

(In some order, those are **simultaneous** [*simul* = ἅμα] of which one is neither prior nor posterior to the other. Whence, *simultaneous* is said in as many modes as *prior* and *posterior*: e.g., simultaneous in time, in nature, in *ratio*, in being, in predication, etc.)<sup>58</sup>

---

determinato principio.” Cf. ARISTOTLE, *Metaphysica* Δ.11, 1018b9–12: “πρότερα καὶ ὕστερα λέγεται ἕνια μὲν, ὡς ὄντος τινὸς πρώτου καὶ ἀρχῆς ἐν ἐκάστῳ γένει, τῷ ἐγγύτερον <εἶναι> ἀρχῆς τινὸς ὠρισμένης ἢ ἀπλῶς καὶ τῇ φύσει ἢ πρὸς τι ἢ τοῦ ἢ ὑπὸ τινῶν.”

<sup>54</sup> *De virtutibus*, q. 4 a. 3 co.: “prius dicitur aliquid, vel secundum rationem alicuius principii, vel quia principio propinquius est.”

<sup>55</sup> *In Metaph.* 5, l. 13, §936: “Huiusmodi autem ordo principii [sc., prioris et posterioris], et eius, quod est principio propinquum, potest attendi multipliciter. Aut enim aliquid est principium et primum simpliciter et secundum naturam, sicut pater est principium filii. Aut est principium ad aliquid, idest per ordinem ad aliquid extrinsecum; sicut dicitur id, quod est secundum se posterius, esse prius quantum ad aliquid; vel quantum ad cognitionem, vel perfectionem, vel dignitatem, vel aliquo tali modo. Vel etiam dicitur aliquid esse principium et prius quantum ad ubi. Aut etiam aliquibus aliis modis.”

<sup>56</sup> *In Sent.* 2, d. 16 q. 1 a. 4 ad 4: “in una comparatione potest aliquid accipi ut prius aliquo, quod in alia accipitur ut posterius respectu alterius: secundum quem modum possunt comparari potentiae intellectivae naturae ad habitus, quibus inveniuntur priores, vel una ad alteram, et sic est una prior altera. [...] aliquid est prius et posterius in aliqua comparatione diversimode acceptum.”

<sup>57</sup> *In Metaph.* 5, l. 11, §906: “In secunda [pars], [Philosophus distinguit] nomina, quae significant, aliquod consequens ad rationem unius, scilicet prius et posterius. Nam unum esse, est principium esse [...]” *Ibid.*, l. 13, §936: “Unum enim quemdam ordinem importat, eo quod uni esse est principium esse, ut supra [l. 11, §906] dictum est.”

<sup>58</sup> We were unable to find an explicit *ratio* of *simul* in St. Thomas, but it can be inferred from multiple places in his work. And we find the requirements in ARISTOTLE, *Categoriae* 13, 14b24–27: “Ἄμα δὲ λέγεται ἀπλῶς μὲν καὶ κυριώτατα ὧν ἡ γένεσις ἐν τῷ αὐτῷ χρόνῳ· οὐδέτερον γὰρ πρότερον οὐδὲ ὕστερόν ἐστιν· ἅμα δὲ κατὰ τὸν χρόνον ταῦτα λέγεται.” Evidently, what is required is (1) an agreement in some order (in this case, in time, κατὰ τὸν χρόνον); (2) a distinction that is *not* based on priority and posteriority (in this case, the things that are generated, ὧν... ταῦτα); (3) the negation of priority and posteriority (οὐδέτερον...)

Considered *according to the relation of principle*, every principle is simultaneous with the thing that is from it: not only *in nature*, but also *in understanding*, insofar as one is in the *ratio* of the other.<sup>59</sup>

Those things are relative (►37.1) *in nature* which are mutually referred to for the same reason, or *ratio (pari ratione)*: for example, father to son, master to servant, double to half.<sup>60</sup> But it is not necessary for the subjects of such relative things—which are **simultaneous in nature**—to be naturally simultaneous (►47.1): rather, only the relations (need to be simultaneous). On the other hand, those relative things in which the *ratio* of referring is not the same on one part and on the other (*non est eadem ratio referendi ex utraque parte*) are **not simultaneous in nature**: rather, one of them is naturally prior, as, for example, ARISTOTLE says of sense and sensible (*de sensu et sensibili*), and (of) science and the scientifically knowable (*scientia et scibili*).

If a relation is an accident (►37.20), it presupposes a distinction of suppositum (i.e., the relation would then be from one individual subject to another).<sup>61</sup> On the other hand, if the

---

πρότερον οὐδὲ ὕστερόν ἐστιν); likewise, in the order of nature, simultaneous are any correlatives of which one is not the cause of the other, as *double* and *half* (ibid., 27–32). In St. Thomas, *In De gen.* 1, l. 5 n. 5: “si enim esset simul quaelibet pars eius, iam non esset secundum prius et posterius.” *In Physic.* 4, l. 15, n. 7: “Illa dicuntur esse simul secundum tempus, et nec prius nec posterius, quae sunt in eodem nunc.” Cf. ARISTOTLE, *Physica* Δ.10, 218a25–27: “εἰ τὸ ἅμα εἶναι κατὰ χρόνον καὶ μήτε πρότερον μήτε ὕστερον τὸ ἐν τῷ αὐτῷ εἶναι καὶ ἐν τῷ νῦν ἐστιν.” *In Sent.* 1, d. 9 q. 2 a. 1 co.: “simul sunt omnibus modis praedictis. Unde patet quod [...] nullo modo potest esse prior [...]” *In Sent.* 2, d. 2 q. 1 a. 1 co.: “ubicumque est prius et posterius, oportet intelligere partem priorem et posteriorem, et in nulla duratione partes priores et posteriores sunt simul; unde oportet quod quando est prius non sit posterius; et ideo oportet posterius de novo advenire, cum prius non fuerit.” *Comp. th.* 1, c. 150, 2–17: “Sicut enim ex motu causatur tempus in quo prius et posterius inuenitur, ita oportet quod remoto motu cesset prius et posterius: et sic ratio eternitatis relinquatur, que est tota simul.” *STh I*, q. 13 a. 5 co.: “aevum est totum simul, non tamen est eternitas, quia compatitur secum prius et posterius.” That *simultaneous* is said in multiple modes can be inferred from what has been said so far; and it is corroborated by many places in which things are said to be simultaneous in some order but not in another. For example, *In Sent.* 1, d. 3 q. 4 a. 3 ad 1: “quamvis sint simul tempore, nihilominus tamen una naturaliter prior est altera.” *In Sent.* 4, d. 16 q. 1 a. 1 q. 3 co.: “quandoque plures eorum, quorum unus est altero prior per naturam, sunt simul tempore.” *STh I*, q. 77 a. 4 ad 1: “alicuius generis species se habent secundum prius et posterius, sicut numeri et figurae, quantum ad esse; licet simul esse dicantur in quantum suscipiunt communis generis praedicationem.” *In Sent.* 3, d. 23 q. 2 a. 5 co.: “aliquid potest dici prius altero et tempore et natura. Tempore quidem omnes virtutes sunt simul, quia simul divinitus infunduntur; sed secundum naturam ordo virtutum pensandus est ex actibus, sicut et ordo potentiarum, quae simul in anima concreantur.”

<sup>59</sup> *STh I*, q. 42 a. 3 ad 2: “si considerentur ipsae relationes causae et causati, et principii et principiatii, manifestum est quod relativa sunt simul natura et intellectu, in quantum unum est in definitione alterius.” For example, *according to the relation of principle*, father and son are simultaneous in the order of understanding because when we understand *son*, we co-understand the principle *father*; and they are simultaneous in the order of nature because the relation of father and son can only exist if the two terms of the relation exist.

<sup>60</sup> *De potentia*, q. 7 a. 8 ad 1: “illa relativa sunt simul natura quae pari ratione mutuo referuntur, sicut pater ad filium, dominus ad servum, duplum ad dimidium. Illa vero relativa in quibus non est eadem ratio referendi ex utraque parte, non sunt simul natura, sed alterum est prius naturaliter, sicut etiam Philosophus dicit, de sensu et sensibili, scientia et scibili. [...] Nihilominus autem non est necesse in illis etiam relativis quae sunt simul natura, quod subiecta sint naturaliter simul sed relationes solae.”

<sup>61</sup> *STh I*, q. 40 a. 2 ad 4: “relatio praesupponit distinctionem suppositorum, quando est accidens, sed si relatio sit subsistens, non praesupponit, sed secum fert distinctionem. Cum enim dicitur quod relativity esse est ad aliud se habere, per ly aliud intelligitur correlativum, quod non est prius, sed simul natura.”

relation should be subsistent, then, rather than presupposing a distinction, it would bear (*ferē*) in itself the distinction; for, when it is said that to be relatives is to be (related) to another (*relativi esse est ad aliud se habere*), the correlative is understood by *another* (*aliud*), which is not prior but simultaneous in nature.<sup>62</sup>

Hence, it is not impossible for some principle to altogether be naturally simultaneous with the thing that is from it.<sup>63</sup> And even if the name *principle* would not befit such a (priority-less) principle in respect of the mode of signifying, the *ratio* of *principle* would most properly befit it in respect of the thing signified, for the name *principle* is imposed to signify *origin* rather than *priority* (► 8.2).<sup>64</sup>

### 8.8. Terminus

The *ratio* of **terminus** (*terminus* = πέρας, *end, limit, boundary*; ὀρισμός, *limitation, marking out by boundaries; definition of a thing*)<sup>65</sup> is *that which is last of anything* (*quod est ultimum cuiuslibet <rei> = τὸ ἔσχατον ἐκάστου*) *in such a way that nothing that belongs to what is first terminated is outside the terminus itself* (*ita quod nihil de primo terminato est extra ipsum terminum < et cuius extra nihil est accipere primi = καὶ οὐ ἔξω μηδὲν ἔστι λαβεῖν πρώτου*) *and everything that belongs to it, is contained in it* (*et omnia quae sunt eius, continentur intra ipsum < et cuius infra omnia primi = καὶ οὐ ἔσω πάντα πρώτου*).<sup>66</sup> (The expression) *of a first* (*primi* = πρώτου) is added because it may happen that that which is last of a first is the principle of a second: for example, the *now* that is the last of the past, is the principle of the future.

<sup>62</sup> Cf. *In Sent.* 1, d. 9 q. 2 a. 1 ad 3: “principium potest dupliciter considerari: vel id quod est principium, et hoc est prius naturaliter eo cuius est principium; vel secundum relationem principii, et sic est simul naturaliter cum principiato.”

<sup>63</sup> *In Sent.* 1, d. 9 q. 2 a. 1 ad 3: “Si igitur esset aliquis ab eodem habens quod sit aliquis et quod sit ad aliquid; omnino simul esset naturaliter cum eo ad quod diceretur.” Cf. *ibid.*, d. 12 q. 1 a. 1 ad 1.

<sup>64</sup> *De potentia*, q. 10 a. 1 ad 10: “licet principium secundum rationem nominis a prioritatem sumatur, non tamen imponitur ad significandum prioritatem sed originem; sicut etiam hoc nomen lapis non imponitur ad significandum laesionem pedis, licet ab hoc nomen sumi videatur.” As St Thomas explains (*In Sent.* 1, d. 29 q. 1 a. 1 ad 1), although the name *principle* expresses an order of origin indefinitely and in absolute, it is imposed from some priority because of the way it is found in creatures, in which every principle is prior—in some mode—to that which is from it. (Note that, in beings composed of act and potency, act is naturally prior: only within something that is pure act can there be no prior or posterior.)

<sup>65</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entries for πέρας and ὀρισμός. St. Thomas often uses other words akin to *terminus*, such as *finis*, *extremitas* (e.g., *In Metaph.* 5, l. 1, §778: “ex terminis praemissarum componitur conclusio, scilicet ex maiori et ex minori extremitate”; *ibid.* 11, l. 2, §2185: “Punctum enim quod est in extremitate lineae, est terminus lineae”), *ultimum* (*In Sent.* 2, d. 1 q. 1 a. 5 ad 6: “aliquid est primum et aliquid ultimum, secundum terminum a quo et in quem”; *STh I-II*, q. 12 a. 2 co.: “In motu autem potest accipi terminus dupliciter, uno modo, ipse terminus ultimus, in quo quiescitur, qui est terminus totius motus; alio modo, aliquid medium, quod est principium unius partis motus, et finis vel terminus alterius”). Whence the alternative renderings such as *term*, *extremity*, *end*, *last*, etc.

<sup>66</sup> *In Metaph.* 5, l. 19, §1044 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a4–5): “ponit [Philosophus] rationem termini; dicens, quod terminus dicitur quod est ultimum cuiuslibet rei, ita quod nihil de primo terminato est extra ipsum terminum; et omnia quae sunt eius, continentur intra ipsum. Dicit autem primi quia contingit id, quod est ultimum primi, esse principium secundi; sicut nunc quod est ultimum praeteriti, est principium futuri.”

A terminus is only (a terminus) of that of which it is the terminus (*terminus non est nisi eius cuius est terminus*).<sup>67</sup> Thus, an extremity and that of which it is an extremity are of one genus (*extremum et id cuius est extremum sunt unius generis*).<sup>68</sup> But those (principles or termini) that are intrinsic to a thing are proportionate to its extrinsic principle and end.<sup>69</sup> Everything that is from a principle tends towards some end (*ad finem aliquem tendit*).<sup>70</sup>

*Terminus* is one of the names that signify a condition of the perfect (►23.2; 23.3); for **perfect** is said (to be) *that which is terminated* (*terminatum*, i.e., complete), *absolute, not dependent on something else, and not deprived* (*non privatum*): rather, *having those things that befit it* (*sibi competunt*) *according to its genus*.<sup>71</sup> Thus, the end of a thing responds to its principle: a thing is perfect when it attains its proper principle, whether by likeness or in whatever mode.<sup>72</sup>

As ARISTOTLE says, *end* or *terminus* is said in multiple modes, of which he posits four:<sup>73</sup>

**1. The end of a magnitude—or of that which has magnitude**—is said to be its terminus in whatever species (εἶδος) of magnitude.<sup>74</sup> For example, a point is said to be the terminus of a line; and a surface (is said to be the terminus or end) of a body—or of a stone, which has continuous quantity.

**2. The extremity (extremum) of a motion or of an action:** namely, *that towards which* (*ad quod* = ἐφ’ ὃ) there is motion, and not *that from which* (*a quo* = ἀφ’ οὗ), though

<sup>67</sup> *In Physic.* 4, l. 18, n. 11 (cf. ARISTOTLE, *Physica* Δ.11, 220a18–24): “terminus non est nisi eius cuius est terminus.”

<sup>68</sup> *In De sensu* 1, c. 5, 291–292: “extremum et id cuius est extremum sunt unius generis.”

<sup>69</sup> *STh* I, q. 77 a. 3 ad 1: “actus, licet sit posterior potentia in esse, est tamen prior in intentione et secundum rationem, sicut finis agente. Obiectum autem, licet sit extrinsecum, est tamen principium vel finis actionis. Principio autem et fini proportionantur ea quae sunt intrinseca rei.” I.e., although act is posterior to potency in being (*in esse*), it is, however, prior in intention and according to ratio, as the end is posterior in being to the agent but prior in intention and according to ratio. Thus, although the object is extrinsic to its intrinsic action, it is, however, the extrinsic principle or end of the action; and therefore, the object is proportionate to the extrinsic principle or end.

<sup>70</sup> *In Sent.* 2, d. 40 q. 1 a. 5 co.: “omne quod a principio est, ad finem aliquem tendit.”

<sup>71</sup> *In Metaph.* 5, l. 19, §1044: “Hic [sc., ARISTOTLE, *Metaphysica* Δ.17, 1022a4] prosequitur [Philosophus] de nominibus, quae significant conditiones perfecti. Perfectum autem, ut ex praemissis patet, est terminatum et absolutum, non dependens ab alio, et non privatum, sed habens ea, quae sibi secundum suum genus competunt. Et ideo primo ponit hoc nomen terminus.”

<sup>72</sup> *ScG* 2, 87 n. 6: “Finis rei respondet principio eius: tunc enim res perfecta est cum ad proprium principium pertingit, vel per similitudinem vel quocumque modo.”

<sup>73</sup> *In Metaph.* 5, l. 19, §1045 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a5–10): “ponit [Philosophus] quatuor modos, quibus dicitur terminus.” *In Sent.* 1, d. 43 q. 1 a. 1 co.: “secundum Philosophum, finis vel terminus multipliciter dicitur.”

<sup>74</sup> *In Metaph.* 5, l. 19, §1045 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a5–6): “quorum primus est secundum quod in qualibet specie magnitudinis, finis magnitudinis, vel habentis magnitudinem, dicitur terminus; sicut punctus dicitur terminus lineae, et superficies corporis, vel etiam lapidis habentis quantitatem.” *In Sent.* 1, d. 43 q. 1 a. 1 co.: “Uno modo [finis vel terminus dicitur] terminus quantitatis, sicut punctus lineae.”

sometimes either extreme of motion—namely, from which (*a quo*) and into which (*in quod*)—is said to be its terminus insofar as we say that every motion is between two terms.<sup>75</sup> For example, the terminus of generation is *being* (*esse*), and not *non-being* (*non esse*). This mode is like the first (i.e., because motion follows upon quantity).

**3. The cause for the sake of which** something comes to be (*cuius causa fit aliquid* < τὸ οὐ ἔνεκα; ►9.8) is said to be its terminus.<sup>76</sup> This is that which is last of an intention (*ultimum intentionis*), just as, according to the second mode, the terminus is that which is last of a motion or of an operation (*ultimum motus vel operationis*).

**4. The substance** (*substantia* = οὐσία) **of a thing**, which is **the essence** and **the definition** signifying *that which* the thing is (*quod quid est* = τὸ τί ἦν εἶναι).<sup>77</sup> This is the terminus **of cognition** (*terminus cognitionis* = γνώσεως πέρας) of a thing, for the cognition of a thing begins from some external signs from which the definition of a thing is reached; and when it is attained, a perfect cognition of the thing is had from it (►49).

The **definition** can also be said (to be) a *terminus* because prior things through which a thing is known are contained under it (►16.6).<sup>78</sup> Thus, definitions are like numbers (►16.7): if any unit or difference is added to—or subtracted from—a number, a different species is constituted; likewise, if a difference were to be mutated, added, or subtracted, it would no longer be the same definition. In this mode, the last constitutive difference is said (to be) a *terminus* in respect of the essence of the thing; for it is that at which the essence of the species is ended (►16.6). Whence, that which signifies the essence of the thing is called *definition* or *terminus* (►1.3, 4.3).

And, if (the essence or definition) is the terminus of cognition, it necessarily is also the terminus **of the thing itself** (< εἰ δὲ τῆς γνώσεως [πέρας], καὶ τοῦ πράγματος); for

<sup>75</sup> *In Metaph.* 5, l. 19, §1046 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a7–8): “Secundus modus est similis primo, secundum quod unum extremum motus vel actionis dicitur terminus, hoc scilicet ad quod est motus, et non a quo: sicut terminus generationis est esse, non autem non esse; quamvis quandoque ambo extrema motus dicantur terminus largo modo, scilicet a quo, et in quod; prout dicimus, quod omnis motus est inter duos terminos.”

<sup>76</sup> *In Metaph.* 5, l. 19, §1047 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a8): “Tertius modus dicitur terminus, cuius causa fit aliquid; hoc enim est ultimum intentionis, sicut terminus secundo modo dictus est ultimum motus vel operationis.”

<sup>77</sup> *In Metaph.* 5, l. 19, §1048 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a8–10): “Quartus modus est secundum quod substantia rei, quae est essentia et definitio significans quod quid est res, dicitur terminus. Est enim terminus cognitionis. Incipit enim cognitio rei ab aliquibus signis exterioribus quibus pervenitur ad cognoscendum rei definitionem; quo cum perventum fuerit, habetur perfecta cognitio de re.”

<sup>78</sup> *In Sent.* 1, d. 43 q. 1 a. 1 co.: “Dicitur alio modo finis quantum ad essentiam rei, sicut ultima differentia constitutiva est ad quam finitur essentia speciei. Unde illud quod significat essentiam rei, vocatur definitio vel terminus.” *In Metaph.* 5, l. 19, §1048 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a8–10): “Vel dicitur terminus cognitionis definitio, quia infra ipsam continentur ea, per quae scitur res. Si autem mutetur una differentia, vel addatur, vel subtrahatur, iam non erit eadem definitio.”

cognition is produced (*fit*) through the assimilation of the knower to the thing known.<sup>79</sup> Thus, each thing is said to be ended by that which determines or limits (*determinat vel contrahit*) its essence.<sup>80</sup> For example, the nature of a genus, which is, of itself (*de se*), indifferent to many (species), is ended by one difference; and first matter, which is of itself indifferent to all (substantial) forms—whence, it is said to be infinite—is ended by a form; likewise, form, which considered in itself (*quantum in se est*) can perfect diverse parts of matter, is ended by the matter in which it is received (► 10.7).

◀ *Terminus* is said in as many modes as *principle*—and then some; for every principle is a terminus, but not every terminus is a principle.<sup>81</sup> For example, that towards which there is motion, is a terminus (i.e., a *terminus ad quem*), but not a principle in any mode; and that from which there is motion, is a principle and a terminus (i.e., a *terminus a quo*).

### 8.9. Mean

The *ratio* of **mean** (*medium*, i.e., *middle*; *intermedium*, i.e., *intermediary*) is *to be between (two) extremes (inter extrema)*.<sup>82</sup> There can be multiple means between two extremes.<sup>83</sup> Therefore, the principle, the mean, and the end can be diversely assigned insofar as, of

<sup>79</sup> *In Metaph.* 5, l. 19, §1048 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a10): “Si autem est terminus cognitionis, oportet quod sit rei terminus, quia cognitio fit per assimilationem cognoscentis ad rem cognitam.”

<sup>80</sup> *In Sent.* 1, d. 43 q. 1 a. 1 co.: “et sic dicitur unumquodque finiri per illud quod determinat vel contrahit essentiam suam; sicut natura generis, quae de se est indifferens ad multa, finitur per unam differentiam; et materia prima, quae de se est indifferens ad omnes formas (unde et infinita dicitur) finitur per formam; et similiter forma, quae, quantum in se est, potest perficere diversas partes materiae, finitur per materiam in qua recipitur.”

<sup>81</sup> *In Metaph.* 5, l. 19, §1049 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a10–13): “concludit [Philosophus] comparisonem termini ad principium; dicens, quod quoties dicitur principium, toties dicitur terminus, et adhuc amplius; quia omne principium est terminus, sed non terminus omnis est principium. Id enim ad quod motus est, terminus est, et nullo modo principium est: illud vero a quo est motus, est principium et terminus, ut ex praedictis patet.”

<sup>82</sup> *In Sent.* 3, d. 19 q. 1 a. 5 qc. 2 co.: “in medio est [...] considerare [...] rationem quare dicatur medium [...]. Dicitur autem aliquid medium ex hoc quod est inter extrema.”

<sup>83</sup> *In Sent.* 1, d. 3 q. 2 a. 2 co.: “Contingit autem inter duo extrema esse plura media; et ideo contingit quod principium et medium et finis diversimode possunt assignari, secundum quod ex his omnibus, scilicet principio, medio et fine, et multis mediis, quaedam possunt accipi ut principium et quaedam ut medium et quaedam ut finis, diversimode combinando.” St. Thomas applies this distinction to *Wisdom* 11:21, “but thou hast ordered all things in measure, and number, and weight” (*sed omnia mensura et numero et pondere disposuisti*), harmonizing the seemingly incompatible interpretations of St. AUGUSTINE and pseudo-DIONYSIUS. He shows that principle, end, and multiple means can be diversely assigned to diverse parts (i.e., measure, number, and weight) of the divine trace (*vestigium*) that is found in created things. Thus, the first that pertains to the perfection of the thing are the principles of that thing; and the last is the perfection of the thing according to its operation towards other things, not only insofar as it is perfect in itself; but between these, there are multiple middles, for there is a disposition of the principles, or an inclination toward being of that which is from the principles, and a limitation of the principles under the form of that which is from the principles. Therefore, a trace can be assigned insofar as one can take as a principle not only that which is first: namely, the substance itself of the principles; and as a middle, that which immediately follows: namely, the disposition of the principles, or inclination towards being; and as an end, the whole that is obtained. Hence, number pertains to the plurality of principles; weight corresponds to the inclination of the principles in the being of that which originates in them; and measure terminates at the termination of the principles under the being of the creature, such that *termination* is taken in being, in operating, and in all other (orders).

all of them—i.e., the principle, the end, and the multiple means—, some can be taken as a principle, some as a mean, and some as an end, combining them diversely.

In any mean, both its *ratio* and its act (*actus*) must be considered.<sup>84</sup> The act of the mean is *to unite the extremes* (*extrema conjungere*), which can only be exerted if the nature of *mean*—namely, being between extremes—is found in it. But being between extremes belongs to something in two respects: **(1)** insofar as the mean *participates* (in) both extremes; and **(2)** according to an *order*, insofar as the mean is under (or inferior to) the first (*sub primo*) and above (or superior to) the last (*supra ultimum*). This is required for the *ratio* of *mean* properly said, because *mean* is said in respect of a first (to which it is posterior) and of a last (to which it is prior), which (i.e., first and last) convey (*dicunt*) an order (i.e., of prior and posterior). For example, the tepid (which participates in the nature of both the hot and the cold) is cold in respect of the hot but is cold in respect of the hot.

### 8.10. Knowing and Naming Principles

We receive knowledge of things through sense; composite, confounded things fall prior in sense (► 49).<sup>85</sup> Hence, those things that are prior according to nature and (in themselves) more knowable (*magis nota*) are posterior and less knowable to us (*quo ad nos*). Whence, composite things fall prior in our cognition, while simpler things, which are prior and more knowable according to nature, fall in our cognition through the posterior (*per posterius*).

Consequently, we define the first principles of things only by negation of posterior things; for we (intellectually) apprehend simple things through composite things.<sup>86</sup> For example, we define the **point** (i.e., the first principle in the genus of magnitude) as *that which has no part* (i.e., by negation of composition in continuous quantity, even if every magnitude

---

<sup>84</sup> *In Sent.* 3, d. 19 q. 1 a. 5 qc. 2 co.: “in medio est duo considerare, scilicet rationem quare dicatur medium, et actum medii. [...] Actus autem medii est extrema conjungere. [...] Non potest autem actus medii exercere nisi aliquo modo natura medii in ipso inveniatur, ut scilicet sit inter extrema. Esse autem inter extrema convenit quantum ad duo; scilicet quantum ad hoc quod medium participat utrumque extremorum; et secundum ordinem, in quantum est sub primo, et supra ultimum: et hoc exigitur ad rationem medii proprie dicti: quia medium dicitur secundum respectum ad primum et ultimum, quae ordinem dicunt.” *In Sent.* 4, d. 46 q. 2 a. 2 qc. 2 co.: “Omne autem medium participat quodammodo cum utroque extremorum.” *STh* I, q. 108 a. 5 ad 4: “Medium autem comparatum uni extremo, videtur alterum, in quantum participat naturam utriusque, sicut tepidum respectu calidi est frigidum, respectu vero frigidi est calidum.” Cf. *De mix. elem.*, 137–140: “Sicut igitur extrema inveniuntur in medio quod participat naturam utriusque, sic qualitates simplicium corporum inveniuntur in propria qualitate corporis mixti.” *In Ethic.* 2, l. 10, 36–37: “considerandum est quod, cum medium participet aliquo modo utrumque extremum [...]” Cf. *In Physic.* 6, l. 5, nn. 17–18; *In De caelo* 2, l. 15, n. 8.

<sup>85</sup> *In Metaph.* 10, l. 4, §1990: “ea quae sunt priora secundum naturam et magis nota, sunt posteriora et minus nota quo ad nos, eo quod rerum notitiam per sensum accipimus. Composita autem et confusa prius cadunt in sensu, ut dicitur in primo Physicorum. Et inde est, quod composita prius cadunt in nostram cognitionem. Simpliciora autem quae sunt priora et notiora secundum naturam, cadunt in cognitionem nostram per posterius.”

<sup>86</sup> *STh* I, q. 11 a. 2 ad 4: “Apprehendimus enim simplicia per composita, unde definimus punctum, cuius pars non est, vel principium lineae.” *In Metaph.* 10, l. 4, §1990: “Inde est quod prima rerum principia non definimus nisi per negationes posteriorum; sicut dicimus quod punctum est, cuius pars non est.”

is naturally posterior to the point; ►4); or as *the principle of the line* (i.e., by reference to the first species of magnitude that originates immediately from the point).

Since names are signs of intelligible conceptions, we first impose names on those things that we understand first, even if they happen to be posterior according to the order of nature.<sup>87</sup> Thus, we sometimes understand prior things from posterior things, and assign a name that befits a thing as (naturally) posterior, but which is prior in respect of us.

Therefore, although a name can be said in multiple modes, all modes can be reduced to a first one in two ways:<sup>88</sup> **(1)** according to the order that is considered in the imposition of names (►8.11); or **(2)** according to the order of things (►8.12).

### 8.11. The Order of Knowing Principles

An order of prior and posterior is found in diverse things.<sup>89</sup> But there are three orders of things that (naturally) follow one upon the other (►48.26): **(1)** magnitude; **(2)** (local) motion; and **(3)** time. Thus, following upon what is prior and posterior in magnitude, there is a prior and a posterior in local motion; and following upon what is prior and posterior in local motion, there is a prior and a posterior in time.

According to what is firstly known by us, order is (first) discovered in local motion because such a motion is more manifest to sense (►48.18), and things are named following the knowledge we have of them (►8.10).<sup>90</sup> Whence, *principle* is said in respect of some order; and the order that is considered according to prior and posterior in magnitude is known to—and named by—us firstly.

1. According to its proper inquiry (*secundum propriam sui inquisitionem*), therefore, the name **principle** properly signifies *that which is first in a magnitude over which motion*

---

<sup>87</sup> *In Metaph.* 5, l. 5, §824: “Nomina enim imponuntur a nobis secundum quod nos intelligimus, quia nomina sunt intellectuum signa. Intelligimus autem quandoque priora ex posterioribus. Unde aliquid per prius apud nos sortitur nomen, cui res nominis per posterius convenit.” *In Metaph.* 9, l. 3, §1805: “Cum enim nomina sint signa intelligibilium conceptionum, illis primo imponimus nomina, quae primo intelligimus, licet sint posteriora secundum ordinem naturae.”

<sup>88</sup> *In Metaph.* 5, l. 5, §824: “Sciendum est autem, quod reductio aliorum modorum ad unum primum, fieri potest dupliciter. Uno modo secundum ordinem rerum. Alio modo secundum ordinem, qui attenditur quantum ad nominis impositionem.”

<sup>89</sup> *In Metaph.* 5, l. 1, §751: “Ordo autem prioris et posterioris invenitur in diversis [...]. Sunt autem trium rerum ordines sese consequentes; scilicet magnitudinis, motus, et temporis. Nam secundum prius et posterius in magnitudine est prius et posterius in motu; et secundum prius et posterius in motu est prius et posterius in tempore, ut habetur quarto Physicorum.” *In Physic.* 4, l. 18, n. 4: “motus quantum ad continuitatem et prius et posterius, sequitur magnitudinem, et tempus motum.” Cf. ARISTOTLE, *Physica* Δ.11, 219b15–16: “ἀκολουθεῖ [...] τῷ μὲν μεγέθει ἢ κίνησις, ταύτη δ' ὁ χρόνος.”

<sup>90</sup> *In Metaph.* 5, l. 1, §751: “sed secundum id, quod primo est nobis notum, est ordo inventus in motu locali, eo quod ille motus est sensui manifestior. [...] igitur principium dicitur quod in aliquo ordine, et ordo qui attenditur secundum prius et posterius in magnitudine, est prius nobis notus, secundum autem quod res sunt nobis notae secundum hoc a nobis nominantur [...].”

passes. This is the first mode posited by ARISTOTLE, according to which **principle** is said (to be) *that <part> of a thing whence something may first be set in motion*: that is, some part of a magnitude from which **local motion** begins: for example, of a length (*in longitudine* < τοῦ μήκους) and of a journey (*et in via* < καὶ ὁδοῦ), the principle is that part from which local motion begins.<sup>91</sup>

2. However, (local) motion does not always begin from the principle of a magnitude, but rather from that part whence each thing is more readily set in motion. Hence, ARISTOTLE posits a second mode, saying that—in another way—the **principle** of motion is said to be *that whence each optimally comes about*, that is, *whence each begins optimally to be moved* (*unde unusquisque incipit optime moveri* < ἢ ὅθεν ἂν κάλλιστα γένοιτο ἕκαστον).<sup>92</sup>

The first mode differs from the second mode in that, in the former, a principle of motion is designated from the principle of a magnitude; conversely, in the latter, a principle is designated in a magnitude from the principle of motion.<sup>93</sup> Thus, even in those motions that are over circular magnitudes, which have no principle, something is taken as a principle from which the mobile optimally or opportunely is set in motion according to its nature.

3. From the order considered in local motion (§1), order is made known to us in other motions.<sup>94</sup> Thus, the significations of *principle* that are taken according to the **generation** or **coming-to-be** of things (*in generatione vel fieri rerum*) follow the one taken from local

<sup>91</sup> *In Metaph.* 5, l. 1, §751: “ideo hoc nomen principium secundum propriam sui inquisitionem significat id quod est primum in magnitudine, super quam transit motus. Et ideo dicit [Philosophus], quod principium dicitur illud unde aliquis rem primo moveat, idest aliqua pars magnitudinis, a qua incipit motus localis. Vel secundum aliam literam, unde aliquid rei primo movebitur, idest ex qua parte rei aliquid incipit primo moveri. Sicut in longitudine et in via quacumque, ex illa parte est principium, unde incipit motus.” Cf. ARISTOTLE, *Metaphysica* Δ.1, 1012b34–35: “ἀρχὴ λέγεται ἢ μὲν ὅθεν ἂν τις τοῦ πράγματος κινηθεῖ πρῶτον.” St. Thomas consigns in his *Commentary* two alternative renderings of this passage, the first of which is not as accurate: “unde aliquis rem primo moveat” (whence someone first sets a thing in motion). Note also that the name *part* is neither in the Greek nor in the *ratio* offered by St. Thomas, “id quod est primum in magnitudine, super quam transit motus.” As to the example provided, both the Greek ὁδός and the Latin *via* can be understood either as “way” (i.e., a length that can be traversed) or as “journey” (i.e., motion along a way), but the context requires *motion along a length* (i.e., the latter), since the length itself has already been distinctly mentioned.

<sup>92</sup> *In Metaph.* 5, l. 1, §752 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a1–2): “Quia vero motus non semper incipit a principio magnitudinis, sed ab ea parte unde est unicuique in promptu magis ut moveatur, ideo ponit [Philosophus] secundum modum, dicens, quod alio modo dicitur principium motus unde unumquodque fiet maxime optime, idest unusquisque incipit optime moveri.”

<sup>93</sup> *In Metaph.* 5, l. 1, §753: “Differt autem hic modus a primo. Nam in primo modo ex principio magnitudinis designatur principium motus. Hic autem ex principio motus designatur principium in magnitudine. Et ideo etiam in illis motibus, qui sunt super magnitudines circulares non habentes principium, accipitur aliquod principium a quo optime vel opportunely movetur mobile secundum suam naturam. Sicut in motu primi mobilis principium est ab oriente. In motibus etiam nostris non semper incipit homo moveri a principio viae, sed quandoque a medio, vel a quocumque termino, unde est ei opportunum primo moveri.”

<sup>94</sup> *In Metaph.* 5, l. 1, §754: “Ex ordine autem, qui consideratur in motu locali, fit nobis etiam notus ordo in aliis motibus; et ideo sequuntur significationes principii, quae sumuntur secundum principium in generatione vel fieri rerum. Quod quidem principium dupliciter se habet. Aut enim est *inexistens*, idest intrinsecum; vel *non est inexistens*, idest extrinsecum.”

motion. This happens both according to the *intrinsic mode* and according to the *extrinsic mode* (► 8.4):

**(a)** According to the *intrinsic mode*, **principle** is said (to be) *that part of a thing that is first generated and from which the generation of the thing begins*.<sup>95</sup> For example, what is made firstly in a ship is its seat or keel, which is—as it were—the foundation of the ship, on which all the timber of the ship is joined together; likewise, what is firstly made in a house is the foundation; (and whatever is firstly generated in an animal, is its principle).<sup>96</sup>

**(b)** According to the *extrinsic mode*, **principle** is said (to be) *that whence the generation of a thing begins, which is, however, outside the thing (extra rem)*.<sup>97</sup> Thus, in natural things that come to be through motion, the principle of generation is said to be that whence motion naturally begins, as in those things that come to be through alteration (i.e., continuous change in quality) or through some other motion of this kind: for example, a man is said to become great (i.e., according to continuous change in quantity) or white (i.e., according to continuous change in quality); or in those things that come to be not through motion but through mutation alone, as is evident in the generation of substances: for example, a child is generated from its father and mother, who are its principles; and war comes to be from reviling, which incites the animus of men to war.

In things subject to **ethics** (*in rebus agibilibus*), moral or political, **principle** is said (to be) *that from whose will or purpose others are moved or mutated*.<sup>98</sup> Thus, those who hold civil,

---

<sup>95</sup> *In Metaph.* 5, l. 1, §755 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a4–5): “Dicitur ergo primo modo principium illa pars rei, quae primo generatur, et ex qua generatio rei incipit; sicut in navi fit primo sedile vel carina, quae est quasi navis fundamentum, super quod omnia ligna navis compaginantur. Similiter quod primo in domo fit, est fundamentum.”

<sup>96</sup> Following an ancient controversy, the heart and the brain are alternatively posited dialectically as principles. *In Metaph.* 5, l. 1, §755 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a5–7): “In animali vero primo fit cor secundum quosdam, et secundum alios cerebrum, aut aliud tale membrum. Animal enim distinguitur a non animali, sensu et motu. Principium autem motus apparet esse in corde. Operationes autem sensus maxime manifestantur in cerebro. Et ideo qui consideraverunt animal ex parte motus, posuerunt cor principium esse in generatione animalis. Qui autem consideraverunt animal solum ex parte sensus, posuerunt cerebrum esse principium; quamvis etiam ipsius sensus primum principium sit in corde, etsi operationes sensus perficiantur in cerebro. Qui autem consideraverunt animal in quantum agit vel secundum aliquas eius operationes, posuerunt membrum adaptatum illi operationi, ut hepar vel aliud huiusmodi, esse primam partem generatam in animali. Secundum autem Philosophi sententiam, prima pars est cor, quia a corde omnes virtutes animae per corpus diffunduntur.”

<sup>97</sup> *In Metaph.* 5, l. 1, §756 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a7–10): “Alio autem modo dicitur principium, unde incipit rei generatio, quod tamen est extra rem; et hoc quidem manifestatur in tribus. Primo quidem in rebus naturalibus, in quibus principium generationis dicitur, unde primum natus est motus incipere in his quae fiunt per motum, sicut in his quae acquiruntur per alterationem, vel per aliquem alium motum huiusmodi. Sicut dicitur homo fieri magnus vel albus. Vel unde incipit permutatio, sicut in his quae non per motum, sed per solam fiunt mutationem; ut patet in factione substantiarum, sicut puer est ex patre et matre qui sunt eius principium, et bellum ex convitio, quod concitat animos hominum ad bellum.”

<sup>98</sup> *In Metaph.* 5, l. 1, §757 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a10–13): “Secundo etiam manifestat [Philosophus] in rebus agibilibus sive moralibus aut politicis, in quibus dicitur principium id, ex cuius voluntate vel proposito moventur et mutantur alia; et sic dicuntur principatus in civitatibus illi qui obtinent

imperial, or even tyrannical power in states, are said to have the primacy (*principatus, first place, preeminence*) in the state, for everything in it is set in motion through their will.

In things subject to **art** (*in artificialibus*), the arts are said to be principles of artifacts because motion towards the construction of an artifact begins from an art.<sup>99</sup> And among these arts, the architectonical (ἀρχιτεκτονικάί, *master-arts*),<sup>100</sup> which take their name from *principle* (ἀρχή), are maximally said (to be) *principles* (► 50.11, ¶1). Those arts are said (to be) *architectonical* which order or command (*imperant*) other, subservient arts, as the art of the navigator orders over that of shipbuilding; the military art, over the equestrian.

4. Finally, in the likeness of the order that is considered in external motion, some order is considered also in the **cognition** of things (*in rerum cognitione*; ► 49):<sup>101</sup> **(a)** above all, an order of cognition is considered insofar as our intellect has some likeness to motion (► 52.5), proceeding (*discurrens*) from principles to conclusions; **(b)** in another mode, **principle** is said (to be) *that whence a thing first comes to be known*. For example, we say that the principles of demonstrations are *suppositions* (*suppositiones* = ὑποθέσεις; ► 54.7, ¶1; 54.8, ¶1)<sup>102</sup> or axioms (*dignitates*; ► 54.6, ¶2; e.g., *contradictories cannot be simultaneously true*),<sup>103</sup> and assumptions (*petitiones*; ► 54.8, ¶2).<sup>104</sup>

## 8.12. The Order of Things

In things, order is twofold: **(1)** the order among themselves **of the parts** of some whole or of some multitude; and **(2)** the order of things **into an end** (*ordo rerum in finem*). The latter is more principal (*principalior*) than the former; for, as ARISTOTLE says, the order of the

---

potestates et imperia, vel etiam tyrannides in ipsis. Nam ex eorum voluntate fiunt et moventur omnia in civitatibus. Dicuntur autem potestates habere homines, qui in particularibus officiis in civitatibus praeponuntur, sicut iudices et huiusmodi. Imperia autem illi, qui universaliter quibuscumque imperant, ut reges. Tyrannides autem obtinent, qui per violentiam et praeter iuris ordinem ad suam utilitatem civitates et regnum detinent.”

<sup>99</sup> *In Metaph.* 5, l. 1, §758 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a13–14): “Tertium exemplum ponit [Philosophus] in artificialibus, quia artes etiam simili modo principia esse dicuntur artificiatorum, quia ab arte incipit motus ad artificii constructionem. Et inter has maxime dicuntur principia architectonicae, quae a principio nomen habent, idest principales artes dictae. Dicuntur enim artes architectonicae quae aliis artibus subservientibus imperant, sicut gubernator navis imperat navifactivae, et militaris equestri.”

<sup>100</sup> See LIDDELL and SCOTT, *A Greek-English Lexicon*, entry for ἀρχιτεκτονικός.

<sup>101</sup> *In Metaph.* 5, l. 1, §759 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a14–16): “Ad similitudinem autem ordinis, qui in motibus exterioribus consideratur, attenditur etiam quidam ordo in rerum cognitione; et praecipue secundum quod intellectus noster quamdam similitudinem motus habet, discurrens de principiis in conclusiones. Et ideo alio modo dicitur principium, unde res primo innotescit; sicut dicimus principia demonstrationum esse suppositiones, idest dignitates et petitiones.”

<sup>102</sup> See *In Physic.* 2, l. 5 n. 8: “*suppositiones*, idest propositiones syllogismi.”

<sup>103</sup> See *In Sent.* 1, d. 8 q. 1 a. 3 co.: “primum quod cadit in credulitate intellectus, sunt dignitates, et praecipue ista, contradictoria non esse simul vera: unde omnia alia includuntur quodammodo in ente unite et indistincte, sicut in principio.”

<sup>104</sup> See *In Post. an.* 1, l. 19, 64–70 (cf. ARISTOTLE, *Analytica Posteriora* A.10, 76b27–31) “Differunt autem [suppositiones et petitiones] ad invicem, quia, *si quidem* talis propositio sit probabilis addiscenti cui fit demonstratio, dicitur suppositio, et sic suppositio dicitur *non simpliciter, set ad aliquem; si vero* ille *neque* sit eiusdem *opinionis* neque *contrarie*, oportet quod demonstrator hoc ab eo petat, et tunc dicitur petitio.”

parts of the army among themselves according to diverse offices is for the sake of (*propter*) the order of the whole army to the good (i.e., end) of the leader, which is victory.<sup>105</sup>

Since something is said to be prior or posterior in an order to some principle (*in ordinem ad principium aliquod*); and since a principle is that which is first in being (*in esse*), in coming-to-be (*in fieri*), or in cognition (*in cognitione*); therefore, the determination of the various orders of prior and posterior (in respect of things) can be divided into three parts:<sup>106</sup> **(1)** the natural order in **being** (►47); **(2)** the order of **coming-to-be** (►48); and **(3)** the order of **cognition** (►49).

That which is prior in cognition is also prior simply (*simpliciter*), i.e., not according to something (*secundum quid*), because a thing is known by its principles.<sup>107</sup> But cognition is twofold: cognition of sense (*sensus*), and cognition of intellect or reason (*intellectus vel rationis*). Thus, we say that something is prior according to sense (*secundum sensum* = κατὰ τὴν αἴσθησιν) in one way; and that something is prior according to reason (*secundum*

---

<sup>105</sup> *In Ethic.* 1, l. 1, 7–14: “Invenitur autem duplex ordo in rebus. Unus quidem partium alicuius totius seu alicuius multitudinis adinvicem, sicut partes domus ad invicem ordinantur; alius autem est ordo rerum in finem. Et hic ordo est principalior, quam primus. Nam, ut Philosophus dicit in XI Metaphysicae, ordo partium exercitus adinvicem, est propter ordinem totius exercitus ad ducem.” Cf. *In Sent.* 1, d. 44 q. 1 a. 2 co., where St. Thomas writes about the order of the whole universe: “secundum Philosophum in 11 Metaph., bonum universi consistit in duplici ordine; scilicet in ordine partium universi ad invicem, et in ordine totius universi ad finem [...]; sicut etiam est in exercitu ordo partium exercitus ad invicem, secundum diversa officia, et est ordo ad bonum ducis, quod est victoria; et hic ordo est praecipuus, propter quem est primus ordo.” Cf. *Comp. th.* 1, c. 103, 23–29. References to ARISTOTLE’s *Metaphysics* are to book Λ rather than K, which St. Thomas comments, *In Metaph.* 12, l. 12 §§2629–31: “Et, quia omnia, quorum unum est finis, oportet quod in ordine ad finem conveniant, necesse est, quod in partibus universi ordo aliquis inveniatur; et sic universum habet et bonum separatum, et bonum ordinis. Sicut videmus in exercitu: nam bonum exercitus est et in ipso ordine exercitus, et in duce, qui exercitui praesidet: sed magis est bonum exercitus in duce, quam in ordine: quia finis potior est in bonitate his quae sunt ad finem: ordo autem exercitus est propter bonum ducis adimplendum, scilicet ducis voluntatem in victoriae consecutionem; non autem e converso, bonum ducis est propter bonum ordinis. Et, quia ratio eorum quae sunt ad finem, sumitur ex fine, ideo necesse est quod non solum ordo exercitus sit propter ducem, sed etiam quod a duce sit ordo exercitus, cum ordo exercitus sit propter ducem.” See ARISTOTLE, *Metaphysica* Λ.10, 1075a14–15: “καὶ γὰρ ἐν τῇ τάξει τὸ εὖ καὶ ὁ στρατηγός, καὶ μᾶλλον οὗτος οὐ γὰρ οὗτος διὰ τὴν τάξιν ἀλλ’ ἐκείνη διὰ τοῦτόν ἐστιν.” Literally, “For the good <of an army consists> both in its order and in its commander, but mainly in the latter; for he does not exist for the sake of the order, but the order exists for him.”

<sup>106</sup> *In Metaph.* 5, l. 13, §937: “quia prius et posterius dicuntur in ordinem ad principium aliquod, principium autem est [...], quod est primum in esse, aut in fieri, aut in cognitione: ideo pars ista dividitur in partes tres. In prima dicit quomodo dicitur aliquid esse prius secundum motum et quantitatem; nam ordo in motu, sequitur ordinem in quantitate. Per prius enim et posterius in magnitudine, est prius et posterius in motu [...]. Secundo ostendit, quomodo aliquid dicitur prius altero in cognitione [...]. Tertio, quomodo dicitur aliquid altero prius in essendo, idest secundum naturam [...].” ARISTOTLE treats first of the order of becoming; then, of cognition; and lastly, of being (*Metaphysica* Δ.11, 1018b12–1019a14). His plan seems to follow the way in which we come scientifically to know. In the ensuing chapters, we instead follow the natural order of dependence outlined by St. Thomas.

<sup>107</sup> *In Metaph.* 5, l. 13, §946 (Cf. ARISTOTLE, *Metaphysica* Δ.11, 1018b29–34): “Ostendit [Philosophus] quomodo aliquid dicitur prius altero in cognitione. Illud autem prius est cognitione, quod etiam prius est simpliciter, non secundum quid [...]: nam res per sua principia cognoscitur. Sed, cum cognitio sit duplex, scilicet intellectus vel rationis, et sensus, aliter dicimus aliqua priora secundum rationem, et aliter secundum sensum.”

*rationem* = κατὰ τὸν λόγον) in another way. Sensory powers (*vires sensitivae*) know some things in absolute (*absolute*).<sup>108</sup> But it befits the intellect or reason alone to know the order of one thing to another (►8.13). And the foremost perfection of reason is wisdom—to which it is proper to know order (►50.14; 51.24; 59). Whence, ARISTOTLE says that it behooves the wise man to order.<sup>109</sup>

### 8.13. The Order of Reason

In every operation of reason, some order is found according to which there is a process from one thing to another (►52.5).<sup>110</sup> But order is compared to reason in a fourfold way:<sup>111</sup>

1. There is an order that reason does not produce, but only **considers**, as is the order of natural things.<sup>112</sup>

Since the consideration of reason is perfected by the habit of science, there are diverse sciences according to the diverse orders that reason properly considers. Thus, it pertains to **natural philosophy** (►58) to consider the order of things that human reason considers but does not produce—that is, if we comprehend under *natural philosophy* (not only physics, but) also mathematics and metaphysics.

2. There is an order that reason, in considering, **produces** (*facit*) in its proper act: for example, when it orders its concepts among themselves; and (when it orders) the signs of the concepts, which are voices that signify (*voces significativae*).<sup>113</sup>

The order that, in considering, reason produces in its proper act, pertains to **rational philosophy** (►52), to which it belongs to consider the order among the parts of the sentence, and the order of principles (of demonstration) into conclusions.

---

<sup>108</sup> *In Ethic.* 1, l. 1, 1–7: “Sicut Philosophus dicit in principio Metaphysicae, sapientis est ordinare. Cuius ratio est, quia sapientia est potissima perfectio rationis, cuius proprium est cognoscere ordinem. Nam etsi vires sensitivae cognoscant res aliquas absolute, ordinem tamen unius rei ad aliam cognoscere est solius intellectus aut rationis.”

<sup>109</sup> ARISTOTLE, *Metaphysica* A.2, 982a17–19: “οὐ γὰρ δεῖν ἐπιτάττεσθαι τὸν σοφὸν ἀλλ’ ἐπιτάττειν, καὶ οὐ τοῦτον ἐτέρῳ πείθεσθαι, ἀλλὰ τούτῳ τὸν ἥττον σοφόν.” Literally, “the wise <man> must not be ordered but <must> order, and he <must> not obey another, but the less wise <must> obey him.”

<sup>110</sup> *In De caelo*, pr. 1: “in omni opere rationis ordo aliquis invenitur, secundum quem proceditur ab uno in aliud.”

<sup>111</sup> *In Ethic.* 1, l. 1, 14–15: “Ordo autem quadrupliciter ad rationem comparatur.”

<sup>112</sup> *In Ethic.* 1, l. 1, 15–17: “Est enim quidam ordo quem ratio non facit, sed solum considerat, sicut est ordo rerum naturalium.” *Ibid.*, 25–31: “Et quia consideratio rationis per habitum scientiae perficitur, secundum hos diversos ordines quos proprie ratio considerat, sunt diversae scientiae. Nam ad philosophiam naturalem pertinet considerare ordinem rerum quem ratio humana considerat sed non facit; ita quod sub naturali philosophia comprehendamus et mathematicam et metaphysicam.”

<sup>113</sup> *In Ethic.* 1, l. 1, 17–20: “alius autem est ordo, quem ratio considerando facit in proprio actu, puta cum ordinat conceptus suos adinvicem, et signa conceptuum, quae sunt voces significativae.” *Ibid.*, 32–35: “Ordo autem quem ratio considerando facit in proprio actu, pertinet ad rationalem philosophiam, cuius est considerare ordinem partium orationis adinvicem, et ordinem principiorum in conclusiones.”

3. There is an order that, in considering, reason **produces in the operations of the will**.<sup>114</sup> The order of voluntary actions pertains to the consideration of **moral philosophy** (not discussed in this work).

4. There is an order that, in considering, reason **produces in exterior things**, of which reason itself is a cause: for example, (reason produces order) in a chest and in a house.<sup>115</sup> The order that, in considering, reason makes in exterior things constituted by human reason, pertains to the **mechanical arts** (not discussed in this work).

◀ Therefore, those things that are from our work and those that are from the work of nature, considered according to their proper *ratios*, do not fall into the same doctrine.<sup>116</sup> In the **disciplines** (*in disciplinis* < μαθήσεως), however, one does not always begin to learn from that which is a principle simply and according to nature (*simpliciter et secundum naturam*), but from that whence one is more easily or opportunely disposed to learn: that is, from those things that are more knowable with respect to us, even if they sometimes are posterior according to nature (▶ 66).<sup>117</sup>

---

<sup>114</sup> *In Ethic.* 1, l. 1, 21–22: “tertius autem est ordo quem ratio considerando facit in operationibus voluntatis.” Ibid., 35–37: “ordo autem actionum voluntariarum pertinet ad considerationem moralis philosophiae.”

<sup>115</sup> *In Ethic.* 1, l. 1, 22–24: “quartus autem est ordo quem ratio considerando facit in exterioribus rebus, quarum ipsa est causa, sicut in arca et domo.” Ibid., 37–39: “Ordo autem quem ratio considerando facit in rebus exterioribus constitutis per rationem humanam, pertinet ad artes mechanicas.”

<sup>116</sup> *In Sent.* 1, q. 1 a. 2 ad 3: “ea quae sunt ab opere nostro et ea quae sunt ab opere naturae, considerata secundum proprias rationes, non cadunt in eandem doctrinam.”

<sup>117</sup> *In Metaph.* 5, l. 1, §752 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a2–4): “in disciplinis [...] non semper incipit aliquis addiscere ab eo quod est principium simpliciter et secundum naturam, sed ab eo unde aliquid facilius sive opportunius valet addiscere, idest ab illis, quae sunt magis nota quo ad nos, quae quandoque posteriora sunt secundum naturam.”

## 9. Cause

*In this chapter, we examine the most important kind of principle—the cause. St. Thomas, following ARISTOTLE, divides it into four species: material, formal, efficient, and final.*

*Since necessity belongs to the ratio of cause, it is also discussed here.*

### 9.1. Cause

Properly, that is the **cause** (*causa* = αἰτίον) of something *without which it cannot be* (*sine quo esse non potest*); for every effect depends on its cause.<sup>1</sup> Hence, **cause** is *that upon which something depends according to its being or to its coming-to-be* (*ex quibus aliquid dependet secundum suum esse vel fieri*), *that upon which follows the being of another* (*ad quam sequitur esse alterius*).<sup>2</sup> We can also say that **cause** is *that on which another follows of necessity* (*ad quam de necessitate sequitur aliud*), if we properly understand by this the sufficient, unimpeded cause (►9.9).<sup>3</sup>

ARISTOTLE posits *principles* in the place of *intrinsic causes* in his *Physics*, but, as stated in his *Metaphysics*, *principle* is properly said of extrinsic causes, while *element* (►12.9; is said) of causes that are parts of the thing—that is, of intrinsic causes—and *cause* is said of both (i.e., intrinsic and extrinsic).<sup>4</sup> That is properly said (to be a) *principle* which is outside as a mover, since the principle of motion is from it (*ab eo*). Nevertheless, sometimes one is posited for the other; for every cause can be said (to be a) *principle*, and every principle (can be said to be a) *cause*. Thus, *cause* is said in as many modes as

---

<sup>1</sup> *STh* III, q. 86 a. 6 s. c.: “illud est proprie causa alicuius sine quo esse non potest, omnis enim effectus dependet a sua causa.” There is a response to this contrary objection, but it does not deny the premise concerning the essence of a cause.

<sup>2</sup> *In Physic.* 1, l. 1, n. 5: “causae autem dicuntur ex quibus aliqua dependent secundum suum esse vel fieri.” *In Physic.* 2, l. 10, n. 15: “cum causa sit ad quam sequitur esse alterius [...]” Cf. *ibid.*, l. 12, n. 1: “necesse est fieri vel esse ea quae ex eis causantur.”

<sup>3</sup> *In Metaph.* 5, l. 1, §749: “causa est ad quam de necessitate sequitur aliud.” *De malo*, q. 3 a. 3 ad 3: “proprie causa dicitur ad quam ex necessitate sequitur aliquid.” *STh* I-II, q. 75 a. 1 arg. 2: “causa est ad quam de necessitate sequitur aliud.” Cf. the reply to this objection, *ibid.*, arg. 2: “si illa definitio causae universaliter debeat verificari, oportet ut intelligatur de causa sufficienti et non impedita. Contingit enim aliquid esse causam sufficientem alterius, et tamen non ex necessitate sequitur effectus, propter aliquod impedimentum superveniens, alioquin sequeretur quod omnia ex necessitate contingerent, ut patet in VI *Metaphys.*”

<sup>4</sup> *De prin. nat.* §3, 59–66: “Sed licet principia ponat Aristoteles pro causis intrinsecis in I *Physicorum*, tamen, ut dicitur in XI *Metaphysice*, principium dicitur proprie de causis extrinsecis, elementum de causis que sunt partes rei, id est de causis intrinsecis, causa dicitur de utrisque; tamen aliquando unum ponitur pro altero: omnis enim causa potest dici principium et omne principium causa.” *In Metaph.* 12, l. 4 §2468: “principium proprie dicitur quod est extra sicut movens. Nam ab eo est principium motus.” Cf. ARISTOTLE, *Physica* A.7, 191a20: “αἱ ἀρχαὶ τρεῖς,” meaning three *intrinsic* principles: matter, form, and privation, where the latter is a principle but not a cause; *Metaphysica* Λ.4, 1070b22–25: “ἔπει δὲ οὐ μόνον τὰ ἐνυπάρχοντα αἴτια, ἀλλὰ καὶ τῶν ἐκτὸς οἷον τὸ κινεῖν, δῆλον ὅτι ἕτερον ἀρχὴ καὶ στοιχεῖον, αἴτια δ’ ἄμφω· καὶ εἰς ταῦτα διαιρεῖται ἡ ἀρχή, τὸ δ’ ὡς κινεῖν ἢ ἰστᾶν ἀρχὴ τις καὶ οὐσία.” Cf. AVERROES, *In Metaph.* XI (=XII), comm. 23: “causa dicitur de omnibus, principium autem de extrinsecis, elementum uero de intrinsecis” (taken from the apparatus of *De prin. nat.*).

*principle*; for all causes are principles, and the motion towards a thing's being (*ad esse rei*) begins from a cause, although *cause* and *principle* are not said according to the same *ratio*.<sup>5</sup>

*Cause* seems to add (some *ratio*) over *principle* said in common (*communiter dictum*); for *that which is first* can be said (to be a) *principle* whether (there) follows a posterior (thing) being (*esse*) or not.<sup>6</sup> For example, a smith (*faber*) is said (to be a) *principle* of a knife as *that from whose operation* the knife's being (*esse cultelli*) is; but when something moves (i.e., changes continuously) from blackness to whiteness (i.e., from one of two contraries to the other), it is said that black is the principle of motion—and universally, everything from which motion begins to be (*incipit esse*) is said (to be a) *principle*—even though blackness is not that from which (there) follows a whiteness being (*esse*).

*Cause*, on the other hand, is said only of that first (principle) from which follows the being of a posterior [thing] (*ex quo consequitur esse posterioris*).<sup>7</sup> Whence, it is said that **cause** is *that from whose being follows another* (*ex cuius esse sequitur aliud*). And thus, that first (principle) from which motion begins to be cannot be said (to be a) *cause* by itself (*per se*), even if it is said (to be a) *principle*. This is why privation (►42.7; e.g., a colored subject that is not white) is posited among the principles but not (among) the causes, because privation is that from which generation begins. But (privation) can also be said (to be an) *accidental cause* insofar as it coincides with matter (which is a cause by itself).

Therefore, even though *principle* and *cause* are the same in subject (*idem subiecto*; e.g., the subject of a contrary, such as black, and the subject of a privation, such as a colored subject that is not white, are the same matter), they differ in *ratio* because the name *principle* conveys (only) some order (►8.2), while the name **cause** (additionally) conveys (*importat*) *some influence towards the being of the thing caused* (*influxum quemdam ad esse causati*), *a respect of origin towards the being of the thing that proceeds from the cause* (*respectum originis per comparationem ad esse rei quod a causa procedit*); for

---

<sup>5</sup> *In Metaph.* 5, l. 1, §760 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a16–17): “His etiam modis et causae dicuntur quaedam principia. Nam omnes causae sunt quaedam principia. Ex causa enim incipit motus ad esse rei, licet non eadem ratione causa dicatur et principium.” Cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a16–17: “ἴσα ἄρα καὶ τὰ αἴτια λέγεται πάντα γὰρ τὰ αἴτια ἀρχαί.”

<sup>6</sup> *De prin. nat.* §3, 66–76: “Sed tamen causa uidetur addere supra principium communiter dictum, quia id quod est primum, siue consequatur esse posterius siue non, potest dici principium, sicut faber dicitur principium cultelli ut ex eius operatione est esse cultelli; sed quando aliquid mouetur de nigredine ad albedinem, dicitur quod nigrum est principium illius motus, et uniuersaliter omne id a quo incipit esse motus dicitur principium: tamen nigredo non est id ex quo consequatur esse albedo.”

<sup>7</sup> *De prin. nat.* §3, 76–85: “Sed causa solum dicitur de illo primo ex quo consequitur esse posterioris: unde dicitur quod causa est ex cuius esse sequitur aliud; et ideo illud primum a quo incipit esse motus non potest dici causa per se, etsi dicatur principium. Et propter hoc priuatio ponitur inter principia et non inter causas, quia priuatio est id a quo incipit generatio; sed potest etiam dici causa per accidens, quantum concidit materie, ut supra expositum est.”

every cause has an order of principle (in relation) to the (act of) being (*esse*) of that which it causes, which (act of being) is constituted by it (i.e., by the cause).<sup>8</sup>

Whence, the name *cause* always posits, conveys a diversity of substance, essence, and a dependence of the thing caused upon its cause, which the name *principle* does not convey; for, in all genera of causes, there is always found a distance—according to some perfection or virtue—between the cause and the thing of which it is a cause.<sup>9</sup>

And thus, the name *principle* is more common (i.e., is said of more things) than *cause*; for there is some principle that is not a cause.<sup>10</sup> For example, the *terminus from which* (*terminus a quo*, e.g., a contrary, such as black; a privation, such as a colored subject that is not white; or the first part of a magnitude whence motion begins, such as a point in a line) is said to be a principle of motion (but not its cause).

## 9.2. Division of Cause

Causes are distinguished by species (*per species* = τῷ εἶδει) and by modes (*per modos* = τρόποι; note that ARISTOTLE and St. Thomas sometimes speak of the species or genera of causes also as being modes, since they are divided analogically; ► 20.12, ¶3):<sup>11</sup>

1. The distinction by species is in virtue of diverse *ratios* of *causing*.<sup>12</sup> Thus, it is like a division by essential differences that constitute (multiple) species (in the genus of *cause*). Every cause is either a part of the essence (i.e., intrinsic), as **matter** (► 9.3) and **form** (► 9.4), or is outside the essence of the thing (i.e., extrinsic), as the **efficient cause** (► 9.7)

---

<sup>8</sup> *In Metaph.* 5, l. 1, §751: “principium et causa licet sint idem subiecto, differunt tamen ratione. Nam hoc nomen principium ordinem quemdam importat; hoc vero nomen causa, importat influxum quemdam ad esse causati.” *In Sent.* 3, d. 11 q. 1 a. 1 ad 5: “nomen principii importat relationem originis absolute; nomen autem causae importat respectum originis per comparisonem ad esse rei quod a causa procedit.” *In Sent.* 1, d. 29 q. 1 a. 1 co.: “omnis causa habet ordinem principii ad esse sui causati quod per ipsam constituitur.”

<sup>9</sup> *STh* I, q. 33 a. 1 ad 1: “hoc nomen causa videtur importare diversitatem substantiae, et dependentiam alicuius ab altero; quam non importat nomen principii. In omnibus enim causae generibus, semper invenitur distantia inter causam et id cuius est causa, secundum aliquam perfectionem aut virtutem.” *In Sent.* 1, d. 12 q. 1 a. 2 ad 1: “causa enim semper ponit diversitatem essentiae, sicut patet in omnibus. [...] causatum habet dependentiam ad causam.”

<sup>10</sup> *In Metaph.* 5, l. 1, §750: “hoc nomen principium communius est quam causa: aliquid enim est principium, quod non est causa; sicut principium motus dicitur terminus a quo.” *In Sent.* 3, d. 11 q. 1 a. 1 ad 5: “unde terminus a quo, dicitur principium motus, non tamen causa.”

<sup>11</sup> *In Metaph.* 5, l. 3, §783: “Est autem distinctio causae per species et per modos.”

<sup>12</sup> *In Metaph.* 5, l. 3, §783: “distinctio per species est penes diversas rationes causandi; et ideo est quasi divisio per differentias essentiales species constituentes.” *In Sent.* 1, d. 29 q. 1 a. 1 co.: “omnis causa vel est extra essentiam rei, sicut efficiens et finis; vel pars essentiae, sicut materia et forma.” *In Metaph.* 12, l. 4 §2468: “computando tam causas intrinsecas quam extrinsecas, sunt quatuor proportionaliter omnium.” Cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b25–30: “στοιχεῖα μὲν κατ’ ἀναλογίαν τρία, αἰτίαι δὲ καὶ ἀρχαὶ τέτταρες: ἄλλο δ’ ἐν ἄλλῳ, καὶ τὸ πρῶτον αἴτιον ὡς κινοῦν ἄλλο ἄλλῳ. ὑγίεια, νόσος, σῶμα: τὸ κινοῦν ἰατρική. εἶδος, ἀταξία τοιαδί, πλίνθοι: τὸ κινοῦν οἰκοδομική. καὶ εἰς ταῦτα διαίρεται ἡ ἀρχή.” *In Metaph.* 5, l. 2, §763: “Primo enumerat [Philosophus] diversas species causarum. Secundo reducit eas ad quatuor.” *Ibid.*, §772 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b16–17): “Concludit ergo quod causae toties dicuntur, idest quatuor modis.”

and the **end** (►9.8). Thus, counting both the intrinsic and the extrinsic, analogically (*proportionaliter* < κατ' ἀναλογίαν), there are four (species of) causes of all things.

2. The division by modes (►11) is in virtue of the diverse *relations of cause to thing caused*.<sup>13</sup> Hence, it is (found) in those (causes) that have the same *ratio* of *causing*. For example, (in causes that have the same *ratio* of *causing*, we find a cause that is related) *by itself* (*per se*) [to the thing caused] and (a cause that is related) *accidentally* (*per accidens*) [to the thing caused]; (likewise, we find a cause that is) *remote* (in relation to the thing caused) and (a cause that is) *proximate*. Whence, (this distinction by modes) is as (a division) by accidental differences that do not diversify the species (of the cause).

◀ Therefore, the name *cause* is said in multiple modes (►20.12, ¶3): not only in respect of the diverse species of cause (¶1), but also in respect of the co-special causes (¶2; i.e., in respect of the various accidental modes of being a cause of the same species).<sup>14</sup>

### 9.3. Material Cause

The *ratio of material cause* is *that from which something comes to be* (*id ex quo fit aliquid* = τὸ ἐξ οὗ γίνεταί τι), *which exists in it* (*est ei inexistens, idest intus existens; cum insit* = ἐνυπάρχοντος, i.e., is intrinsic).<sup>15</sup> It (moreover) belongs to the *ratio of matter* to be *that which of itself* (*de se*) *lacks any form* (►9.4).<sup>16</sup>

(The expression *which exists in it*) is said to differentiate (this mode of being a cause) from *privation* (►42.7) and *contrary* (►43); for something is said to come to be from a contrary (*ex contrario*) or from a privation (*ex privatione*) as from something that does not exist within (*ex non inexistente*, i.e., from something extrinsic).<sup>17</sup> Thus, white comes to be from black (*ex nigro*, i.e., from the contrary of white) or from non-white (*ex non albo*, i.e., from the privation of white); and a statue comes to be from an un-figured (*ex infigurato*, i.e.,

<sup>13</sup> *In Metaph.* 5, l. 3, §783: “Divisio autem per modos est penes diversas habitudines causae ad causatum. Et ideo est in his quae habent eandem rationem causandi, sicut per se et per accidens, remotum et propinquum. Unde est quasi per differentias accidentales non diversificantes speciem.”

<sup>14</sup> *In Metaph.* 5, l. 3, §784: “Causae enim multis modis dicuntur, non solum quantum ad diversas species causae, sed etiam quantum ad causas conspicias.” Cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b30–31): “λέγονται γὰρ αἴτια πολλαχῶς.”

<sup>15</sup> *In Metaph.* 5, l. 2, §763 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a24–25): “uno modo dicitur causa id ex quo fit aliquid, et est ei inexistens, idest intus existens.” Ibid. 5, l. 3, §777 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b17–21): “in omnibus istis [sc., *literae syllabarum, materia artificialium, et cetera*] est una ratio causae, secundum quod dicitur causa illud ex quo fit aliquid, quod est ratio causae materialis.” *In Physic.* 2, l. 5, n. 3 (cf. ARISTOTLE, *Physica* B.3, 194b23–24): “uno modo dicitur causa ex quo fit aliquid cum insit.”

<sup>16</sup> *Q. d. de anima*, a. 7 co.: “Cum autem de ratione materiae sit quod de se careat omni forma [...]”

<sup>17</sup> *In Metaph.* 5, l. 2, §763 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a24–25): “Quod quidem [sc., *et est ei inexistens, idest intus existens*] dicitur ad differentiam privationis, et etiam contrarii. Nam ex contrario vel privatione dicitur aliquid fieri sicut ex non inexistente, ut album ex nigro vel album ex non albo.” *In Physic.* 2, l. 5, n. 3 (cf. ARISTOTLE, *Physica* B.3, 194b24): “Apposuit autem cum insit, ad differentiam privationis et contrarii: nam statua [...] fit etiam ex infigurato, quod quidem non inest statuae iam factae.”

something deprived of figure; ►42.9), which is not in the statue that has already come into being. On the other hand, a statue is made from bronze—and a saucer from silver—as from something that exists within; for, when the statue is made, the *ratio* of *bronze* is not removed—nor is the *ratio* of *silver* removed when a saucer is made.<sup>18</sup> Hence, bronze is a cause of the statue—and silver, of the saucer—according to the mode of matter (*per modum materiae*); but not the non-figured, which is a principle by accident (*per accidens*).

In this mode, letters or phonemes (*elementa, idest literae* < τὰ [φωνῆς] στοιχεῖα)<sup>19</sup> are said to be elements and causes of syllables.<sup>20</sup>

Likewise, the matter of artifacts is said to be a (material) cause of those things that are made through art; and all simple bodies (►12.9) are said to be causes of compound bodies (*corporum mixtorum*);<sup>21</sup> and parts are said to be a cause of the whole (►13.1); and the propositions of a syllogism's premises are said to be a cause of the conclusion: (that is), insofar as a conclusion is constituted from the termini of the propositions, and not insofar as they stand under the order of the propositions (►53.6, ¶13), just as flour is said to be the matter of bread, but not insofar as it is under the form of flour.<sup>22</sup>

<sup>18</sup> *In Metaph.* 5, l. 2, §763 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a25–26): “Statua autem fit ex aere, et phiala ex argento, sicut ex inexistente. Nam cum statua fit, non tollitur ratio aeris, nec si fit phiala, tollitur ratio argenti. Et ideo aes statuae, et argentum phialae sunt causa per modum materiae.” *In Physic.* 2, l. 5, n. 3 (cf. ARISTOTLE, *Physica* B.3, 194b24–25): “sicut aes dicitur causa statuae et argentum causa phialae.” *In Physic.* 2, l. 5, n. 3: “statua quidem fit ex aere, quod inest statuae iam factae [...]. Unde aes est causa statuae, non autem infiguratum, cum sit principium per accidens tantum, ut in primo dictum est.”

<sup>19</sup> Cf. *In Peri.* 1, l. 2, 147–151: “etiam littere dicuntur in prolatione et scriptura, quamvis magis proprie secundum quod sunt in scriptura dicantur littere, secundum autem quod sunt in prolatione, dicantur elementa uocum.” Cf. ARISTOTLE, *De interpretatione* 1, 16a3–4: “Ἔστι μὲν οὖν τὰ ἐν τῇ φωνῇ τῶν ἐν τῇ ψυχῇ παθημάτων σύμβολα, καὶ τὰ γραφόμενα τῶν ἐν τῇ φωνῇ.” Cf. *Merriam-Webster Dictionary*, entry for *phoneme*: “the smallest unit of speech that can be used to make one word different from another word.” This definition, of course, accounts also for quantity, which goes against the ratio of *element*.

<sup>20</sup> *In Metaph.* 5, l. 3, §777 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b17–21): “Dicuntur enim elementa, idest literae, causae syllabarum, et materia artificialium dicitur esse causa factorum per artem, et ignis et terra et huiusmodi omnia simplicia corpora, dicuntur esse causae corporum mixtorum. Et partes dicuntur esse causa totius. Et suppositiones, idest propositiones praemissae, ex quibus propositis syllogizatur, dicuntur esse causa conclusionis.”

<sup>21</sup> St. Thomas, following ARISTOTLE, explicitly mentions fire and earth among the elements (*et ignis et terra et huiusmodi* = καὶ τὸ πῦρ καὶ ἡ γῆ καὶ τὰ τοιαῦτα πάντα) as causes of composite bodies, according to ancient science. But the same can be said in modern chemistry, for example, of sodium (Na) and chloride (Cl), which are causes of common salt; or, in modern physics, the same can be said of so-called elementary particles, which are taken to be the ultimate material causes of all composite bodies. Thus, the ratio of *element* and of *material cause* remain the same regardless of the development of science.

<sup>22</sup> *In Physic.* 2, l. 5, n. 9: “potest esse dubium de hoc quod dicit [Philosophus], quod propositiones sunt materia conclusionis. Materia enim inest ei cuius est materia: unde supra notificans causam materialem, dixit quod est ex quo fit aliquid cum insit; propositiones autem sunt seorsum a conclusione. Sed dicendum quod ex terminis propositionum constituitur conclusio: unde secundum hoc propositiones dicuntur materia conclusionis, in quantum termini, qui sunt materia propositionum, sunt etiam materia conclusionis, licet non secundum quod stant sub ordine propositionum; sicut et farina dicitur materia panis, licet non secundum quod stat sub forma farinae. Ideo tamen potius dicuntur propositiones materia conclusionis quam e converso, quia termini qui coniunguntur in conclusione, separatim ponuntur in praemissis. Sic igitur habemus duos modos causae.”

#### 9.4. Formal Cause

The **formal cause** is compared to a thing in two modes:<sup>23</sup> **(1)** as the **intrinsic** form (►9.5) of the thing, which is the **species** (*species* = τὸ εἶδος) mentioned by those natural (philosophers) who posited forms in matter (as ARISTOTLE does); **(2)** as **extrinsic** to the thing (►9.6), but in the likeness of which the thing is said to come to be (*ad cuius similitudinem res fieri dicitur*), which is the **exemplar** or **paradigm** (*exemplum, id est exemplar; exemplum vel paradigma* = τὸ παράδειγμα), according to which PLATO posited ideas to be abstract forms.

In every form, we find a respect towards that which is formed according to it: for example, (scientific) knowledge is related to (scientific) knower (*scientia respicit scientem*; i.e., knowledge *in-forms* the knower).<sup>24</sup> This respect is what the name *form* conveys. Hence, *form* always denotes a relation of cause (*notat habitudinem causae*); for a form is in some mode a cause of that which is formed according to it, whether such formation comes to be by the mode of **inherence** (*per modum inhaerentiae*), as in intrinsic forms, or by the mode of **imitation** (*per modum imitationis*), as in exemplar forms. Some forms have, moreover, a respect towards that which is outside, as (scientific) knowledge is related to the (scientifically) knowable (*scientia respicit scibile*); but the relation of cause does not belong to such forms according to this likeness and *ratio* (►37.1, ¶3; 37.10; 37.11, ¶3).

#### 9.5. Species-Form

That is something's (intrinsic) **formal cause** (*causa alicuius ut substantia, id est ut forma* < ὡς οὐσία) which is the *cause of being* (*causa essendi* = τὸ αἴτιον τοῦ εἶναι); for each thing is in act by its form.<sup>25</sup> The (intrinsic) **formal cause** (*causa formalis*) is (moreover) *the ratio of the essence or quiddity of a thing* (*ratio ipsius quod quid erat esse* = ὁ λόγος τοῦ

---

<sup>23</sup> *In Metaph.* 5, l. 2, §764 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a26–27): “Alio autem modo dicitur causa, species et exemplum, id est exemplar; et haec est causa formalis, quae comparatur dupliciter ad rem. Uno modo sicut forma intrinseca rei; et haec dicitur species. Alio modo sicut extrinseca a re, ad cuius tamen similitudinem res fieri dicitur; et secundum hoc, exemplar rei dicitur forma. Per quem modum ponebat Plato ideas esse formas.” *In Physic.* 2, l. 5, n. 4 (cf. ARISTOTLE, *Physica* B.3, 194b26): “Secundo modo dicitur causa *species et exemplum*. Considerandum est etiam quod duo posuit [Philosophus] pertinentia ad quidditatem rei, scilicet speciem et exemplum, propter diversas opiniones de essentiis rerum. Nam Plato posuit naturas specierum esse quasdam formas abstractas, quas dicebat exemplaria et ideas; et propter hoc posuit *exemplum vel paradigma*. Naturales autem philosophi qui aliquid de forma tetigerunt, posuerunt formas in materia; et propter hoc nominavit *speciem*.”

<sup>24</sup> *De veritate*, q. 3 a. 3 co.: “Invenimus autem in quibusdam formis duplicem respectum: unum ad id quod secundum eas formatur, sicut scientia respicit scientem; alium ad id quod est extra, sicut scientia respicit scibile; hic tamen respectus non est omni formae communis, sicut primus. Hoc igitur nomen forma importat solum primum respectum; et inde est quod forma semper notat habitudinem causae. Est enim forma quodammodo causa eius quod secundum ipsam formatur; sive talis formatio fiat per modum inhaerentiae, ut in formis intrinsecis, sive per modum imitationis, ut in formis exemplaribus. Sed similitudo et ratio respectum etiam secundum habent, ex quo non competit eis habitudo causae.”

<sup>25</sup> *In De anima* 2, c. 7, 176–179 (cf. ARISTOTLE, *De anima* B.4, 415b12–13): “illud est causa alicuius ut substantia, id est ut forma, quod est causa essendi, nam per formam unumquodque est actu.”

τί ἦν εἶναι, *ratio quidditativa rei* = ὁ λόγος ὁ τοῦ τί ἦν εἶναι = ἡ μορφή καὶ τὸ εἶδος): that is, the definition by which we know *what* a thing is.<sup>26</sup> Whence, a formal difference varies the species (►16.7); for it is the form that gives the (act of) being (*esse*) to a thing.<sup>27</sup>

Considered abstractly, every form has infinity (►24.8) in its proper *ratio*.<sup>28</sup> For example, in (the form of) whiteness abstractly considered, the *ratio* of *whiteness* is not finite according to something. It is, however, contracted (*contrahitur*) into a determinate species; for the *ratio* of *color* (*ratio coloris*) and the *ratio* of *being* (*ratio essendi*) are determined in it (i.e., whiteness is limited, determined *to be some species of color*).

Since every form (of a composite being) informs matter through its essence, a form is the origin and principle of the properties that naturally follow upon a composite thing (e.g., having a specific figure or shape follows upon the substantial form of a specific natural body, as the shape of a dog follows upon its substantial form).<sup>29</sup> Thus, from any one form follows some inclination; and from the inclination, an operation. The same form that gives (to) matter the (act of) being (*esse*) is also a principle of operation because each thing

<sup>26</sup> *In Metaph.* 5, l. 2, §764 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a27): “forma est ratio ipsius quod quid erat esse, idest definitio per quam scitur quid est res.” *In Physic.* 2, l. 5, n. 4 (cf. ARISTOTLE, *Physica* B.3, 194b26–27): “et hoc [sc., *forma*] dicitur causa in quantum est ratio quidditativa rei; hoc enim est per quod scimus de unoquoque quid est.” See also ARISTOTLE, *Metaphysica* Δ.8, 1017b10–26.

<sup>27</sup> *Q. d. de anima*, a. 7 co.: “Formalis autem differentia speciem variat. Nam forma est quae dat esse rei.” *In Sent.* 1, d. 8 q. 5 a. 2 co.: “forma [...] dat esse materiae.” *De virtutibus*, q. 4 a. 4 co.: “Sicut autem forma in rebus naturalibus dat speciem, ita et in moralibus obiectum dat speciem actui, et per consequens habitui.” *In Sent.* 2, d. 9 q. 1 a. 4 co.: “omnis denominatio est a forma, quae dat esse et est principium operationis.” *In Sent.* 2, d. 12 q. 1 a. 4 co.: “omnis forma substantialis dat esse completum in genere substantiae.” *In Sent.* 2, d. 18 q. 1 a. 2 co.: “cum omnis forma det aliquod esse, et impossibile sit unam rem habere duplex esse substantiale, oportet, si prima forma substantialis adveniens materiae det sibi esse substantiale, quod secunda superveniens det esse accidentale.” *In Sent.* 2, d. 26 q. 1 a. 6 ad 2: “una enim forma est quae dat esse, et quae est principium operis.” *STh* I, q. 76 a. 4 co.: “forma substantialis in hoc a forma accidentali differt quia forma accidentalis non dat esse simpliciter, sed esse tale, sicut calor facit suum subiectum non simpliciter esse, sed esse calidum.” *STh* I-II, q. 18 a. 3 co.: “in rebus naturalibus non invenitur tota plenitudo perfectionis quae debetur rei, ex forma substantiali, quae dat speciem; sed multum superadditur ex supervenientibus accidentibus, sicut in homine ex figura, ex colore, et huiusmodi; quorum si aliquod desit ad decentem habitudinem, consequitur malum.” *STh* III, q. 6 a. 4 ad 2: “forma actu dat speciem, materia autem, quantum est de se, est in potentia ad speciem. Et ideo contra rationem formae esset quod praeexisteret naturae speciei, quae perficitur per unionem eius ad materiam, non autem est contra naturam materiae quod praeexistat naturae speciei.” *STh* III, q. 72 a. 4 co.: “forma rei naturalis dat ei speciem.” *De veritate*, q. 29 a. 8 ad 8: “in eodem instanti forma dat esse, ordinat et distinguit.”

<sup>28</sup> *In Sent.* 1, d. 43 q. 1 a. 1 co.: “Omnis enim forma in propria ratione si abstracte consideretur, infinitatem habet; sicut in albedine abstracte intellecta, ratio albedinis non est finita ad aliquid; sed tamen ratio coloris et ratio essendi determinatur in ea, et contrahitur ad determinatam speciem.”

<sup>29</sup> *In Sent.* 4, d. 44 q. 3 a. 3 qc. 1 co.: “forma est principium proprietatum compositi. [...] forma quaelibet ex hoc ipso quod per essentiam suam materiam informat, est origo proprietatum quae compositum naturaliter consequuntur.” *In De anima* 2, c. 5, 107–109: “ex unaquaque autem forma sequitur aliqua inclinatio et ex inclinatione operatio.” *Q. d. de anima*, a. 9 co.: “quia eadem forma quae dat esse materiae est etiam operationis principium, eo quod unumquodque agit secundum quod est actu; necesse est quod anima, sicut et quaelibet alia forma, sit etiam operationis principium.” *Comp. th.* 1, c. 87, 20–22: “omnis actio que est propria alicui speciei, est a principiis consequentibus formam que dat speciem.” *Q. d. de anima*, a. 10 ad 2: “cum materia sit propter formam, hoc modo forma dat esse et speciem materiae, secundum quod congruit suae operationi.”

acts insofar as it is in act. Thus, every action that is proper to some species, is from the principles that follow upon the form that gives the species.

## 9.6. Exemplar-Form

*The likeness (similitudo) of one thing that exists in another has either:<sup>30</sup> (1) the ratio of exemplar, if it is related (to the thing in which the likeness exists) as a principle; or (2) the ratio of image, if it is related to that of which it is a likeness as to a principle.*

As (not only PROCLUS, but) also (pseudo-)DIONYSIUS says, it is manifest that the effect must preexist in the cause in an exemplary way (*exemplariter*); for causes produce effects according to their likeness; and conversely too, caused (things) have the image of their causes.<sup>31</sup>

An example of both is ascertained in our intellect. Indeed, (1) the likeness of the artifact that exists in the mind of the artificer, (which) is the principle of the operation by which the artifact is constituted, is compared to the artifact as the exemplar (is compared) to that which is exemplified. And (2) the likeness of a natural thing conceived in our intellect is compared to the thing whose likeness it is as to its principle; for our understanding begins from the senses, which are affected (*immutantur*) by natural things (► 49.3, ¶1).<sup>32</sup>

An **exemplar** is necessary for the production of anything in order for the effect to attain a determinate form.<sup>33</sup> Thus, the artificer produces a determinate form in matter because of the exemplar considered, whether it is (something) external or it is conceived internally in the mind. Likewise, it is manifest that those things that come to be naturally, attain determinate forms, and that the determination of these forms must be reduced into a first principle and first exemplar of all things. But other things are said to be exemplars, too,

---

<sup>30</sup> ScG 4, 11 n. 14: "Similitudo autem alicuius in altero existens vel habet rationem exemplaris, si se habeat ut principium: vel habet potius rationem imaginis, si se habeat ad id cuius est similitudo sicut ad principium."

<sup>31</sup> *In De causis*, l. 14: "Manifestum est autem quod oportet effectus praeexistere in causis exemplariter, quia causae producunt effectus secundum suam similitudinem; et e converso causata habent imaginem suarum causarum, ut etiam Dionysius dicit II capitulo De Divinis Nominibus."

<sup>32</sup> ScG 4, 11 n. 14: "Utriusque autem [sc., exemplaris atque imaginis] exemplum in nostro intellectu perspicitur. Quia enim similitudo artificiatum existens in mente artificis est principium operationis per quam artificiatum constituitur, comparatur ad artificiatum ut exemplar ad exemplatum: sed similitudo rei naturalis in nostro intellectu concepta comparatur ad rem cuius similitudo existit ut ad suum principium, quia nostrum intelligere a sensibus principium accipit, qui per res naturales immutantur."

<sup>33</sup> *STh* I, q. 44 a. 3 co.: "ad productionem alicuius rei ideo necessarium est exemplar, ut effectus determinatam formam consequatur, artifex enim producit determinatam formam in materia, propter exemplar ad quod inspicit, sive illud sit exemplar ad quod extra intuetur, sive sit exemplar interius mente conceptum. Manifestum est autem quod ea quae naturaliter fiunt, determinatas formas consequuntur. Haec autem formarum determinatio oportet quod reducat[ur] [...] in primum principium [...] primum exemplar omnium. Possunt etiam in rebus creatis quaedam aliorum exemplaria dici, secundum quod quaedam sunt ad similitudinem aliorum, vel secundum eandem speciem, vel secundum analogiam alicuius imitationis."

insofar as some are (produced) in (*ad*) the likeness of others, whether according to the same species (e.g., human begets human) or according to the analogy of some imitation.

The preposition *in* (*ad*) can designate an exemplar cause, as when we say, “This book is made in [the likeness of] that [book].”<sup>34</sup>

### 9.7. Efficient Cause

The **efficient** or **moving cause** (*causa movens, vel efficiens*) is *whence the first principle of change and of rest is (unde primum est principium permutationis et quietis < ἡ ἀρχὴ τῆς μεταβολῆς ἢ πρώτη ἢ τῆς ἡρεμῆσεως)*.<sup>35</sup> ARISTOTLE says not only *of motion* (*motus* = τῆς μεταβολῆς) but also *of rest* (*quietis* = τῆς ἡρεμῆσεως) because natural motion and natural rest are reduced to the same cause (► 12.4). Likewise, violent motion and violent rest (are reduced to the same cause); for that cause by which something moves into a place is the same cause by which the thing rests in that place (whether naturally or violently).

An agent-cause produces an effect in the likeness (*in similitudine*) of its form.<sup>36</sup> Whence, not only is it an efficient cause, but also an exemplar (► 9.6) of the effect. This happens in two modes: **(a)** sometimes, the form itself by which the likeness of the agent to the effect is considered, is directly the principle of the action by which the effect is produced, as heat in a heating fire; but **(b)** sometimes it is not the principle first and by itself (*primo et per se*) of the active generation of the action by which the effect is produced; rather, the principles of that form (are the generative principles): for example, when a white man generates a white man, the whiteness itself of the begetter is not the principle of active generation; and, nonetheless, the whiteness of the begetter is said to be a cause of the whiteness of the begotten because the principles of whiteness in the begetter are the generative principles producing whiteness in the begotten.

---

<sup>34</sup> *STh* I, q. 93 a. 5 ad 4: “haec praepositio ad potest designare causam exemplarem; sicut cum dicitur, iste liber est factus ad illum.” Cf. *In Sent.* 1, d. 8 q. 1 a. 2 ad 2: “esse creatum non est per aliquid aliud, si ly per dicat causam formalem intrinsecam; immo ipso formaliter est creatura; si autem dicat causam formalem extra rem, vel causam effectivam, sic est per divinum esse et non per se.”

<sup>35</sup> *In Metaph.* 5, l. 2, §765 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a29–30): “Tertio modo dicitur causa unde primum est principium permutationis et quietis; et haec est causa movens, vel efficiens. Dicit autem, motus, aut etiam quietis, quia motus naturalis et quies naturalis in eadem causam reducuntur, et similiter quies violenta et motus violentus. Ex eadem enim causa ex qua movetur aliquid ad locum, quiescit in loco.” *In Physic.* 2, l. 5, n. 5 (cf. ARISTOTLE, *Physica* B.3, 194b29–30): “Ulterius autem dicit quod alio modo dicitur causa a quo est principium motus vel quietis.”

<sup>36</sup> *In Sent.* 4, d. 43 q. 1 a. 2 qc. 1 co.: “Causa autem univoca agens producit effectum in similitudine suae formae; unde non solum est causa efficiens, sed exemplaris, istius effectus. Hoc autem contingit dupliciter. Quandoque enim ipsa forma, per quam attenditur similitudo agentis ad effectum, est directe principium actionis qua producitur ille effectus, sicut calor in igne calefaciente. Quandoque autem illius actionis qua effectus producitur, non est principium primo et per se ipsa forma secundum quam attenditur similitudo, sed principia illius formae; sicut si homo albus generaret hominem album, ipsa albedo generantis non est principium generationis activae; et tamen albedo generantis dicitur causa albedinis generati, quia principia albedinis in generante sunt principia generativa facientia albedinem in generato.”

To this genus of cause is reduced whatever produces (*facit*) something in whatever mode of being (*quocumque modo esse*): not only according to substantial being (*secundum esse substantiale*), but also accidental (*accidentale*), which is possible in every motion.<sup>37</sup> Whence, ARISTOTLE not only adds that—universally (*universaliter* = ὅλως)—every producer (*faciens* = τὸ ποιῶν) is a cause of the thing produced (*facti* = τοῦ ποιουμένου); but also every changer (*mutans; permutans; commutans* = τὸ μεταβλητικόν), of the thing changed (*mutati; permutati; commutati* = τοῦ μεταβάλλοντος).

For example, an advisor (*consiliator* = βουλευσας) is a cause because it is from the advisor that motion begins insofar as someone acts following advice for the sake of preserving something.<sup>38</sup> Likewise, the father is a cause of the son. In these two examples, ARISTOTLE points to two principles of motion from which everything is produced: namely, purpose (*propositum*) in the counsellor, and nature (► 12) in the father. Also, although propositions are as matter in respect of their termini (► 9.3), they are reduced to the genus of efficient cause in respect of their inferring virtue (*quantum ad vim illativam*), because the principle of the discourse of reason comes from the propositions into its conclusion (► 55).<sup>39</sup>

### 9.8. Final Cause

The **end** (*finis* = τὸ τέλος) is the *cause for the sake of which* (*cuius causa* < τὸ οὗ ἕνεκα) something comes to be (*aliquid fit*), as health is a cause of walking.<sup>40</sup>

The end or **final cause** is a principle only insofar as it is in the intention of the mover; whence, it is not altogether something extrinsic to the act; for it is compared to the act as a *terminus* or as a *principle* (► 33.5):<sup>41</sup>

<sup>37</sup> *In Metaph.* 5, l. 2, §770 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a32): “Ad hoc autem genus causae reducitur quicquid facit aliquid quocumque modo esse, non solum secundum esse substantiale, sed secundum accidentale; quod contingit in omni motu. Et ideo non solum dicit quod faciens sit causa facti, sed etiam mutans mutati.” *Ibid.*, §765: “Et universaliter omne faciens est causa facti per hunc modum, et permutans permutati.” *In Physic.* 2, l. 5, n. 5 (cf. ARISTOTLE, *Physica* B.3, 194b31–32): “et omne commutans commutati.”

<sup>38</sup> *In Metaph.* 5, l. 2, §765 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a30–32): “Sicut consiliator est causa. Nam ex consiliatore incipit motus in eo, qui secundum consilium agit ad rei conservationem. Et similiter pater est causa filii. In quibus duobus exemplis duo principia motus tetigit ex quibus omnia fiunt, scilicet propositum in consiliatore, et naturam in patre.” *In Physic.* 2, l. 5, n. 5 (cf. ARISTOTLE, *Physica* B.3, 194b30–31): “sicut consilians dicitur causa, et pater filii.”

<sup>39</sup> *In Physic.* 2, l. 5, n. 10: “propositiones quidem quantum ad terminos sunt materia conclusionis, ut dictum est; quantum autem ad vim illativam ipsarum reducuntur ad hoc genus causae; nam principium discursus rationis in conclusione est ex propositionibus.”

<sup>40</sup> *In Metaph.* 5, l. 2, §771 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a32–34): “Quarto modo dicitur causa finis; hoc autem est cuius causa aliquid fit, sicut sanitas est causa ambulandi.” *In Physic.* 2, l. 5, n. 6 (cf. ARISTOTLE, *Physica* B.3, 194b32–33): “Quartum autem modum causae ponit, quod aliquid dicitur causa ut finis; et hoc est *cuius causa* aliquid fit, sicut sanitas dicitur ambulationis.”

<sup>41</sup> *In Metaph.* 12, l. 4, §2470: “finis non est principium nisi secundum quod est in intentione moventis.” *STh* I-II, q. 1 a. 3 ad 1: “finis non est omnino aliquid extrinsecum ab actu, quia comparatur ad actum ut principium vel terminus.”

1. It belongs to the *ratio* of *act* to be *towards something* (*ad aliquid*) in respect of the affection (*quantum ad passionem*, i.e., as the terminus of the act; ► 33.5, ¶1).<sup>42</sup>
2. (It belongs to the *ratio* of *act*) to be *from something* (*ab aliquo*) in respect of the action (*quantum ad actionem*, i.e., as the principle of the act; ► 33.5, ¶2).<sup>43</sup>

Two (things) must be considered in any action: the agent (*agens*) and the *ratio* of *acting* (*ratio agendi*).<sup>44</sup> For example, in (the action of) heating, fire is the agent, and heat is the *ratio* of *acting*. In moving, the end is said to move as the *ratio* of *moving*; but the efficient (cause is said to move) as the agent (produces) motion: that is, educating (*educens*, i.e., by drawing out) the mobile from potency into act. Thus, both the end and the efficient (cause) are said to move, but diversely. The *ratio* of *acting* is the form of the agent by which it acts; whence, it must be in the agent for it to act. However, it is not in (the agent) according to the perfect (act of) being of nature (*secundum esse naturae perfectum*); for motion would cease as soon as this is had; rather, it is in the agent by the mode of *intention*; for the end is prior in intention but posterior in being (► 11.5).

As is evident from the name itself, **intention** (*intentio*) signifies *to tend into something* (*in aliquid tendere*).<sup>45</sup> Both the action of a mover and the motion (i.e., the affection) of a mobile tend into something, but the motion of a mobile tends into something because it proceeds from the action of a mover. Whence, *intention* pertains first and principally to that which moves. Thus, architects, and all those who give precepts to anyone, are said to move others into that which they intend; and the will moves all the other powers of the soul into an end.

Properly, therefore, the intention of the mover is the act of an appetitive power; for the name *intention* designates, first and by itself (*primo et per se*), the act of the will (i.e. of an intellectual appetitive power, rather than a sensitive or natural one).<sup>46</sup> But there is also a

---

<sup>42</sup> *STh* I-II, q. 1 a. 3 ad 1: “et hoc ipsum est de ratione actus, [...] ut sit ad aliquid, quantum ad passionem.”

<sup>43</sup> *STh* I-II, q. 1 a. 3 ad 1: “et hoc ipsum est de ratione actus, ut scilicet sit ab aliquo.”

<sup>44</sup> *De veritate*, q. 22 a. 12 co.: “tam finis quam efficiens movere dicuntur, sed diversimode; cum in qualibet actione duo considerentur: scilicet agens, et ratio agendi; ut in calefactione ignis est agens, et ratio agendi calor. In movendo dicitur finis movere sicut ratio movendi: sed efficiens sicut agens motum, hoc est educens mobile de potentia in actum. Ratio autem agendi est forma agentis per quam agit; unde oportet quod insit agenti ad hoc quod agat. Non autem inest secundum esse naturae perfectum, quia hoc habito quiescit motus; sed inest agenti per modum intentionis; nam finis est prior in intentione, sed posterior in esse.”

<sup>45</sup> *STh* I-II, q. 12 a. 1 co.: “intentio, sicut ipsum nomen sonat, significat in aliquid tendere. In aliquid autem tendit et actio moventis, et motus mobilis. Sed hoc quod motus mobilis in aliquid tendit, ab actione moventis procedit. Unde intentio primo et principaliter pertinet ad id quod movet ad finem, unde dicimus architectorem, et omnem praecipientem, movere suo imperio alios ad id quod ipse intendit. Voluntas autem movet omnes alias vires animae ad finem.”

<sup>46</sup> *STh* I-II, q. 12 a. 1 co.: “Unde manifestum est quod intentio proprie est actus voluntatis.” *De malo*, q. 16 a. 11 ad 3: “intentio est virtutis appetitivae actus: quae quidem est duplex. Una sensitiva, quae quidem

natural appetitive power whereby things tend towards something even if they do not possess any sense or intellectual cognition: that is, they have a natural tendency or inclination—an *intention*.<sup>47</sup> Thus, the intention of the mover is not the act of a cognitive power (unlike intellectual intentions; ►8.1), even though the name *intention* (*intentio*) is taken from the act of the mind, which is *to intend*.<sup>48</sup>

Since the end is prior in intention and posterior (*posterior*) or last (*ultimum*) in being (*in esse*), in execution (*in executione*), in generation (*in generatione*), it would seem less to be a cause; and so, it had been neglected by the earliest philosophers.<sup>49</sup> This is why ARISTOTLE proves especially that the end is a cause, in this way: to ask “why?” (*quare*) or “for the sake of what?” (*propter quid* = δὲ τὶ) is to inquire for a cause (►55.4, ¶2); when we are asked why or for the sake of what someone walks, befittingly (*convenienter*) replying we say, “(in order) to be healthy” (*ut sanetur* = ἵνα ὑγιαίνῃ); and thus answering, we believe that we have rendered the cause. Hence, it is evident that the end is a cause.

## 9.9. Necessary

*Necessary* is among the proper differences of being (*ens*).<sup>50</sup> *Necessary* is a name that signifies something that pertains to the discourse of *cause*: *necessary* follows upon *cause*;

---

est virtus organi corporei [...]. Alia autem est vis appetitiva intellectiva, scilicet voluntas [...].” *In Sent.* 2, d. 38 q. 1 a. 3 co.: “intentio primo et per se actum voluntatis nominat secundum quod in ea est vis intellectus ordinantis.”

<sup>47</sup> *In Sent.* 2, d. 38 q. 1 a. 3 ad 2: “naturalia quamvis non habeant voluntatem, tamen intendunt aliquid per appetitum naturalem.” Cf. *In Ethic.* 1, l. 1, 165–183.

<sup>48</sup> *De veritate*, q. 21 a. 3 ad 5: “finis dicitur esse prior in intentione his quae sunt ad finem, non autem aliis causis, nisi secundum quod ipsae sunt ad finem [...]. Et tamen sciendum, quod cum dicitur quod finis est prior in intentione, intentio sumitur pro actu mentis, qui est intendere.” *In Sent.* 2, d. 38 q. 1 a. 3 co.: “Intellectus autem speculativus neque fugit aut prosequitur, neque etiam aliquid de fugiendo et prosequendo dicit; et ideo intentio non est actus cognoscitivae, sed appetitivae.”

<sup>49</sup> *In Sent.* 3, d. 23 q. 2 a. 5 ad 4: “finis est prior in intentione, et posterior in esse.” *De malo*, q. 2 a. 3 co.: “Finis autem est posterior in esse, sed prior in intentione.” *Contra retr.*, c. 7, 334–335: “Finis autem prior est in intentione, posterior autem in executione.” *In Metaph.* 5, l. 2, §771 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a34–35): “Et quia de fine videbatur minus quod esset causa, propter hoc quod est ultimum in esse, unde etiam ab aliis prioribus philosophis haec causa est praetermissa, ut in primo libro prae habitum est, ideo specialiter probat de fine quod sit causa. Nam haec quaestio quare, vel propter quid, quaerit de causa: cum enim quaeritur quare, vel propter quid quis ambulat, convenienter respondentes dicimus, ut sanetur. Et sic respondentes opinamur reddere causam. Unde patet quod finis est causa.” *In Physic.* 2, l. 5, n. 6 (cf. ARISTOTLE, *Physica* B.3, 194b33–35): “Et hoc patet quia respondetur ad quaestionem factam *propter quid*: cum enim quaerimus *propter quid ambulat*? Dicimus *ut sanetur*; et hoc dicentes opinamur nos assignare causam. Ideo autem potius probat de fine quod sit causa quam de aliis, quia hoc minus videbatur propterea quia finis est ultimum in generatione.”

<sup>50</sup> *De sub. sep.*, c. 16, 133–134: “Necessarium autem et possibile sunt propriae differentiae entis.” *In Metaph.* 5, l. 1, §749: “Primo distinguit [Philosophus] nomina significantia causas. Secundo quoddam nomen significans quoddam quod consequitur ad causam, scilicet necessarium.” *In Metaph.* 5, l. 6, §827: “Postquam Philosophus distinxit nomina, quae significant causas, hic distinguit nomen quod significat aliquid pertinens ad orationem causae; scilicet necessarium. Causa enim est ad quam de necessitate sequitur aliud.” *STh* I, q. 82 a. 1 co.: “necessitas dicitur multipliciter.” *In Metaph.* 5, l. 6, §827 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a20–36): “distinguit [Philosophus] modos necessarii. [...] Ponit autem [...] quatuor modos necessarii.” *Ibid.*, §832 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a33–35): “Quartum modum [...] necessarium etiam dicimus sic se habere, quod non contingit aliter se habere: et hoc est necessarium absolute. Prima autem necessaria sunt secundum quid.” *Ibid.*, §836 (cf. ARISTOTLE,

for cause is *that from which another follows of necessity*. Necessity (*necessitas*) is said in multiple modes.

ARISTOTLE posits four modes of the necessary (the first three are: ► 9.10, ¶1, ¶2; ► 9.11, ¶3); but all of them are reduced to the fourth one (discussed here, under ¶1): **necessary** (*necessarium* = ἀναγκαῖον) is *that which cannot be otherwise* (*quod non contingit aliter se habere* = τὸ οὐκ ἐνδέχεται ἄλλως ἔχειν). This is the absolutely necessary (*absolute*), while the other modes are necessary according to something (*secundum quid*; under ¶2).

1. The **absolutely necessary** (*absolute*) differs from the other (modes of being necessary) because absolute and natural necessity pertains to a thing according to that which is intrinsic, intimate and proximate to it.<sup>51</sup> This can be **(a) the form, (b) the matter, or (c) the essence** (i.e., form and matter together) of the thing. Thus, **(a)** that which has necessity from (its) formal cause is absolutely necessary: for example, (we say) that man is rational, or that it is necessary for an animal to be sensible, because it follows upon its form; or that a triangle has three angles equal to two right angles, which (necessity) is reduced to the definition of *triangle*.<sup>52</sup> Likewise, in **(b)**, the necessary that depends on matter: for example, it is absolutely necessary that an animal be corruptible because this (necessity) follows from its being composed from contraries (*ex contrariis*).<sup>53</sup> Also, we say **(c)** that an animal necessarily is a sensible animated-substance, because it is its essence (i.e., *sensible* is taken from its form, while *animated-substance* is taken from its matter).<sup>54</sup>

2. The **necessary according to something** (*secundum quid*)—and not absolutely (*non absolute*)—is that whose necessity depends upon an extrinsic cause; and the extrinsic

---

*Metaphysica* Δ.5, 1015a35–b2): “reducit [Philosophus] omnes modos ad unum [...] ostendit quod omnes modi necessitatis, qui in rebus inveniuntur ad hunc ultimum modum pertinent.” The same definition is found in *In Post. an.* 1, l. 44, 31–32 (cf. ARISTOTLE, *Analytica Posteriora* A.33, 88b31–32). Cf. the adverbial use in *STh* I, q. 82 a. 1 co.: “Necesse est enim quod non potest non esse.”

<sup>51</sup> *In Metaph.* 5, l. 6, §833: “Differt autem necessarium absolute ab aliis necessariis: quia necessitas absoluta competit rei secundum id quod est intimum et proximum ei; sive sit forma, sive materia, sive ipsa rei essentia.” *STh* I, q. 82 a. 1 co.: “Quod quidem [*sc.*, *quod non potest non esse*] convenit alicui, uno modo ex principio intrinseco, sive materiali [...]; sive formali [...]. Et haec est necessitas naturalis et absoluta.”

<sup>52</sup> *In Physic.* 2, l. 15, n. 2: “Similiter etiam quod habet necessitatem ex causa formali, est necessarium absolute; sicut hominem esse rationalem, aut triangulum habere tres angulos aequales duobus rectis, quod reducitur in definitionem trianguli.” *In Metaph.* 5, l. 6, §833: “Dicimus etiam animal necessario esse sensibile, quia consequitur eius formam.” *STh* I, q. 82 a. 1 co.: “ex principio intrinseco [...] formali, sicut cum dicimus quod necesse est triangulum habere tres angulos aequales duobus rectis.” *In Sent.* 4, d. 7 q. 1 a. 1 qc. 2 co.: “Una est necessitas absoluta, sicut [...] triangulum habere tres angulos.”

<sup>53</sup> *In Physic.* 2, l. 15, n. 2: “necessitas quae dependet ex causis prioribus, est necessitas absoluta, ut patet ex necessario quod dependet ex materia. Animal enim esse corruptibile, est necessarium absolute: consequitur enim ad hoc quod est animal, esse compositum ex contrariis.” *In Metaph.* 5, l. 6, §833: “dicimus animal necesse esse corruptibile, quia hoc consequitur eius materiam in quantum ex contrariis componitur.” *STh* I, q. 82 a. 1 co.: “ex principio intrinseco [...] materiali, sicut cum dicimus quod omne compositum ex contrariis necesse est corrumpi.”

<sup>54</sup> *In Metaph.* 5, l. 6, §833: “Dicimus [...] animal necessario esse substantiam animatam sensibilem, quia est eius essentia.”

cause is twofold: the end (►9.10); and the efficient (►9.11).<sup>55</sup> Both modes of necessity *according to something* pertain (i.e., are reduced) to the simply necessary.<sup>56</sup> Thus, that cause is said to be *necessary in respect of an end* without which it is impossible (for something) to live or to be; or to have (some) good; or to be deprived of (some) bad; so that (its) first *ratio* of *necessary* is *that it is impossible to be otherwise*. On the other hand, that which suffers a force is said to necessarily act or to necessarily be acted upon because it is not possible for it to act according to its proper impetus due to the violence of an agent, which is some necessity on account of which *it cannot be otherwise*.

### 9.10. Necessary According to an End

The necessity of anything that is ordered to an end is taken from its end.<sup>57</sup> That which has necessity from something posterior in being (*posterius in esse*; i.e., where the end is prior in intention but posterior in being) is necessary **from a condition or supposition** (*ex conditione, vel suppositione*).<sup>58</sup>

For example, when it is necessary for *this* (thing) to be if *this* (other thing) must come to be, the necessity is from the end (*ex fine*); or from the form (*ex forma*) insofar as it is the end of generation.<sup>59</sup> In natural things, as in artificial things, the necessary is by supposition: but not in such a way that the necessary is as an end; for that which is necessary is posited from the part of matter, while the *ratio* of *necessity* is posited from the part of the end.<sup>60</sup> Thus, we do not say that such an end is necessary because the

<sup>55</sup> *In Metaph.* 5, l. 6, §834: “Necessarium autem secundum quid et non absolute est, cuius necessitas dependet ex causa extrinseca. Causa autem extrinseca est duplex; scilicet finis et efficiens.” *STh* I, q. 82 a. 1 co.: “Alio modo convenit [necessitas] alicui quod non possit non esse, ex aliquo extrinseco, vel fine vel agente.”

<sup>56</sup> *In Metaph.* 5, l. 6, §836 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a35–b2): “Dicit ergo [Philosophus] primo, quod secundum istum ultimum modum necessarii, omnes alii modi aliquid dicuntur. Quod primo ostendit in tertio modo. Illud enim quod vim patitur, de necessitate dicitur aliquid facere vel pati, propter hoc quod non contingit secundum proprium impetum aliquid agere propter violentiam agentis, quae est quaedam necessitas propter quam non contingit aliter se habere.” *Ibid.*, §837 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015b2–5): “ostendit [Philosophus] hoc in primo et secundo modo, in quibus necessitas sumitur ex causis vivendi vel essendi simpliciter, quantum ad primum modum: vel ex causis boni, quantum ad secundum modum. Sic enim in aliis modis necessarium dicebatur, sine quo non poterat esse ex una parte bonum, et ex alia parte vivere et esse. Et sic illa causa, sine qua non contingit vivere vel esse, vel bonum habere, vel malo carere, necessitas dicitur; quasi ex hoc sit prima ratio necessarii, quia impossibile est aliter se habere.”

<sup>57</sup> *In Post. an.* 1, l. 1, 133–134: “Necessitas autem cuiuslibet rei ordinate ad finem ex suo fine sumitur.”

<sup>58</sup> *In Physic.* 2, l. 15, n. 2: “Quod autem habet necessitatem ab eo quod est posterius in esse, est necessarium ex conditione, vel suppositione.”

<sup>59</sup> *In Physic.* 2, l. 15, n. 2: “ut puta si dicatur, necesse est hoc esse si hoc debeat fieri: et huiusmodi necessitas est ex fine, et ex forma in quantum est finis generationis.”

<sup>60</sup> *In Physic.* 2, l. 15, n. 5 (cf. ARISTOTLE, *Physica* B.9, 200a15–19): “Sic igitur patet quod in rebus naturalibus est necessarium ex suppositione, sicut et in rebus artificialibus: sed non ita quod id quod est necessarium, sit sicut finis; quia id quod necessarium est, ponitur ex parte materiae; sed ex parte finis ponitur ratio necessitatis. Non enim dicimus quod necessarium sit esse talem finem, quia materia talis est; sed potius e converso, quia finis et forma talis futura est, necesse est materiam talem esse. Et sic necessitas ponitur ad materiam, sed ratio necessitatis ad finem.”

matter is such, but conversely: i.e., because the end and the form is to be such, it is necessary for matter to be such. And thus, necessity is posited for matter—but the *ratio of necessity*, for the end.

Necessity from the supposition of an end (*ex suppositione finis*) is twofold; for *necessary* is said (to be):<sup>61</sup>

1. *That without which something cannot be preserved in being.*<sup>62</sup> For example, nutriment (is said to be necessary) for an animal to live. Here, the end is *the absolute (act of) being itself (ipsum esse absolutum)*, and the necessity taken from this end pertains to the first mode posited by ARISTOTLE, according to which it is said to be necessary insofar as something cannot live or be without it, which, even if it is not the principal cause of the thing, is some co-cause (*concausa* = συναίτιον).<sup>63</sup> For example, to breathe is necessary to the breathing animal because it cannot live without breathing. Thus, even if respiration itself is not the cause of life, it is, however, a co-cause of life insofar as it cooperates to its preservation; and the same can be said of food, without which an animal cannot live, insofar as (food) cooperates to restoring what is lost. Thus, in this mode are said to be necessary *those (things) without which it is impossible (for something) to be.*

2. *That without which something that pertains to being well cannot be had.*<sup>64</sup> For example, a horse is said (to be) *necessary* for someone who wants to travel; or medicine (is said to be necessary) for a man to live healthily. This is called **necessity of an end** (*necessitas finis*) or, sometimes, **utility** (*utilitas*). Here, the end is *to be well (bene esse)* or *to have something good (aliquid bonum habere)*; and the necessity of the second mode posited by ARISTOTLE is taken from this end: namely, that is said to be necessary *without*

---

<sup>61</sup> *In Sent.* 4, d. 7 q. 1 a. 1 qc. 2 co.: “Tertia est necessitas ex suppositione finis; et est duplex.”

<sup>62</sup> *In Sent.* 4, d. 7 q. 1 a. 1 qc. 2 co.: “uno modo dicitur necessarium sine quo aliquis non potest conservari in esse, sicut nutrimentum animali.” *STh* I, q. 82 a. 1 co.: “[convenit necessitas alicui quod non possit non esse ex] fine quidem, sicut cum aliquis non potest sine hoc consequi [...] finem aliquem, ut cibus dicitur necessarius ad vitam.”

<sup>63</sup> *In Metaph.* 5, l. 6, §834: “Finis autem est [...] ipsum esse absolutum, et ab hoc fine necessitas sumpta pertinet ad primum modum.” *Ibid.*, §827 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a20–23): “Primus [modus] est, secundum quod dicitur aliquid necessarium, sine quo non potest aliquid vivere aut esse; quod licet non sit principalis causa rei, est tamen quaedam concausa. Sicut respirare est necessarium animali respiranti, quia sine respiratione vivere non potest. Ipsa enim respiratio, etsi non sit causa vitae, est tamen concausa, inquantum cooperatur ad contemperamentum caloris, sine quo non est vita. Et similiter est de cibo, sine quo animal vivere non potest, inquantum cooperatur ad restaurationem deperditi, et impedit totalem consumptionem humidi radicalis, quod est causa vitae. Igitur huiusmodi dicuntur necessaria, quia sine eis impossibile est esse.” In accordance with ancient science, St. Thomas points to respiration as keeping the proper balance of heat, *without which there is no life*, and to nutrition as preventing the total consumption of moisture, *which is a cause of life*.

<sup>64</sup> *In Sent.* 4, d. 7 q. 1 a. 1 qc. 2 co.: “Alio modo [dicitur necessarium] sine quo non potest haberi quod pertinet ad bene esse, sicut equus dicitur necessarius ambulare volenti, et medicina ad hoc quod homo sane vivat.” *STh* I, q. 82 a. 1 co.: “[convenit necessitas alicui quod non possit non esse ex] fine quidem, sicut cum aliquis non potest sine hoc [...] bene consequi finem aliquem, ut [...] dicitur necessarius [...] equus ad iter. Et haec vocatur necessitas finis; quae interdum etiam utilitas dicitur.”

which something good cannot be or come to be, or something bad (cannot be) avoided or expelled.<sup>65</sup> For example, we say that taking a drug is necessary not because the animal cannot live without it but (because it is necessary) to expel or to avoid illness. Likewise, navigating to some place is necessary not because man cannot be without it, but because without it, he cannot acquire something good, e.g., wealth; and such navigation is said to be necessary for the acquisition of wealth.

### 9.11. Necessary According to an Efficient Cause

3. That which exerts violence, and violence itself, receives the name *necessary* because violence is said (to be) *necessary*; and one who is forced is said to do *of necessity* that which he is compelled to do.<sup>66</sup> Thus, in natural things there is an **impetus** (*impetus* = ὀπή) or **inclination** toward some end, which responds to the will in a rational nature; and so, natural inclination itself is called *appetite* (►9.8). Either of them, the impetus of natural inclination or the purpose of will, can be impeded and prevented: impeded in the prosecution of a motion that has already started; prevented, so that motion does not start. Hence, that is said violent which is against the inclination of a natural thing and impedes the prosecution of a voluntary motion already started or prevents one from starting.

The necessity that is (had) from an external mover pertains to this third mode posited by ARISTOTLE; for there is violence when something is moved by an external agent toward something to which it is not naturally inclined.<sup>67</sup> Hence, if it were ordered according to its

<sup>65</sup> *In Metaph.* 5, l. 6, §834: “Finis autem est [...] bene esse, sive aliquod bonum habere, et ab hoc fine sumitur necessitas secundi modi.” *Ibid.*, §828 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a23–26): “secundo modo dicuntur necessaria, sine quibus non potest esse vel fieri bonum aliquod, vel vitari aliquod malum, vel expelli; sicut bibere pharmacum, idest medicinam laxativam, dicimus esse necessarium, non quia sine hoc vivere animal non possit; sed ad expellendum, scilicet hoc malum quod est infirmitas, vel etiam vitandum. Est enim hoc necessarium ut non laboret, idest ut non infirmetur aliquis. Similiter navigare ad Aeginam, scilicet ad illum locum, est necessarium, non quia sine hoc non possit homo esse; sed quia sine hoc non potest acquirere aliquod bonum, idest pecuniam. Unde dicitur, quod necessaria est talis navigatio, ut aliquis pecuniam recipiat.”

<sup>66</sup> *In Metaph.* 5, l. 6, §829 (cf. ARISTOTLE, *Metaphysica* Δ.5, 1015a26–28): “Tertium modum [...] id quod infert violentiam, et etiam ipsa violentia necessarii nomen accepit; nam violentia necessaria dicitur, et qui vim patitur dicitur de necessitate id facere ad quod cogitur. Quid autem sit faciens vim, manifestat in naturalibus, et in voluntariis. In naturalibus quidem est impetus, sive inclinatio ad aliquem finem, cui respondet voluntas in natura rationali; unde et ipsa naturalis inclinatio appetitus dicitur. Utrumque autem, scilicet et impetum naturalis inclinationis, et propositum voluntatis, contingit impediri et prohiberi. Impediri quidem, in prosecutione motus iam incepti. Prohiberi autem, ne etiam motus incipiat. Illud ergo dicitur esse violentum, quod est praeter impetum, idest praeter inclinationem rei naturalis, et est impediens praevoluntatem, idest propositum in prosecutione motus voluntarii iam incepti, et prohibens etiam ne incipiat. Alia litera habet et hoc est secundum ormin, idest secundum impetum. Violentia enim est cum aliquid agit secundum impetum exterioris agentis, contra voluntatem vim passi. Violentum autem est secundum impetum vim faciens.”

<sup>67</sup> *In Metaph.* 5, l. 6, §835: “Necessitas autem quae est a movente exteriori, pertinet ad tertium modum. Nam violentia est quando aliquid movetur ab exteriori agente ad aliud ad quod ex propria natura aptitudinem non habet. Si enim secundum suam naturam ordinetur ad hoc quod recipiat motum ab exteriori agente, tunc motus non erit violentus, sed naturalis. Sicut patet de motu caelestium orbium a substantiis separatis, et de motu inferiorum corporum a superioribus.”

own nature to receive motion from an external agent, then the motion will not be violent, but natural.

For example, a necessity from an efficient cause happens when someone is forced by some agent in such a way that it cannot act contrarily.<sup>68</sup> This is called **necessity of coaction** (*necessitas coactionis*), and is altogether opposed to will; for we call **violent that which is against the inclination of a thing**, since the motion of will is some inclination into something (*inclinatio quaedam in aliquid*). Hence, just as that is said to be natural which is according to the inclination of (a thing's) nature, so is something said to be voluntary which is according to the inclination of the (power of) will. Therefore, just as it is impossible for something to be at once violent and natural, so is it impossible for someone to be simply (*simpliciter*) forced (*coactum sive violentum*) and (to act out of) voluntary (will).

The necessity of an end is not opposed to the will when the end can only be attained in one mode.<sup>69</sup> For example, from the will to traverse the sea, there comes to be in the will a necessity to want a vessel. Likewise, nor is natural necessity opposed to the will. Indeed, it is necessary that, just as the intellect begins, of necessity (*ex necessitate*), from first principles, so the will, of necessity, begins from the last end, which is happiness; for, in things subject to operations, the end is related as the principle (is related) in things subject to theorizing. Thus, that which befits (*convenit*) something naturally and without motion must be the foundation and principle of all other things, because the nature of a thing is the first in each thing, and every motion proceeds from something immobile.

### 9.12. Multiple Causes of the Same Thing

Since *cause* is said in multiple modes, one thing may have multiple causes not only accidentally (*secundum accidens* = κατὰ συμβεβηκός) but also by itself (*secundum se*).<sup>70</sup>

---

<sup>68</sup> *In Sent.* 4, d. 7 q. 1 a. 1 qc. 2 co.: "Alia est necessitas ex causa efficiente, quae dicitur necessitas coactionis." *STh* I, q. 82 a. 1 co.: "Ex agente autem hoc alicui convenit, sicut cum aliquis cogitur ab aliquo agente, ita quod non possit contrarium agere. Et haec vocatur necessitas coactionis. Haec igitur coactionis necessitas omnino repugnat voluntati. Nam hoc dicimus esse violentum, quod est contra inclinationem rei. Ipse autem motus voluntatis est inclinatio quaedam in aliquid. Et ideo sicut dicitur aliquid naturale quia est secundum inclinationem naturae, ita dicitur aliquid voluntarium quia est secundum inclinationem voluntatis. Sicut ergo impossibile est quod aliquid simul sit violentum et naturale; ita impossibile est quod aliquid simpliciter sit coactum sive violentum, et voluntarium."

<sup>69</sup> *STh* I, q. 82 a. 1 co.: "Necessitas autem finis non repugnat voluntati, quando ad finem non potest perveniri nisi uno modo, sicut ex voluntate transeundi mare, fit necessitas in voluntate ut velit navem. Similiter etiam nec necessitas naturalis repugnat voluntati. Quinimmo necesse est quod, sicut intellectus ex necessitate inhaeret primis principiis, ita voluntas ex necessitate inhaereat ultimo fini, qui est beatitudo, finis enim se habet in operativis sicut principium in speculativis, ut dicitur in II Physic. Oportet enim quod illud quod naturaliter alicui convenit et immobiliter, sit fundamentum et principium omnium aliorum, quia natura rei est primum in unoquoque, et omnis motus procedit ab aliquo immobili."

<sup>70</sup> *In Metaph.* 5, l. 2, §773 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b3–6): "quia causa multis modis dicitur, contingit multas causas esse unius rei non secundum accidens, sed secundum se." *De prin. nat.* §4, 1–5: "Viso igitur quod quatuor sunt causarum genera, sciendum est quod non est impossibile quod idem habeat plures causas."

That one thing may accidentally have multiple causes does not seem difficult; for many things can happen to the thing that by itself is a cause of some effect, and all of them can also be said to be causes by accident (► 11.7).<sup>71</sup>

That one thing has multiple causes by themselves (*per se*) is made manifest by this: that *cause* is said in multiple modes.<sup>72</sup> Thus, the maker of the statue is by itself a cause of the statue, and so is the bronze—but not in the same mode; for it is impossible for the same thing, according to the same genus, to have multiple causes by themselves in the same order. Rather, each is a cause of the statue in diverse modes: bronze, as matter; but the artificer—or the art of the sculptor—as an efficient (cause).

Whence, sometimes multiple definitions are assigned to one thing according to diverse causes; but the perfect definition embraces all the causes (► 54.13).<sup>73</sup>

On the other hand, there can be multiple causes by themselves according to the same genus if one is proximate and the other remote (► 11.3).<sup>74</sup> Likewise, there can be multiple causes by themselves such that none of them is a sufficient cause, and yet all of them constitute a sufficient cause in conjunction, as happens when many persons run a ship (► 11.10).

---

<sup>71</sup> *In Metaph.* 5, l. 2, §773: “Quod enim secundum accidens multae sint causae unius rei, hoc difficile non videbatur; quia rei, quae est causa per se alicuius effectus, multa possunt accidere, qua omnia illius effectus possunt etiam causa per accidens dici.”

<sup>72</sup> *In Metaph.* 5, l. 2, §773 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b6–9): “sed, quod causae per se sint multae unius, hoc fit manifestum ex hoc, quod causae multipliciter dicuntur. Statuae enim causa per se et non per accidens est factor statuae, et aes; sed non eodem modo. Hoc enim est impossibile quod eiusdem secundum idem genus, sint multae causae per se eodem ordine [...]. Sed in proposito diversis modis ista duo sunt causa statuae: aes quidem ut materia, artifex vero ut efficiens.” *In Physic.* 2, l. 5, n. 7 (cf. ARISTOTLE, *Physica* B.3, 195a5–8): “sicut causa statuae est ars statuifica ut efficiens, et aes ut materia.” *De prin. nat.* §4, 3–5: “ut ydolum cuius causa est cuprum et artifex, sed artifex ut efficiens, cuprum ut materia.”

<sup>73</sup> *In Physic.* 2, l. 5, n. 7: “Et inde est quod aliquando unius rei assignantur plures definitiones secundum diversas causas; sed perfecta definitio omnes causas complectitur.”

<sup>74</sup> *In Metaph.* 5, l. 2, §773: “licet possint esse plures causae hoc modo, quod una sit proxima, alia remota: vel ita, quod neutrum sit causa sufficiens, sed utrumque coniunctim; sicut patet in multis, qui trahunt navem.”

## 10. Order among Causes

Hitherto, we have determined that: (1) a principle is that from which something originates; (2) causes are principles upon which something depends according to its being or to its coming-to-be; (3) according to the four diverse ratios of causing, there are four genera or species of causes: material, formal, efficient and final. Here, we aim to determine the order among these kinds of causes.

### 10.1. Order of Ratio

The name *cause* conveys (*importat*) some order; and an order is found in causes, one to another.<sup>1</sup> Causes have an order to one another (*ad invicem ordinem habent*) because the *ratio* of one is taken from (the *ratio* of) another:<sup>2</sup>

1. The *ratio* of **efficient** cause is taken from (the *ratio* of) **end**; for every agent acts for the sake of an end (*omne agens agit propter finem*).<sup>3</sup>

2. The *ratio* of **form** is (taken from the *ratio* of the) **efficient** (*cause*).<sup>4</sup> Since *the agent produces its like* (*agens agit sibi simile*), the mode of the form that is attained from the action (*modus formae quae ex actione consequitur*) must also be according to the mode of the agent (*secundum modum agentis*).

3. The *ratio* of **matter** is taken from (the *ratio* of) **form**; for such must be the matter as the form requires (*talem oportet esse materiam, qualem forma requirit*).<sup>5</sup>

Whenever things are related to each other in such a way that one is the cause of the other, the one that has the *ratio* of *cause* can have (the act of) being (*esse*) without the other, but not conversely.<sup>6</sup>

### 10.2. Coincidence of Causes

Three causes can coincide (*incidere*) in one (thing): the form, the end, and the efficient (*cause*).<sup>7</sup> For example, in the generation of fire, fire generates fire, so fire is an efficient

---

<sup>1</sup> *In De causis*, pr.: “nomen causae ordinem quemdam importat et in causis ordo ad invicem invenitur.”

<sup>2</sup> *In Post. an.* 1, l. 16, 63–65: “Cause autem ad invicem ordinem habent, nam ex una sumitur ratio alterius.”

<sup>3</sup> *In Post. an.* 1, l. 16, 70–72: “ex fine autem sumitur ratio efficientis, nam omne agens agit propter finem.”

<sup>4</sup> *In Post. an.* 1, l. 16, 67–70: “efficiens autem est ratio forme, quia enim agens agit sibi simile, oportet quod secundum modum agentis sit etiam modus forme que ex actione consequitur.”

<sup>5</sup> *In Post. an.* 1, l. 16, 65–67: “ex forma enim sumitur ratio materie, talem enim oportet esse materiam, qualem forma requirit.”

<sup>6</sup> *De ente*, c. 4, 42–45: “Quecumque enim ita se habent ad invicem quod unum est causa esse alterius, illud quod habet rationem cause potest habere esse sine altero, sed non conuertitur.”

<sup>7</sup> *De prin. nat.* §4, 95–103: “tres cause possunt incidere in unum, scilicet forma, finis et efficiens, sicut patet in generatione ignis: ignis enim generat ignem, ergo ignis est causa efficiens in quantum generat;

cause insofar as it generates; and again, fire is a form insofar as it makes to be in act what was prior in potency; and again, it is an end insofar as it is intended by the agent, and insofar as the operations of the agent itself terminate in it.

### 10.3. Order of Causes of the Same Thing

According to the order of causes of the same thing, it is evident that, in things having four (non-coincident) causes, one cause is—in some mode—the cause of another:<sup>8</sup>

1. Matter is for the sake of form (*propter formam*), and not conversely, since the definition that is taken from the formal cause is the cause of the definition that is taken from the material cause of the same thing (► 10.1, ¶3).<sup>9</sup>

2. Since that which is generated attains a form through the action of that which generates, it follows that the agent is—in some mode—a cause of the form (► 10.1, ¶2); and (the act of) defining (is a cause) of the definition.<sup>10</sup>

3. Ultimately, every agent acts (*agit*) for the sake of an end (*propter finem*); whence, also the definition that is taken from the end is—in some mode—a cause of the definition that is taken from the agent cause (► 10.1, ¶1).<sup>11</sup>

Beyond this, it is impossible to proceed in the genera of causes; whence, the end is said (to be the) *cause of causes* (► 10.9).<sup>12</sup> However, (it is possible to proceed) in each of the genera of causes from posterior to prior (► 11.3); but definitions must be given through proximate causes (► 54.13).

### 10.4. Cause and Caused in Respect of the Same Thing

In whatever genus of cause, the cause is naturally prior to the (thing) caused.<sup>13</sup> Whence, it is impossible for something to be cause and caused according to the same genus of

---

et iterum ignis est forma in quantum facit esse actu quod prius erat potentia; et iterum est finis in quantum est intentum ab agente et in quantum terminantur ad ipsum operationes ipsius agentis.”

<sup>8</sup> *In Post. an. 2*, l. 8, 27–30: “Alio modo potest intelligi [sc., quod *quorundam est quedam altera causa, quorundam autem non*] secundum ordinem causarum eiusdem rei. Manifestum est enim in rebus habentibus quatuor causas, quod una causa est quodam modo causa alterius.”

<sup>9</sup> *In Post. an. 2*, l. 8, 30–34: “quia enim materia est propter formam et non e converso, ut probatur in II Phisicorum, diffinitio que sumitur ex causa formali, est causa diffinitionis, que sumitur ex causa materiali eiusdem rei.”

<sup>10</sup> *In Post. an. 2*, l. 8, 34–37: “et quia generatum consequitur formam per actionem generantis, consequens est quod agens sit quodam modo causa forme et diffinitio diffinitionis.”

<sup>11</sup> *In Post. an. 2*, l. 8, 37–40: “ulterius autem omne agens agit propter finem, unde et diffinitio que a fine sumitur, est quodam modo causa diffinitionis que sumitur a causa agente.”

<sup>12</sup> *In Post. an. 2*, l. 8, 41–45: “ulterius autem non est procedere in generibus causarum, unde dicitur quod finis est causa causarum. Potest tamen in singulis causarum generibus a posterioribus ad priora <procedi>; set diffinitiones debent dari per causas proximas.”

<sup>13</sup> *De veritate*, q. 28 a. 7 co.: “in quolibet genere causae, causa naturaliter est prior causato. Contingit autem secundum diversa genera causarum idem respectu eiusdem esse causam et causatum.” *In Sent.*

cause. However, it is possible for the same thing to be both a cause and (the thing) caused in respect of the same (thing) according to diverse genera of causes or in diverse modes; for nothing prevents something from being prior and posterior to another according to diverse *ratios*.

### 10.5. Correspondence between Intrinsic and Extrinsic Causes

A thing is said to be caused because it has a cause of its (act of) being (*esse*).<sup>14</sup> This cause of being (*causa essendi*) is either: **(1)** the same as the essence of the thing, as form and matter are parts of the essence (► 10.6); or **(2)** other (than the essence of the thing), as the efficient cause and the end (► 10.8), which are—in some mode—causes of form and of matter; for the agent operates for the sake of an end, and unites form to matter.

Thus, of the four (genera of) causes, two correspond to each other (i.e., the extrinsic); and likewise, the other two (i.e., the intrinsic): matter and form (i.e., the intrinsic causes correspond to each other) because form gives (the act of) being (*forma dat esse*), while matter receives it (*materia recipit*); likewise, the efficient (cause) and the end (i.e., the extrinsic causes) correspond to each other because the efficient is the principle of motion, while the end is the terminus (of motion).<sup>15</sup>

### 10.6. Matter and Form

The relation between matter and form is such that: **(1)** according to the genus of material cause, matter is a cause of form as sustaining it; **(2)** according to the genus of the formal cause, form is a cause of matter as making it be in act.<sup>16</sup> Form is prior to matter according to the *ratio* of fulfilling (*secundum rationem complementi*), while matter is prior to form in generation and in time in anything that is moved from potency into act (► 46.29).<sup>17</sup>

---

4, d. 17 q. 1 a. 4 qc. 1 co.: “In causis autem contingit quod idem est causa et causatum, secundum diversum genus causae, ut patet in 2 Physic. et in 5 Metaph.” *In Metaph.* 5, l. 2, §774: “Secundum enim idem genus causae aliquid esse causam et causatum est impossibile.” *De veritate*, q. 28 a. 7 co.: “nihil prohibet aliquid altero esse prius et posterius secundum diversum genus causae.” *In Physic.* 2, l. 5, n. 7: “Nihil enim prohibet aliquid esse prius et posterius altero secundum diversas rationes.” *De prin. nat.* §4, 9–11: “possibile est ut aliquid idem sit causa et causatum respectu eiusdem, sed diuersimode.”

<sup>14</sup> *In Post. an.* 2, l. 7, 33–41: “oportet quod eius quod est rem esse, sit aliqua causa (per hoc enim dicitur aliquid causatum, quod habet causam sui esse); hec autem causa essendi aut est eadem, scilicet cum essentia ipsius rei, aut alia (eadem quidem, sicut forma et materia, que sunt partes essencie; alia uero, sicut efficiens et finis, que quidem due cause sunt quodam modo cause forme et materie, nam agens operatur propter finem et unit formam materie).”

<sup>15</sup> *In Metaph.* 5, l. 2, §775: “Sciendum est autem, quod cum sint quatuor causae superius positae, earum duae sibiinvicem correspondent, et aliae duae similiter. Nam efficiens et finis sibi correspondent invicem, quia efficiens est principium motus, finis autem terminus. Et similiter materia et forma: nam forma dat esse, materia autem recipit.”

<sup>16</sup> *In Sent.* 4, d. 17 q. 1 a. 4 qc. 1 co.: “de habitudine quae est inter materiam et formam: [...] secundum genus causae materialis materia est causa formae quasi sustentans ipsam, et forma est causa materiae quasi faciens eam esse actu secundum genus causae formalis.”

<sup>17</sup> *In Physic.* 2, l. 5, n. 7: “Et similiter forma est prior quam materia secundum rationem complementi, materia autem est prius quam forma generatione et tempore in omni eo quod movetur de potentia in actum.”

It is necessary for form to be something of that to which it gives (the act of) being (*esse*); for form and matter are intrinsic principles that constitute the essence of the thing.<sup>18</sup> Matter is said to be a cause of form insofar as form is only in matter.<sup>19</sup> Likewise, form is a cause of matter insofar as matter has being in act only by form; for matter and form are said (to be) relative to one another (► 37.1, ¶2); they are said (to be related) to the composite as *parts to the whole* (► 13.1); and as *the simple to the composite*.

### 10.7. Termination of Matter and of Form

In some mode, both, matter is ended (*finitur*) by form and form (is ended) by matter:<sup>20</sup>

**1. Matter is ended by form** insofar as matter, before it receives form, is in potency to many forms; but when it receives one, it is terminated by it.

**2. Form is ended by matter** insofar as form, considered in itself, is common to many; but by being received in matter, it comes to be the determined form of *this* thing.

### 10.8. Agent and End

The efficient is a cause of the end; and the end is a cause of the efficient.<sup>21</sup> The end is prior according to *ratio* (*secundum rationem*) and posterior in being (*in esse*); the agent, conversely.<sup>22</sup> Thus,

**1.** The efficient is a cause of the end in respect of the (act of) being; for the efficient cause, by moving, brings the end into being, since the end is in act only by the operation of the agent.<sup>23</sup> The efficient is a cause of that which is an end—e.g., health—but does not make the end be an end.<sup>24</sup> Hence, it is not the cause of the causality of the end—that is,

<sup>18</sup> *Q. d. de anima*, a. 10 co.: “oportet quod forma sit aliquid eius cui dat esse; nam forma et materia sunt principia intrinsecus constituentia essentiam rei.”

<sup>19</sup> *De prin. nat.* §4, 37–43: “Materia enim dicitur causa forme in quantum forma non est nisi in materia; et similiter forma est causa materie in quantum materia non habet esse in actu nisi per formam: materia enim et forma dicuntur relative ad inuicem, ut dicitur in II Phisicorum; dicuntur enim ad compositum sicut partes ad totum et simplex ad compositum.”

<sup>20</sup> *STh* I, q. 7 a. 1 co.: “Finitur autem quodammodo et materia per formam, et forma per materiam. Materia quidem per formam, in quantum materia, antequam recipiat formam, est in potentia ad multas formas, sed cum recipit unam, terminatur per illam. Forma vero finitur per materiam, in quantum forma, in se considerata, communis est ad multa, sed per hoc quod recipitur in materia, fit forma determinate huius rei.” Cf. *Quodlibet* 3, q. 2 a. 1 co.; *De spirit. creat.*, a. 1 ad 2; *In Sent.* 4, d. 49 q. 2 a. 1 ad 12; *ScG* 2, 95 n. 3.

<sup>21</sup> *In Metaph.* 5, l. 2, §775: “Est igitur efficiens causa finis, finis autem causa efficientis.”

<sup>22</sup> *In Physic.* 2, l. 5, n. 7: “finis enim est prius secundum rationem, sed posterius in esse; agens autem e converso.”

<sup>23</sup> *In Metaph.* 5, l. 2, §775: “Efficiens est causa finis quantum ad esse quidem, quia movendo perducit efficiens ad hoc, quod sit finis.” *De prin. nat.* §4, 16–17: “Efficiens enim dicitur causa respectu finis, cum finis non sit in actu nisi per operationem agentis.”

<sup>24</sup> *De prin. nat.* §4, 19–24: “Vnde efficiens est causa illius quod est finis—ut sit sanitas—, non tamen facit finem esse finem; et ita non est causa causalitatis finis, id est non facit finem esse finalem: sicut medicus facit sanitatem esse in actu, non tamen facit quod sanitas sit finis.”

it does not make the end be an end. For example, the physician makes health be in act; but does not make health be an end.

2. The end is a cause of the efficient not in respect of the (act of) being, but in respect of the *ratio* of *causality*, for the efficient is a cause insofar as it acts, but it acts only for the sake of an intended end.<sup>25</sup> Whence, the efficient has its causality from the end. The end is not a cause of that which is efficient: rather, it is the cause of the efficient being efficient.<sup>26</sup> For example, health—i.e., that which the physician causes—does not make the physician be a physician: rather, it makes the physician be an efficient (cause). Thus, the end is the cause of the causality of the efficient because it makes the efficient be efficient.

### 10.9. Causes of Each Other

(From what has just been said), it is possible for some to be causes of each other according to a diverse species of cause; for, then, the causes are said in multiple modes.<sup>27</sup>

For example, (in extrinsic causes) purgation is a cause of health in the genus of efficient cause; but health is a cause of purgation according to the genus of final cause.<sup>28</sup> Likewise, exercise is an efficient cause of wellbeing; and wellbeing is a final cause of exercise.

In turn, (in intrinsic causes) form and matter are causes of one another in respect of (the act of) being (*quantum ad esse*):<sup>29</sup> form is a cause of matter insofar as it gives (to) matter

---

<sup>25</sup> *In Metaph.* 5, l. 2, §775: “Finis autem est causa efficientis non quantum ad esse, sed quantum ad rationem causalitatis. Nam efficiens est causa in quantum agit: non autem agit nisi causa finis. Unde ex fine habet suam causalitatem efficiens.” *De prin. nat.* §4, 18–19: “finis dicitur causa efficientis, cum non operetur nisi per intentionem finis.”

<sup>26</sup> *De prin. nat.* §4, 25–31: “Finis autem non est causa illius quod est efficiens, sed est causa ut efficiens sit efficiens; sanitas enim non facit medicum esse medicum—et dico sanitatem que fit operante medico—, sed facit ut medicus sit efficiens. Unde finis est causa causalitatis efficientis, quia facit efficiens esse efficiens.”

<sup>27</sup> *In Physic.* 2, l. 5, n. 7: “quaedam sibi invicem sunt causae secundum diversam speciem causae.” *In Metaph.* 5, l. 2, §774: “contingit, quod aliqua duo adinvicem sibi sunt causae: quod impossibile est in eodem genere causae. Manifestum vero fit multipliciter dictis causis.” Cf. ARISTOTLE, *Physica* B.3, 195a8–11 (= *Metaphysica* Δ.2, 1013b9–11): “ἔστι δέ τινα καὶ ἀλλήλων αἴτια [...] ἀλλ’ οὐ τὸν αὐτὸν τρόπον, ἀλλὰ τὸ μὲν ὡς τέλος τὸ δ’ ὡς ἀρχὴ κινήσεως.”

<sup>28</sup> *De veritate*, q. 28 a. 7 co.: “purgatio est causa sanitatis in genere causae efficientis, sanitas vero est causa purgationis secundum genus causae finalis.” *In Physic.* 2, l. 5, n. 7 (cf. ARISTOTLE, *Physica* B.3, 195a9–10): “laborare est causa efficiens bonae habitudinis, bona autem habitudo est causa finalis laboris.” Cf. *In Metaph.* 5, l. 2, §774 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b9–10): “«laborare causa est euexiae», idest bonae dispositionis, quae causatur ex labore moderato, qui ad digestionem confert et superfluos humores consumit.” St. Thomas offers another reading, according to which pain resulting from the incision of a wound is a cause of health as an efficient cause or principle of motion; and health is a cause of that pain as an end, *ibid.*: “Sicut dolor ex incisione vulneris est causa sanitatis, ut efficiens sive principium motus: sanitas autem est causa illius doloris, ut finis.” This reading follows the *translatio anonyma*, which, as St. Thomas says (in *ibid.*), is inferior: “Alia litera habet melius.” Cf. *In Sent.* 4, d. 17 q. 1 a. 4 qc. 1 co.: “ambulatio est causa efficiens sanationis, et sanatio est causa finalis ambulationis.” *De prin. nat.* §4, 11–14: “deambulatio est causa sanitatis ut efficiens, sed sanitas est causa deambulationis ut finis, deambulatio enim est aliquando propter sanitatem.”

<sup>29</sup> *In Metaph.* 5, l. 2, §775: “Forma autem et materia sibi invicem sunt causa quantum ad esse. Forma quidem materiae in quantum dat ei esse actu; materia vero formae in quantum sustentat ipsam.” *De*

being in act (*inquantum dat ei* [sc., *materiae*] *esse actu*), while matter (is a cause of form) insofar as (matter) sustains it (*inquantum sustentat ipsam* [sc., *formam*]). For example, the body is the matter of the soul, while the soul is the form of the body.<sup>30</sup>

### 10.10. Primacy of the Final Cause

Although in some things the end is last in being (*ultimus in esse*), it is always prior in causality (*in causalitate*).<sup>31</sup> Hence, the principal (*potissima*) species of cause among all is the final cause, which is said (to be) *the cause of the causes* (*causa causarum*); for it is the cause of the causality (*causa causalitatis*) in all causes.

The end is the cause of the causality of the efficient cause because the agent acts for the sake of an end.<sup>32</sup> The efficient cause, in turn, is the cause of the causality of both matter and form; for, through its motion, it makes matter susceptible of form; and (makes) form be in matter. The end makes matter be matter, and form be form, because matter receives (< *suscipiat*) form only for (the sake of) an end; and form completes (< *perficiat*) matter only for (the sake of) the end. Consequently, the end is the cause of the causality of both matter and form, too.

For example, in artifacts, form is ordered to use as to an end; and matters (are ordered) to forms as to an end.

In all those (things) that are for the sake of an end (*propter finem*), the definition by final cause is the *ratio* of the definition by the material cause.<sup>33</sup> For example, a house must be built from stone and timber (i.e., its material causes) because it is a cover (*operimentum*) that protects us from the cold and heat. Whence, in those things in which something is done (*agitur*) for the sake of an end (*propter finem*), as in natural, moral, and artificial

---

*veritate*, q. 28 a. 7 co.: “*materia causa est formae aliquo modo in quantum sustinet formam, et forma est aliquo modo causa materiae in quantum dat materiae esse actu.*”

<sup>30</sup> *De prin. nat.* §4, 14–15: “*corpus est materia anime, anima uero est forma corporis.*”

<sup>31</sup> *In Metaph.* 5, l. 3, §782: “*licet finis sit ultimus in esse in quibusdam, in causalitate tamen est prior semper. Unde dicitur causa causarum, quia est causa causalitatis in omnibus causis.*” *In Physic.* 2, l. 5, n. 11 (cf. ARISTOTLE, *Physica* B.3, 195a23–27): “*In aliis vero causis invenitur alia ratio causae, secundum scilicet quod finis vel bonum habet rationem causae. Et haec species causae potissima est inter alias causas: est enim causa finalis aliarum causarum causa [...]: et pro tanto dicitur finis causa causarum.*” *De prin. nat.* §4, 34–36: “*dicitur quod finis est causa causarum, quia est causa causalitatis in omnibus causis.*” Note that *causa causarum* is a Semitism, akin to שִׁיר הַשִּׁירִים.

<sup>32</sup> *In Metaph.* 5, l. 3, §782: “*Est enim [finis] causa causalitatis efficientis [...]. Efficiens autem est causa causalitatis et materiae et formae. Nam facit per suum motum materiam esse susceptivam formae, et formam inesse materiae. Et per consequens etiam finis est causa causalitatis et materiae et formae.*” *In Physic.* 2, l. 5, n. 11: “*Manifestum est enim quod agens agit propter finem; et similiter [...] in artificialibus, [...] formae ordinantur ad usum sicut ad finem, et materiae in formas sicut in finem.*” *De prin. nat.* §4, 31–36: “*similiter facit materiam esse materiam et formam esse formam, cum materia non suscipiat formam nisi per finem, et forma non perficiat materiam nisi per finem.*”

<sup>33</sup> *In Post. an.* 1, l. 4, 41–47: “*in omnibus que sunt propter finem, diffinitio que <est> per causam finalem est ratio diffinitionis que est per causam materialem et medium probans ipsam: propter hoc enim oportet ut domus fiat ex lapidibus et lignis, quia est operimentum prohibens nos a frigore et estu.*”

things, the most forceful demonstrations are taken from the end (►54.13; note that even the definition of *demonstration* is taken from the end: *to scientifically know*; ►53.2).<sup>34</sup>

### 10.11. Contrary Causes of the Same Thing

Contraries (►43) can also be causes of the same.<sup>35</sup> This would seem difficult or even impossible if they were to be referred to one another in a like mode (*similiter*); but one is a cause of the other in an unlike mode (*dissimiliter*). Thus, that which is the cause of *this* by its presence, is accounted as a cause of the contrary when it is absent; for an opposite is a cause of (its) opposite in the same mode as the latter is a cause of the former.

For example, the pilot is a cause of the ship's safety by his presence; but we say that his absence is the cause of the ship's loss.<sup>36</sup> And one and the other (of these two contraries) is reduced to the same genus of cause: the mover (i.e., efficient) cause.<sup>37</sup>

### 10.12. Order of Nature

Speaking simply (*simpliciter*), that is prior in the order of nature (►47.1) which is prior according to the genus of the cause that is prior in the *ratio* of *causality*.<sup>38</sup> Thus, the end is called *the cause of the causes* because all other causes receive their being causes from the final cause; for the efficient acts only for the sake of an end; from the action of the efficient, the form is reduced towards the material cause; and matter sustains the form.

In the *ratio of material cause*, whenever one form is expelled from matter and another (form) is induced (►48.6), the expulsion of the preceding form is naturally prior; for every disposition towards a form is reduced to the material cause; and the denudation of matter

---

<sup>34</sup> *In Metaph.* 5, l. 3, §782: "et ideo potissimae demonstrationes sumuntur a fine, in illis in quibus agitur aliquid propter finem, sicut in naturalibus, in moralibus et artificialibus."

<sup>35</sup> *In Metaph.* 5, l. 2, §776 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b11–13): "dicit [Philosophus], quod idem contrariorum contingit esse causam. Quod etiam difficile videbatur vel impossibile, si similiter ad utrumque referatur; sed dissimiliter est causa utriusque. Illud enim, quod per sui praesentiam est causa huius, quando est absens «causamur» id est accusamus ipsum «de contrario,» id est dicimus ipsum esse causam contrarii. [...] Eodem enim modo oppositum est causa oppositi, quo haec est causa huius." *In Physic.* 2, l. 5, n. 7 (cf. ARISTOTLE, *Physica* B.3, 195a11–13): "idem est causa contrariorum quandoque." *De prin. nat.* §4, 5–6: "Non autem est impossibile ut idem sit causa contrariorum."

<sup>36</sup> *In Metaph.* 5, l. 2, §776 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b13–15): "Sicut patet, quod gubernator per sui praesentiam est causa salutis navis, dicimus eius absentiam esse causam perditionis. Ne autem putetur quod hoc sit referendum ad diversa genera causarum sicut et priora duo, ideo subiungit quod utrumque istorum reducitur ad idem genus causae, scilicet ad causam moventem." *In Physic.* 2, l. 5, n. 7 (cf. ARISTOTLE, *Physica* B.3, 195a14–15): "sicut per suam praesentiam gubernator est causa salutis navis, per absentiam autem suam causa est submersionis eius." *De prin. nat.* §4, 6–8: "sicut gubernator est causa salutis navis et submersionis, sed huius per absentiam, illius quidem per praesentiam."

<sup>37</sup> *In Metaph.* 5, l. 2, §776 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b15–16): "Ne autem putetur quod hoc sit referendum ad diversa genera causarum sicut et priora duo, ideo subiungit [Philosophus] quod utrumque istorum reducitur ad idem genus causae, scilicet ad causam moventem."

<sup>38</sup> *De veritate*, q. 28 a. 7 co.: "Sed tamen illud est prius simpliciter dicendum ordine naturae, quod est prius secundum genus illius causae quae est prior in ratione causalitatis; sicut finis, qui dicitur causa causarum, quia a causa finali omnes aliae causae recipiunt quod sint causae: quia efficiens non agit nisi propter finem, et ex actione efficientis forma perficit materiam, et materia sustinet formam."

from a contrary form is some disposition towards the undertaking of a form (►46.29, ¶1).<sup>39</sup> Also, the subject—that is, matter—is numerable; and it is numbered according to *ratio* insofar as privation—which is had from the part of matter and of subject—is found in it, besides the substance of the subject.

On the other hand, in the *ratio* of *formal cause*, the introduction of the form—which formally perfects the subject and expels the contrary—is naturally prior (►46.29, ¶2).<sup>40</sup> The form and the end coincide (*incidunt*) in the same (thing) in number, while the form and the efficient (cause coincide) in the same (thing) in species insofar as the form is a likeness (*similitudo*) of the agent. Hence, the introduction of the form is prior naturally according to the order of the efficient and final causes. From what has been said, it is evident that (form) is simply prior in the order of nature (►46.29, ¶2; 12.4).

### 10.13. Order in Causing vs. in the Thing Caused

That which is first in causing is last in (the thing) caused (*id quod est primum in causando, ultimum est in causato*).<sup>41</sup> For example, fire heats first, before it induces the form of fire (i.e., according to the order in the thing caused), although in fire heat follows upon the substantial form (i.e., according to the order in causing).

1. Thus, in **causing** (*in causando*):<sup>42</sup>

(a) The *good* and the *end* is found first, which moves the efficient (cause).

(b) Secondly, the *action* of the efficient (cause), which moves towards the form.

(c) Thirdly, comes the *form*.

2. Whence, it must be conversely in **(the thing) caused** (*in causato*):<sup>43</sup>

---

<sup>39</sup> *De veritate*, q. 28 a. 7 co.: “quandocumque a materia una forma expellitur et alia inducitur, expulsio formae praecedentis est prior naturaliter in ratione causae materialis: omnis enim dispositio ad formam reducitur ad causam materialem: denudatio autem materiae a forma contraria, est quaedam dispositio ad formae susceptionem. Subiectum etiam, id est materia, ut dicitur in libro I Physic. numerabilis est: numeratur enim secundum rationem, in quantum in eo praeter subiecti substantiam invenitur privatio, quae se tenet ex parte materiae et subiecti.”

<sup>40</sup> *De veritate*, q. 28 a. 7 co.: “Sed in ratione causae formalis est prior naturaliter introductio formae; quae formaliter perficit subiectum, et expellit contrarium. Et quia forma et finis in idem numero incidunt, forma vero et efficiens in idem specie, in quantum forma est similitudo agentis; ideo formae introductio est prior naturaliter secundum ordinem causae efficientis et finalis: et ex hoc patet, secundum praedicta, quod ordine naturae sit simpliciter prior.”

<sup>41</sup> *STh* I, q. 5 a. 4 co.: “Videmus enim quod id quod est primum in causando, ultimum est in causato, ignis enim primo calefacit quam formam ignis inducat, cum tamen calor in igne consequatur formam substantialem.”

<sup>42</sup> *STh* I, q. 5 a. 4 co.: “In causando autem, primum invenitur bonum et finis, qui movet efficientem; secundo, actio efficientis, movens ad formam; tertio advenit forma.”

<sup>43</sup> *STh* I, q. 5 a. 4 co.: “Unde e converso esse oportet in causato, quod primum sit ipsa forma, per quam est ens; secundo consideratur in ea virtus effectiva, secundum quod est perfectum in esse (quia

**(a)** First is the *form*, by which the being is.

**(b)** The *effective virtue* (*virtus effectiva*, i.e., the active power; ►22.2), according to which (a thing) is perfect in being, is considered in (the form) secondly; for each thing is perfect when it can produce its like (*unumquodque tunc perfectum est, quando potest sibi simile facere*).

**(c)** Thirdly, follows the *ratio* of *good*, through which perfection (►23) is founded in the being.

---

unumquodque tunc perfectum est, quando potest sibi simile facere, ut dicit Philosophus in IV Meteor.); tertio consequitur ratio boni, per quam in ente perfectio fundatur.”

## 11. Modes of a Cause

*In this chapter, we determine the division of a genus or species of cause according to its diverse—or, as it were, accidental—modes (► 9.2, ¶2).*

### 11.1. Division in Modes

Any of the four causes—i.e., efficient, material, formal, and final—is divided in multiple modes that are distinguished also according to the same species of cause.<sup>1</sup>

ARISTOTLE distinguishes them according to four divisions or combinations of modes:<sup>2</sup>

**(1) prior vs. posterior (► 11.3); (2) by itself vs. by accident (► 11.7); (3) in potency vs. in act (► 11.9); and (4) simple vs. composite (► 11.10).**

When these multiple modes are thus recapitulated, they are fewer; and the combinations of modes are fewer than the (combined) modes (► 11.11).<sup>3</sup> Thus, *by itself* and *by accident* are two modes; yet, they are reduced to one heading insofar as the consideration of both is the same.<sup>4</sup> And it is likewise (the case) concerning the other opposite modes; for causes are said in multiple modes not only in respect of diverse species of causes (► 9.2, ¶1), but also in respect of co-special causes, which are reduced to one species of cause.

---

<sup>1</sup> *In Metaph.* 5, l. 3, §784 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b29–30): “Dicit ergo [Philosophus], quod multi sunt modi causarum.” *In Physic.* 2, l. 6, n. 1 (cf. ARISTOTLE, *Physica* B.3, 195a27–28): “Postquam Philosophus distinxit species causarum, hic distinguit diversos modos causarum, etiam secundum eandem speciem causae. [...] Circa primum distinguit modos causarum secundum quatuor divisiones.” *De prin. nat.* §5, 1–4: “Viso igitur quod sint quatuor cause, scilicet efficiens, materialis, formalis et finalis, sciendum est quod quelibet istarum causarum diuiditur multis modis.”

<sup>2</sup> **(1)** *In Physic.* 2, l. 6, n. 2 (cf. ARISTOTLE, *Physica* B.3, 195a29–32): “Prima ergo divisio vel combinatio modorum est, quod in eadem specie causae dicitur una causa prior altera.” *In Metaph.* 5, l. 3, §785 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b31–34): “Dicitur enim [causa] una prior, et altera posterior.” *De prin. nat.* §5, 4–5: “Dicitur enim aliquid causa per prius et aliquid per posterius.” **(2)** *In Physic.* 2, l. 6, n. 4 (cf. ARISTOTLE, *Physica* B.3, 195a32–b3): “Secundam divisionem [...]. Est enim praeter causas *per se*, accipere causas *per accidens*.” *In Metaph.* 5, l. 3, §787 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b34–1014a6): “Alia divisio est causarum, secundum quod aliquid dicitur esse causa per se et per accidens.” *De prin. nat.* §5, 29: “Item causarum alia est per se, alia per accidens.” **(3)** *In Physic.* 2, l. 6, n. 5 (cf. ARISTOTLE, *Physica* B.3, 195b3–9): “Tertiam divisionem [...], quaedam dicuntur causae in potentia [...]; quaedam vero [...] in actu.” *In Metaph.* 5, l. 3, §790 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a7–13): “Tertia distinctio est, [...] quaedam sunt causae in potentia, quaedam [...] in actu.” *De prin. nat.* §5, 56–57: “Item causarum quedam est actu, quedam potentia.” **(4)** *In Physic.* 2, l. 6, n. 7 (cf. ARISTOTLE, *Physica* B.3, 195b10–12): “Quartam divisionem [...] quandoque complexe accipiuntur causae.” *In Metaph.* 5, l. 3, §792 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a13–15): “Uterius ponit [Philosophus] quartam distinctionem causae, quae est in simplex et in compositum.” *De prin. nat.* §5, 38–39: “Item causarum quedam est simplex et quedam composita.”

<sup>3</sup> *In Metaph.* 5, l. 3, §784 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b30): “sed pauciores [sc., modi causarum] inveniuntur quando «capitulatim,» idest quodam compendio comprehenduntur.” *In Physic.* 2, l. 6, n. 1 (cf. ARISTOTLE, *Physica* B.3, 195a27–29): “Dicit ergo [Philosophus] primo quod multi numero sunt modi causarum: sed si reducuntur capitulatim, sive in quadam summa, ad aliqua communia, inveniuntur pauciores. Vel *capitales* [sive *capitularie* < κεφαλαιούμενοι] accipiuntur secundum combinationem: manifestum est enim quod pauciores sunt combinationes modorum quam modi.”

<sup>4</sup> *In Metaph.* 5, l. 3, §784: “Per se enim et per accidens sunt duo modi; tamen reducuntur ad unum capitulum, secundum quod est eadem consideratio de utroque. Et similiter est de aliis modis oppositis. Causae enim multis modis dicuntur, non solum quantum ad diversas species causae, sed etiam quantum ad causas conspicales, quae scilicet reducuntur ad unam speciem causae.”

## 11.2. Coincidence in One Mode

Cause and effect do not coincide (*non incidunt*) in the same (thing) according to the same mode of cause, even if it is possible for the same (thing) to be cause and caused according to diverse genera of causes (► 10.4): for example, the end is a cause of the efficient (► 10.8, ¶2); and the efficient is a cause of the end (► 10.8, ¶1).<sup>5</sup>

However, in respect of diverse (things), it is possible for something to be a cause of one and (to be) caused by another even according to the same genus (and the same mode) of cause.<sup>6</sup>

## 11.3. Prior vs. Posterior

According to the first division or combination of modes, one cause is said (to be) **prior** and another **posterior** (► 8.6) in respect of the same species of cause.<sup>7</sup> (It is the same to say) **remote** cause and *prior* cause, and it is the same to say **proximate** cause and *posterior* cause. Hence, these two divisions, one by *prior* and *posterior* causes, and the other by *remote* and *proximate* causes, signify the same.

The *prior* cause is understood to be **more universal**, while the *posterior* cause (is understood to be more) **proper** (or more *special*).<sup>8</sup> Hence, that which is *more universal* is always said (to be a) *remote* cause; that which is **more special** (is said to be a more) *proximate* (cause). A **common** cause is *prior* and **superior** to *proper* causes: the more a cause is *superior*, the more it is *universal*, the greater is its virtue (*virtus*, i.e., power), and (the more) it extends to many.

*The higher a cause is, the more its causality extends to many.*<sup>9</sup> The higher cause has its proper higher caused, which is more common and is found in more (things). However, the

---

<sup>5</sup> *In Sent.* 2, d. 36 q. 1 a. 3 ad 2: “Ad secundum dicendum, quod causa et effectus respectu ejusdem non incidunt in idem, secundum eundem modum causae (quia secundum diversa genera causarum etiam hoc non est inconveniens ut idem sit ejusdem causa et causatum, sicut finis est causa efficientis, et efficiens est causa finis).”

<sup>6</sup> *In Sent.* 2, d. 36 q. 1 a. 3 ad 2: “sed respectu diversorum non est inconveniens ut etiam secundum idem genus causae aliquid sit causa unius, et causatum ab altero.”

<sup>7</sup> *In Metaph.* 5, l. 3, §785 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b31–32): “Dicitur enim [causa] una prior, et altera posterior.” *In Physic.* 2, l. 6, n. 2 (cf. ARISTOTLE, *Physica* B.3, 195a30): “Prima ergo divisio vel combinatio modorum est, quod in eadem specie causae dicitur una causa prior altera.” *De prin. nat.* §5, 14–21: “Sciendum est quod idem est dictu causa propinqua quod causa posterior, et causa remota quod causa prior; unde iste due diuisiones causarum, alia per prius alia per posterius, et causarum alia remota alia propinqua, idem significant. Hoc autem obseruandum est quod semper illud quod uniuersalius est causa remota dicitur, quod autem specialius causa propinqua.”

<sup>8</sup> *In Physic.* 2, l. 6, n. 2: “ut intelligamus causam priorem universaliolem.” *Ibid.*, n. 3: “causa universalis et propria, vel prior et posterior.” *De sub. sep.*, c. 10, 104–125: “quanto aliqua causa est superior, tanto est universalior et virtus eius ad plura se extendit.” *Ibid.*, c. 17, 87–90: “Causa autem communis prior est et superior propriis causis, quanto enim est aliqua causa superior, tanto virtus eius maior et ad plura se extendens.”

<sup>9</sup> *In Metaph.* 6, l. 3, §1205: “quanto aliqua causa est altior, tanto eius causalitas ad plura se extendit. Habet enim causa altior proprium causatum altius quod est communius et in pluribus inventum. Sicut in

ordering that is in the effects (that originate) from some cause extends only as much as the causality of that cause. For example, in artificial things, it is evident that the political art, which is above the military, extends to the whole status of the community; but the military (art extends) only to those who are *contained* in the military order.

Indeed, since every cause has the *ratio* of *principle* (►8.2), an order (►8.5) is derived from any which cause towards its effects.<sup>10</sup> Hence, following upon the multiplication of causes, orders too are multiplied, of which one is **contained** under another, just as *one cause is contained under another*. Whence, a *superior* cause is not contained under the order of an *inferior* cause: rather, conversely.

An example of this is evident in human affairs; for on the paterfamilias depends the order of a household, which is contained under the order of the city, which proceeds from the ruler of the city, while the latter is contained under the order of the king, by whom the whole kingdom is ordered.<sup>11</sup>

*That which belongs to a prior cause is participated by the posterior* (►26).<sup>12</sup> Hence, that in which some things participate is a cause of the participants, as whiteness is a cause of white (things).<sup>13</sup> The more some receptive (thing) is proximate to an influent cause, the more it participates in its influence.<sup>14</sup> And the more something is proximate to a cause, the more it participates in its effect.<sup>15</sup>

Both PLATO and ARISTOTLE agree in that every participant receives that (in) which it participates from that which participates (it); and, insofar as this (is the case), that which participates is its cause.<sup>16</sup> For example, air (i.e., the participant) has light participated from the sun (i.e., that which participates light), which is the cause of its illumination.

---

artificialibus patet quod ars politica, quae est supra militarem, ad totum statum communitatis se extendit. Militaris autem solum ad eos, qui in ordine militari continentur. Ordinatio, autem quae est in effectibus ex aliqua causa tantum se extendit quantum extendit se illius causae causalitas.”

<sup>10</sup> *STh* I, q. 105 a. 6 co.: “a qualibet causa derivatur aliquis ordo in suos effectus, cum quaelibet causa habeat rationem principii. Et ideo secundum multiplicationem causarum, multiplicantur et ordines, quorum unus continetur sub altero, sicut et causa continetur sub causa. Unde causa superior non continetur sub ordine causae inferioris, sed e converso.”

<sup>11</sup> *STh* I, q. 105 a. 6 co.: “Cuius exemplum apparet in rebus humanis, nam ex paterfamilias dependet ordo domus, qui continetur sub ordine civitatis, qui procedit a civitatis rectore, cum et hic contineatur sub ordine regis, a quo totum regnum ordinatur.”

<sup>12</sup> *STh* I-II, q. 10 a. 1 ad 1: “quod est prioris causae, participatur a posteriori.”

<sup>13</sup> *In De div. nom.*, c. 13, l. 2: “id quo aliqua participant est causa participantium, sicut albedo est causa alborum.”

<sup>14</sup> *STh* III, q. 7 a. 1 co.: “Quanto enim aliquod receptivum propinquius est causae influenti, tanto magis participat de influenza ipsius.”

<sup>15</sup> *ScG* 2, 28 n. 14: “Quanto aliquid propinquius est causae, tanto plus participat de effectu ipsius.”

<sup>16</sup> *De sub. sep.*, c. 3, 11–21 (cf. ARISTOTLE, *Metaphysica* α.1, 993b23–31): “omne autem participans aliquid accipit id quod participat ab eo a quo participat, et quantum ad hoc id a quo participat est causa

An effect is said to participate in its cause insofar as it receives particularly what pertains universally to its cause (► 26.3).<sup>17</sup> (This is said) above all, when (the effect) does not attain (*non adequat*) the virtue of its cause (by equaling it). Thus, we say that air participates (in) the light of the sun because it does not receive it in the brightness that is in the sun.

An effect is reduced to its cause as a participant (is reduced) to that which is participated (► 26.2, ¶4).<sup>18</sup> Effects participate (in) the likeness of their causes as much as they can.<sup>19</sup> Every effect participates (in) something of the virtue of its cause.<sup>20</sup> Just as a cause is—in some mode—in (its) effect by its participated likeness, so, too, every effect is in its cause in a more excellent mode according to its virtue.<sup>21</sup>

A cause is prior to that of which it is a cause.<sup>22</sup> Prior (causes) are causes of posterior (causes).<sup>23</sup> The posterior is not a cause of the prior.<sup>24</sup> And posterior (causes) have their necessity (► 9.9) from prior (causes) according to the mode of the prior.<sup>25</sup>

However, it should be noted that, in causes, *prior* and *posterior* is found in **two modes**:<sup>26</sup>

1. According to **community of predication** (► 11.4; 45.8, ¶1).<sup>27</sup> (This occurs) in one and the same cause in number *according to the order of ratio* that there is between universal and particular (*ratios*), for the universal is prior, (while) the particular (is) posterior.

---

ipsius: sicut aer habet lumen participatum a sole, quae est causa illuminationis ipsius. Sic igitur secundum Platonem summus deus causa est omnibus immaterialibus substantiis quod unaquaeque earum et unum sit et bonum. Et hoc etiam Aristoteles posuit, quia, ut ipse dicit, necesse est ut id quod est maxime ens et maxime verum sit causa essendi et veritatis omnibus aliis.”

<sup>17</sup> *In De ebd.*, l. 2, 70–85: “quando aliquid particulariter recipit id quod ad alterum pertinet uniuersaliter, dicitur participare illud, sicut [...] effectus dicitur participare suam causam, et precipue quando non adequat uirtutem sue cause, puta si dicamus quod aer participat lucem solis quia non recipit eam in claritate qua est in sole.” See LEWIS and SHORT, *A Latin Dictionary*, entry for *ādaequo*, “To make equal to, to equalize, to level with; to attain to, or reach, by equaling.”

<sup>18</sup> *In Sent.* 3, d. 26 q. 1 a. 4 ad 5: “sicut effectus [reducitur] ad causam, et participans ad participatum.”

<sup>19</sup> *In Sent.* 2, d. 35 q. 1 a. 4 ad 5: “effectus participant similitudinem suarum causarum quantum possunt.”

<sup>20</sup> *In De causis*, l. 3: “Effectus autem omnis participat aliquid de virtute suae causae.”

<sup>21</sup> *De sub. sep.*, c. 14, 74–77: “sicut causa est quodam modo in effectu per sui similitudinem participatam, ita omnis effectus est in sua causa excellentiori modo secundum virtutem ipsius.”

<sup>22</sup> *In Post. an.* 2, l. 18, n. 6: “causa est prior eo cuius est causa.”

<sup>23</sup> *In De causis*, l. 14: “priora sunt causa posteriorum.”

<sup>24</sup> *In De caelo* 2, l. 10, n. 10: “posterius non est causa prioris.”

<sup>25</sup> *STh* I, q. 19 a. 8 ad 3: “posteriora habent necessitatem a prioribus, secundum modum priorum.” Cf. *ScG* 2, 28 n. 14.

<sup>26</sup> *In Metaph.* 5, l. 3, §785: “Prius autem et posterius in causis invenitur dupliciter.” *In Physic.* 2, l. 6, n. 3: “Advertendum est autem quod causa universalis et propria, vel prior et posterior, potest accipi aut secundum communitatem praedicationis [...]; vel secundum communitatem causalitatis.” ARISTOTLE omits the first mode in both his *Physics* and his *Metaphysics*. In his *Commentary* on the latter, St. Thomas inverts these two modes and notes ARISTOTLE’s omission, *In Metaph.* 5, l. 3, §786: “Praetermittit autem primum modum, et accipit secundum.” Cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b31–34.

<sup>27</sup> *In Metaph.* 5, l. 3, §785: “Alio modo in una et eadem causa numero secundum ordinem rationis qui est inter universale et particulare. Nam universale naturaliter est prius, particulare posterius.”

2. According to **community of causality** (► 11.5; 45.8, ¶2).<sup>28</sup> (This happens) in causes (that are) diverse in number (and) ordered to each other such that one is first and remote, and the other (is) second and proximate.

Nonetheless, *these two modes correspond to each other*, for it is manifest that any virtue (*virtus*, i.e., power; ► 22.2) extends to some things insofar as it communicates in one *ratio* of *object* (► 14.9): the more it extends to many, the more common that *ratio* must be; and since the virtue is proportioned to the object according to its *ratio*, it follows that the superior cause acts according to a more universal and less contracted form.<sup>29</sup> In the same way must it be considered in the order of things; for the more some things are superior in beings, the more they have forms (that are) less contracted and more dominant over matter, which contracts the virtue of a form.

Whence, that which is prior in causing is also found to be prior—in some mode—according to a *ratio* of more universal predication.<sup>30</sup>

#### 11.4. Prior vs. Posterior in *Ratio*

According to community of predication, that is always said to be a **prior cause** *which contains singulars* (*ea quae continent singularia*), i.e., *that which contains any one cause in the community of its ambit* (*ea quae continet unamquamque causam communitate sui ambitus*): that is, the **universal**.<sup>31</sup>

In this mode, unlike that of community of causality (► 11.5), the effect exists immediately from both causes—that is, from the prior and the posterior (i.e., there is no effect that is a *mean*; ► 8.9).<sup>32</sup>

---

<sup>28</sup> *In Metaph.* 5, l. 3, §785: “Uno modo in causis diversis numero adinvicem ordinatis, quarum una est prima et remota, et alia secunda et propinqua.”

<sup>29</sup> *In Physic.* 2, l. 6, n. 3: “Advertendum est autem quod causa universalis et propria, vel prior et posterior, potest accipi aut secundum communitatem praedicationis [...]; vel secundum communitatem causalitatis [...]; et haec duo sibi invicem correspondent. Manifestum est enim quod quaelibet virtus extenditur ad aliqua secundum quod communicant in una ratione obiecti; et quanto ad plura extenditur, tanto oportet illam rationem esse communiorem: et cum virtus proportionetur obiecto secundum eius rationem, sequitur quod causa superior agat secundum formam magis universalem et minus contractam. Et sic est considerare in ordine rerum: quia quanto aliqua sunt superiora in entibus, tanto habent formas minus contractas, et magis dominantes supra materiam, quae coarctat virtutem formae. Unde et id quod est prius in causando, invenitur esse prius quodammodo secundum rationem universalioris praedicationis.”

<sup>30</sup> *In Physic.* 2, l. 6, n. 3: “id quod est prius in causando, invenitur esse prius quodammodo secundum rationem universalioris praedicationis; ut puta, si ignis est primum calefaciens, caelum non tantum est primum calefaciens, sed primum alterans.” The example provided is, of course, obsolete.

<sup>31</sup> *In Metaph.* 5, l. 3, §786: “In secundo enim modo [...] semper ea quae continent singularia, scilicet universalialia, dicuntur causae priores.” *In Physic.* 2, l. 6, n. 2: “Et similiter ea quae continet unamquamque causam communitate sui ambitus, dicitur causa prior.” Cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b33–34: “τὰ περιέχοντα ὁτιοῦν τῶν καθ’ ἕκαστα”; *Physica* B.3, 195a32: “τὰ περιέχοντα πρὸς τὰ καθ’ ἕκαστον.”

<sup>32</sup> *In Metaph.* 5, l. 3, §786: “In secundo enim modo immediate effectus ab utraque causa existit, scilicet priori et posteriori, quod in primo non convenit.”

For example, in the order of efficient cause, a cause of health is the physician and the artificer: the artificer as *universal* or *more common*, and *prior*; the physician, on the other hand, as *particular* or *special*, and *posterior*.<sup>33</sup> Likewise, (in the genus of material cause) the proximate matter of a statue is bronze; a remote (matter) is *metal*; and an even more remote, *body*.<sup>34</sup>

In *formal causes*, all superior (forms) are forms of the inferiors (*omnia superiora sunt formae inferiorum*); so, the cause is twofold (i.e., prior-universal-common-superior, and posterior-particular-special-inferior).<sup>35</sup>

For example, a formal cause of the octave (*diapason* = τοῦ διὰ πασῶν; ► 6.4) is the double (*duplum* = τὸ διπλάσιον), double ratio (*proportio dupla*), or twoness (*dualitas*), as *special* or *proper*, and *posterior*; and (a formal cause of the octave) as *universal* or *more common*, and *prior*, is numerical proportion—i.e., the ratio of a number to a number or to the unit (*proportio numeri ad numerum vel ad unum*)—or (as still more universal and prior) number (*numerum* = ἀριθμός).<sup>36</sup>

Also, we say that the form of man is (a cause) proximate to its definition: that is, *rational mortal animal*; but *animal* is more remote; and, again, *substance* is even more remote.<sup>37</sup>

*In a multitude of forms or ratios, the prior is always more*.<sup>38</sup> This is not to be understood as if it were more complete; for only specific forms are complete. Rather, it is said to be

<sup>33</sup> *In Metaph.* 5, l. 3, §786 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b32–33): “Unde dicit [Philosophus], quod sanitatis causa est medicus et artifex in genere causae efficientis. Artifex quidem ut universale, et prius; medicus vero ut particulare, sive speciale, et posterius.” *In Physic.* 2, l. 6, n. 2 (cf. ARISTOTLE, *Physica* B.3, 195a30–31): “ut sanitatis causa est medicus ut causa propria et posterior, artifex autem ut communior et prior; et hoc in specie causae efficientis.” *In Physic.* 2, l. 6, n. 3: “Advertendum est autem quod causa universalis et propria, vel prior et posterior, potest accipi [...] secundum communitatem praedicationis, secundum exempla hic posita de medico et artifice.”

<sup>34</sup> *De prin. nat.* §5, 26–28: “Et similiter materia ydoli propinqua est cuprum, sed remota est metallum, et iterum remotius corpus.”

<sup>35</sup> *De prin. nat.* §5, 25–26: “Omnia enim superiora sunt forme inferiorum.” *In Metaph.* 5, l. 3, §786: “Similiter etiam in causis formalibus dupliciter est causa formalis.” *In Physic.* 2, l. 6, n. 2: “Et simile est in specie causae formalis.”

<sup>36</sup> *In Metaph.* 5, l. 3, §786 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b33–34): “ut diapason duplum, vel proportio dupla, vel dualitas est causa formalis, ut speciale et posterius; numerum autem, vel proportio numeri ad numerum vel ad unum, ut universale et prius.” *In Physic.* 2, l. 6, n. 2 (cf. ARISTOTLE, *Physica* B.3, 195a31–32): “causa formalis diapason propria et posterior est proportio dupla; causa autem prior et communior est proportio numeralis, quae dicitur multiplicitas.”

<sup>37</sup> *De prin. nat.* §5, 21–25: “sicut dicimus quod forma hominis propinqua est sua diffinitio, scilicet animal rationale mortale, sed animal est magis remota, et iterum substantia remotior est.”

<sup>38</sup> *In Metaph.* 2, l. 4, §322 (cf. ARISTOTLE, *Metaphysica* α.2, 994b18–20): “Deinde cum dicit *semper enim* probat propositum quatuor rationibus. Quarum prima talis est. In multitudine formarum vel rationum semper illa quae est prius est magis. Quod non est intelligendum quasi sit completior; quia formae specificae sunt completae. Sed dicitur esse magis, quia est in plus quam illa quae est posterior, quae non est ubicumque est prior. Non enim ubicumque est ratio animalis, est ratio hominis. Ex quo argumentatur, quod si primum non est, nec habitum idest consequens est. Sed si in infinitum procedatur in rationibus et formis, non erit prima ratio vel forma definitiva; ergo excludentur omnes consequentes.”

more because the prior form is in more (things) than the form that is posterior, which is not wherever the prior is. Thus, the *ratio* of *man* is not wherever the *ratio* of *animal* is.

### 11.5. Prior vs. Posterior in Causing

According to *community of causality* (► 11.3), the effect does not exist immediately from both the prior and the posterior causes (i.e., there exists a *mean* effect; ► 8.9).<sup>39</sup>

For example, in efficient causes, a man generates a man as a *proximate* and *posterior* cause, while the sun (generates a man) as a *remote* and *prior* cause.<sup>40</sup> Likewise, the sun can be said to be a universal cause of heating, while fire is a proper cause. And we say that art (i.e., the art of medicine) and the physician are causes of health, but art is a prior cause, and the physician a posterior (cause). Thus, inferior causes move through their proper virtues insofar as they participate (in) the virtue of superior causes (► 26).<sup>41</sup>

And the same can be said of the formal cause, and of the other species of causes.<sup>42</sup> Whence, nothing prevents one form from being formed by the participation of another form.<sup>43</sup> And the more proximate something is to an end, the more prior it is in purpose (*in proposito*), even if it should be posterior in being, in time, or in nature.<sup>44</sup>

### 11.6. Reduction to a First Cause

It should be noted that one ought always to reduce a question (► 55.4) to a first cause (► 46).<sup>45</sup> Thus, in natural, as in other—e.g., artificial—things, it is always necessary to inquire (i.e., to seek) the highest cause (< δεῖ δ' αἰετὸ ἀίτιον ἐκάστου τὸ ἀκρότατον ζητεῖν, ὡσπερ καὶ ἐπὶ τῶν ἄλλων).

For example, if it is asked, “Why is this healthy?”, one must say, “Because the physician healed.” And, again, “Why did the physician heal?”, “Because of the art of healing that he

---

<sup>39</sup> *In Metaph.* 5, l. 3, §786: “In secundo enim modo immediate effectus ab utraque causa existit, scilicet priori et posteriori, quod in primo non convenit.”

<sup>40</sup> *In Metaph.* 5, l. 3, §785: “sicut in causis efficientibus homo generat hominem ut causa propinqua et posterior, sol autem ut causa prior et remota.” *In Physic.* 2, l. 6, n. 3: “ut si dicamus solem esse causam universalem calefactionis, ignem vero causam propriam.” *De prin. nat.* §5, 5–8: “sicut dicimus quod ars et medicus sunt causa sanitatis, sed ars est causa per prius et medicus per posterius.”

<sup>41</sup> *De veritate*, q. 5 a. 9 ad 7: “inferiores causae [movent] per virtutes proprias, secundum quod participant virtutem superiorum causarum.”

<sup>42</sup> *In Metaph.* 5, l. 3, §785: “et similiter potest considerari in aliis speciebus causarum.” *De prin. nat.* §5, 5–8: “et similiter in causa formali et in aliis causis.”

<sup>43</sup> *De potentia*, q. 6 a. 6 ad 5: “secundum Philosophum, etiam in causis formalibus prius et posterius invenitur; unde nihil prohibet unam formam per alterius formae participationem formari.”

<sup>44</sup> *In Sent.* 3, d. 23 q. 2 a. 5 ad 4: “sicut finis est prior in intentione, et posterior in esse; ita quanto aliquid est propinquius fini, est prius in proposito, quamvis sit posterius in esse vel tempore vel natura.”

<sup>45</sup> *De prin. nat.* §5, 9–10: “Et nota quod semper debemus reducere questionem ad primam causam.” *In Physic.* 2, l. 6, n. 10 (cf. ARISTOTLE, *Physica* B.3, 195b21–23): “in naturalibus oportet semper supremam causam uniuscuiusque requirere, sicut contingit in artificialibus.”

possesses.”<sup>46</sup> Likewise, if we should inquire why a man builds, one would answer, “because he is a builder.” And if we should ask why he is a builder, one would answer, “because he has the art of building [*quia habet artem aedificativam*].” And here one rests; for this is the first cause in this order.

Hence, in natural things (as in all others, ὥσπερ καὶ οὕτως ἐπὶ πάντων), one must proceed up to the highest cause.<sup>47</sup> And this is so because the effect is only (scientifically) known if the cause is known (►53.4). Whence, if the cause of some effect were also an effect of another cause, it could not be (scientifically) known unless its cause is known; and so on, until the first cause is reached (►46).

### 11.7. By Itself vs. by Accident

There is another division of causes (in modes) insofar as something is said to be a cause *by itself* or *by accident*.<sup>48</sup> That is said (to be a) cause **by itself** (*secundum se sive per se* = καθ’ αὐτό), or *cause properly said* (*proprie dicta* = οἰκείως λεγόμενον), which is a *cause of something as such* (*causa alicuius rei in quantum huiusmodi*), as a builder is the (efficient) cause of a house, and wood is the matter of a bench. A cause **by accident** (*secundum accidens sive per accidens* = κατὰ συμβεβηκός) is *whatever is conjoined to the cause by itself that does not belong to its ratio* (*omne illud quod coniungitur causae per se, quod non est de ratione eius*): i.e., *those (accidents) that happen to the cause by itself* (*illa quae accidit causae per se*), as when we say that the grammarian builds; for the grammarian is said (to be a) *cause of the building* by accident—indeed, (the grammarian builds) not insofar as (he is) a grammarian, but insofar as (to be a grammarian) befalls the builder. And the same can be said of the other (genera of) causes.

This cause by accident is, therefore, said **from the part of the cause**, as when the white or the musical or musician is said (to be a) cause of the house because it (i.e., the white

<sup>46</sup> *De prin. nat.* §5, 10–13: “ut si queratur ‘Quare est iste sanus?’, dicendum est ‘Quia medicus sanauit’; et iterum ‘Quare medicus sanauit?’, ‘Propter artem sanandi quam habet.’” *In Physic.* 2, l. 6, n. 10 (cf. ARISTOTLE, *Physica* B.3, 195b23–25): “Ut si quaeramus quare homo aedificat, respondetur, quia est aedificator; et similiter si quaeramus quare est aedificator, respondetur, quia habet artem aedificativam; et hic statur, quia haec est prima causa in hoc ordine.”

<sup>47</sup> *In Physic.* 2, l. 6, n. 10 (cf. ARISTOTLE, *Physica* B.3, 195b25): “Et ideo oportet in rebus naturalibus procedere usque ad causam supremam. Et hoc ideo est, quia effectus nescitur nisi sciatur causa; unde si alicuius effectus causa sit etiam alterius causae effectus, sciri non poterit nisi causa eius sciatur; et sic quousque perveniatur ad primam causam.”

<sup>48</sup> *In Metaph.* 5, l. 3, §787: “Alia divisio est causarum, secundum quod aliquid dicitur esse causa per se et per accidens.” *In Physic.* 2, l. 6, n. 4: “causa per accidens dicitur omne illud quod coniungitur causae per se, quod non est de ratione eius.” *In Physic.* 2, l. 6, n. 5 (cf. ARISTOTLE, *Physica* B.3, 195b3–4 = *Metaphysica* Δ.2, 1014a7): “causas proprie dictas, idest per se.” *De prin. nat.* §5, 29–37: “Item causarum alia est per se, alia per accidens. Causa per se dicitur causa alicuius rei in quantum huiusmodi, sicut edificator est causa domus et lignum materia scamni. Causa per accidens est illa que accidit cause per se, sicut cum dicimus ‘Grammaticus edificat’; grammaticus enim dicitur causa edificationis per accidens, non enim in quantum grammaticus sed in quantum accidit edificatori. Et similiter est in aliis causis.”

or the musical) is conjoined to the builder (i.e., is conjoined to the cause by itself of the building).<sup>49</sup> This must be distinguished from the cause by accident that is said **from the part of the effect** (► 11.8), which occurs when something is accidentally conjoined to that which is the effect by itself: for example, when the builder is a cause of strife (i.e., because strife is not by itself an effect of the builder, but befalls the effect).

The cause *by itself* differs from the cause *by accident* in that the cause by itself is finite and determinate (*finita et determinata* < ὥρισμένον), while the cause by accident is infinite and indeterminate (*infinita et indeterminata* < ἀόριστον), since many (accidents) can happen to one (subject).<sup>50</sup>

Just as the *cause by itself* is divided into *universal* and *particular*, or into *prior* and *posterior*, so, too, (is divided) the *cause by accident*.<sup>51</sup> Whence, not only causes by accident themselves are said (to be) *causes by accident*, but also their genera (► 11.3).

For example, the sculptor (*statae factor* = ἀνδριαντοποιός) is the cause by itself of the statue (i.e., it belongs to the *ratio* of *sculptor* to produce a statue).<sup>52</sup> Polycleitus,<sup>53</sup> on the other hand, is a cause by accident insofar as he happens (*accidit ei*) to be the sculptor (i.e., because it does not belong to the *ratio* of *this sculptor* to produce a statue). And just as Polycleitus is a cause by accident of the statue, so are said (to be) *causes by accident*

<sup>49</sup> *In Physic.* 2, l. 8, n. 8 (cf. ARISTOTLE, *Physica* B.5, 196b23–27): “considerandum est quod causa per accidens dicitur dupliciter: uno modo ex parte causae; alio modo ex parte effectus. Ex parte quidem causae, quando illud quod dicitur causa per accidens, coniungitur causae per se; sicut si album vel musicum dicatur causa domus, quia accidentaliter coniungitur aedificatori. Ex parte autem effectus, quando accipitur aliquid quod accidentaliter coniungitur effectui; ut si dicamus quod aedificator est causa discordiae, quia ex domo facta accidit discordia.” *In Metaph.* 5, l. 3, §789: “Sciendum autem est, quod aliquid potest dici causa per accidens alterius dupliciter. Uno modo ex parte causae; quia scilicet illud quod accidit causae, dicitur causa per accidens, sicut si album dicatur causa domus. Alio modo ex parte effectus; ut scilicet aliquid dicatur causa per accidens alicuius, quod accidit ei quod est effectus per se.”

<sup>50</sup> *In Physic.* 2, l. 8, n. 8: “Ponit autem [Philosophus] differentiam inter causam per se et causam per accidens: quia causa per se est finita et determinata; causa autem per accidens est infinita et indeterminata, eo quod infinita uni possunt accidere.” Cf. ARISTOTLE, *Physica* B.5, 196b27–29: “τὸ μὲν οὖν καθ’ αὐτὸ αἴτιον ὥρισμένον, τὸ δὲ κατὰ συμβεβηκὸς ἀόριστον· ἄπειρα γὰρ ἂν τῷ ἐνὶ συμβαίῃ.” *In Sent.* 4, d. 30 q. 1 a. 3 co.: “causae per accidens sunt infinitae.”

<sup>51</sup> *In Metaph.* 5, l. 3, §787 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b34–35): “Sicut enim causa per se dividitur in universale et particulare, sive in prius et posterius, ita etiam causa per accidens. Unde non solum ipsae causae accidentales dicuntur causae per accidens, sed etiam ipsarum genera.” *In Physic.* 2, l. 6, n. 4 (cf. ARISTOTLE, *Physica* B.3, 195a32–33): “dicit [Philosophus] quod sicut causae per se dividuntur per causas priores et posteriores, vel communes et proprias, ita etiam et causae per accidens. Est enim praeter causas *per se*, accipere causas *per accidens*, et genera horum.”

<sup>52</sup> *In Metaph.* 5, l. 3, §787 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b35–1014a3): “Ut statae factor, statae causa est per se; Polycleitus autem per accidens est causa, in quantum accidit ei factorem statae esse. Et sicut Polycleitus est causa statae per accidens, ita omnia universalia continentia accidens, id est causam per accidens, dicuntur per accidens causae; sicut homo et animal, quae sub se continent Polycleitum, qui est homo et animal.” *In Physic.* 2, l. 6, n. 4 (cf. ARISTOTLE, *Physica* B.3, 195a33–b1): “sicut causa statae per accidens quidem est Polycleitus, per se autem causa statae est faciens statuam: Polycleitus enim est causa statae in quantum accidit ei esse statuam facientem. Et etiam ea quae sua communitate continent Polycleitum, sunt causa statae per accidens, sicut et homo et animal.”

<sup>53</sup> A fifth-century BC Greek sculptor and architect.

all the universals that, in their community, contain the accident (*continentia accidens* = τὰ περιέχοντα τὸ συμβεβηκός): that is, the causes by accident; for example, *man* and *animal*, which contain under themselves Polycleitus, who is a man and an animal.

Moreover, just as some causes by themselves are proximate and others remote, so too (are) causes by accident; for in causes by accident, some are more proximate to causes by themselves, and some are more remote (from them).<sup>54</sup> Again, anything is said (to be a) *cause by accident* which is conjoined to the cause by itself that does not belong to its *ratio*; but this may be either more proximate to the *ratio* of the cause or more remote from it; and according to this, causes by accident will be either more proximate or more remote.

For example, if the sculptor happens to be white (*album* = ὁ λευκός) and to be musical or musician (*musicum* = ὁ μουσικός), then the musical is more proximate because it is in the same subject and according to the same—that is, according to the soul (i.e., mind), in which music exists, and also the art of producing—while the white is in (the subject) according to the body.<sup>55</sup> In turn, the subject is related even more proximately than other accidents, as Polycleitus (is more proximately related to the sculptor) than the white or the musical, for these are conjoined to the sculptor only on account of the subject (i.e., Polycleitus).

Thus, Polycleitus is a more proximate cause of the statue than the white or the musical or musician, for the accidental mode of predication (►17) is more remote when an accident is predicated of an accident than when an accident is predicated of a subject.<sup>56</sup> An accident is predicated of an accident only because both accidents are predicated of the subject; whence, it is more remote to attribute to an accident what belongs to another (accident). For example, (it is more remote to attribute) to the musical or musician what

---

<sup>54</sup> *In Metaph.* 5, I. 3, §788 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a4–5): “Et sicut causarum per se quaedam sunt propinquae, quaedam remotae, ut dictum est, ita et inter causas per accidens.” *In Physic.* 2, I. 6, n. 4 (cf. ARISTOTLE, *Physica* B.3, 195b1–2): “Et iterum considerandum est quod in causis per accidens quaedam sunt propinquiores causis per se, et quaedam magis remotae. Nam causa per accidens dicitur omne illud quod coniungitur causae per se, quod non est de ratione eius; hoc autem contingit esse vel propinquius rationi causae, vel remotius ab ea; et secundum hoc causae per accidens erunt vel propinquiores vel remotiores.”

<sup>55</sup> *In Physic.* 2, I. 6, n. 4 (cf. ARISTOTLE, *Physica* B.3, 195b2–4): “sicut, si statuam facienti accidat esse album et musicum, musicum propinquius est, quia est in eodem subiecto et secundum idem, scilicet secundum animam, in qua est musica et ars statuae factiva; album autem inest secundum corpus. Sed subiectum propinquius se habet adhuc quam alia accidentia, sicut Polycleitus quam album vel musicum: non enim coniunguntur haec statuam facienti nisi propter subiectum.”

<sup>56</sup> *In Metaph.* 5, I. 3, §788 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a5–6): “Nam Polycleitus est causa statuae magis propinqua quam album et musicum. Magis enim remotus modus praedicationis per accidens est, cum accidens praedicatur de accidente, quam cum accidens praedicatur de subiecto. Accidens enim non praedicatur de accidente, nisi quia ambo praedicantur de subiecto. Unde magis remotum est ut attribuatur uni accidenti quod est alterius, sicut musico quod est aedificatoris, quam quod attribuatur subiecto quod est accidentis, sicut Polycleto quod est aedificatoris.”

belongs to the builder than it is to attribute to the subject what belongs to the accident, as (to attribute) to Polycleitus what belongs to the builder.

Every cause by itself (*causa per se*) has determinate effects, which it produces according to some order.<sup>57</sup> Therefore, it is manifest that effects (that are) related to some inferior cause seem to have no order: rather, they (seem to) accidentally coincide with each other; which (causes), if they were to be referred to a superior, common cause, would be found to be ordered, and not (to be) by accident, but simultaneously produced by one cause by itself.

### 11.8. By Accident from the Part of the Effect

As just noted, that is said (to be an) *accidental cause* of another **from the part of the effect** *insofar as something befalls that which is the effect by itself (quod accidit ei quod est effectus per se)*.<sup>58</sup>

This can happen in one of three modes:

1. Because the cause that is said to be accidental from the part of the effect has a *necessary order to the effect*, as the removal of an impediment has a necessary order to the effect.<sup>59</sup> Hence, anything that removes that which prohibits (*prohibens*, i.e., that which prevents the cause by itself from causing its effect) is said to be an accidental mover (*movens per accidens*), whether the accident is a contrary or not.
2. When an accident has an *order to the effect that is neither necessary nor as in the more, but as in the fewer (cases)*.<sup>60</sup> For example, the discovery of a treasure is an accident that has an order that is not necessary to the digging of the soil. And it is in this mode that fortune and chance (*fortuna et casus*) are said to be accidental causes.

---

<sup>57</sup> *In Metaph.* 6, l. 3, §1205: "Omnis enim causa per se habet determinatos effectus, quos secundum aliquem ordinem producit. Manifestum igitur est, quod effectus relati ad aliquam inferiorem causam nullum ordinem habere videntur, sed per accidens sibiipsis coincidunt; qui si referantur ad superiorem causam communem, ordinati inveniuntur, et non per accidens coniuncti, sed ab una per se causa simul producti sunt."

<sup>58</sup> *In Metaph.* 5, l. 3, §789: "aliquid potest dici causa per accidens alterius [...] ex parte effectus; ut scilicet aliquid dicatur causa per accidens alicuius, quod accidit ei quod est effectus per se. Quod quidem potest esse tripliciter."

<sup>59</sup> *In Metaph.* 5, l. 3, §789: "Uno modo, quia habet ordinem necessarium ad effectum, sicut remotio impedimenti habet ordinem necessarium ad effectum. Unde removens prohibens dicitur movens per accidens; sive illud accidens sit contrarium [...] sive etiam si non sit contrarium [...]" As an example of contraries, St. Thomas resorts to ancient medicine, in which some medication is said to accidentally cause coolness: namely, not insofar as it cools, but insofar as it removes an impediment to cooling. As an example of non-contraries, he proposes a pillar that holds a stone, for that which removes the pillar is said to be an accidental mover of the stone.

<sup>60</sup> *In Metaph.* 5, l. 3, §789: "Alio modo, quando accidens habet ordinem ad effectum, non tamen necessarium, nec ut in pluribus, sed ut in paucioribus, sicut inventio thesauri ad fossionem in terra. Et hoc modo fortuna et casus dicuntur causae per accidens." *In Physic.* 2, l. 8, n. 8 (cf. ARISTOTLE, *Physica* B.5, 196b23–27): "Et hoc modo dicitur fortuna esse causa per accidens, ex eo quod effectui aliquid coniungitur per accidens; utpote si fossurae sepulcri adiungatur per accidens inventio thesauri."

Just as the effect by itself of a natural cause is what is attained (*consequitur*) according to the requirement of its form, so the effect of an agent cause (that acts) on purpose is that which happens from the intention of the agent.<sup>61</sup> Whence, whatever is brought forth in the effect apart from the intention, is by accident—as long as it is attained as in the fewer, for that which is always or frequently conjoined to the effect falls under the same intention: it is foolish to say that someone intends something but does not want that which is adjoined (to it) frequently or always.

3. When the accidental cause and the effect have *no order*, except perhaps according to supposition (*secundum existimationem*).<sup>62</sup> For example, if someone were to say that he is the cause of an earthquake because an earthquake happens as he enters a house.

### 11.9. In Potency vs. in Act

The third distinction of causes by modes, before or beyond all the above (*prae omnibus his vel praeter omnia haec < παρὰ πάντα*) that are said to be causes by themselves or by accident, is insofar as some are causes *in act* and some *in potency*.<sup>63</sup> A cause **in act** (*in actu = ὡς ἐνεργοῦντα*) is *that which causes in act a thing (quae actu causat rem)*, as the builder when he is building, or copper when the statue is (made) from it (*ex eo*). A cause **in potency** (*in potentia = ὡς δυνάμενα*) is *that which can cause, although it does not cause the thing in act*, as the builder while he does not build (but can build).

Thus, the builder is a cause *in potency* of that which is (being) built (*aedificationis = τοῦ οἰκοδομεῖσθαι*) insofar as the name *builder* (*aedificator = οἰκοδόμος*) refers to (*sonat*) the habit or office (*habitus vel officium*), rather than to the builder *in act* (i.e., the builder actually producing that which is being built).<sup>64</sup>

<sup>61</sup> *In Physic.* 2, l. 8, n. 8: “Sicut enim effectus per se causae naturalis est quod consequitur secundum exigentiam suae formae, ita effectus causae agentis a proposito est illud quod accidit ex intentione agentis: unde quicquid provenit in effectu praeter intentionem, est per accidens. Et hoc dico si id quod est praeter intentionem ut in paucioribus consequatur: quod enim vel semper vel ut frequenter coniungitur effectui, cadit sub eadem intentione. Stultum est enim dicere quod aliquis intendat aliquid, et non velit illud quod ut frequenter vel semper adiungitur.”

<sup>62</sup> *In Metaph.* 5, l. 3, §789: “Tertio, quando nullum ordinem habent, nisi forte secundum existimationem; sicut si aliquis dicat se esse causam terraemotus, quia eo intrante domum accidit terraemotus.”

<sup>63</sup> *In Metaph.* 5, l. 3, §790 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a7–9): “Tertia distinctio est, secundum quod prae omnibus his vel praeter omnia haec, quae dicuntur esse secundum se sive per se, et secundum accidens, quaedam sunt causae in potentia, quaedam ut agentia, idest in actu.” *De prin. nat.* §5, 56–61: “Item causarum quaedam est actu, quaedam potentia. Causa in actu est quae actu causat rem, sicut edificator cum edificat, uel cuprum cum ex eo est ydolum; causa autem in potentia est quae, licet non causet rem in actu, tamen potest causare, ut edificator dum non edificat.” *In Physic.* 2, l. 6, n. 5 (cf. ARISTOTLE, *Physica* B.3, 195b3–5): “dicit [Philosophus] quod praeter causas proprie dictas, idest per se, et per accidens, quaedam dicuntur causae in potentia.”

<sup>64</sup> *In Metaph.* 5, l. 3, §790 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a9–10): “Sicut aedificationis causa est aedificator in potentia. Hoc enim sonat habitum vel officium. Vel aedificans actu.” *In Physic.* 2, l. 6, n. 5 (cf. ARISTOTLE, *Physica* B.3, 195b5–6): “sicut potentes operari; quaedam vero sicut operantes in actu; sicut causa aedificandi domum potest dici vel aedificans in habitu vel aedificans in actu.”

Everything acts insofar as it is in act: that is, (in act) of that which it acts; for fire heats not insofar as it is bright in act, but insofar as it is hot in act.<sup>65</sup> Thence it is that *every agent produces its like (omne agens agit sibi simile; ►9.7; 9.6)*.

### 11.10. Simple vs. Composite

Finally, ARISTOTLE posits a fourth division of causes, which is into *simple* and *composite*, such that causes by themselves would be complexly taken with causes by accident.<sup>66</sup> According to this, a cause is said (to be) **simple** (*simplex*) *when it alone is said (to be a) cause (quando solum dicitur causa illud; secundum quod accipitur causa... totum vel solum)*,<sup>67</sup> whether it is a cause by itself or by accident. A **composite** (*composita < complexa = συμπλεκόμενα*) cause occurs *when multiple (causes) need to come together in order for there to be a cause (quando oportet plura advenire ad hoc quod sit causa)*.

For example, *the sculptor* is said (to be a) *simple* cause by itself; *Polycleitus*, by accident; and neither *the sculptor* nor *Polycleitus*, but *Polycleitus (the) sculptor*, is said (to be a) *composite* cause.<sup>68</sup> Likewise, *the builder* is a (simple) cause (by itself) of the house, and *the physician* is a (simple) cause (by accident) of the house; but *the physician builder* is a (composite) cause of the house.

In another mode, according to AVICENNA, *that which is a cause without addition of another (illud quod sine adiunctione alterius est causa)* can also be said (to be) a **simple** cause.<sup>69</sup> A **composite** cause would then be *when many must be present in order for there to be a*

---

<sup>65</sup> Q. d. de anima, a. 12 co.: “unumquodque agit secundum quod actu est, illud scilicet quod agit; ignis enim calefacit non in quantum actu est lucidum, sed in quantum est actu calidum: et exinde est quod omne agens agit sibi simile.”

<sup>66</sup> In Physic. 2, l. 6, n. 7 (cf. ARISTOTLE, Physica B.3, 195b10): “Quartam divisionem ponit [Philosophus] ibi: *Amplius autem complexae* etc. Et dicit quod quandoque complexe accipiuntur causae per se cum causis per accidens.” In Metaph. 5, l. 3, §792 (cf. ARISTOTLE, Metaphysica Δ.2, 1014a13–14): “Uterius ponit [Philosophus] quartam distinctionem causae, quae est in simplex et in compositum; ut simplex causa dicatur secundum quod accipitur causa [...] per se totum [...], sive per accidens tantum [...]. Composita autem secundum quod utrumque simul accipitur.” De prin. nat. §5, 38–45: “Item causarum quedam est simplex et quedam composita. Simplex causa dicitur quando solum dicitur causa illud quod per se est causa, uel etiam solum illud quod est per accidens. [...] Composita autem dicitur quando utrumque dicitur causa, ut si dicarupus ‘edificator medicus est causa domus’.”

<sup>67</sup> Editions of St. Thomas’s *Commentary* vary. At the time of writing, we are still waiting for the Leonine critical edition to be published.

<sup>68</sup> In Physic. 2, l. 6, n. 7 (cf. ARISTOTLE, Physica B.3, 195b11–12): “ut si non dicamus causam statuæ Polycletum, qui est causa per accidens, neque facientem statuam, qui est causa per se, sed Polycletum statuam facientem.” In Metaph. 5, l. 3, §792 (cf. ARISTOTLE, Metaphysica Δ.2, 1014a14–15): “ut simplex causa dicatur [...] statuæ factor, [...] per accidens tantum, [...] Polycletus. Composita autem [...] Polycletus statuæ factor.” De prin. nat. §5, 41–43: “sicut si dicamus edificatorem esse causam domus, et similiter si dicamus medicum esse causam domus.” Ibid., 45–46: “ut si dicarupus ‘edificator medicus est causa domus’.”

<sup>69</sup> De prin. nat. §5, 46–53: “Potest etiam dici causa simplex, secundum quod exponit Avicenna, illud quod sine adiunctione alterius est causa [...]. Composita autem causa est quando oportet plura aduenire ad hoc quod sit causa.” In Metaph. 5, l. 3, §793: “Est autem alius modus quo causae possunt dici compositae, secundum quod plures causae concurrunt ad unius rei constitutionem.”

cause (*quando oportet plura advenire ad hoc quod sit causa*), insofar as multiple causes concur in the constitution of one thing (*secundum quod plures causae concurrunt ad unius rei constitutionem*).

For example, bronze (is said to be a *simple* cause) of the statue when the statue is made from bronze without the addition of other matters.<sup>70</sup> Likewise, when it is said that the physician produces health, or that fire heats. On the other hand, multiple men (are said to be a *composite* cause of the motion of a ship because they) concur as an efficient cause in running the ship (*ad trahendum navem*); for one man is not the cause of the motion of the ship, but many.<sup>71</sup> Likewise, multiple stones concur as the matter of a house, for one stone is not the matter of a house, but many.

However, ARISTOTLE omits this (mode of being a *composite* cause) because none of these is a cause, but **part of a cause** (*pars causae*).<sup>72</sup>

### 11.11. Modal Combinations

All these modes of causes amount to six, having a twofold variation (*variantur dupliciter < λεγόμενα διχῶς*), making a total of twelve.<sup>73</sup> The six modes are:<sup>74</sup> as **(1) singular** (*singulare < ὡς τὸ καθ' ἕκαστον*) or **(2) genus** (*genus < ὡς τὸ γένος*), which are called *prior* and *posterior* above (► 11.3); as **(3) by itself** (*secundum se*) or **(4) by accident** (*per accidens < ὡς τὸ συμβεβηκός*), to which is reduced the genus of the accident (*genus accidentis < ὡς τὸ γένος τοῦ συμβεβηκότος*); for the genus of the accident is an accidental cause (► 11.6); and as **(5) complex** (*per complexum < ὡς συμπλεκόμενα*) or **(6) simple** (*simplex < ὡς ἀπλῶς*; ► 11.10).

These six modes are further divided by *potency* and by *act* (*per potentiam et per actum*; ► 11.9); for *that which is in potency is not simply* (*quod est in potentia, non simpliciter est*),

---

<sup>70</sup> *De prin. nat.* §5, 48–51: “sicut cuprum ydoli, sine adiunctione enim alterius materie ex cupro fit ydolum; et sicut dicitur quod medicus facit sanitatem, uel quod ignis calefacit.”

<sup>71</sup> *In Metaph.* 5, l. 3, §793: “sicut plures homines ad trahendum navem, vel plures lapides, ut sint materia domus.” *De prin. nat.* §5, 53–55: “sicut unus homo non est causa motus nauis, sed multi; et sicut unus lapis non est materia domus, sed multi.”

<sup>72</sup> *In Metaph.* 5, l. 3, §793: “Sed hoc praetermisit [Philosophus], quia nullum illorum est causa, sed pars causae.”

<sup>73</sup> *In Metaph.* 5, l. 3, §794 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a15–17): “His autem modis positus, colligit [Philosophus] istorum modorum numerum, dicens, quod isti modi causarum sunt sex et variantur dupliciter, et ita efficiuntur duodecim.” *In Physic.* 2, l. 6, n. 8 (cf. ARISTOTLE, *Physica* B.3, 195b12–13): “reducit [Philosophus] praedictos modos ad certum numerum. Et dicit quod praedicti modi certo numero sunt sex; sed quilibet eorum dupliciter dicitur.”

<sup>74</sup> *In Metaph.* 5, l. 3, §794 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a17–19): “Hi enim modi sex sunt aut singulare, aut genus, quod superius dixit prius et posterius. Et secundum se et per accidens, ad quod etiam reducitur genus accidentis, nam genus accidentis est causa per accidens. Et iterum per complexum et simplex.” *In Physic.* 2, l. 6, n. 8 (cf. ARISTOTLE, *Physica* B.3, 195b13–16): “Sex autem modi sunt isti: singulare et genus, quod supra dixit prius et posterius; accidens et genus accidentis; simplex et complexum.”

thus bringing the total to twelve.<sup>75</sup> These must be divided by potency and act because potency and act diversify the relation of cause to effect: (when) operating in act, singular causes—i.e., particular, proper causes of singular acts—*simultaneously* (► 8.7) *are or are not* with those things of which they are causes in act—i.e., (such causes) are removed together with their effects.

For example, *this physician* simultaneously is or is not with *this patient who is becoming healthy*; and *this builder* with *this building*; for something can be built in act only if there is a builder in act.<sup>76</sup> Taking *the builder of this building* and *this building insofar as it is being built*, if one is posited or removed, the other is necessarily posited or removed too. But this would not be true if proper causes were not taken, even if (causes) were taken in act. Thus, (it is) not (true that) *a builder* simultaneously is or is not with *this (building) that is being built*; for it can (happen) that there is a builder in act, yet this building is not being built, but another.

On the other hand, causes according to potency (*secundum potentiam*) are not always removed with their effects.<sup>77</sup> For example, the house and the builder who built it do not simultaneously cease to be (*corrumpuntur*).

In some (things), it happens that the substance of the effect is removed when the action of the efficient (cause) is removed, as in those (things) whose (act of) being (*esse*) is coming to be (*in fieri*); or in those whose cause is not only a cause of coming-to-be (*causa*

---

<sup>75</sup> *In Metaph.* 5, l. 3, §794 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a19–20): “Hi autem sex modi ulterius dividuntur per potentiam et per actum, et sunt duodecim. Ideo autem oportet omnes istos modos per potentiam et actum dividi, quia potentia et actus diversificant habitudinem causae ad effectum. Nam causae in actu particulares sunt simul et tolluntur cum suis effectibus. [...] Dicit autem [Philosophus] causas singulares, quia actus singularium sunt.” *In Physic.* 2, l. 6, n. 8 (cf. ARISTOTLE, *Physica* B.3, 195b16): “Distinguit autem [Philosophus] omnes modos per potentiam et actum, quia quod est in potentia, non simpliciter est.” *Ibid.*, n. 9: “inter causas in actu et causas in potentia est ista differentia, quod causae operantes in actu simul sunt et non sunt cum eis quorum causae sunt in actu; ita tamen quod accipiantur causae singulares, idest propriae.” *De prin. nat.* §5, 61–64: “Et sciendum quod loquendo de causis in actu, necessarium est causam et causatum simul esse, ita quod si unum sit, et alterum.”

<sup>76</sup> *In Metaph.* 5, l. 3, §794 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a20–23): “sicut hic medicans cum hoc convalescente, et hic aedificans cum hoc aedificato: non enim potest aliquid actu aedificari, nisi sit actu aedificans.” *In Physic.* 2, l. 6, n. 9 (cf. ARISTOTLE, *Physica* B.3, 195b16–20): “sicut hic medicans simul est et non est cum hoc qui fit sanus, et hic aedificans cum hoc quod aedificatur. Si vero non acciperentur causae propriae, licet acciperentur in actu, non esset verum quod dicitur. Non enim aedificans est et non est simul cum hoc quod aedificatur: potest enim esse quod est aedificans in actu, sed tamen hoc aedificium non aedificatur, sed aliud. Sed si accipiamus aedificantem hoc aedificium, et hoc aedificium secundum quod est in aedificari, necesse est quod posito uno ponatur et alterum, et remoto uno removeatur et alterum.” *De prin. nat.* §5, 64–66: “si enim est edificator in actu, oportet quod edificet, et si sit edificatio in actu, oportet quod sit edificator in actu.”

<sup>77</sup> *In Metaph.* 5, l. 3, §794 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a23–25): “Sed causae secundum potentiam non semper removeantur cum effectibus; sicut domus et aedificator non simul corrumpuntur.” *In Physic.* 2, l. 6, n. 9 (cf. ARISTOTLE, *Physica* B.3, 195b20–21): “Hoc autem non accidit semper in causis quae sunt in potentia: non enim simul corrumpitur domus et homo qui aedificavit ipsam.” *De prin. nat.* §5, 66–68: “Sed hoc non est necessarium in causis quae sunt solum in potentia.”

*fiendi*) of the effect, but a cause of its being (*essendi*).<sup>78</sup> For example, light is taken away when the illumination of the sun is removed from the air.

### 11.12. Modal Division of Effects

In the same modes in which causes are divided, so too can be divided the things caused in which or of which (*in quibus vel quorum*) the causes are causes.<sup>79</sup> Thus, the thing caused can be divided into *prior and posterior* or *universal and particular*.<sup>80</sup> For example, the sculptor is a cause of *this statue*, which is posterior; or of *the statue*, which is more universal and prior; or of *the image* (*imago* = εἰκών), which is even more universal. Likewise, something is the formal or the motive cause of *this bronze*; or of *bronze*, which is more universal; or of *matter*, which is even more universal.<sup>81</sup>

And the same can be said of effects by accident—both that something is more common and (that) something (is) less common.<sup>82</sup> For example, the sculptor, who is a cause of the statue (by itself), is also a cause of the heavy, or of the white or red (i.e., all of them effects by accident), which befall (*accidunt*) from the part of matter (*ex parte materiae*) and are not caused by *this agent*.

That is said (to be an) **effect by accident** *which is conjoined to the effect by itself and is outside its ratio* (*quod coniungitur effectui per se et est praeter rationem eius*).<sup>83</sup> For

---

<sup>78</sup> *In Metaph.* 5, l. 3, §794: “In quibusdam tamen contingit, quod remota actione efficientis tollitur substantia effectus, sicut in his quorum esse est in fieri, vel quorum causa non solum est effectui causa fiendi sed essendi. Unde remota illuminatione solis ab aere, tollitur lumen.” *In Physic.* 2, l. 6, n. 9: “Unde habetur quod sicut agentia inferiora, quae sunt causa rerum quantum ad suum fieri, oportet simul esse cum iis quae fiunt quandiu fiunt; ita agens divinum, quod est causa existendi in actu, simul est cum esse rei in actu. Unde subtracta divina actione a rebus, res in nihilum deciderent, sicut remota praesentia solis lumen in aere deficeret.”

<sup>79</sup> *In Metaph.* 5, l. 3, §791 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a10–11): “Et eisdem modis, quibus dividuntur causae, possunt dividi causata in quibus vel quorum causae sunt causae.” *In Physic.* 2, l. 6, n. 6 (cf. ARISTOTLE, *Physica* B.3, 195b6–7): “Et sicut distinguuntur causae modis praedictis, similiter distinguuntur ea quorum sunt causae.”

<sup>80</sup> *In Metaph.* 5, l. 3, §791 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a11–12): “Potest enim dividi causatum per prius et posterius sive particulare et universale; sicut si dicamus, quod statuae factor est causa huius statuae, quod est posterius, aut statuae, quod est universalis et prius, aut imaginis, quod est adhuc universalis.” *In Physic.* 2, l. 6, n. 6 (cf. ARISTOTLE, *Physica* B.3, 195b7–8): “Est enim aliquid causatum posterius et magis proprium, et aliquid quod est prius et magis commune: sicut si dicatur quod aliquid est causa huius statuae vel statuae in communi; et adhuc communius si dicatur causa imaginis.”

<sup>81</sup> *In Metaph.* 5, l. 3, §791 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a12): “Et similiter aliquid est causa formalis huius aeris, aut aeris, quod est universalis, aut materiae, quod est adhuc universalis.” *In Physic.* 2, l. 6, n. 6 (cf. ARISTOTLE, *Physica* B.3, 195b8–9): “Et similiter si dicatur aliquid causa motiva huius aeris, vel aeris in universali, vel materiae.”

<sup>82</sup> *In Metaph.* 5, l. 3, §791 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1014a12–13): “Et similiter potest dici in accidentalibus, scilicet in effectibus per accidens. Nam statuae factor qui est causa statuae, est etiam causa gravis vel albi vel rubei quae accidunt ex parte materiae, et non sunt ab hoc agente causata.” *In Physic.* 2, l. 6, n. 6 (cf. ARISTOTLE, *Physica* B.3, 195b9–10): “Et ita etiam potest dici in effectibus per accidens, et quod aliquid sit communius, et aliquid minus commune.”

<sup>83</sup> *In Physic.* 2, l. 6, n. 6: “Et dicitur effectus per accidens, quod coniungitur effectui per se et est praeter rationem eius: sicut per se effectus coqui est cibus delectabilis, per accidens autem cibus sanativus; medici autem e converso.”

example, the effect by itself of the cook is delectable food, while an effect by accident is healing food. On the other hand, (the effect by itself) of the physician (is) conversely.

### 11.13. Proportion of Effect to Cause

From what has been said, it follows that effects must proportionately respond to causes.<sup>84</sup> Thus, from general causes are rendered general effects, while singular (effects are rendered) by singular (causes). And a universal cause is compared to a universal caused, while a singular (cause) is compared to a singular caused. Likewise, effects in potency respond to causes in potency; and effects in act, to causes in act. And only a cause by itself—not a cause by accident—is proportioned to an effect.

For example, the cause of *the statue* is *the sculptor*, but (the cause) of *this statue* (is) *this sculptor*.<sup>85</sup> Likewise, we say that *the builder* is a cause of *the house*, and that *this builder* is a cause of *this house*.<sup>86</sup>

---

<sup>84</sup> *De prin. nat.* §5, 69–71: “Sciendum est autem quod causa uniuersalis comparatur causato uniuersali, causa uero singularis comparatur causato singulari.” *In Physic.* 2, l. 6, n. 9: “determinat [Philosophus] tria consequentia ad praedictam distinctionem modorum.” The first consequence is the difference between causes in potency and act; the second one, the requirement of seeking the highest cause; these have already been noted. This is the third consequence, *ibid.*, n. 11 (cf. ARISTOTLE, *Physica* B.3, 195b25–27): “Tertium [...] est, quod causis debent proportionaliter respondere effectus, ita quod generalibus causis generales effectus reddantur, et singularibus singulares.” *Ibid.* (cf. ARISTOTLE, *Physica* B.3, 195b27–28): “Et similiter causis in potentia respondent effectus in potentia, et causis in actu effectus in actu.” *In Sent.* 2, d. 21 q. 1 a. 3 co.: “Cum ergo causa per accidens non sit proportionata ad effectum, sed solum causa per se [...]”

<sup>85</sup> *De prin. nat.* §5, 71–73: “Sciendum est autem quod causa uniuersalis comparatur causato uniuersali, causa uero singularis comparatur causato singulari: sicut dicimus quod edificator est causa domus, et hic edificator huius domus.”

<sup>86</sup> The requirement of proportion between cause and effect according to their diverse modes and combinations is applied by St. Thomas through his work to all genera of causes and in all orders. For example, *STh* I-II, q. 96 a. 1 co.: “unumquodque quod est propter finem, necesse est quod sit fini proportionatum.” *ScG* 2, 15 n. 4: “Secundum ordinem effectuum oportet esse ordinem causarum: eo quod effectus causis suis proportionati sunt. Unde oportet quod, sicut effectus proprii reducuntur in causas proprias, ita id quod commune est in effectibus propriis, reducat in aliquam causam communem: sicut supra particulares causas generationis huius vel illius est sol uniuersalis causa generationis; et rex est uniuersalis causa regiminis in regno, supra praepositos regni et etiam urbium singularium. Omnibus autem commune est esse. [...]” *Ibid.*, 16 n. 3: “Unaquaeque materia per formam superinductam contrahitur ad aliquam speciem. Operari ergo ex materia praeiacente superinducendo formam quocumque modo, est agentis ad aliquam determinatam speciem. Tale autem agens est agens particulare: causae enim causatis proportionales sunt. Agens igitur quod requirit ex necessitate materiam praeiacentem ex qua operetur, est agens particulare.” *Ibid.*, 21 n. 4: “Effectus suis causis proportionaliter respondent: ut scilicet effectus in actu causis actualibus attribuamus, et effectus in potentia causis quae sunt in potentia; et similiter effectus particulares causis particularibus, uniuersalibus uero uniuersales; ut docet Philosophus, in II Physicorum.” *Ibid.*, n. 10: “effectus proportionaliter reducuntur in causas.” *Ibid.* 3, 10 n. 4: “Quicquid est proprie et per se alicuius causa, tendit in proprium effectum.” *In Post. an.* 1, l. 4, 179–182 (cf. ARISTOTLE, *Analytica Posteriora* A.2, 71b22–23): “si propositiones demonstrationis sunt causae conclusionis, necesse est quod sint *propria principia eius*: oportet enim causas esse proportionatas effectibus.” *In Sent.* 1, d. 3 q. 4 a. 2 co.: “effectus proprius et immediatus oportet quod proportionetur suae causae.” *De potentia*, q. 3 a. 16 co.: “multa non posse procedere ab uno principio immediate et proprie, videtur esse ex determinatione causae ad effectum, ex qua videtur debitum et necessarium ut si est talis causa, talis effectus proveniat.” *In Sent.* 2, d. 27 q. 1 a. 1 co.: “cum effectus proportionetur suae causae, oportet actum potentiae rationalis ipsi potentiae proportionatum esse.” *Ibid.* 3, d. 23 q. 1 a. 2 co.: “Si autem effectus non fuerint proportionati causae, non facient causam cognoscere quid est, sed quia est tantum, sicut patet de Deo.” *Ibid.* 4, d. 24 q. 1 a. 3 qc. 3 co.: “causa debet esse

---

proportionata suo effectui." *De veritate*, q. 26 a. 3 ad 8: "Effectus enim proportionantur secundum proportionem causarum." *De sub. sep.*, c. 10, 79–82: "Oportet autem effectus proportionaliter causis respondere: ut scilicet effectus particularis causae particulari respondeat, effectus autem universalis universali causae." *In De div. nom.*, c. 5, l. 1: "Quae enim est proportio particularis causae ad suos effectus, eadem est proportio universalis causae ad omnia." *Ibid.*, l. 2: "Eadem autem est proportio causae particularis ad suos particulares effectus et causae universalis ad suos; quinimmo plus influit causa universalis ad suos effectus, quam causa particularis."

## 12. Nature and Element

As mentioned above (►8.4), nature and element signify intrinsic principles. We consider here how they are related to the genera of causes and their modes.

### 12.1. Nature

The name **nature** (*natura* = φύσις) signifies some cause especially (*in speciali*).<sup>1</sup> Whence, it always has the *ratio* of principle.<sup>2</sup>

*Nature* is said in multiple modes, of which the five principal are, according to ARISTOTLE: **(1)** generation or begetting (►12.2); **(2)** the intrinsic principle from which the begotten is generated (►12.3); **(3)** the principle of motion and of rest (►12.4); **(4)** matter (►12.5); and **(5)** form (►12.6).<sup>3</sup> He posits two more modes, adjunct to the latter two, according to which *first matter* (►12.7) and *essence* (►12.8) are said (to be) *nature*.<sup>4</sup>

According to this order, which follows the imposition of names (►8.10), generation or begetting receives the name *nature* first—while form receives it last—because the forms and the virtues (*virtutes*) of things are known through (their) acts.<sup>5</sup> Thus, the name *nature* (*natura*) is said or taken from *about to be begotten* (*nascendo*).<sup>6</sup> And it was first imposed to signify *the generation of living things* (►12.2), which is called *begetting* (*nativitas*) or *sprouting* (*pullulatio*), as though *that which is to be begotten* (*nascitura*) were called *nature* (*natura*). Thence, the name *nature* was transferred to signify *the principle of generation in living things* (►12.3).<sup>7</sup> And since the principle of such generation is intrinsic, the name

---

<sup>1</sup> *In Metaph.* 5, l. 1, §749: “Primo distinguit [Philosophus] nomina significantia causas. [...] Primo distinguit nomina significantia causas generaliter. Secundo distinguit quoddam nomen, quod significat quamdam causam in speciali, scilicet hoc nomen natura.”

<sup>2</sup> *In Sent.* 1, d. 34 q. 2 a. 1 ad 3: “natura semper habet rationem principii: est enim principium motus et quietis in eo in quo est, per se, et non secundum accidens, ut in 2 Physic. dicitur.” Although the last remark refers especially to the third mode in which *nature* is said according to ARISTOTLE, it is evident, from what has been said, that *nature* has the *ratio* of principle also according to all the other modes.

<sup>3</sup> *STh* I-II, q. 10 a. 1 co.: “sicut Boetius dicit in libro *de Duabus Naturis*, et Philosophus in V *Metaphys.*, natura dicitur multipliciter.” *In Metaph.* 5, l. 5, §808 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b16–37): “Primo distinguit [Philosophus] diversos modos, quibus natura dicitur. [...] ponit quinque modos principales.”

<sup>4</sup> *In Metaph.* 5, l. 5, §821 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a7–13): “ponit [Philosophus] duos modos adiunctos duobus ultimis praecedentibus.”

<sup>5</sup> *In Metaph.* 5, l. 5, §824: “reductio aliorum modorum ad unum primum, fieri potest [...] secundum ordinem, qui attenditur quantum ad nominis impositionem. [...] et sic est in proposito. Quia enim formae et virtutes rerum ex actibus cognoscuntur, per prius ipsa generatio vel nativitas, naturae nomen accepit, et ultimo forma.”

<sup>6</sup> *STh* III, q. 2 a. 1 co.: “nomen naturae a nascendo est dictum vel sumptum. Unde primo est impositum hoc nomen ad significandum generationem viventium, quae nativitas vel pullulatio dicitur, ut dicatur natura quasi nascitura.” *STh* I, q. 29 a. 1 ad 4: “secundum Philosophum, in V *Metaphys.*, nomen naturae primo impositum est ad significandam generationem viventium, quae dicitur nativitas.” *ScG* 3, c. 35, n. 5: “Nomen naturae primo impositum est ad significandum ipsam generationem nascentium.”

<sup>7</sup> *ScG* 3, c. 35, n. 5: “Et exinde translatum est [nomen naturae] ad significandum principium generationis huiusmodi [sc., nascentium].” *STh* III, q. 2 a. 1 co.: “Deinde translatum est nomen naturae ad significandum principium huius [sc., nascentium] generationis.”

*nature* was further derived to signify *any which intrinsic principle of motion* (► 12.4), according to what ARISTOTLE says, that *nature is the principle of motion in that in which it is by itself and not by accident* (*natura est principium motus in eo in quo est per se et non secundum accidens*).<sup>8</sup> Now, the intrinsic principle of motion of the mobile thing is either matter or form.<sup>9</sup> Whence, sometimes matter (► 12.5) is said (to be) *nature*, and sometimes form (► 12.6).

According to the order of things, on the other hand, the *ratio* of *nature* befits (*competit*) form priorly (*prius*), because nothing is said to have a nature unless it has a form.<sup>10</sup> First and properly, therefore, *nature* is said of the substance (*substantia* = ἡ οὐσία)—i.e., the **(substantial) form**—of things having in themselves the principle of motion as such.<sup>11</sup> Form itself is the principle of motion of things that exist according to nature, whether in act or in potency; for form does not always produce (*facit*) motion in act, but sometimes only in potency: for example, when natural motion is impeded by some exterior thing that prohibits it, or when natural action is impeded due to a defect of matter.<sup>12</sup>

Those (things) that have a nature are those that have in themselves the principle of their motion.<sup>13</sup> And natural subjects are all such; for (nature) **is in a subject** insofar as **form** is said (to be) *nature*; and nature **is a subject** insofar as **matter** is said (to be) *nature*. **Matter** (*materia* = ἡ ὕλη) is said to be nature insofar as it is susceptible (*susceptibilis* = δεκτική)

<sup>8</sup> *STh* III, q. 2 a. 1 co.: “Et quia principium generationis in rebus viventibus est intrinsecum, ulterius derivatum est nomen naturae ad significandum quodlibet principium intrinsecum motus, secundum quod Philosophus dicit, in II *Physic.* quod *natura est principium motus in eo in quo est per se et non secundum accidens.*” *STh* I, q. 29 a. 1 ad 4: “Et quia huiusmodi generatio est a principio intrinseco, extensum est hoc nomen ad significandum principium intrinsecum cuiuscumque motus. Et sic definitur natura in II *Physic.*” *STh* I-II, q. 10 a. 1 co.: “Quandoque enim [natura] dicitur principium intrinsecum in rebus mobilibus.”

<sup>9</sup> *STh* I-II, q. 10 a. 1 co.: “Et talis natura [sc., principium intrinsecum in rebus mobilibus] est vel materia, vel forma materialis, ut patet ex II *Physic.*” *STh* III, q. 2 a. 1 co.: “Hoc autem principium vel forma est, vel materia. Unde quandoque natura dicitur forma, quandoque vero materia.” *STh* I, q. 29 a. 1 ad 4: “Et quia huiusmodi principium est formale vel materiale, communiter tam materia quam forma dicitur natura.” *ScG* 3, c. 35, n. 5: “Et inde [translatum est nomen naturae] ad significandum principium motus intrinsecum mobili.” *ScG* 3, c. 35, n. 5: “Et quia huiusmodi principium [sc., principium motus intrinsecum mobili] est materia vel forma, ulterius natura dicitur forma vel materia rei naturalis habentis in se principium motus.”

<sup>10</sup> *In Metaph.* 5, l. 5, §824: “reductio aliorum modorum ad unum primum, fieri potest [...] secundum ordinem rerum.” *Ibid.*, §825: “Sed secundum rerum ordinem, formae prius competit ratio naturae, quia, ut dictum est, nihil dicitur habere naturam, nisi secundum quod habet formam.”

<sup>11</sup> *In Metaph.* 5, l. 5, §826 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a13–16): “Unde patet ex dictis, quod primo et proprie natura dicitur substantia, idest forma rerum habentium in se principium motus in quantum huiusmodi. Materia enim dicitur esse natura, quia est formae susceptibilis.”

<sup>12</sup> *In Metaph.* 5, l. 5, §826 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a17–19): “Et idipsum, scilicet forma est principium motus rerum existentium secundum naturam, aut in actu, aut in potentia. Forma enim non semper facit motum in actu, sed quandoque in potentia tantum: sicut quando impeditur motus naturalis ab aliquo exteriori prohibente, vel etiam quando impeditur actio naturalis ex materiae defectu.”

<sup>13</sup> *In Physic.* 2, l. 1, n. 6 (cf. ARISTOTLE, *Physica* B.1, 192b32–34): “habentia naturam sunt illa quae habent in seipsis principium sui motus. Et talia sunt omnia subiecta naturae: quia natura est subiectum, secundum quod natura dicitur materia; et est in subiecto, secundum quod natura dicitur forma.”

of form. However, form is more nature than matter; for something is said (to be) *more* insofar as it is in act rather than insofar as it is in potency.<sup>14</sup> Thus, form, according to which something natural is in act, is more nature than matter, according to which something natural is in potency. **Generations (and begetting)** also have the name *nature* because they are motions proceeding from a form—and towards forms.<sup>15</sup>

## 12.2. Generation and Begetting

According to the first mode posited by ARISTOTLE, **nature** is said (to be) *the generation (generatio = γένεσις) of those (things) that are begotten (nascentium = τῶν φουομένων)*.<sup>16</sup> This is said only of living beings such as plants and animals, or their parts; for, properly speaking, the generation of non-living things cannot be called *nature* according to the common use of the vocable. The Greek φύσις that signifies the generation of living beings is with a long ū; φύσις with a short ũ, as commonly used, signifies *principle*.<sup>17</sup>

When said as generation—e.g., as begetting—nature is (signified as) a way towards nature (*via in naturam*): that towards which generation tends is a form; and form, therefore, is a nature.<sup>18</sup> That which is begotten goes (1) *from* something, and (2) *towards* something insofar as it is begotten; but that which is begotten is denominated from that *into which (in*

<sup>14</sup> *In Physic.* 2, l. 2, n. 5 (cf. ARISTOTLE, *Physica* B.1, 193b6–8): “procedit [Philosophus] ad ostendendum quod forma sit magis natura quam materia; quia unumquodque magis dicitur secundum quod est in actu, quam secundum quod est in potentia. Unde forma, secundum quam aliquid est naturale in actu, est magis natura quam materia, secundum quam est aliquid naturale in potentia.”

<sup>15</sup> *In Metaph.* 5, l. 5, §826 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a16–17): “Et generationes habent nomen naturae, quia sunt motus procedentes a forma, et iterum ad formas.” St. Thomas omits *et nasci* (< καὶ τὸ φύεσθαι) from his commentary, but it is in the text he is reading.

<sup>16</sup> St. Thomas consigns first the reading of the *translatio anonyma*, “of those [things] that are generated” (*generatorum*), which he shows to be inferior, since it does not apply specifically to living things. *In Metaph.* 5, l. 5, §808 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b16–17): “Dicit ergo [Philosophus] primo, quod natura dicitur uno modo generatio generatorum, vel ut alia litera habet melius, nascentium. Non enim omnia generata nascentia dici possunt; sed solum in viventibus, sicut in plantis, sive in animalibus, et in partibus eorum. Non autem generatio rerum non viventium potest dici natura proprie loquendo secundum communem usum vocabuli, sed solum generatio viventium; ut dicatur natura ipsa nativitas vel ipsa nascentia, quod ipsum nomen sonare videtur.”

<sup>17</sup> St. Thomas rejects the *translatio anonyma* as corrupted, although he proposes another interpretation for it. *In Metaph.* 5, l. 5, §808: “«Ut si quis porrigens dicat naturam.» Litera ista corrupta est. Quod ex alia translatione patet, quae sic habet «ut si quis producens dicat ypsilon.» Physis enim, quod apud Graecos naturam significat, si pro generatione viventium accipiatur, habet primum ypsilon productum; si vero pro principio, sicut communiter utitur, habet primum ypsilon breve. Posset tamen per hanc literam intelligi quod hoc nomen natura de generatione viventium dicatur secundum quamdam porrectionem idest extensionem.” Cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b17: “οἷον εἴ τις ἐπεκτείννας λέγοι τὸ υ.”

<sup>18</sup> *In Physic.* 2, l. 2, n. 7 (cf. ARISTOTLE, *Physica* B.1, 193b12–18): “Natura potest significari ut generatio, puta si natura dicatur nativitas. Sic igitur natura dicta ut generatio, idest nativitas, est via in naturam. Haec enim est differentia inter actiones et passiones, quod actiones denominantur a principiis, passiones vero a terminis. Unumquodque enim denominatur ab actu, qui est principium actionis et terminus passionis. Non enim ita est in passionibus sicut in actionibus: medicatio enim non dicitur via in medicinam, sed in sanitatem; necesse est enim quod medicatio sit a medicina, non in medicinam. Sed natura dicta ut generatio, idest nativitas, non sic se habet ad naturam sicut medicatio ad medicinam: sed se habet ad naturam sicut ad terminum, cum sit passio. Id enim quod nascitur, a quodam in quoddam venit in quantum nascitur: unde id quod nascitur, denominatur ab eo in quod, non ab eo ex quo. Id autem in quod tendit nativitas, est forma: forma igitur est natura.”

*quod*; ►48.21), and not from that *from which* (*ex quo*). This (too) is the difference between actions and affections (►33.5): actions are denominated from principles, while affections (are denominated) from termini; for each (thing) is denominated from (its) *act*, which is *the principle of the action and the terminus of the affection*. Thus, (generation) is not the same in affections as in actions: (e.g.), medication is not said (to be a) way towards (the art of) medicine, but towards health; for it is necessary that medication be from (the art of) medicine, and not toward (the art of) medicine. But *nature* said as *generation*—e.g., begetting—is not related to nature as medication (is related) to (the art of) medicine; rather, it is related to nature (i.e., form) as to (its) terminus, since it is an affection.

### 12.3. The Intrinsic Principle of the Begotten

In the second mode posited by ARISTOTLE, which follows from the first, **nature** is said (to be) *that from which the begotten is first generated* (*ex quo illud, quod nascitur generatur primo* < ἐξ οὗ φύεται πρώτου τὸ φυόμενον) *as from an intrinsic principle* (*sicut ex intrinseco principio* < ἐνυπάρχοντος).<sup>19</sup>

### 12.4. The Principle of Motion and of Rest

According to the third mode posited by ARISTOTLE (in his *Metaphysics*), in the likeness of begetting (*nativitatis*) to other motions, **nature**, in whatever beings, is said (to be) *whence the principle of motion is in any of the beings according to nature* (*unde est principium motus in quolibet entium secundum naturam* < ὅθεν ἡ κίνησις ἢ πρώτη ἐν ἐκάστω τῶν φύσει ὄντων), provided the principle of motion is *in it as such* (*in eo in quantum huiusmodi* < ἐν αὐτῷ ἢ αὐτὸ ὑπάρχει), and not accidentally (*et non per accidens*).<sup>20</sup>

This third mode is the same definition posited by ARISTOTLE in his *Physics*: *the principle (and cause) of motion and of rest in that in which it is first and by itself, and not accidentally* (*principium [et causa] motus et quietis in eo in quo est primo et per se et non secundum accidens* < ἀρχῆς τινὸς καὶ αἰτίας τοῦ κινεῖσθαι καὶ ἡρεμεῖν ἐν ᾧ ὑπάρχει πρώτως καθ' αὐτὸ καὶ μὴ κατὰ συμβεβηκός).<sup>21</sup>

<sup>19</sup> *In Metaph.* 5, l. 5, §809 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b17–18): “Ex hoc autem quod ipsa nativitas primo natura dicta est, secutus est modus secundus, ut scilicet generationis principium, ex quo aliquid generatur, sive ex quo illud, quod nascitur generatur primo, sicut ex intrinseco principio, dicatur natura.”

<sup>20</sup> *In Metaph.* 5, l. 5, §810 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b18–20): “Et per similitudinem nativitatis ad alios motus, ulterius processit huius nominis significatio, ut natura tertio modo dicatur id, unde est principium motus in quolibet entium secundum naturam, dummodo sit in eo in quantum huiusmodi, et non per accidens.”

<sup>21</sup> *In Physic.* 2, l. 1, n. 5 (cf. ARISTOTLE, *Physica* B.1, 192b20–23): “concludit [Philosophus] ex praemissis definitionem naturae hoc modo. Naturalia differunt a non naturalibus in quantum habent naturam; sed non differunt a non naturalibus nisi in quantum habent principium motus in seipsis; ergo natura nihil aliud est quam *principium motus et quietis in eo in quo est primo et per se et non secundum accidens*.” *In Metaph.* 5, l. 5, §810: “Et haec est definitio naturae posita in secundo Physicorum.”

1. In this definition, *principle* is posited as a genus, and not (as) something absolute, because the name *nature* conveys the *relation* of a principle (►8.2).<sup>22</sup> The principle of generation or motion is denominated *nature* because those are said to be begotten which are generated after having been joined to a generator, as is evident in plants and animals. Whence, those are to be derided who, wanting to correct ARISTOTLE's definition, have tried to define *nature* by something absolute, saying that nature is *an innate power in things (vis insita rebus)*, or something of this sort.
2. (The expression) *principle and cause* is said to designate that nature is not a principle in the same mode for all motions in that which is moved, but diversely.<sup>23</sup> In natural things, the principle of motion is in the mode in which motion pertains (*convenit*) to them: in those (things) to which it pertains *to move*, there is an active principle of motion, while in those (things) to which it pertains *to be moved*, there is a passive principle, which is matter. This principle, insofar as it has a natural potency (*potentia*, i.e., power) towards such a form and motion, makes the motion to be natural. This is why the productions of artificial things are not natural; for, although the material principle is in that which comes to be, however, it does not have a natural potency towards that form.
3. (The expression) *of moving and of resting* is said because those that are moved naturally towards a place, rest in the place likewise or more naturally.<sup>24</sup> However, one should not understand (by this) that, in whatever (thing) that is moved naturally, nature would be a principle of resting: rather, that (nature) is a principle not only of motion, but also of rest.
4. (The expression) *in which it is*, is said to differentiate (natural beings) from artifacts, in which there is motion only accidentally.<sup>25</sup>

<sup>22</sup> *In Physic. 2, l. 1, n. 5*: "Ponitur autem in definitione naturae *principium*, quasi genus, et non aliquid absolutum, quia nomen naturae importat habitudinem principii. Quia enim nasci dicuntur ea quae generantur coniuncta generanti, ut patet in plantis et animalibus, ideo principium generationis vel motus natura nominatur. Unde deridendi sunt qui volentes definitionem Aristotelis corrigere, naturam per aliquid absolutum definire conati sunt, dicentes quod natura est *vis insita rebus*, vel aliquid huiusmodi."

<sup>23</sup> *In Physic. 2, l. 1, n. 5*: "Dicitur autem *principium et causa*, ad designandum quod non omnium motuum natura est eodem modo principium in eo quod movetur, sed diversimode, ut dictum est." *In Physic. 2, l. 1, n. 4*: "in rebus naturalibus eo modo est principium motus, quo eis motus convenit. Quibus ergo convenit movere, est in eis principium activum motus; quibus autem competit moveri, est in eis principium passivum, quod est materia. Quod quidem principium, in quantum habet potentiam naturalem ad talem formam et motum, facit esse motum naturalem. Et propter hoc factiones rerum artificialium non sunt naturales: quia licet principium materiale sit in eo quod fit, non tamen habet potentiam naturalem ad talem formam."

<sup>24</sup> *In Physic. 2, l. 1, n. 5*: "Dicit autem [Philosophus] *movendi et quiescendi*, quia ea quae naturaliter moventur ad locum, similiter vel magis naturaliter in loco quiescunt [...]. Non tamen intelligendum est quod in quolibet quod movetur naturaliter, natura sit etiam principium quiescendi [...]: sed hoc pro tanto dicitur, quia non solum motus, sed etiam quietis principium est."

<sup>25</sup> *In Physic. 2, l. 1, n. 5*: "Dicit autem [Philosophus] *in quo est*, ad differentiam artificialium, in quibus non est motus nisi per accidens."

5. (The term) *first* is added because, although nature is a principle of motion of composite (things), it is not, however, the first.<sup>26</sup> Thus, an animal is moved downwards not because of the nature of animal insofar as it is an animal, but because of the nature of the dominant element (i.e., due the natural heaviness of the prevailing elements that constitute it).

6. (The expression) *by itself and not accidentally* is said because, sometimes, it may happen that (something is not *per se* the principle of motion; for example), some physician is to itself a cause of health.<sup>27</sup> And in this way, the principle of his healing is in him, but accidentally (*per accidens* = *secundum accidens* = κατὰ συμβεβηκός). Thus, nature is not a principle of healing in him; for he does not possess the art of medicine insofar as he is healed, but insofar as he is a physician; and in this way, the principle of motion is not in him insofar as he is moved. Being a physician and being healed happens (*accidit*) to the same (subject); but he is healed insofar as he is sick. Wherefrom, since they are conjoined accidentally, sometimes they are divided accidentally.<sup>28</sup> Thus, it may happen that the physician who heals is other than the sick (subject) who is healed. But the principle of natural motion is in the natural body that is moved insofar as it is moved.

All artificial things are also like the physician who heals; for not one of them has in itself the principle of its production.<sup>29</sup> Rather, some of them come to be from an extrinsic (principle), as a house and other things that are manufactured, while others come to be from an intrinsic principle, but accidentally.

### 12.5. Matter

The fourth mode posited by ARISTOTLE follows upon the third: since *nature* is said (to be) the principle of motion of natural things, and matter seemed—to some (philosophers)—to

---

<sup>26</sup> *In Physic.* 2, l. 1, n. 5: “Addit autem *primum*, quia natura, etsi sit principium motus compositorum, non tamen primo. Unde quod animal movetur deorsum, non est ex natura animalis in quantum est animal, sed ex natura dominantis elementi.”

<sup>27</sup> *In Physic.* 2, l. 1, n. 5 (cf. ARISTOTLE, *Physica* B.1, 192b23–26): “Quare autem dicat [Philosophus] *per se et non secundum accidens*, exponit consequenter cum dicit, *Dico autem non secundum accidens*. Contingit enim aliquando quod aliquis medicus est sibi ipsi causa sanitatis; et sic principium suae sanationis est in eo, sed per accidens: unde principium sanationis in eo non est natura. Non enim secundum quod sanatur habet medicinam, sed secundum quod est medicus; accidit autem eundem esse medicum et sanari; sanatur enim secundum quod est infirmus.”

<sup>28</sup> *In Metaph.* 5, l. 5, §810: “Sicut in medico, qui infirmatur, inest principium sanationis, scilicet ars medicinae, non tamen in quantum est infirmus, sed in quantum medicus. Sanatur autem non in quantum est medicus, sed in quantum infirmus: et sic principium motus non est in eo in quantum movetur.” *In Physic.* 2, l. 1, n. 5 (cf. ARISTOTLE, *Physica* B.1, 192b26–27): “Et ideo, quia per accidens coniunguntur, aliquando per accidens dividuntur: contingit enim alium esse medicum sanantem et alium infirmum qui sanatur. Sed principium motus naturalis est in corpore naturali quod movetur, in quantum movetur: [...]. Nec dividuntur ad invicem [...], sed semper [sunt] unum et idem.”

<sup>29</sup> *In Physic.* 2, l. 1, n. 5 (cf. ARISTOTLE, *Physica* B.1, 192b27–32): “Et sicuti est de medico sanante, ita est de omnibus artificialibus. Nullum enim eorum habet in seipso suae factionis principium: sed quaedam eorum fiunt ab extrinseco, ut domus et alia quae manu inciduntur; quaedam autem fiunt a principio intrinseco, sed per accidens, ut dictum est.”

be the principle of motion in natural things, consequently, matter came to be called *nature*.<sup>30</sup> In this mode, matter is said (to be the) *nature* that underlies any natural thing which has in itself the principle of motion or of any mutation; for motion is a species of mutation (►48.2, ¶3).<sup>31</sup> However, matter is a principle of a thing both (in respect) of being (*quantum ad esse*) and (in respect) of coming-to-be (*quantum ad fieri*).<sup>32</sup>

Whence, ARISTOTLE says that **nature** is (*that*) *from which some being first is or comes to be* (*ex quo aliquod entium primo est aut fit < ex quo primo aut est aut fit aliquid entium natura = ἐξ οὗ πρώτου ἢ ἔστιν ἢ γίγνεται τι τῶν φύσει ὄντων*).<sup>33</sup>

1. (*That*) *from which*: an *existent without order* (*existente inordinato = ἀρρυθμίστου ὄντος*), that is, without form; whence, another version says: *for it is formless* (*cum informe sit*).<sup>34</sup> For in some (things), order itself (*ipse ordo*) is had instead of form (*pro forma*), as in an army or in a state.

2. (*That*) *from which* (is) *immutable by its power* (*immutabili ex [sive a] sua [propria] potestate = ἀμεταβλήτου ἐκ τῆς δυνάμεως τῆς αὐτοῦ*).<sup>35</sup> That is, it cannot be moved by its power, but (only) according to the power of an agent higher than it; for matter—considered without form—does not move itself towards form, but is moved by another: i.e., from a higher exterior agent. Thus, we could say that bronze is the matter of a statue and of brazen vessels, and timber of wooden things, if such vessels were natural bodies. And in all other things that are or come to be from matter, it is likewise; for any one of them comes to be from its matter having been preserved; but the dispositions of form are not preserved in generation; for one form is introduced (when) the other is expelled (►48.6).<sup>36</sup>

<sup>30</sup> *In Metaph.* 5, l. 5, §816: “Ex hac autem tertia ratione naturae sequitur quarta. Si enim principium motus rerum naturalium natura dicitur, principium autem motus rerum naturalium quibusdam videbatur esse materia, consequens fuit ut materia natura diceretur.”

<sup>31</sup> *In Physic.* 2, l. 2, n. 2 (cf. ARISTOTLE, *Physica* B.1, 193a9–30): “natura uno modo dicitur materia quae subiicitur unicuique rei naturali habenti in se principium motus vel cuiuscumque mutationis: nam motus est species mutationis.”

<sup>32</sup> *In Metaph.* 5, l. 5, §816: “quae quidem [materia] est principium rei, et quantum ad esse et quantum ad fieri.” *In Metaph.* 5, l. 5, §817: “Quod ideo dicit, quia materia essendi et fiendi est principium.”

<sup>33</sup> *In Metaph.* 5, l. 5, §816 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b26–27): “Et ideo dicit [Philosophus] quod natura dicitur ex quo aliquod entium primo est aut fit.”

<sup>34</sup> *In Metaph.* 5, l. 5, §817 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b27–28): “Ex quo, dico, «existente inordinato» idest absque forma. Unde alia litera habet «Cum informe sit.» In quibusdam enim ipse ordo habetur pro forma, sicut in exercitu et civitate.”

<sup>35</sup> *In Metaph.* 5, l. 5, §817 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b28–30): “Ex quo, dico, «immutabili ex sua potestate», idest, quod moveri non potest per suam potestatem, sed secundum potestatem sui superioris agentis. Nam materia non movet seipsam ad formam, sed movetur a superiori exteriori agente.” *In Metaph.* 5, l. 5, §816: “Ipsa etiam [materia] absque omni forma consideratur, nec a seipsa movetur, sed ab alio.”

<sup>36</sup> *In Metaph.* 5, l. 5, §817 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b30–32): “Sicut si diceremus aes materiam statucae et vasorum aereorum, et ligna ligneorum, si huiusmodi vasa, naturalia corpora essent. Similiter est in omnibus aliis quae ex materia sunt vel fiunt. Unumquodque enim eorum fit ex sua materia,

## 12.6. Form

According to the fifth mode posited by ARISTOTLE, form is said (to be) *nature* because the motion of natural things is caused more from their (intrinsic) form than from their matter.<sup>37</sup> Whence, some (philosophers) said that the nature of things is the composition itself of the compounds; for those (substances) are said to have a diverse nature which have diverse composition.

(Such philosophers) brought forward the following reason to posit that nature is a form: whatever things that naturally are and come to be—provided that the matter from which they are naturally apt to come to be exists—are said to have a nature only if they have the proper species and form, by which they may attain the species.<sup>38</sup> However, the name *species* (*species* = εἶδος) seems to be posited instead of *substantial form* (*pro forma substantiali*), and *form* (*forma* = μορφή) instead of *figure* (*figura*, i.e., σχῆμα, *shape*), which follows upon the species and is a sign of the species. Therefore, if form is nature, something can only be said to have a nature if it has a form, since that which is composed from form and matter is according to nature (*secundum naturam* = φύσει): for example, animals and their parts, such as flesh, bones, and such.

Thus, **nature** is said (to be), firstly and properly (*primo et proprie natura dicitur < prima natura et proprie dicta* = ἡ πρώτη φύσις καὶ κυρίως λεγομένη), *the substance*—i.e., *the form*—of things having in themselves the principle of motion as such (*substantia, idest forma rerum habentium in se principium motus in quantum huiusmodi < substantia quae principium motus habentium in se in quantum ipsa* = ἡ οὐσία ἢ τῶν ἐχόντων ἀρχὴν κινήσεως ἐν αὐτοῖς ἢ αὐτά).<sup>39</sup>

---

ea salvata. Dispositiones autem formae non salvantur in generatione; una enim forma introducitur altera abiecta.” Because of this, as ARISTOTLE says and St. Thomas explains, to some philosophers, forms seemed to be accidents, and only matter seemed to be substance and nature. Ibid. (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b32–35): “Et propter hoc formae videbantur esse quibusdam accidentia, et sola materia substantia et natura, ut dicitur secundo Physicorum.” See *ibid.*, §§818–20 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b35–1015a7).

<sup>37</sup> *In Metaph.* 5, l. 5, §819 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b35–1015a7): “Quia vero motus rerum naturalium magis causatur ex forma quam ex materia, ideo supervenit quintus modus quo ipsa forma dicitur natura. [...] sicut naturam rerum dixerunt esse ipsam compositionem mixtorum; [...]. Dicuntur enim quae sunt permixtionis diversae, naturam diversam habere.”

<sup>38</sup> *In Metaph.* 5, l. 5, §820 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a3–7): “Ad ponendum autem formam esse naturam, hac ratione inducebantur, quia quaecumque sunt et fiunt naturaliter non dicuntur habere naturam, existente materia ex qua nata sunt fieri vel esse, nisi habeant speciem propriam et formam, per quam speciem consequantur. Videtur autem nomen speciei poni pro forma substantiali, et forma pro figura quae consequitur speciem, et est signum speciei. Si igitur forma est natura, nec aliquid potest dici habere naturam nisi quando habet formam, illud ergo quod compositum est ex materia et forma «dicitur esse natura,» idest secundum naturam, ut animalia et partes eorum, sicut caro et os et huiusmodi.”

<sup>39</sup> *In Metaph.* 5, l. 5, §826 (ARISTOTLE, *Metaphysica* Δ.4, 1015a13–15): “Unde patet ex dictis, quod primo et proprie natura dicitur substantia, idest forma rerum habentium in se principium motus in quantum huiusmodi.” Ibid., §819 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1014b35–36): “Et sic alio modo natura dicitur ipsa substantia, idest forma rerum existentium secundum naturam.”

## 12.7. First Matter

The first adjunct mode posited by ARISTOTLE is added to the fourth mode, in which matter is said (to be) *nature* (► 12.5).<sup>40</sup> According to this mode, only the **first matter** (*materia prima* = πρώτη ὕλη, i.e., prime matter) is said (to be a) *nature*. This can be understood in two modes: **(1)** in respect of that which is a genus; or **(2)** wholly and simply first. For example, of artifacts that are made from bronze, first matter according to genus is bronze; but *simply first* is the physical element from which bronze comes to be (► 46.7).<sup>41</sup>

## 12.8. Essence

The second adjunct mode posited by ARISTOTLE borders upon the aforesaid fifth mode, in which form was said (to be) *nature* (► 12.6).<sup>42</sup> According to this mode, not only the form of the part (*forma partis*) is said (to be) *nature*, but the species itself is the form of the whole (*forma totius*): for example, if we were to say that the nature of man is not merely the soul, but the humanity and **substance** (i.e., essence) that the definition signifies (► 16). According to this mode, then, **nature** is said (to be) *the form and the species that is according to ratio* (*forma et species quae est secundum rationem* = ἡ μορφή καὶ τὸ εἶδος τὸ κατὰ τὸν λόγον), i.e., from which the *ratio* of the thing is constituted.<sup>43</sup>

Since matter and form constitute the essence of a natural thing, the name *nature* was extended to signify the essence of anything existing in nature, such that the **essence** of a thing—which (its) definition signifies—would be said (to be its) *nature*.<sup>44</sup> And since the essence of any one thing is completed by a form, the **essence in common** (*communiter*

---

<sup>40</sup> *In Metaph.* 5, l. 5, §821 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a7–10): “Deinde cum dicit *natura autem* ponit duos modos adiunctos duobus ultimis praecedentibus, quorum primus additur quarto modo quo materia dicebatur natura. Et dicit, quod materia dicitur natura non quaecumque, sed prima. Quod potest intelligi dupliciter aut quantum ad id quod est genus; aut ex toto vel simpliciter prima. Sicut operum artificialium quae fiunt ex aere, prima materia secundum genus illud est aes. Prima vero simpliciter est aqua. Nam omnia quae liquescunt calido et indurantur frigido sunt aquea magis, ut dicitur quarto Meteororum.”

<sup>41</sup> Replacing “water” with “the physical element from which bronze comes to be.” Some ancient authors thought that all composite substances that can be liquefied are made from of water. But ARISTOTLE allows water to be the first matter of such substances only hypothetically: “ὄλως δ’ ἴσως ὕδωρ, εἰ πάντα τὰ τηκτὰ ὕδωρ.” Today, we would refer, e.g., to the subatomic particles of modern physics.

<sup>42</sup> *In Metaph.* 5, l. 5, §822: “Secundus modus adiacet quinto modo praedicto quo forma dicebatur natura. Et secundum hunc modum non solum forma partis dicitur natura, sed species ipsa est forma totius. Ut si dicamus quod hominis natura non solum est anima, sed humanitas et substantia quam significat definitio.”

<sup>43</sup> *In Physic.* 2, l. 2, n. 3 (cf. ARISTOTLE, *Physica* B.1, 193a30–31): “ostendit [Philosophus] quod natura dicitur de forma. Et [...] primo ostendit propositum, scilicet quod forma sit natura; [...]. Dicit ergo primo quod alio modo dicitur natura forma et species, quae est secundum rationem, idest ex qua ratio rei constituitur.”

<sup>44</sup> ScG 3, c. 35, n. 5: “Et quia forma et materia constituunt essentiam rei naturalis, extensum est nomen naturae ad significandum essentiam cuiuscumque rei in natura existentis: ut sic natura alicuius rei dicatur essentia, quam significat definitio.” *STh* III, q. 2 a. 1 co.: “Et quia finis generationis naturalis est, in eo quod generatur, *essentia speciei, quam significat definitio*, inde est quod huiusmodi essentia speciei vocatur etiam natura.” *STh* I, q. 29 a. 1 ad 4: “Et quia per formam completur essentia uniuscuiusque rei, communiter essentia uniuscuiusque rei, quam significat eius definitio, vocatur natura.”

*essentia*) of any one thing, which its definition signifies, is called *nature*; for the end of natural generation is, in that which is generated, *the essence of the species, which the definition signifies* (*essentia speciei, quam significat definitio*; ► 16).

Thus, just as that is (said to be) *art* (*ars* < τέχνη λέγεται) which befits something insofar as it is according to art and artificial (*secundum artem et artificiosum* = τὸ κατὰ τέχνην καὶ τὸ τεχνικόν), so too that is (said to be) *nature* (*natura* = φύσις) which befits something insofar as it is according to nature and natural (*secundum naturam et naturale* = τὸ κατὰ φύσιν καὶ τὸ φυσικόν).<sup>45</sup> But we do not say that that which is only in potency of being artificial has something of art; for it does not yet have the species (for example) of bed. Therefore, in natural things, that which is flesh and bone in potency does not have the nature of flesh and bone before it receives the form according to which the definitive *ratio* of the thing is taken (*ratio definitiva rei* < τὸ εἶδος τὸ κατὰ τὸν λόγον; ► 8.1): that is, (the *ratio*) by which we know what flesh or bone is; nor is there a nature in it before it has a form.

Therefore, the **nature** of natural things having in themselves the principle of motion is, in another mode, also a *form* (*forma* < ἡ μορφή καὶ τὸ εἶδος) *that differs from matter in ratio* (*ratione* < κατὰ τὸν λόγον), even though it cannot be separated from matter according to the thing (*non separetur <a materia> secundum rem* < οὐ χωριστὸν ὄν).<sup>46</sup> Thus, just as bronze and figureless are one in subject but differ in *ratio*, so matter and form (are one in subject but differ in *ratio*). ARISTOTLE says this because the mode in which matter is said (to be) *nature* can only be other than the mode in which form is said (to be) *nature* if form is other than matter according to *ratio* (*secundum rationem*).

Hence, just as form or matter is said (to be) *nature* because it is the principle of generation, which (generation) is said (to be) *nature* according the first imposition of the name, so too **the species and substance** (*species et substantia* = τὸ εἶδος καὶ ἡ οὐσία) is said (to be) *nature* because it is the end of generation (*finis generationis* = τὸ τέλος τῆς γενέσεως).<sup>47</sup>

---

<sup>45</sup> *In Physic.* 2, l. 2, n. 3 (cf. ARISTOTLE, *Physica* B.1, 193a31–b3): “et hoc probat tali ratione. Sicuti enim illud est ars, quod competit alicui in quantum est secundum artem et artificiosum; ita illud est natura, quod competit alicui in quantum est secundum naturam et naturale. Sed illud quod est in potentia tantum ad hoc quod sit artificiosum, non dicimus habere aliquid artis, quia nondum habet speciem lecti: ergo in rebus naturalibus id quod est potentia caro et os, non habet naturam carnis et ossis antequam accipiat formam, secundum quam sumitur ratio definitiva rei (per quam scilicet scimus quid est caro vel os); nec adhuc est natura in ipso antequam habeat formam.”

<sup>46</sup> *In Physic.* 2, l. 2, n. 3 (cf. ARISTOTLE, *Physica* B.1, 193b3–5): “Ergo natura rerum naturalium habentium in se principium motus, alio modo etiam forma est: quae licet non separetur a materia secundum rem, tamen differt ab ea ratione. Sicut enim aes et infiguratum, quamvis sint unum subiecto, tamen ratione differunt, ita materia et forma. Et hoc pro tanto dicit [Philosophus], quia nisi forma esset aliud secundum rationem a materia, non esset alius et alius modus quo materia dicitur natura, et quo forma dicitur natura.”

<sup>47</sup> *In Metaph.* 5, l. 5, §822 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a10–11): “Sicut autem forma vel materia dicebatur natura, quia est principium generationis, quae secundum primam nominis impositionem natura dicitur; ita species et substantia dicitur natura, quia est finis generationis. Nam generatio terminatur ad speciem generati, quae resultat ex unione formae et materiae.”

For generation is terminated at the species of the thing generated, which results from the union of form and matter (► 15.14).

Therefore, according to some metaphor (*secundum quamdam metaphoram* < μεταφορᾶ) and extension of the name, *nature* is said of every **substance**; for the nature that we said is the terminus of generation is some substance.<sup>48</sup> And thus, every substance has a likeness with that which is said (to be) *nature*. It is on account of this mode that the name *nature* is distinguished from the other common names; for in this way it is as common as *substance*.

In this mode, not only any substance, but even any **being** (*quodlibet ens*)—is said (to be a) *nature*.<sup>49</sup> According to this, that is said to be natural to a thing (*naturale rei*) which befits it (*convenit ei*) according to its substance. And this (i.e., whatever befits a thing according to its substance) is what is by itself in the thing (*quod per se inest rei*). In all things, those that are not by themselves in (the thing) are reduced to something that is by itself as to a principle. Hence, taking *nature* in this mode, it is necessary, in those that befit (*conveniunt*) a thing, that the principle always be natural. This is evident in (the habit of) understanding (► 51.21); for the principles of intellectual cognition are known naturally.

According to this mode too, BOETHIUS defines **nature** as *the specific difference that informs any one thing* (*unumquodque informans specifica differentia*), since the specific difference is that which completes the substance (i.e., essence) of a thing and gives it a species, for the specific difference completes the definition and is taken from the proper form of the thing (► 13.16; 16.7).<sup>50</sup>

---

<sup>48</sup> *In Metaph.* 5, l. 5, §823 (cf. ARISTOTLE, *Metaphysica* Δ.4, 1015a7–13): “Et ex hoc secundum quamdam metaphoram et nominis extensionem omnis substantia dicitur natura; quia natura quam diximus quae est generationis terminus, substantia quaedam est. Et ita cum eo quod natura dicitur, omnis substantia similitudinem habet. [...] Ratione autem istius modi distinguitur hoc nomen natura inter nomina communia. Sic enim commune est sicut et substantia.” *In Metaph.* 5, l. 5, §808: “Hic distinguit hoc nomen natura: cuius quidem consideratio, licet non videatur ad primum philosophum, sed magis ad naturalem pertinere, ideo tamen hic hoc nomen natura distinguitur, quia natura secundum sui quamdam acceptionem de omni substantia dicitur, ut patebit. Et per consequens cadit in consideratione philosophi primi, sicut et substantia universalis.”

<sup>49</sup> *STh* I-II, q. 10 a. 1 co.: “Alio modo dicitur natura quaelibet substantia, vel etiam quodlibet ens. Et secundum hoc, illud dicitur esse naturale rei, quod convenit ei secundum suam substantiam. Et hoc est quod per se inest rei. In omnibus autem, ea quae non per se insunt, reducuntur in aliquid quod per se inest, sicut in principium. Et ideo necesse est quod, hoc modo accipiendo naturam, semper principium in his quae conveniunt rei, sit naturale. Et hoc manifeste apparet in intellectu, nam principia intellectualis cognitionis sunt naturaliter nota.”

<sup>50</sup> *In Metaph.* 5, l. 5, §823: “Et hunc modum etiam ponit Boetius.” *In Metaph.* 5, l. 5, §822: “Secundum hoc enim Boetius dicit, quod natura est unumquodque informans specifica differentia. Nam specifica differentia est, quae complet substantiam rei et dat ei speciem.” *STh* III, q. 2 a. 1 co.: “Et hoc modo Boetius naturam definit, in libro *de Duabus Naturis*, dicens: *Natura est unamquamque rem informans specifica differentia*, quae scilicet complet definitionem speciei.” *STh* I, q. 29 a. 1 ad 4: “Unde Boetius in eodem libro dicit quod *natura est unumquodque informans specifica differentia*, specifica enim differentia est quae complet definitionem, et sumitur a propria forma rei.”

## 12.9. Element

Properly (as opposed to metaphorically: ► 12.12), **element** (*elementum* = στοιχεῖον) is *that intrinsic (principle) from which something is first composed, specifically indivisible into another species (ex quo aliquid componitur primo inexistente, indivisibili specie in aliam speciem = ἐξ οὗ σύγκειται πρώτου ἐνυπάρχοντος, ἀδιαίρετου τῷ εἶδει εἰς ἕτερον εἶδος)*.<sup>51</sup> (Or, according to another wording of the same Aristotelian definition), *that from which a thing is composed first, is in it, and is not divided (or divisible) according to form (id ex quo componitur res primo, et est in ea, et non diuiditur secundum formam)*. Whence, it can be gathered that four (*ratios*) belong to the *ratio* of *element*.<sup>52</sup>

1. That (an element) should be a cause *from which* (*ex quo* = ἐξ οὗ).<sup>53</sup> Whence, *element* is posited in the genus of *material cause* (► 9.3); for it is properly said only of those causes from which (*ex quibus*) the composition of the thing is, which are properly material.

2. That (an element) should be a principle from which something comes to be *first* (*primo* < πρώτου); for *element* is not said of whatever material cause, but (only) of that (material cause) from which composition first comes to be (► 11.6).<sup>54</sup>

For example, limbs (*membra*) are not the elements of man; for limbs, too, are composed from (*ex*) other (material causes).<sup>55</sup> Likewise, copper is (a material cause) from which (*ex quo*) a statue is made, but is not an element; for it has another matter from which it is made.<sup>56</sup>

---

<sup>51</sup> *In Metaph.* 5, l. 4, §795 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014a26–27): “ostendit [Philosophus] quomodo elementum proprie dicatur.” *Ibid.*, §807 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b14–15): “dicit, quod omnibus praedictis modis elementi hoc est commune, esse primum in unoquoque, sicut dictum est.” This Latin definition has been taken directly from the version that St. Thomas is using. *De prin. nat.* §3, 95–98: “Vnde Aristoteles in V Methaphisice dicit quod «elementum est id ex quo componitur res primo, et est in ea, et non diuiditur secundum formam».”

<sup>52</sup> *In Metaph.* 5, l. 4, §795: “Ponit [Philosophus] ergo primo, quamdam elementi descriptionem; ex qua colligi potest, quod quatuor sunt de ratione elementi.” *Ibid.*, §798: “Propter hoc dicit, quod elementum est ex quo aliquid componitur, quantum ad primum. Primo, quantum ad secundum. Inexistente, quantum ad tertium. Indivisibili specie in aliam speciem, quantum ad quartum.”

<sup>53</sup> *In Metaph.* 5, l. 4, §795: “primum est, ut sit causa sicut ex quo: per quod patet, quod elementum ponitur in genere causae materialis.” *De prin. nat.* §3, 86–88: “Elementum uero non dicitur proprie nisi de causis ex quibus est compositio rei, que proprie sunt materiales.”

<sup>54</sup> *In Metaph.* 5, l. 4, §796: “Secundum est, quod sit principium ex quo aliquid fiat primo.” *De prin. nat.* §3, 88–91: “et iterum non de qualibet causa materiali [dicitur proprie elementum], sed de illa ex qua est prima compositio.” Cf. *ibid.*, 99–100: “Expositio prime particule, ‘ex quo componitur res primo’, patet per ea que diximus.”

<sup>55</sup> *De prin. nat.* §3, 88–91: “sicut nec membra elementa sunt hominis, quia membra etiam sunt composita ex aliis.”

<sup>56</sup> *In Metaph.* 5, l. 4, §796: “Cuprum enim est ex quo fit statua; non tamen est elementum, quia habet aliquam aliam materiam ex qua fit.” St. Thomas is referring here to the composition of copper from the elements of ancient physics (earth, water, air, fire); cf. *De prin. nat.* §3, 91–95: “sed dicimus quod terra et aqua sunt elementa, quia hec non componuntur ex aliis corporibus, sed ex ipsis est prima compositio corporum naturalium.” Chemically speaking, of course, copper *is* an element, and in this sense, a statue could be said to be made from an element—a chemical one. However, the argument that St. Thomas

What is first in composition is last in resolution.<sup>57</sup> Hence, an element is that from which a thing is first composed, and into which it is last divided. However, we find a double mode of composition and division: **(a)** according to *ratio*, in which species are resolved into genera, as PLATO posited genera to be principles and elements;<sup>58</sup> **(b)** according to nature, insofar as natural bodies are composed from natural elements and are resolved into them,<sup>59</sup> as the natural philosophers posited elements to be the first principles.

3. That (an element) should be *intrinsic (inexistens sive intrinsecum, est in ea = ἐνυπάρχοντος)*.<sup>60</sup> This is posited to differentiate (elements) from that matter that is totally (*ex toto*) corrupted by generation.<sup>61</sup> Whence, an element differs from anything transient (*transeunte*) from which something comes to be, whether it is a privation, a contrary, or matter subjected to contrariety or privation, which is transient matter (► 43).<sup>62</sup>

For example, bread is the matter of blood; but blood is generated only if bread is corrupted; and, since bread does not remain in blood, bread cannot be said to be an element of blood; for elements must somehow remain, since they are not corrupted.<sup>63</sup> Likewise, we say that a musical man comes to be from a non-musical man (i.e., from a man-matter subjected to privation), or that a musical (comes to be) from a non-musical (i.e., from a privation); but elements must remain in those things of which they are elements.<sup>64</sup>

---

makes here can be readily applied to our modern understanding of nature insofar as any chemical element is known to be composed of other, more *elementary* physical particles—whatever they may be. Thus understood, a copper statue is *not* made from a natural element—which is precisely the point that St. Thomas is making here.

<sup>57</sup> *In Metaph.* 3, l. 3, §355 (cf. ARISTOTLE, *Metaphysica* B.1, 995b27–29): “elementum est ex quo primo componitur res, et in quod ultimo dividitur. Invenimus autem duplicem modum compositionis et divisionis: unum scilicet secundum rationem, prout species resolvuntur in genera. Et secundum hoc videntur genera esse principia et elementa, ut Plato posuit. Alio modo secundum naturam sicut corpora naturalia componuntur ex igne et aere et aqua et terra, et in haec resolvuntur. Et propter hoc naturales posuerunt esse prima principia elementa.”

<sup>58</sup> As St. Thomas explains, supposing genera were the principles of things, the question would arise of whether the most specific species or the most generic genera are the principles of things: for example, whether *animal* or *man* is more of a principle. He explains that this question comes from two divisions: (1) according as we divide genera into species; and (2) according as we resolve species into genera.

<sup>59</sup> Replacing “fire, air, water, and earth” with “natural elements.”

<sup>60</sup> *In Metaph.* 5, l. 4, §797: “Tertium est, quod sit inexistens sive intrinsecum.”

<sup>61</sup> *De prin. nat.* §3, 100–109: “Secunda particula, scilicet ‘et est in ea’, ponitur ad differentiam illius materie que ex toto corrumpitur per generationem.”

<sup>62</sup> *In Metaph.* 5, l. 4, §797: “Tertium est, quod sit inexistens sive intrinsecum: per quod differt elementum ab omni eo ex quo fit aliquid sicut ex transeunte, sive sit privatio, aut contrarium, sive materia contrarietati et privationi subiecta, quae est materia transiens. Ut cum dicimus, quod homo musicus fit ex homine non musico, vel musicum ex non musico. Elementa enim oportet manere in his quorum sunt elementa.”

<sup>63</sup> *De prin. nat.* §3, 100–109: “sicut panis est materia sanguinis, sed non generatur sanguis nisi corrumpatur panis, unde panis non remanet in sanguine: unde non potest dici panis elementum sanguinis; sed elementa oportet aliquo modo manere cum non corrumpantur, ut dicitur in libro De generatione.” Cf. ARISTOTLE, *De generatione* A.10, 327b29–31.

<sup>64</sup> *In Metaph.* 5, l. 4, §797: “Ut cum dicimus, quod homo musicus fit ex homine non musico, vel musicum ex non musico. Elementa enim oportet manere in his quorum sunt elementa.”

4. That (an element) should be of some *species that is not divisible into another species* (*indivisibili specie in aliam speciem* < ἀδιαίρετου τῷ εἶδει εἰς ἕτερον εἶδος).<sup>65</sup> This (*ratio*) is posited to differentiate (an element) from those (things) that have parts diverse in form: i.e., in species, as a hand, whose parts are flesh and bones, which differ according to species.<sup>66</sup> Hence, *element* differs from *first matter*—which does not have any species—and from all other matters that can be resolved into other species, such as blood.<sup>67</sup>

An element is not divided into parts that are diverse according to species, as water, of which whatever part is water.<sup>68</sup> On the other hand, it is not necessary for an element not to be divided according to quantity: it suffices for it not to be divided according to species; and if it is not divisible (according to species), it is said to be an element, as letters or phonemes are said to be the elements of diction.<sup>69</sup> Thus, when it is posited in this definition that an element is not divisible into things that are diverse according to species (*non dividitur in diversa secundum speciem*), this must not be understood of the parts into which something is divided according to the division of quantity (*divisione quantitatis*; ► 13.9).<sup>70</sup> Otherwise, wood would be an element; for every part of wood is wood. Instead, it should be understood of the division that is done according to alteration, as compounds (*mixta*) are resolved into simpler bodies.

#### 12.10. Properties of Elements

All (things) that are composite are not constituted from elements that are related in just any mode whatsoever (*quocumque modo* = ὅπωςοῦν), but always according to a certain *ratio* and composition (*quadam ratione et compositione* = λόγῳ τινὶ καὶ συνθέσει).<sup>71</sup>

<sup>65</sup> *In Metaph.* 5, l. 4, §798: “Quartum est, quod habeat aliquam speciem, quae non dividatur in diversas species.”

<sup>66</sup> *De prin. nat.* §3, 109–120: “Tertia particula, scilicet ‘et non dividitur secundum formam’, ponitur ad differentiam eorum scilicet que habent partes diuersas in forma, id est in specie, sicut manus cuius partes sunt caro et ossa que differunt secundum speciem.”

<sup>67</sup> *In Metaph.* 5, l. 4, §798: “per quod differt elementum a materia prima, qua nullam speciem habet, et etiam ab omnibus materiis, quae in diversas species resolvi possunt, sicut sanguis et huiusmodi.”

<sup>68</sup> *De prin. nat.* §3, 109–120: “elementum non dividitur in partes diuersas secundum speciem, sicut aqua cuius quelibet pars est aqua. Non enim oportet ad esse elementi ut non diuidatur secundum quantitatem, sed sufficit si non diuidatur secundum speciem; et si etiam non diuiditur, dicitur elementum, sicut littere dicuntur elementa dictionum.”

<sup>69</sup> Thus, phonemes of the same species may be short or long according to quantity.

<sup>70</sup> *In Metaph.* 5, l. 4, §800: “Sciendum est, quod cum in definitione elementi ponatur, quod non dividitur in diversa secundum speciem, non est intelligendum de partibus in quas aliquid dividitur divisione quantitatis: sic enim lignum esset elementum, quia quaelibet pars ligni est lignum: sed de divisione, quae fit secundum alterationem, sicut corpora mixta resolvuntur in simplicia.” Thus, according to quantitative division, any part of salt is salt; but, as chemistry shows, sodium chloride (a *mixtum*) is resolved into sodium and chlorine, which are its chemical elements.

<sup>71</sup> *In De anima* 1, c. 12, 41–45 (cf. ARISTOTLE, *De anima* A.1, 410a1–2): “omnia que sunt composita non consistunt quocumque modo se habeant elementa, set quadam ratione et compositione, ut scilicet sint proportionata ad inuicem.”

Elements are not in a compound (*in mixto*) *actually* (*actu*), but *virtually* (*virtute*).<sup>72</sup>

No element is the same as that which is composed from the elements; for nothing is a cause or an element of itself.<sup>73</sup> For example, an element of the syllable BA is the letter B or A (and neither B nor A is the same as BA).

### 12.11. Principle vs. Element

From what has been said thus far, it is evident that *principle* is somehow had in more (things) that *cause*; and *cause*, in more (things) than *element*.<sup>74</sup>

Not only are causes those that are intrinsic to the thing, but also those that are outside the thing: for example, the moving (cause; ►9.7).<sup>75</sup> Whence, it is evident that *principle* and *element* differ; for, properly, that is said (to be) an element which is an intrinsic cause from which (*ex qua*) a thing is constituted.

Thus, just as the name *principle* is more common than *cause* (i.e., for there are principles that are not causes), so is *cause* (found) in more (things) than *element*; for only an intrinsic cause can be said (to be an) *element*.<sup>76</sup>

### 12.12. Element Metaphorically Speaking

*Element* is also said metaphorically (*transumptive* < μεταφέρωντες),<sup>77</sup> such that, from the preceding *ratio* and signification of *element*, some (thinkers) have transferred the name to

---

<sup>72</sup> *In De anima* 2, c. 8, 92–93: “cum elementa non sint actu in mixto, set uirtute [...]”

<sup>73</sup> *In Metaph.* 12, l. 4 §2461 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b4–7): “Nullum elementum est idem cum eo quod ex elementis est compositum: quia nihil est causa aut elementum suiipsius; sicut huius syllabae BA, elementum est haec litera B aut A.” This is applied directly in *ibid.*, §2462 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b7–8): “Et quia videbatur hoc habere instantiam in principiis a Platone positis, quae sunt unum et ens, eo quod unumquodque principiorum est unum et ens; ideo consequenter hoc excludit, dicens, quod neque etiam intellectualium elementorum, quae sunt unum et ens, possibile est aliquod esse idem cum his quae sunt ex elementis. Vocat autem ea intellectualia, quia universalia intellectu percipiuntur, et quia Plato ea ponebat separata a sensibilibus.” And *ibid.*, §2463 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b8–10): “Et quod huiusmodi elementa sint alia ab eis quorum sunt elementa, probat, quia huiusmodi elementa, idest unum et ens, insunt singulis compositorum ex eis, nullum autem compositorum ex eis inest aliis. Unde patet, quod et ista elementa differunt ab his quae sunt composita ex eis. Si igitur verum est quod elementa non sunt idem cum his quae sunt ex elementis, si eadem sunt elementa substantiarum et aliorum generum, consequitur, quod nihil eorum sit in genere substantiae, neque in aliis generibus. Sed hoc est impossibile; quia necesse est omne quod est, esse in aliquo genere: non igitur possibile est, quod sint eadem principia omnium.”

<sup>74</sup> *De prin. nat.* §3, 120–123: “Patet igitur quod principium quodammodo in plus habet se quam causa, et causa in plus quam elementum: et hoc est quod dicit Commentator in V Methaphisice.”

<sup>75</sup> *In Metaph.* 12, l. 4 §2468 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b22–23): “quia non solum sunt causae ea quae dicta sunt intrinseca rei, sed etiam ea quae sunt extra rem, sicut movens, manifestum est quod principium et elementum differunt. [...] Elementum autem proprie dicitur causa intrinseca ex qua constituitur res.”

<sup>76</sup> *In Metaph.* 5, l. 1, §750: “hoc nomen principium communius est quam causa: aliquid enim est principium, quod non est causa; [...]. Et iterum causa est in plus quam elementum. Sola enim causa intrinseca potest dici elementum.”

<sup>77</sup> *In Metaph.* 5, l. 4, §802 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b3–6): “ostendit [Philosophus] quomodo elementum dicatur transumptive; dicens, quod ex hac praemissa ratione et significatione elementi

signify *that which is one, small, and useful for many* (*quod est unum, et parvum, et ad multa utile* = ὁ ἓν ἐν ὄν καὶ μικρὸν ἐπὶ πολλὰ ἢ χρήσιμον).

Since an element is indivisible into diverse species, this has been taken to be *one*; from its being first, to be *simple*; and because others are composed from elements, to be *useful for many*. And thus, this *ratio* of *element* was established so that everything that is small in quantity, simple—as if not composed from others—, and indivisible into diverse things, would be called *element*.<sup>78</sup> Once this *ratio* of *element* was established by transfer, it happened that two modes of *elements* were arrived at:<sup>79</sup>

1. Those would be called *elements* which are maximally universal (*ea quae sunt maxime universalia* = τὰ μάλιστα καθόλου).<sup>80</sup>

The universal is *one* according to *ratio* (*secundum rationem*; ►38); it is simple because its definition is not composed from diverse things; and is in many, and thus useful for many, whether it be in everything, as *one* and *being*, or in many, as the other genera.<sup>81</sup>

2. Through the same *ratio*, it happened that the point and the unit came to be called *principles* and *elements*; for each of them is one, simple, and useful for many.<sup>82</sup>

◀ However, these two modes fall short of the *ratio* of *element*.<sup>83</sup> Universals are not the matter from which particular things are composed; rather, they predicate their substance (i.e., they predicate, of particular things, their essence). Likewise, the point is not the matter of lines; for a line is not composed from points (►34.23; and, although numbers are composed from units, it is prime numbers that are properly the *elements* of other numbers, since they are the first species of numbers).

---

transtulerunt quidam hoc nomen elementum ad significandum aliquid, quod est unum, et parvum, et ad multa utile.”

<sup>78</sup> *In Metaph.* 5, l. 4, §802: “Ex hoc enim quod elementum est indivisibile in diversas species, acceperunt quod sit unum. Ex eo vero quod est primum, quod sit simplex. Ex eo vero, quod ex elementis alia componuntur, acceperunt quod sit utile ad multa. Unde hanc rationem elementi constituerunt, ut elementum dicerent omne illud, quod est parvum in quantitate, et simplex, quasi ex aliis non compositum, et indivisibile in diversa.”

<sup>79</sup> *In Metaph.* 5, l. 4, §803: “Hac autem ratione elementi constituta, per transumptionem contingebat eis ut duos modos elementorum adinvenirent.”

<sup>80</sup> *In Metaph.* 5, l. 4, §803 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b6–8): “quorum primus est, ut ea quae sunt maxime universalia, dicerent elementa.”

<sup>81</sup> *In Metaph.* 5, l. 4, §803: “Universale enim est unum secundum rationem, et est simplex, quia eius definitio non componitur ex diversis, et est in multis, et sic est ad multa utile, sive sit in omnibus, sicut unum et ens; sive in pluribus, sicut alia genera.”

<sup>82</sup> *In Metaph.* 5, l. 4, §803 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b8–9): “Per eandem vero rationem contingebat eis secundo, quod punctum et unitatem dicerent esse principia vel elementa, quia utrumque eorum est unum simplex et ad multa utile.”

<sup>83</sup> *In Metaph.* 5, l. 4, §804: “Sed in hoc a vera ratione elementi defecerunt, quia universalia non sunt materia, ex quibus componuntur particularia, sed praedicant eorum substantiam. Similiter et punctus non est materia linearum; non enim linea ex punctis componitur.”

## 13. Whole and Part

*It has already been determined that parts are said to be the material cause of the whole (► 9.3). Here, we aim to resolve what whole and part are, how they are related, and what kinds of wholes and parts there are.*

### 13.1. Part as Matter, Whole as Form

All parts are compared to the whole according to the *ratio* of *matter* as the imperfect to the perfect, which is a comparison of *matter to form*.<sup>1</sup> Since every part is ordered to the whole as the imperfect to the perfect, every part naturally is on account of the whole (*omnis pars naturaliter est propter totum*). Any part in itself is imperfect; it has perfection—i.e., it is completed—in its whole; whence, whole is related to parts as *form to matter*.

### 13.2. Whole

The common *ratio* of **whole** (*totum* = ὅλον) consists in two (*ratios*); for it is both:<sup>2</sup>

1. *That which lacks no part of those (parts) from which it is said to be a whole by nature (et cuius nulla pars abest ex quibus dicitur totum natura = οὐ τε μηθὲν ἄπτεστι μέρος ἐξ ὧν λέγεται ὅλον φύσει)*, which signifies that the perfection of the whole is integrated from (*ex*) the parts; for **whole** is *that of which none of its parts is lacking*: i.e., (lacking) parts from which it is said to be a whole by nature—that is, (the parts from which) the whole is constituted according to its nature.<sup>3</sup> Hence, the opposite of whole is **truncated** (► 13.22).

Therefrom, any which **whole** is defined as *that from which nothing is wanting (cui nihil deest = οὐ μηδὲν ἄπτεστιν)*.<sup>4</sup> For example, a whole man and a whole box lack none (of the

---

<sup>1</sup> *In Physic.* 2, l. 5, n. 9: “omnes partes comparantur ad totum ut imperfectum ad perfectum, quae quidem est comparatio materiae ad formam.” ARISTOTLE, *Physica* B.3, 195a18–19 = *Metaphysica* Δ.2, 1013b19–21: “τὰ μέρη τοῦ ὅλου καὶ [...] ὡς τὸ ἐξ οὗ αἰτιά ἐστιν.” *In Post. an.* 2, l. 9, 81–83: “partes enim se habent ad totum secundum rationem materie, ut habetur in II Phisicorum.” *STh* II-II, q. 64 a. 2 co.: “Omnis autem pars ordinatur ad totum ut imperfectum ad perfectum. Et ideo omnis pars naturaliter est propter totum.” *STh* II-II, q. 65 a. 1 co.: “pars totius [...] est propter totum, sicut imperfectum propter perfectum.” *STh* I-II, q. 90 a. 2 co.: “cum omnis pars ordinetur ad totum sicut imperfectum ad perfectum [...]” *In Sent.* 3, d. 21 q. 2 a. 1 co.: “omnis autem pars est imperfecta respectu totius, ut patet per Philosophum in 3 Physic.” *In Sent.* 3, d. 29 q. 1 a. 3 co.: “pars quaelibet imperfecta est in seipsa, perfectionem autem habet in suo toto.” *In Sent.* 4, d. 49 q. 1 a. 4 qc. 1 co.: “omnis pars imperfecta est, et completur in suo toto; unde et totum se habet ad partes sicut forma ad materiam.” *ScG* 2, 83 n. 11: “pars a suo toto separata est imperfecta.” *De rat. Fidei*, c. 6 co.: “omnis pars imperfecta est.”

<sup>2</sup> *In Metaph.* 5, l. 21, §1098: “Primo ponit [Philosophus] rationem communem totius, quae consistit in duobus.”

<sup>3</sup> *In Metaph.* 5, l. 21, §1098 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b26–27): “prosequitur de ipso nomine totius. Secundo de eius opposito, scilicet de colobon [...]. Primo in hoc [consistit totum] quod perfectio totius integratur ex partibus. Et significat hoc, cum dicit quod totum dicitur cui nulla suarum partium deest, ex quibus scilicet partibus dicitur totum natura, idest totum secundum suam naturam constituitur.”

<sup>4</sup> *In Physic.* 3, l. 11, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 207a8–12): “Definitur enim unumquodque totum esse cui nihil deest: sicut dicimus hominem totum aut arcam totam, quibus nihil deest eorum quae debent habere. Et sicut hoc dicimus in aliquo singulari toto, ut est hoc particulare vel illud, ita etiam haec ratio competit in eo quod est vere et proprie totum, scilicet in universo, extra quod simpliciter nihil est. Cum

parts) they ought to have. This is said not only of some singular whole: e.g., *this* or *that* whole; for this *ratio* also befits (*competit in*) that which is truly and properly a whole: that is, the universe, outside of which there is nothing simply (*simpliciter*). But when something is lacking due to the absence of something intrinsic, then there is no whole (► 13.22). Whence, it is manifest that the definition of **whole** is *that of which nothing is outside* (*totum est cuius nihil est extra* = τὸ ὅλον οὐ μὴδὲν ἐστὶν ἔξω).

2. *And that which so contains the (parts) contained, that they are something one* (*et continens contenta ut unum aliquid sunt illa* = καὶ τὸ περιέχον τὰ περιεχόμενα ὥστε ἓν τι εἶναι ἐκεῖνα): (which signifies) that the parts are united in the whole; for the whole contains the parts in such a way that the (parts) contained are something *one* in the whole.<sup>5</sup>

Thus, a whole is defined through its parts.<sup>6</sup> However, parts are compared to whole in two modes: **(a) according to composition**, insofar as a whole is composed from parts; **(b) according to resolution**, insofar as a whole is divided (or divisible) into parts.

Those that are posterior in composition are prior in resolution (and vice-versa).<sup>7</sup> However, division is naturally posterior to composition; for division is only of composite (and, consequently, divisible) things, just as corruption is only of things generated.

*Division*—like *separation*—is properly said of composite things insofar as a whole is divided (or divisible) into parts.<sup>8</sup> Therefore, a whole is not found in simple things, which do not have parts: in these, we use the name **perfect** (► 23.1).

### 13.3. Part

**Part** is *that into which a whole is divided* (or *divisible*), just like *whole* is *what is divided* (or *divisible*) into parts; for *division* constitutes the *ratio* of *whole* and of *part* (► 13.2, ¶2).<sup>9</sup>

---

autem aliquid desit per absentiam alicuius intrinseci, tunc non est totum. Sic igitur manifestum est quod haec est definitio totius: totum est cuius nihil est extra.”

<sup>5</sup> *In Metaph.* 5, l. 21, §1098 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b27–28): “Secundum est quod partes uniuntur in toto. Et sic dicit quod totum continens est contenta, scilicet partes, ita quod illa contenta sunt aliquid unum in toto.”

<sup>6</sup> *In Physic.* 3, l. 1, n. 3: “totum, per partes suas definiri habet: partes autem dupliciter comparantur ad totum, scilicet secundum compositionem, prout ex partibus totum componitur; et secundum resolutionem, prout totum dividitur in partes.”

<sup>7</sup> *De virtutibus*, q. 4 a. 3 ad 11: “ea quae sunt posteriora in compositione, sunt priora in resolutione.” *In Peri.* 1, l. 8, 28–31: “diuisio autem naturaliter posterior est compositione, nam non est diuisio nisi compositorum, sicut non est corruptio nisi generatorum.”

<sup>8</sup> *STh* I, q. 31 a. 2 co.: “Ne autem tollatur simplicitas [...], vitandum est nomen separationis et divisionis, quae est totius in partes.” Cf. *De potentia*, q. 9 a. 8 ad 4; *In Sent.* 1, d. 24 q. 1 a. 2 ad 2. *In Physic.* 3, l. 11, n. 4: “totum non invenitur in simplicibus, quae non habent partes: in quibus tamen utimur nomine perfecti.”

<sup>9</sup> *In De div. nom.*, c. 4, l. 8: “divisio autem constituit rationem totius et partis, quia pars est in quam dividitur totum.” *STh* I, q. 76 a. 8 co.: “cum totum sit quod dividitur in partes [...].”

### 13.4. Genera of Wholes and Parts

Every whole is reduced to (one of) three genera: **universal** (► 13.5), **integral** (► 13.7), or **potential** (► 13.20); and since *whole* is *that which is divided into parts* (► 13.2, ¶2), there are three corresponding (genera of) parts: **(1) subjective** (► 13.6), as *ox* and *lion* are parts of *animal*; **(2) integral** (► 13.8), as walls, roof, and foundation are parts of a house; and **(3) potential** (► 13.21), as the nutritive and the sensitive are parts of the soul.<sup>10</sup>

### 13.5. Universal Whole

**Universal** (*universale* = καθόλου) is *that which is totally*—i.e., *commonly*—*predicated* (*quod totaliter idest quod communiter praedicatur* = τὸ ὅλως λεγόμενον) *as some whole being* (*ut totum aliquid ens* = ὡς ὅλον τι ὄν), because it is predicated of each (of its parts).<sup>11</sup> It is universal in that, as though containing many (*quasi multa continens* = ὡς πολλὰ περιέχον) as parts, it is predicated of any (or each) of them (*praedicatur de unoquoque* = τῷ κατηγορεῖσθαι καθ' ἐκάστου); and all of them are one (*et omnia illa sunt unum* < καὶ ἔν ἅπαντα εἶναι) in the universal whole in such a way that any (*ita quod unumquodque* = ὡς ἕκαστον) of them is that one whole.

Thus, the **universal whole** (*totum universale*; sc., *ut unumquodque unum* = ὡς ἕκαστον ἔν) <sup>12</sup> is predicated of any/each of its parts, such that any of the (parts) contained by the

---

<sup>10</sup> *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “omne totum ad tria genera reducitur, scilicet universale, integrale et potentiale; et similiter pars triplex invenitur dictis tribus respondens.” *STh* I, q. 76 a. 8 co.: “cum totum sit quod dividitur in partes, secundum triplicem divisionem est triplex totalitas.” *De spirit. creat.*, a. 11 ad 2: “sciendum est triplex esse totum. Unum universale [...]. Aliud vero est totum integrale [...]. Tertium est totum potentiale [...].” *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “omne totum ad tria genera reducitur, scilicet universale, integrale et potentiale; et similiter pars triplex invenitur dictis tribus respondens.” *STh* II-II, q. 48 co.: “triplex est pars, scilicet integralis, ut paries, tectum et fundamentum sunt partes domus; subiectiva, sicut bos et leo sunt partes animalis; et potentialis, sicut nutritivum et sensitivum sunt partes animae.” As St. Thomas observes (*In Metaph.* 5, l. 21, §1099), ARISTOTLE posits only two modes of *whole* (*universal* and *integral*) in his *Metaphysics*: “ponit duos modos totius; dicens quod totum dicitur dupliciter.” To these, St. Thomas adds in other places the *potential* whole and its part, usually providing the example of the rational soul, which is said to be a whole because all the powers of the soul are joined in it, while the sensible soul in brutes, and the vegetable soul in plants, are said to be parts of the soul because they have something of the (active) potency of the soul, but not the whole, whence ARISTOTLE says in his book *On plants* that they do not have the soul, but *parts* of the soul. See *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “Rationalis enim anima tota anima dicitur, eo quod in ipsa omnes animae potentiae congregantur. Sensibilis vero in brutis, et in plantis vegetabilis, dicuntur partes animae, quia aliquid de potentia animae habent, sed non totum. Unde dicitur in Lib. *De plantis*, quod non habent animam, sed partes animae.” Hence, also the potential part—and its whole—is based on ARISTOTLE, *De plantis* A.1, 815b27–31: “οὐδὲ συνίσταται παρ’ ἡμῶν τοῦτο εἰ μὴ διότι τὸ θρεπτικὸν καὶ αὐξητικὸν νοῦμεν μέρη εἶναι τῆς ψυχῆς. ὁπότεν γοῦν τὸ τοιοῦτον φυτὸν εὐρίσκωμέν τι μέρος ψυχῆς τοιαύτης ἐν αὐτῷ ἔχον, ἐξ ἀνάγκης νοῦμεν καὶ ψυχὴν ἔχειν αὐτό.” Cf. *ibid.* A.2, 817b24: “τοῦτο δὲ [sc., τὸ φυτὸν] ἔχει μᾶλλον μέρος μέρους ψυχῆς.”

<sup>11</sup> *In Metaph.* 5, l. 21, §1100 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b29–31): “*universale et quod totaliter idest quod communiter praedicatur, dicitur quasi sit aliquod unum totum ex hoc quod praedicatur de unoquoque, sicut universale, quasi multa continens ut partes, in eo quod praedicatur de unoquoque. Et omnia illa sunt unum in toto universali, ita quod unumquodque illorum est illud unum totum.*”

<sup>12</sup> *In Metaph.* 5, l. 21, §1099 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b28): “aut ita quod unumquodque contentorum a toto continente, sit ipsum unum, scilicet ipsum totum continens, quod est in toto universali de qualibet suarum partium praedicato.” *Ibid.*, §1100 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b32): “Sicut animal continet *hominem* et *equum* [...], *quia omnia sunt animalia*, idest quia animal praedicatur de unoquoque.”

containing whole is *something one*: i.e., the containing whole itself. For example, *animal* contains *man* and *horse* because *animal* is predicated of one and of the other.

This is so because the universal whole is present in each of its subjective parts according to its whole essence and virtue both simultaneously (*simul*; ►8.7) and equally (provided the whole is predicated of the parts according to one *ratio*).<sup>13</sup> For example, when we say that *man is (an) animal*, the whole virtue of *animal*, insofar as it is *animal*, is preserved in whichever species of *animal* that at once and equally divide (the whole genus of) *animal*.

However, the universal whole, whether it is a genus (e.g., *animal*) or a species (e.g., *man*), is not predicated singularly (*in singulari*) of its plural parts taken simultaneously (*simul acceptis*).<sup>14</sup> Thus, *three men* are not (*an*) *animal*, but *animals*.

### 13.6. Subjective Parts

A **subjective part** is *that (part) of which the whole is predicated essentially, and it is in fewer (de qua essentialiter praedicatur totum, et est in minus; e.g., man, which is a part of animal, is found in fewer things than animal)*.<sup>15</sup> This can happen in two (modes):

1. Sometimes, something is predicated of many **according to one ratio**: for example, *animal* (is predicated) of *horse* and of *ox*.<sup>16</sup> (Thus, subjective) parts are (parts) *into which something is divided without quantity (in quae dividitur aliquid sine quantitate < εἰς ἃ τὸ εἶδος διαίρεθῆναι ἂν ἄνευ τοῦ ποσοῦ)*.<sup>17</sup> It is in this mode that species are said to be parts of a genus (►14); for a whole quantity is not in any of its parts (e.g., the whole of six is not in three), while a genus is in any of (its) species.

2. Sometimes, on the other hand, (something) is predicated (of many) **according to prior and posterior**: e.g., *being* (►30.14) is predicated of *substance* and of *accident*.<sup>18</sup>

---

<sup>13</sup> *De spirit. creat.*, a. 11 ad 2: “totum [...] universale, quod adest cuilibet parti secundum totam suam essentiam et virtutem; unde proprie praedicatur de suis partibus, ut cum dicitur: homo est animal.” *STh* III, q. 90 a. 3 co.: “partibus subiectivis singulis adest tota virtus totius, et simul, et aequaliter, sicut tota virtus animalis, in quantum est animal, salvatur in qualibet specie animalis, quae simul et aequaliter dividunt animal.” *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “universalis vero [pars] totius pars suscipit totius praedicationem, sicut homo animalis.”

<sup>14</sup> *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “totum universale non praedicatur in singulari de suis partibus pluralibus simul acceptis, sive sit genus, sive species: tres enim homines non sunt animal, sed animalia.”

<sup>15</sup> *STh* II-II, q. 120 a. 2 co.: “Pars autem subiectiva est de qua essentialiter praedicatur totum, et est in minus. Quod quidem contingit dupliciter.”

<sup>16</sup> *STh* II-II, q. 120 a. 2 co.: “quandoque enim aliquid praedicatur de pluribus secundum unam rationem, sicut animal de equo et bove.”

<sup>17</sup> *In Metaph.* 5, l. 21, §1094 (cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b17–19): “Secundo modo ea dicuntur partes, in quae dividitur aliquid sine quantitate: et per hunc modum species dicuntur esse partes generis. Dividitur enim in species, non sicut quantitas, in partes quantitatis. Nam tota quantitas non est in una suarum partium. Genus autem est in qualibet specierum.”

<sup>18</sup> *STh* II-II, q. 120 a. 2 co.: “quandoque autem praedicatur secundum prius et posterius, sicut ens praedicatur de substantia et accidente.”

### 13.7. Integral Whole

The *ratio* of **integral whole** (*totum integrale*; sc., *ut ex hiis unum* = ὅς ἐκ τούτων τὸ ἓν) is that (*whole*) which is predicated of none of its integral parts (*quod de nulla suarum partium integralium praedicatur*).<sup>19</sup> It is a *one* so constituted from parts, that no part whatsoever is *that one* (i.e., no part of an integral whole is essentially the same as the containing whole).

The integral whole is not present in any of its parts according to its whole essence or according to its whole virtue: rather, (it is) simultaneously (present) in all (of its parts).<sup>20</sup> Whence, it is in no mode predicated of a part, as if one were to say, “a wall is a house.” This is what is required for the *ratio* of *integral part*, which enters into the constitution of the whole, as a wall (enters into the constitution) of a house: the *ratio* of **integral whole** consists in *composition*, and the *ratio* of *integral part* has the associated (*annexam*) imperfection (i.e., the associated imperfection of being a part according to composition).

(The integral whole is twofold:)

1. **(Quantitative whole).** There is an (integral) whole that is divided into quantitative parts, as the whole line or the whole body.<sup>21</sup>
2. **(Essential or substantial whole).** There is an (integral) whole that is divided into parts of the essence and of the *ratio*, as the composite is resolved into matter and form, and as that which is defined (*definitum*) [is divided] into the parts of the definition.<sup>22</sup>

### 13.8. Integral Parts

(Corresponding to the twofold integral whole), integral parts are twofold:<sup>23</sup>

---

<sup>19</sup> *In Metaph.* 5, l. 21, §1099 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b28–29): “totum dicitur dupliciter; aut ita quod [...]. Aut ex partibus constituatur unum, ita quod non quaelibet partium sit unum illud. Et haec est ratio totius integralis, quod de nulla suarum partium integralium praedicatur.”

<sup>20</sup> *De spirit. creat.*, a. 11 ad 2: “Aliud vero est totum integrale, quod non adest alicui suae parti neque secundum totam essentiam neque secundum totam suam virtutem; et ideo nullo modo praedicatur de parte, ut dicatur: paries est domus.” *STh* III, q. 90 a. 3 co.: “partes integrales [...], ad quarum rationem exigitur ut totum non adsit singulis partibus neque secundum totam virtutem eius, neque secundum totam essentiam, sed omnibus simul.” *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “Integralis enim pars intrat in constitutionem totius, sicut paries domus.” *In Sent.* 1, d. 19 q. 4 a. 1 co.: “ratio totius integralis consistit in compositione. Ratio autem partis integralis habet imperfectionem annexam.”

<sup>21</sup> *STh* I, q. 76 a. 8 co.: “Est enim quoddam totum [integrale] quod dividitur in partes quantitativas, sicut tota linea vel totum corpus.”

<sup>22</sup> *STh* I, q. 76 a. 8 co.: “Est etiam quoddam totum [integrale] quod dividitur in partes rationis et essentiae; sicut definitum in partes definitionis, et compositum resolvitur in materiam et formam.”

<sup>23</sup> *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “partes integrales sunt duplices. Quaedam sunt partes quantitatis [...]. Quaedam vero sunt partes essentiae.” *STh* I, q. 8 a. 2 ad 3: “Est autem duplex pars [integralis], scilicet pars essentiae [...]; et etiam pars quantitatis, in quam scilicet dividitur aliqua quantitas.” *STh* III, q. 90 a. 2 co.: “duplex est pars [integralis], ut dicitur in V *Metaphys.* scilicet pars essentiae, et pars quantitatis.” *In Metaph.* 5, l. 21, §1093 (cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b12–25): “[Philosophus] ponit quatuor modos, quibus aliquid dicitur esse pars.” The first mode corresponds to our mode number (1); the third and fourth modes are subsumed under number (2) as (a) and (b), respectively, *ibid*: “In

1. **Parts of quantity** (► 13.9), i.e., those parts into which some quantity is divided.<sup>24</sup> These are *parts of the matter* (► 13.15); for quantity is had from the part of matter.

2. **Parts of the essence or substance.** *Naturally (speaking)*, these are **matter** and **form**; but *logically (speaking)*, **genus** and **difference**.<sup>25</sup> Whence, the parts of the essence are either: **(a) parts of the thing** (► 13.10), into which a whole is materially divided; or **(b) parts of the ratio or definition** (► 13.16).

### 13.9. Parts of Quantity

In this mode, an **integral part** is *that into which something is divided according to quantity* (*in quam dividitur aliquid secundum quantitatem* < εἰς ὃ διαιρεθεῖη ἂν τὸ ποσόν).<sup>26</sup>

This (can moreover be) in two modes:

1. (Broadly), that into which a greater quantity is divided regardless of how much lesser the quantity into which the greater is divided should be (*quantumcumque fuerit quantitas minor, in quam quantitas maior dividitur* < ὁπωσοῦν); for that which is removed from a quantity is always said to be its part, as two is—in some mode—a part of three.<sup>27</sup>

2. (Properly), *only the lesser part that measures the whole* (*solum pars quantitas minor, quae mensurat maiorem* < τὰ καταμετροῦντα τῶν τοιούτων μόνον; ► 3); and in this mode, two is not a part of three; yet, two is a part of four, since twice two is four ( $2 \times 2 = 4$ ).<sup>28</sup>

---

secundo enim modo sumebatur pars pro parte subiectiva totius universalis; in aliis autem tribus pro parte integrali. Sed in primo [= (1)] pro parte quantitatis, in aliis autem duobus pro parte substantiae; ita tamen, quod pars secundum tertium modum [= (2a)] est pars rei; sive sit pars speciei, sive pars individui. Quarto autem modo [= (2b)] est pars rationis." Cf. *In Sent.* 3, d. 8 q. 1 a. 2 ad 1: "est duplex pars [integralis]. Est enim pars substantiae secundum quantitatem [...]. Sunt etiam partes substantiae, in quas dividitur totum secundum rationem, sicut materia et forma."

<sup>24</sup> *STh* III, q. 90 a. 2 co.: "quia quantitas se tenet ex parte materiae, partes quantitatis sunt partes materiae."

<sup>25</sup> *STh* III, q. 90 a. 2 co.: "Partes quidem essentiae sunt, naturaliter quidem, forma et materia." *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: "partes essentiae, sicut materia et forma, non quantitatis." *STh* I, q. 8 a. 2 ad 3: "pars essentiae, ut forma et materia dicuntur partes compositi, et genus et differentia partes speciei." *STh* III, q. 90 a. 1 co.: "partes rei sunt in quas materialiter totum dividitur, habent enim se partes ad totum sicut materia ad formam; unde in II *Physic.* partes ponuntur in genere causae materialis, totum autem in genere causae formalis. Ubi cumque igitur ex parte materiae invenitur aliqua pluralitas, ibi est invenire partium rationem."

<sup>26</sup> *In Metaph.* 5, l. 21, §1093 (cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b12–13): "Primo modo pars dicitur, in quam dividitur aliquid secundum quantitatem: et hoc dupliciter."

<sup>27</sup> *In Metaph.* 5, l. 21, §1093: "Uno enim modo quantumcumque fuerit quantitas minor, in quam quantitas maior dividitur, dicitur eius pars. Semper enim id quod aufertur a quantitate, dicitur pars eius; sicut duo aliquo modo sunt partes trium." Cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b12–15: "μέρος λέγεται ἓνα μὲν τρόπον εἰς ὃ διαιρεθεῖη ἂν τὸ ποσόν ὁπωσοῦν· αἰεὶ γὰρ τὸ ἀφαιρούμενον τοῦ ποσοῦ ἢ ποσόν μέρος λέγεται ἐκείνου, οἷον τῶν τριῶν τὰ δύο μέρος λέγεταιί πως."

<sup>28</sup> *In Metaph.* 5, l. 21, §1093: "Alio modo dicitur solum pars quantitas minor, quae mensurat maiorem. Et sic duo non sunt pars trium; sed sic duo sunt pars quatuor, quia bis duo sunt quatuor." Cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b15–17: "ἄλλον δὲ τρόπον τὰ καταμετροῦντα τῶν τοιούτων μόνον· διὸ τὰ δύο τῶν τριῶν ἔστι μὲν ὡς λέγεται μέρος, ἔστι δ' ὡς οὐ."

The parts from which a (quantitative integral) whole is constituted can be in the whole in two modes: **(a) in potency** (*in potentia* = δυνάμει), in a **continuous whole**; or **(b) in act** (*in actu* = ἐνεργεία), in a **non-continuous** (i.e., **discrete**) **whole**, as in those (parts) that are joined by contact: for example, stones are in act in a heap.<sup>29</sup>

The parts of quantity sometimes are of one and the same nature and *ratio* both to each other and with the whole, as in a homogeneous whole.<sup>30</sup> For example, the parts of a whole line (are of one and the same nature and *ratio*, both to each other and with the whole line; for any part of a whole line is itself a line), and (the parts) of a whole (geometrical) body. But sometimes they are of diverse *ratios*, as in a heterogeneous whole (e.g., a house is composed of walls, roof, and foundation, which are parts of diverse *ratios*; ► 39.19).<sup>31</sup>

There is a question of whether whole and parts are one or many.<sup>32</sup> And it concerns not only the continuous whole, but also the contiguous, whose parts are not continuous (► 39.5): for example, the parts of a house, which are one according to contact and composition. (In reply), it is evident that the whole is the same as the parts *according to something* (*secundum quid*), but not *simply* (*simpliciter*). If the whole were simply the same as one part, it would be—for the same reason—the same as another of the parts: but those that are the same as another are themselves one and the same; thus, it would follow that both parts would be the same as each other, if posited as being the same simply; and thus, it would follow that the whole would be indivisible, not having diversity of parts.

The form of the whole is perfect, while the forms of parts are imperfect.<sup>33</sup> Hence, parts are imperfect in respect of the whole. For example, the parts of a man are not a man; the parts

---

<sup>29</sup> *In Metaph.* 5, l. 21, §1102 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b34): “Partes autem ex quibus constituitur totum dupliciter possunt esse in toto. Uno modo in potentia, alio modo in actu. Partes quidem sunt in potentia in toto continuo; actu vero in toto non continuo, sicut lapides actu sunt in acervo.” *In Sent.* 3, d. 8 q. 1 a. 2 ad 1: “pars substantiae secundum quantitatem [...] vel subsistit in potentia, ut in continuis: vel in actu, ut in his quae per tactum junguntur.”

<sup>30</sup> *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “partes quantitatis; quae sunt quandoque unius rationis, ut in totis homogeneis.” *STh* I, q. 76 a. 8 co.: “Est enim quoddam totum quod dividitur in partes quantitativas, sicut tota linea vel totum corpus.” *In De caelo* 3, l. 3, n. 6: “Est autem considerandum quod ista ratio [sc., *corpus sensibile non potest componi ex rebus non habentibus gravitatem, sicut ex punctis, ex lineis, et ex superficiebus*] tenet in partibus quantitativis, quae sunt eiusdem naturae et rationis et ad invicem et cum toto.”

<sup>31</sup> *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “partes quantitatis; quae sunt quandoque [...] diversarum rationum, ut in totis heterogeneis.”

<sup>32</sup> *In Physic.* 1, l. 3, n. 3 (cf. ARISTOTLE, *Physica* A.2, 185b11–16): “Est enim dubitatio utrum totum et partes sint unum aut plura. [...] Et non solum de totis continuis, sed etiam de totis contiguis, quorum partes non sunt continuae; sicut partes domus, quae sunt unum contactu et compositione. Et manifestum est quod totum secundum quid est idem parti, non tamen simpliciter. Si enim simpliciter totum esset idem uni partium, eadem ratione esset idem alteri partium; quae autem uni et eidem sunt eadem, sibi invicem sunt eadem; et sic sequitur quod ambae partes, si ponantur simpliciter esse idem toti, quod sint idem ad invicem. Et sic sequeretur quod totum sit indivisibile, non habens diversitatem partium.”

<sup>33</sup> *In Ethic.* 10, l. 5, 74–75: “forma totius [...] est perfecta, formae autem partium sunt imperfectae.” *ScG* 1, 18 n. 6: “partes sunt imperfectae respectu totius: sicut partes hominis non sunt homo, partes etiam

of the number six (properly, the numbers one, two, and three; ►3) do not have the perfection of six (which is considered a *perfect number*, above all, because it is equal to the sum of its parts, i.e.,  $1 + 2 + 3 = 6$ , according to EUCLID’s definition; ►3); and the parts of a line do not attain the perfection of measure (i.e., of magnitude; ►34.2) that is found in the whole line.

The continuous [whole] (►39) is more *one*—and, consequently, more *whole*—than the non-continuous.<sup>34</sup> Whence, (integral) parts must be in a whole, above all (*maxime* = μάλιστα), in potency, as in the continuous whole—and if not in potency, at least in act.

Accordingly, the most manifest integral whole is that which is divisible into (continuous) quantitative parts.<sup>35</sup> The common *ratio* of **(continuous) integral whole** is *that (whole) which is continuous and finite* (*continuum et finitum* = τὸ συνεχὲς καὶ πεπερασμένον)—that is, whole and perfect; for *infinite* does not have the *ratio* of *whole* (►25.16, ¶2), but of *part*—when something one comes to be from many (parts) that are in the whole (*quando unum aliquid ex pluribus est quae insunt* = ὅταν ἓν τι ἐκ πλειόνων ἢ ἐνυπαρχόντων)—i.e., it does not come to be from another as from a contrary (rather, from its intrinsic parts).

However, multitude does not totally deprive of unity: when the whole is (actually) divided, the part remains still undivided (►40).<sup>36</sup> Thus, while (a quantitative whole) is more whole when the parts are in it in potency than when they are in act, and every part separated from its whole is imperfect, on the other hand, if we consider the parts, they are more parts when they are in act than when they are in potency.<sup>37</sup>

---

numeri senarii non habent perfectionem senarii, et similiter partes lineae non perveniunt ad perfectionem mensurae quae in tota linea invenitur.”

<sup>34</sup> *In Metaph.* 5, l. 21, §1102 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b34): “Magis autem est unum, et per consequens magis totum, continuum, quam non continuum. Et ideo dicit [Philosophus] quod oportet partes inesse toti, maxime quidem in potentia sicut in toto continuo. Et si non in potentia, saltem *energia*, idest in actu. Dicitur enim energia, interior actio.”

<sup>35</sup> *In Metaph.* 5, l. 21, §1101 (cf. ARISTOTLE, *Metaphysica* Δ.26, 1023b32–34): “exponit [Philosophus] modum secundum totius qui pertinet ad totum integrale; [...] ponit rationem communem huius totius, et praecipue de toto quod dividitur in partes quantitativas, quod est manifestius; dicens, quod aliquid dicitur continuum et finitum, idest perfectum et totum. Nam infinitum non habet rationem totius, sed partis, ut dicitur in tertio Physicorum; quando scilicet unum aliquid fit ex pluribus quae insunt toti. Et hoc dicit ad removendum modum quo aliquid fit ex aliquo sicut ex contrario.”

<sup>36</sup> *De potentia*, q. 3 a. 16 ad 3: “Nec tamen multitudo privat unitatem totaliter, cum diviso toto adhuc remaneat pars indivisa; sed removet unitatem totius.”

<sup>37</sup> *In Metaph.* 5, l. 21, §1103: “Licet autem magis sit totum quando partes sunt in eo in potentia, quam quando sunt actu, tamen si respiciamus ad partes, magis sunt ipsae partes, quando sunt actu, quam quando sunt in potentia.” St. Thomas adds this clarification in the context of his criticism of less accurate versions he has before his eyes, *ibid.*: “Unde alia litera habet maxime quidem perfectione et actu. Sin autem, et potestate. Et subiungit etiam quod prius dictum est et maxime potestate. Sin autem, et energia. Unde videtur quod translator duas invenit literas et utramque transtulit, et errore factum est, sic ut coniungantur ambae quasi una litera. Et hoc patet ex alia translatione quae non habet nisi alterum tantum. Sic enim dicit continuum autem et finitum est, cum unum aliquid sit ex pluribus inhaerentibus, maxime quod potentia. Si autem non, actu sunt.” ScG 2, 83 n. 11: “Omnis pars a suo toto separata est imperfecta.”

### 13.10. Parts of the Thing

In this mode, **integral parts** are those (parts) into which some whole is divided, or from which it is composed (in quas dividitur, aut ex quibus componitur aliquod totum = εἰς ἃ διαίρεται τι ἢ ἐξ ὧν σύγκειται τὸ ὅλον), whether (the whole) should be a species (sive sit species < ἢ τὸ εἶδος) or something having a species (sive aliquid habens speciem < ἢ τὸ ἔχον τὸ εἶδος), i.e. an individual.<sup>38</sup> Whence, we must moreover distinguish:

#### 1. The parts of the species (► 13.14).

For example, a cube is a body contained by (six equal) square surfaces.<sup>39</sup> (That is, *body* and *square surfaces* are parts of the cube-species: the former, as its matter; the latter, as its terminus, which constitutes the difference of its specific form or figure; ► 4.5. Moreover, the species of cube can be multiplied in many individual matters, as in *this bronze* or *that bronze*; or even in any of the individual imaginary bodies considered by mathematicians.)

Likewise, angle is part of triangle as (a part) of the species (that is, insofar as angles are principles of the species of triangle; ► 4.4), which can be multiplied (in individuals).<sup>40</sup>

#### 2. The parts of matter (► 13.15), which are the parts of the individual (*partes individui* < τῶν καθ' ἕκαστα μέρη; i.e., these are the parts of *the individual having a species*).

For example, bronze is part of a bronze cube—or of a bronze sphere—as matter, in which the species (of cube or of sphere) is received (as its formal part); whence, bronze is not a part of the species, but a part of that which has the species (i.e., a part of the individual).<sup>41</sup>

### 13.11. Form and Matter of the Thing

Among those (causes) from which a thing is integrated, some are related according to the mode of subject (*per modum subiecti* = ὡς τὸ ὑποκείμενον), such as parts (*partes* = τὰ μέρη) and other aforesaid (causes that pertain to the *ratio* of *matter*); others are related

<sup>38</sup> *In Metaph.* 5, l. 21, §1097: “pars secundum tertium modum [= (2a)] est pars rei; sive sit pars speciei, sive pars individui.” *Ibid.*, §1095 (cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b19–20): “Tertio modo dicuntur partes, in quas dividitur, aut ex quibus componitur aliquod totum; sive sit species, sive aliquid habens speciem, scilicet individuum.”

<sup>39</sup> *In Metaph.* 5, l. 21, §1095: “Sunt enim [...] quaedam partes speciei [...]. Est autem cubus corpus contentum ex superficiebus quadratis.”

<sup>40</sup> *In Metaph.* 5, l. 21, §1095: “Angulus autem est pars trianguli sicut speciei.” Cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b22: “καὶ ἡ γωνία μέρος.” *In Metaph.* 3, l. 14, §516: “cum sint multa mathematica numero differentia in una specie, non poterunt esse mathematica principia mathematicorum determinata numero, sed determinata specie solum: puta si dicamus quod principia triangulorum sunt tria latera et tres anguli. Sed haec determinatio est secundum speciem: contingit enim quodlibet eorum in infinitum multiplicari.”

<sup>41</sup> *In Metaph.* 5, l. 21, §1095: “Sunt enim [...] quaedam partes materiae, quae sunt partes individui. Aes enim est pars sphaerae aereae, aut cubi aerei, sicut materia, in qua species est recepta. Unde aes non est pars speciei, sed pars habentis speciem.” Cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b20–22: “οἶον τῆς σφαιράς τῆς χαλκῆς ἢ τοῦ κύβου τοῦ χαλκοῦ καὶ ὁ χαλκὸς μέρος: τοῦτο δ' ἐστὶν ἡ ὕλη ἐν ἧ τὸ εἶδος.”

as essence or quiddity (*ut quod quid erat esse* = ὡς τὸ τί ἦν εἶναι): the **species** (*species* = τὸ εἶδος), the **whole** (*totum* = τὸ ὅλον), and the **composition** (*compositio* = ἡ σύνθεσις), which pertain to the *ratio* of *form*, according to which the quiddity of a thing is completed.<sup>42</sup>

Nonetheless, it should be known that sometimes a thing is the matter of something *simply* (*simpliciter*), as silver is the matter of a saucer: then, the form that corresponds to such matter can be said (to be its) **species**.<sup>43</sup> Sometimes, however, *multiple things united to each other* are the matter of something. And this can happen in three modes:

1. Sometimes, things are united *only according to an order*: for example, men in an army, or houses in a city; and thus, the form corresponds to the **whole** designated by the name *army* or *city*.<sup>44</sup>
2. Sometimes, things are united according not only to an order, but *also by contact or binding*, as the parts of a house (which are quantitative parts, and therefore parts of the matter; ► 13.8, 13.9; moreover, they are heterogenous parts); and then their **composition** corresponds to the form.<sup>45</sup>
3. Sometimes, to these (i.e., order and composition) is added the *alteration of the components*, which happens in the compounding (of elements; e.g., as common salt is a compound of sodium and chloride); and then, the form is the **compounding** (*mixtio*) itself, which is, however, some species of **composition**.<sup>46</sup>

The quiddity or essence of the thing (*quod quid est rei*) is from whichever of these three—i.e., the *species*, the *whole*, or the *composition*—, as is evident when *saucer*, *army*, and *house* are defined.<sup>47</sup> So, those (names) that convey (*important*) *whole*, *composition*, or whatever *species*, are related (to their matter) according to the *ratio* of *form* (*in ratione*

---

<sup>42</sup> *In Metaph.* 5, l. 3, §779 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013b21–23): “Inter ea autem ex quibus res integratur, aliquid se habet per modum subiecti, sicut partes et alia quae praedicta sunt; alia vero se habent ut quod quid erat esse, scilicet totum, et compositio, et species, quae pertinent ad rationem formae, secundum quam quidditas rei completur.”

<sup>43</sup> *In Metaph.* 5, l. 3, §779: “Sciendum est enim, quod quandoque una res simpliciter est alicuius materia, sicut argentum phialae; et tunc forma correspondens tali materiae potest dici species. Quandoque autem plures adinvicem adunatae sunt materia alicuius rei. Quod quidem contingit tripliciter.”

<sup>44</sup> *In Metaph.* 5, l. 3, §779: “Quandoque enim adunantur secundum ordinem tantum, sicut homines in exercitu, vel domus in civitate; et sic pro forma respondet totum, quod designatur nomine exercitus vel civitatis.”

<sup>45</sup> *In Metaph.* 5, l. 3, §779: “Quandoque autem non solum adunantur ordine, sed contactu et colligatione, sicut apparet in partibus domus; et tunc respondet pro forma compositio.”

<sup>46</sup> *In Metaph.* 5, l. 3, §779: “Quandoque autem super hoc additur alteratio componentium, quod contingit in mixtione; et tunc forma est ipsa mixtio, quae tamen est quaedam compositionis species.”

<sup>47</sup> *In Metaph.* 5, l. 3, §779: “Ex quolibet autem trium horum sumitur quod quid est rei, scilicet ex compositione et specie et toto: sicut patet si definiretur exercitus, domus et phiala.” *In Physic.* 2, l. 5, n. 8: “sed ea quae important totum vel compositionem vel quamcumque speciem, se habent in ratione formae; ut species referatur ad formas simplicium, totum autem et compositio ad formas compositorum.”

*formae*), if by *species* we refer to the forms of simple things (*formas simplicium*, i.e., when a thing is the matter of something *simply*, such as silver is the matter of a saucer), and (if by) *whole* and *composition* (we refer) to the forms of composite (matters).

### 13.12. Common vs. Individual Matter

Matter is twofold:<sup>48</sup> **(1) designated** or **individual matter** (*materia signata vel individualis*), as *this flesh* and *these bones* (*hae carnes et haec ossa*; i.e., the individual matter of *this individual man*); **(2) common** or **universal matter** (*materia communis vel universalis*), as *flesh* and *bone* (*caro et os*; i.e., the common matter from which the species *man* is integrated insofar as *man* is a natural thing and not a logical species).

The parts of individual matter are parts of the composite singular (► 13.15), in which the nature of the species is taken simultaneously with individuating matter itself; but not (parts) of the species or of the form.<sup>49</sup> The parts of universal matter are parts of the species (► 13.14), but not (parts) of the form. Whence, since the universal—but not the singular—is defined, the parts of individual matter are not posited in the definition (► 13.16): only the parts of common matter simultaneously with the form or the parts of the form.

Indeed, as has been said (► 8.1), that which a definition signifies is the essence or quiddity (*quod quid erat esse*); and a definition is not assigned to individuals, but to species.<sup>50</sup> Hence, individual matter, which is the principle of individuation, is other than (*praeter*) that

---

<sup>48</sup> *STh* I, q. 85 a. 1 ad 2: “materia est duplex, scilicet communis, et signata vel individualis, communis quidem, ut caro et os; individualis autem, ut hae carnes et haec ossa.” ARISTOTLE uses *flesh* and *bones* to exemplify these two kinds of matter, even if he does not have a name for them. See. e.g., *Metaphysica* I.9, 1058b6–8: “οὐκ ἀνθρώπου γὰρ εἶδη εἰσὶν οἱ ἄνθρωποι διὰ τοῦτο, καίτοι ἕτεραι αἱ σάρκες καὶ τὰ ὀστᾶ ἐξ ὧν ὄδε καὶ ὄδε.” Ibid. Z.8, 1034a5–8: “ἴκανόν τὸ γεννῶν ποιῆσαι καὶ τοῦ εἶδους αἴτιον εἶναι ἐν τῇ ὕλῃ. τὸ δ' ἅπαν ἤδη τὸ τοῖόνδε εἶδος ἐν ταῖσδε ταῖς σαρκί καὶ ὀστοῖς Καλλίας καὶ Σωκράτης· καὶ ἕτερον μὲν διὰ τὴν ὕλην, ἕτερα γάρ, ταῦτό δὲ τῷ εἶδει· ἄτομον γὰρ τὸ εἶδος.”

<sup>49</sup> *In Metaph.* 7, l. 10, §1497 (cf. ARISTOTLE, *Metaphysica* Z.10, 1036a12–13): “Partes enim materiae individuae sunt partes compositi singularis, non autem speciei, nec formae. Partes autem materiae universalis, sunt partes speciei, sed non formae. Et quia universale definitur et non singulare, ideo partes materiae individualis non ponuntur in definitione, sed solum partes materiae communis, simul cum forma vel partibus formae.” *In Metaph.* 5, l. 21, §1093: “pars secundum tertium modum [= (2a)] est pars rei; sive sit pars speciei, sive pars individui.” Ibid., §1095: “Sunt enim [...] quaedam partes speciei, et quaedam partes materiae, quae sunt partes individui.” Ibid., §1089: “Sunt enim partium, quaedam partes speciei, et quaedam partes materiae.” *In Metaph.* 7, l. 11, §1501 (cf. ARISTOTLE, *Metaphysica* Z.11, 1036a26–27): “Distinxerat enim [Philosophus], solvendo praemissam quaestionem, inter partes speciei, et partes individui, quod est compositum ex specie et ex materia. Et ideo hic quaerit, quae sint partes speciei, et quae non. [...] Dicit ergo primo, quod cum dictum sit quod partes speciei ponuntur in definitionibus, non autem partes compositi ex specie et materia, merito dubitatur quae sunt partes speciei, et quae non sunt partes speciei sed simul sumpti, idest individui, in quo simul sumitur natura speciei cum materia ipsa individuante.”

<sup>50</sup> *In Metaph.* 7, l. 11, §1535: “Sicut enim supra dictum est, quod quid erat esse est id quod significat definitio. Definitio autem non assignatur individuis, sed speciebus; et ideo materia individualis, quae est individuationis principium est praeter id quod est quod quid erat esse. Impossibile est autem in rerum natura esse speciem nisi in hoc individuo. Unde oportet quod quaelibet res naturae, si habeat materiam quae est pars speciei, quae est pertinens ad quod quid est, quod etiam habeat materiam individuaalem, quae non pertinet ad quod quid est. Unde nulla res naturae si materiam habeat, est ipsum quod quid est, sed est habens illud. Sicut Socrates non est humanitas, sed est humanitatem habens.”

which the essence is. However, in things of nature, a species can only exist in *this* individual. Whence, if a thing of nature has matter that is a part of the species, which pertains to the essence, it must also have individual matter, which does not pertain to the essence. Therefore, no natural thing (*res naturae*), if it has matter, *is* (its) essence itself: rather, it is (something) *having* it. For example, Socrates is not humanity: rather, it is (something) having humanity.

Hence, in everything that is not its own species but is some determined individual in a species, there must be some parts of matter that are not parts of the species.<sup>51</sup> Thus, because Socrates is not his humanity itself but is (something) having humanity, he has in himself material parts that are not parts of the species but are parts of *this* individual matter, which is the principle of individuation, as *this flesh* and *these bones*.

On the other hand, if some individual were itself its species, (then there would be in it no parts that would not be parts of the species).<sup>52</sup> For example, if Socrates himself were his humanity, then there would be in him no parts that would not be parts of humanity.

### 13.13. Sensible vs. Intelligible Matter

Matter, whether individual or common (► 13.12), is found in two modes:<sup>53</sup> **(1) sensible matter** (*materia sensibilis* = ὕλη αἰσθητή), which is corporeal matter insofar as it underlies sensible qualities—such as hot and cold, hard and soft—from which mathematical (things)

<sup>51</sup> *In Metaph.* 7, l. 11, §1521: “in omni eo quod non est ipsa sua species, sed est aliquod individuum determinatum in specie, oportet esse aliquas partes materiae quae non sunt partes speciei. Socrates enim, quia non est ipsa sua humanitas, sed est habens humanitatem, ideo habet in se partes materiales quae non sunt partes speciei, sed quae sunt partes huius materiae individualis quae est individuationis principium, ut has carnes et haec ossa.”

<sup>52</sup> *In Metaph.* 7, l. 11, §1522: “Si autem esset aliquod individuum quod esset ipsa sua species, sicut si Socrates esset ipsa sua humanitas, non essent in Socrate aliquae partes quae non essent partes humanitatis.”

<sup>53</sup> *In Metaph.* 7, l. 11, §1522: “Utroque enim modo [sc. sensibile et intelligibile] invenitur materia.” Cf. ARISTOTLE, *Metaphysica* Z.11, 1037a4–5: “ἔστι γὰρ ὕλη ἢ μὲν αἰσθητή ἢ δὲ νοητή.” *In Metaph.* 8, l. 5, §1760: “dicit [Philosophus] quod duplex est materia: scilicet sensibilis et intelligibilis.” Cf. ARISTOTLE, *Metaphysica* H.6, 1045a33–34: “ἔστι δὲ τῆς ὕλης ἢ μὲν νοητή ἢ δ’ αἰσθητή.” *De veritate*, q. 2 a. 6 ad 1: “duplex est materia a qua fit abstractio; scilicet materia intelligibilis et sensibilis, ut patet in VII Metaph. [...] Utraque autem dupliciter accipitur; scilicet ut signata, et ut non signata: et dico signatam secundum quod consideratur cum determinatione dimensionum, harum scilicet vel illarum; non signatam autem quae sine determinatione dimensionum consideratur.” *In De anima* 3, c. 2, 94–97: “est enim duplex materia, scilicet sensibilis, a qua abstrahunt mathematica et concernunt eam naturalia, et intelligibilis, quam etiam mathematica concernunt.” **Sensible matter:** *In Metaph.* 8, l. 5, §1760: “Sensibilis quidem [materia] est, quae concernit qualitates sensibiles, calidum et frigidum, rarum et densum, et alia huiusmodi, cum qua quidem materia concreta sunt naturalia, sed ab ea abstrahunt mathematica.” *STh* I, q. 85 a. 1 ad 2: “Materia enim sensibilis dicitur materia corporalis secundum quod subiacet qualitatibus sensibilibus, scilicet calido et frigido, duro et molli, et huiusmodi.” *STh* III, q. 77 a. 2 ad 4: “Dicitur autem materia sensibilis ex hoc quod subiicitur sensibilibus qualitatibus.” *De veritate*, q. 2 a. 6 ad 1: “et dico [...] sensibilem autem sicut est materia naturalis.” **Intelligible matter:** *In Metaph.* 8, l. 5, §1760: “Intelligibilis autem materia dicitur, quae accipitur sine sensibilibus qualitatibus vel differentiis, sicut ipsum continuum. Et ab hac materia non abstrahunt mathematica.” *STh* I, q. 85 a. 1 ad 2: “Materia vero intelligibilis dicitur substantia secundum quod subiacet quantitati.” *De veritate*, q. 2 a. 6 ad 1: “et dico [materiam] intelligibilem, ut quae consideratur in natura continui.”

abstract, but which qualities concern natural (things); and **(2) intelligible matter** (*materia intelligibilis* = ὕλη νοητή), which is substance insofar as it underlies quantity, from which mathematical (things) do not abstract.

Therefore, just as natural (things) have a form in matter (► 13.11), so, too, mathematical (things).<sup>54</sup> This is why in natural, as much as in mathematical (things), *the thing* and *that which (the thing) is* (i.e., the essence of the thing) differ. Whence, in both (i.e., in natural and in mathematical things), there are found multiple individuals under one species. For example, there are multiple men (i.e., human beings) of one species, just as (there are) also multiple triangles under one species.

### 13.14. Parts of the Species

(The expression) *part of the species* can be taken in two (modes):<sup>55</sup> (1) *according to the ratio* (► 13.16), as *biped* is part of *man* because it is a part of its definition; (2) *according to the thing* (► 13.10), and in this way (which is the one discussed here), *biped* is not part of *man*, because otherwise it would not be predicated of the whole; for it befits (*competit*) the whole man to have two feet.

Those are said to be **parts of the species** (*partes speciei* = μέρη τοῦ εἴδους) upon which the perfection of the species depends, and without which the species cannot be (a quibus dependet perfectio speciei, et sine quibus esse non potest species).<sup>56</sup> Whence, such parts are posited in the definition of the whole (► 13.16): for example, *angle* (is posited) in the definition of *triangle*; and *letter* (or *phoneme*), in the definition of *syllable*.

(In natural things, the form does not *per se* have a species; for) the species of a natural thing is constituted by the union of form and matter.<sup>57</sup> If some form were to be composed from form and matter, some species in the things of nature would be constituted from the

---

<sup>54</sup> *In De anima* 3, c. 2, 117–123: “sicut naturalia habent formam in materia, ita et mathematica, et propter hoc tam in naturalibus quam in mathematicis differt res et quod quid est; unde in utrisque inveniuntur plura individua sub una specie: sicut enim sunt plures homines unius speciei, ita et plures trianguli sub una specie.”

<sup>55</sup> *In Metaph.* 5, l. 21, §1088 (cf. ARISTOTLE, *Metaphysica* Δ.24, 1023a35–b1): “Pars autem speciei potest accipi dupliciter: aut secundum rationem, aut secundum rem. Secundum rationem, sicut bipes est pars hominis, quia est pars definitionis eius, quamvis secundum rem non sit pars, quia aliter non praedicaretur de toto. Toti enim homini competit habere duos pedes.”

<sup>56</sup> *In Metaph.* 5, l. 21, §1089: “Partes quidem speciei dicuntur, a quibus dependet perfectio speciei, et sine quibus esse non potest species. Unde et tales partes in definitione totius ponuntur, sicut anima et corpus in definitione animalis, et angulus in definitione trianguli, et litera in definitione syllabae.” *In Metaph.* 5, l. 21, §1088 (cf. ARISTOTLE, *Metaphysica* Δ.24, 1023a35–36): “Secundum rem vero, sicut syllaba est ex elemento, idest ex litera sicut ex parte speciei.”

<sup>57</sup> *Q. d. de anima*, a. 6 co.: “forma materiae adveniens constituit speciem. Si ergo [aliqua forma] sit ex materia et forma composita, ex ipsa unione formae ad materiam [illae formae], constituetur quaedam species in rerum natura. Quod autem per se habet speciem, non unitur alteri ad speciei constitutionem, nisi alterum ipsorum corrumpatur aliquo modo; sicut elementa uniuntur ad componendam speciem mixti.”

union itself (of form and matter). But that which has a species by itself (*per se*) is not united to another to constitute a species—unless the other becomes corrupted in some mode, as elements are united to compose the species of a compound (body).

Although the parts of the species (i.e., form and common matter; ►13.12), which are posited in the definition (►13.16), are compared to the suppositum of nature (i.e., to the integral individual) by the mode of a formal cause, (the same parts of the species) are compared as matter to the nature itself of which they are parts (e.g., form and common matter are *parts* of the natural species; therefore, they have the *ratio* of *matter* in respect of the whole nature); for all parts are compared to the whole as imperfect to perfect, which is a comparison of matter to form (►13.1).<sup>58</sup>

### 13.15. Parts of Individual Matter

Those are said (to be) **parts of (individual) matter** (*partes materiae* < μέρη ὡς ὕλη) upon which the species does not depend, but (which) somehow befall the species (*ex quibus species non dependet, sed quodammodo accidunt speciei*).<sup>59</sup> For example, to come to be from bronze—or from any matter—befalls a statue. Likewise, to be divided into two semicircles befalls a circle; and (it befalls) a right angle that an acute angle is (its) part.

The matter that is not part of the species belongs to anything that is not the essence and species itself according to itself (*quod quid erat esse et species eadem secundum se* = ὁ μὴ ἔστι τί ἦν εἶναι καὶ εἶδος αὐτὸ καθ' αὐτό) but is *this something* (*hoc aliquid* = τόδε τι), i.e., some determined particular (*particulare aliquod demonstratum*).<sup>60</sup>

Whence, the parts of matter are not posited in the definition of the whole species: rather, conversely.<sup>61</sup> For example, *circle* is posited in the definition of *semicircle*; for *semicircle* is *a half part of the circle* (likewise, *right angle* is posited in the definition of *acute angle*;

---

<sup>58</sup> *In Physic.* 2, l. 5, n. 10: “licet partes speciei quae ponuntur in definitione, comparentur ad suppositum naturae per modum causae formalis, tamen ad ipsam naturam cuius sunt partes, comparantur ut materia: nam omnes partes comparantur ad totum ut imperfectum ad perfectum, quae quidem est comparatio materiae ad formam.”

<sup>59</sup> *In Metaph.* 5, l. 21, §1089: “Partes vero materiae dicuntur ex quibus species non dependet, sed quodammodo accidunt speciei; sicut accidit statuae quod fiat ex aere, vel ex quacumque materia. Accidit etiam circulo quod dividatur in duos semicirculos: et angulo recto, quod angulus acutus sit eius pars.”

<sup>60</sup> *In Metaph.* 7, l. 11, §1521 (cf. ARISTOTLE, *Metaphysica* Z.11, 1037a1–2): “Et talis materia, quae scilicet non est pars speciei, est omnis eius quod non est quod quid erat esse et species eadem secundum se, sed est hoc aliquid, idest particulare aliquod demonstratum.”

<sup>61</sup> *In Metaph.* 5, l. 21, §1089: “Unde huiusmodi partes non ponuntur in definitione totius speciei, sed potius e converso, ut in septimo huius erit manifestum.” The reference is to ARISTOTLE, *Metaphysica* Z.12, 1037b27–1038a35. *In Polit.* 4, l. 4, n. 2: “Et eadem ratio est de aliis huiusmodi partibus, quae dicuntur partes materiae, in quarum definitione ponitur totum, sicut et in definitione semicirculi ponitur circulus. Est semicirculus media pars circuli. Secus autem est de partibus speciei, quae ponuntur in definitione totius, sicut lineae ponuntur in definitione trianguli.” *In Physic.* 2, l. 5, n. 9: “potest dici quod supra locutus est de partibus speciei, quae cadunt in definitione totius: hic autem loquitur de partibus materiae, in quarum definitione cadit totum, sicut circulus cadit in definitione semicirculi.”

► 4.4). But it is otherwise concerning the parts of the species (► 13.14), which are posited in the definition of the whole, as *line* is in the definition of *triangle*. Thus, while the parts of the species fall in the definition of the whole (species), the whole (species) falls in the definition of the parts of matter, as *circle* falls in the definition of *semicircle*.

It makes no difference whether the parts of matter are sensible or non-sensible; for also non-sensible things have some intelligible matter.<sup>62</sup> For example, in *this circle* there are *these lines* that are not parts of the species. Whence it is evident that such (lines) are not parts of the circle that is universal, but parts of singular circles. Hence, semicircles are not posited in the definition of the universal circle because they are parts of singular circles, and not of the universal (circle). And this is true both of sensible matter and of intelligible matter.

### 13.16. Parts of the Ratio

In this mode, **integral parts** are *those that are posited in the definition of whatever thing (quae ponuntur in definitione cuiuslibet rei < τὰ ἐν τῷ λόγῳ τῷ δηλοῦντι ἕκαστον)*, which are the parts of the *ratio*: e.g., *animal* and *biped* are parts of (the *ratio* of) *man*.<sup>63</sup>

As ARISTOTLE says, every definition is some **ratio** (*omnis definitio est quaedam ratio < ὁ ὀρισμὸς λόγος ἐστὶ*): that is, some *composition of names ordered by reason (quaedam compositio nominum per rationem ordinata; ► 8.13)*.<sup>64</sup> One name cannot be a definition because a definition must distinctly make known those principles of the thing that concur to constitute the essence of the thing—otherwise, the definition would not sufficiently manifest the essence of the thing.<sup>65</sup> The definition expresses distinctly the single principles

---

<sup>62</sup> *In Metaph.* 7, l. 11, §1521 (cf. ARISTOTLE, *Metaphysica* Z.11, 1036b32–1037a2): “hoc nihil differt quantum ad propositum, utrum scilicet partes materiae sint sensibilia vel non sensibilia; quia etiam non sensibilia est aliqua materia intelligibilis. Et talis materia, quae scilicet non est pars speciei, est omnis eius quod non est quod quid erat esse et species eadem secundum se, sed est hoc aliquid, idest particulare aliquod demonstratum.” *In Metaph.* 7, l. 11, §1522 (cf. ARISTOTLE, *Metaphysica* Z.11, 1037a2–5): “Et similiter in hoc circulo sunt hae lineae quae non sunt partes speciei. Unde patet quod huiusmodi non sunt partes circuli qui est universalis, sed sunt partes singularium circulorum [...]. Et propter hoc semicirculi non ponuntur in definitione circuli universalis, quia sunt partes singularium circulorum, et non universalis. Et hoc est verum tam in materia sensibili, quam in materia intelligibili.”

<sup>63</sup> *In Metaph.* 5, l. 21, §1093: “Quarto autem modo [= (1b)] est pars rationis.” *Ibid.*, §1096: “Quarto modo dicuntur partes, quae ponuntur in definitione cuiuslibet rei, quae sunt partes rationis sicut animal et bipes sunt partes hominis.” Cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b23–24: “τὰ ἐν τῷ λόγῳ τῷ δηλοῦντι ἕκαστον, καὶ ταῦτα μέρη τοῦ ὅλου.”

<sup>64</sup> *In Metaph.* 7, l. 9, §1460 (cf. ARISTOTLE, *Metaphysica* Z.10, 1034b20): “Postquam Philosophus ostendit quid est quod quid erat esse, et quorum est, et quomodo se habet ad ea quorum est, et quod non oportet ponere quidditates rerum separatas propter generationem, hic intendit ostendere *ex quibus constituitur quod quid erat esse* [...]. Dicit ergo *primo*, quod «omnis definitio est quaedam ratio,» idest quaedam compositio nominum per rationem ordinata.”

<sup>65</sup> *In Metaph.* 7, l. 9, §1460: “Unum enim nomen non potest esse definitio, quia definitio oportet quod distincte notificet principia rerum quae concurrunt ad essentiam rei constituendam; alias autem definitio non sufficienter manifestaret essentiam rei. Et propter hoc dicitur in primo Physicorum, quod definitio dividit «definitum in singulare,» idest exprimit distincte singula principia definiti. Hoc autem non potest fieri nisi per plures dictiones: unde una dictio non potest esse definitio, sed potest esse manifestativa eo

of that which is defined. And this can only be done through multiple dictions. Whence, one diction cannot be a definition, although it can manifest (a thing) in the way in which a name (that is) less known is manifested by (a name that is) more know. But every *ratio* has parts because it is a composite sentence (*oratio composita*), and not a simple name.

There will be a definition—i.e., a *ratio* that signifies the essence—only of that which is the same as its essence.<sup>66</sup> This is so because the essence (*quod quid erat esse* < τὸ τί ἦν εἶναι) is the same as that of which it is: for example, the essence of circle and circle are the same. Such (definitions or *ratios*) are universal and not singular. Hence, there is no definition of those (individuals) that are composed from species and individual matter: for example, (there is no definition of) *this circle*.

A definition, therefore, is only of universals, never of singulars.<sup>67</sup> And among universals, the species is properly (defined); for a species is constituted from genus and difference, of which every definition consists, while a genus is not defined unless there is also a species. Whence, it is evident that only if one knows which part is as (individual) matter, and which (part) is not as matter but as pertaining to the species itself, will it be manifest how the definition should be assigned to a thing; for (a definition) is only assigned to the species, and (one) should posit in the definition of the species the parts of the species, and not the parts that are posterior to the species (i.e., the parts of the individual).

Consequently, even though man is not (found) in the nature of things apart from (*praeter*) singulars, (the species of man) is (found apart from singulars) in the *ratio* that pertains to logical consideration.<sup>68</sup> Thus, *man (in) common* is the same as its essence logically

---

modo, quo nomen minus notum manifestatur per magis notum. Omnis autem ratio partes habet, quia est quaedam oratio composita, et non simplex nomen.” Cf. ARISTOTLE, *Metaphysica* Z.10, 1034b20: “πᾶς δὲ λόγος μέρη ἔχει.”

<sup>66</sup> *In Metaph.* 7, l. 10, §1493 (cf. ARISTOTLE, *Metaphysica* Z.10, 1036a1–2): “Cum enim quod quid erat esse sit idem cum eo cuius est, ut supra ostensum est [cf. ARISTOTLE, *Metaphysica* Z.6, 1031a15–1032a11 (*In Metaph.* 7, l. 5, §§1356–1380)], illius tantum erit definitio, quae est ratio significans quod quid erat esse, quod est idem cum suo quod quid erat esse. Huiusmodi autem sunt universalis et non singularis. Circulus enim, et id quod est circulo esse, sunt idem; et similiter anima, et id quod est animae esse. Sed ipsorum, quae sunt composita ex specie et materia individuali, sicut circuli huius, aut alicuius aliorum singularium: horum non est definitio.”

<sup>67</sup> *In Metaph.* 7, l. 11, §1502 (cf. ARISTOTLE, *Metaphysica* Z.11, 1036a27–31): “definitio nunquam est rei singularis, sed solum universalis [...]. Et inter universalis proprie est species, quae constituitur ex genere et differentia, ex quibus omnis definitio constat. Genus enim non definitur, nisi etiam sit species. Unde patet, quod nisi sciatur quae pars sit sicut materia, et quae non est sicut materia sed sicut ad speciem ipsam pertinens, non erit manifestum qualis debeat esse definitio rei assignanda, cum non assignetur nisi speciei, et oporteat in definitione speciei partes speciei ponere, et non partes quae sunt posteriores specie.”

<sup>68</sup> *In Metaph.* 7, l. 11, §1536: “Licet autem homo praeter singularia non sit in rerum natura, est tamen in ratione quae pertinet ad logicam considerationem. Et ideo superius ubi logice consideravit [Philosophus] de quod quid erat esse, non exclusit substantias materiales, quin in illis etiam esset idem quod quid est, cum eo cuius est. Homo enim communis est idem cum suo quod quid est, logice loquendo. Nunc autem postquam iam descendit ad principia naturalia quae sunt materia et forma, et ostendit quomodo diversimode comparantur ad universale et particulare quod subsistit in natura, excipit hic ab eo quod

speaking. But descending towards natural principles, which are matter and form, essence compares diversely to the universal and to the particular that subsists in nature.

Whence, it seems that just as *ratio* is related to thing, so are the parts of the *ratio* to the parts of the thing.<sup>69</sup> But it is not as though the parts of the definition were the parts of the thing.<sup>70</sup> Rather, the parts of the definition signify the parts of the thing insofar as the parts of the definition are taken from the parts of the thing. Thus, neither animal nor rational is a part of man. Rather, *animal* is taken from one part (of man), and *rational* from another; for *animal* is *that which has a sensitive nature*, while *rational* is *that which has reason*; and *sensitive nature* is as (a) material (cause) in respect of *reason*. Whence, the genus is taken from matter; the difference (is taken) from the form; and the species (is taken) from form and matter simultaneously; for *man* is *that which has reason in a sensitive nature*.

Thus, in any definition, whether in sensible or in mathematical (things), there must always be something as matter and something as form.<sup>71</sup> For example, in “circle is a superficial figure,” a definition of the mathematical circle, *surface* is as matter; and *figure*, as form.

The nature of a species constituted from *form* and *common matter* is related as formal in respect of the individual that participates of such a nature.<sup>72</sup> Whence, all the parts that are posited in the definition pertain to—and are reduced to—the formal cause; for the parts of the species are posited in the definition, but not the parts of matter.<sup>73</sup> This does not

---

supra dixerat idem esse quod quid est cum unoquoque, substantias materiales in rerum natura existentes.”

<sup>69</sup> *In Metaph.* 7, l. 9, §1460: “Et ideo videtur quod sicut se habet ratio rei ad rem, ita se habent partes rationis ad partes rei.” Cf. ARISTOTLE, *Metaphysica* Z.10, 1034b20–22: “ὡς δὲ ὁ λόγος πρὸς τὸ πρᾶγμα, καὶ τὸ μέρος τοῦ λόγου πρὸς τὸ μέρος τοῦ πράγματος ὁμοίως ἔχει.”

<sup>70</sup> *In Metaph.* 7, l. 9, §1463 (cf. ARISTOTLE, *Metaphysica* Z.10, 1034b22–28): “Sed dicendum est, quod partes definitionis significant partes rei, in quantum a partibus rei sumuntur partes definitionis; non ita quod partes definitionis sint partes rei. Non enim animal est pars hominis, neque rationale; sed animal sumitur ab una parte, et rationale ab alia. Animal enim est quod habet naturam sensitivam, rationale vero quod habet rationem. Natura autem sensitiva est ut materialis respectu rationis. Et inde est quod genus sumitur a materia, differentia a forma, species autem a forma et materia simul. Nam homo est, quod habet rationem in natura sensitiva.”

<sup>71</sup> *In Metaph.* 8, l. 5, §1761 (cf. ARISTOTLE, *Metaphysica* H.6, 1045a33–35): “sive in sensibilibus, sive in mathematicis, semper oportet quod sit in definitionibus aliquid quasi materia et aliquid quasi forma. Sicut in hac definitione circuli mathematici, circulus est figura superficialis, superficies est quasi materia, et figura quasi forma. Eadem enim est ratio quare definitio mathematica est una, et quare definitio naturalis (licet in mathematicis non sit agens, sicut in naturalibus), quia utrobique alterum est sicut materia, et alterum sicut forma.”

<sup>72</sup> *In Physic.* 2, l. 5, n. 4: “Natura igitur speciei constituta ex forma et materia communi, se habet ut formalis respectu individui quod participat talem naturam; et pro tanto hic dicitur quod partes quae ponuntur in definitione, pertinent ad causam formalem.”

<sup>73</sup> *In Physic.* 2, l. 5, n. 4 (cf. ARISTOTLE, *Physica* B.3, 194b26–29): “ad hunc modum causae [sc., formalem] reducuntur omnes partes quae ponuntur in definitione: nam partes speciei ponuntur in definitione, non autem partes materiae, ut dicitur in VII *Metaphys.* Nec est hoc contra id quod supra dictum est, quod in definitione rerum naturalium ponitur materia: nam in definitione speciei non ponitur materia individualis, sed materia communis; sicut in definitione hominis ponuntur carnes et ossa, non autem hae carnes et haec ossa.” *In Metaph.* 7, l. 10, §1492 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b33–1036a1): “quia

contradict what was said earlier: that matter is posited in the definition of natural things; for it is not individual matter that is posited in the definition of the species, but common matter. For example, *flesh* and *bones* are posited in the definition of *man*, but not *this flesh* and *these bones*. This is so because the definitive *ratio* is assigned only universally.

Indeed, each thing attains the nature of a genus or of a species through its form.<sup>74</sup> The nature of a genus or of a species is that which the definition signifies, saying *what* the thing is. Thus, although some material parts are posited in the definition, that which is principal in the definition must be from the part of the form. Therefore, the form is a cause insofar as it perfects (i.e., completes) the *ratio* of the quiddity of a thing (*perficit rationem quidditatis rei*; ►9.5; 16.7).

Not only the whole definition is compared to the thing defined as a form, but also the parts of the definition (*partes definitionis* < τὰ μέρη τὰ ἐν τῷ λόγῳ): that is, those (parts) that are posited directly (*in recto*) in the definition.<sup>75</sup> For example, just as *biped*, *capable-of-walking animal* (*animal gressibile bipes*) is the form of man (i.e., human being), so is *animal* (i.e., the genus of man), *biped*, and *capable-of-walking* (i.e., specific differences). Sometimes, however, matter is posited in a definition, but indirectly (*in obliquo*), as when it is said that the *soul* is *the act of a physical, organic body having life in potency* (i.e., the act of that matter which corresponds to the soul).<sup>76</sup>

### 13.17. Integral vs. Universal Whole

According to the mode of the integral whole, the genus is an (integral) part of the species, while in a universal whole the species is a (subjective) part of the genus.<sup>77</sup> Therefore,

---

materia communiter sumpta est pars speciei, haec autem materia determinata est pars individui: manifestum est, quod solum illae partes sunt partes rationis, quae sunt partes speciei; non autem quae sunt partes individui. In definitione enim hominis ponitur caro et os, sed non haec caro et hoc os. Et hoc ideo, quia ratio definitiva non assignatur nisi universaliter.”

<sup>74</sup> In *Metaph.* 5, l. 2, §764 (cf. ARISTOTLE, *Metaphysica* Δ.2, 1013a27): “unumquodque consequitur naturam vel generis vel speciei per formam suam, natura autem generis vel speciei est id quod significat definitio, dicens quid est res [...]. Quamvis enim in definitione ponantur aliquae partes materiales, tamen id quod est principale in definitione, oportet quod sit ex parte formae. Et ideo haec est ratio quare forma est causa, quia perficit rationem quidditatis rei.” In *Physic.* 2, l. 5, n. 4 (cf. ARISTOTLE, *Physica* B.3, 194b26–27): “et hoc dicitur causa inquantum est ratio quidditativa rei; hoc enim est per quod scimus de unoquoque quid est.”

<sup>75</sup> In *Metaph.* 5, l. 2, §764: “Et non solum tota definitio comparatur ad definitum ut forma, sed etiam partes definitionis, quae scilicet ponuntur in definitione in recto. Sicut enim animal gressibile bipes est forma hominis, ita animal, et gressibile, et bipes. Ponitur autem interdum materia in definitione, sed in obliquo; ut cum dicitur, quod anima est actus corporis organici physici potentia vitam habentis.”

<sup>76</sup> In other words, *organic physical body having life in potency* is the matter posited in this definition of the soul, while the act that corresponds to such a matter is a form: namely, the soul that is being defined. Thus, matter is sometimes obliquely posited in definitions—even in those of forms.

<sup>77</sup> In *Metaph.* 5, l. 21, §1097 (cf. ARISTOTLE, *Metaphysica* Δ.25, 1023b24–25): “Ex quo patet, quod genus quarto modo [= (3)] est pars speciei: aliter vero, scilicet secundo modo [sc., secundum quod sumebatur pars pro parte subiectiva totius universalis], species est pars generis.” *STh* I-II, q. 67 a. 5 co.: “Genus enim et differentia non sunt partes speciei, alioquin non praedicarentur de specie. Sed sicut species

genus and difference are not (subjective) parts of the species. Otherwise they would not be predicated of the species (► 13.6). Rather, as the species signifies a (universal) whole (► 13.5)—i.e., a composite from matter and form in material things—so the difference signifies a (universal) whole; and likewise, the genus. But the genus denominates a (universal) whole from that which is as matter, while the difference (signifies a universal whole) from that which is as form; and the species (signifies a universal whole) from one and the other.

For example, in man, sensitive nature is materially related to intellective (nature).<sup>78</sup> That which has a sensitive nature is said (to be an) *animal*; that which has an intellective (nature is said to be) *rational*; and that which has both (is said to be a) *man*. And thus, the same whole is signified by these three, but not from the same (natures).

Therefore, the genus is not compared to the difference as matter to form in such a way that the substance of the genus would remain the same in number if the difference were removed, as the substance of matter remains the same if the form is removed (► 18.17).<sup>79</sup> Since the difference is designative only of the genus, if the difference is removed, the substance of the genus cannot remain the same in number. Thus, the same animality would not remain if there were some other soul constituting an animal. Likewise, if the difference constitutive of whiteness is removed, the substance of color does not remain the same in number, as though a numerically same color could sometimes be whiteness and sometimes blackness.

### 13.18. Priority of Integral Whole and Parts

If we distinguish between the parts of matter and the parts of form, then, in anything that is the same with its form, the parts of the *ratio* are prior to the parts of matter; and the parts of sensible matter are prior to the parts of intelligible matter.<sup>80</sup> For example, the right

---

significat totum, idest compositum ex materia et forma in rebus materialibus, ita differentia significat totum, et similiter genus, sed genus denominat totum ab eo quod est sicut materia; differentia vero ab eo quod est sicut forma; species vero ab utroque.”

<sup>78</sup> *STh* I-II, q. 67 a. 5 co.: “Sicut in homine sensitiva natura materialiter se habet ad intellectivam, animal autem dicitur quod habet naturam sensitivam; rationale quod habet intellectivam; homo vero quod habet utrumque. Et sic idem totum significatur per haec tria, sed non ab eodem.”

<sup>79</sup> *STh* I-II, q. 67 a. 5 co.: “Non enim, remota differentia alicuius speciei, remanet substantia generis eadem numero, sicut, remota differentia constitutiva albedinis, non remanet eadem substantia coloris numero, ut sic idem numero color sit quandoque albedo, quandoque vero nigredo. Non enim comparatur genus ad differentiam sicut materia ad formam, ut remaneat substantia generis eadem numero, differentia remota; sicut remanet eadem numero substantia materiae, remota forma. [...] Unde patet quod, cum differentia non sit nisi designativa generis, remota differentia, non potest substantia generis eadem remanere, non enim remanet eadem animalitas, si sit alia anima constituens animal.”

<sup>80</sup> *In Metaph.* 7, l. 10, §1499 (cf. ARISTOTLE, *Metaphysica* Z.10, 1036a13–23): “Si enim idem est anima quod animal vel animatum, aut similiter unumquodque est idem cum forma uniuscuiusque, ut circulus idem cum forma circuli, et rectus angulus idem cum forma recti, dicendum est determinando quid sit posterius, et quo sit posterius; quia secundum hoc partes materiae sunt posteriores his, quae sunt in

angle is the same with the form of the right angle; whence, the parts of the form of the right angle, which are (posited) in (its) *ratio*, are prior to the parts of *this* right angle with singular lines, which is a right angle with intelligible matter; and the parts of *this* right angle are prior to the parts of a bronze right angle, which is a right angle with sensible matter.

This is why, on one hand, the right angle seems to be prior to the acute angle, and man (seems to be prior) to finger, in two (modes):<sup>81</sup>

1. *According to ratio* (► 13.16), in which mode those are said to be prior which are posited in their *ratios*, and not contrarily.<sup>82</sup> Thus, *acute (angle)* and *finger* are defined from (i.e., in terms of) *right (angle)* and *man* (respectively). Whence, it seems that *man* and *right (angle)* are prior to *finger* and to *right angle*. In this mode, all parts of the *ratio*, and (those) into which the *ratio* is divided, must be prior to the (whole) definition.<sup>83</sup> This must be understood of the parts of the form that belong to the necessity of the species, and not to (its) perfection. For example, sight and hearing, which are parts of the sensible soul, do not belong to the *integrity or necessity of animal*; for there can be an animal without these senses. They belong, however, to the *perfection of animal*; for a perfect animal has these senses too. And in this way, it is universally true that those parts that are posited in the definition of something are universally prior to it.

Again, the parts of the *ratio* are the parts of the form, not the parts of matter.<sup>84</sup> Wherefrom, if only the parts of the *ratio* are prior, and not the parts of matter, it follows that whichever

---

ratione, et sunt etiam posteriores aliquo recto, scilicet recto communi, sed sunt priores recto singulari. Hic enim rectus qui est aereus, est cum materia sensibili. Et hic rectus qui est cum lineis singularibus, est cum materia intelligibili. Sed ille rectus qui est sine materia, idest communis, erit posterior partibus formae quae sunt in ratione, sed erit prior partibus materiae quae sunt partes singularium. Nec erit secundum hanc opinionem distinguere inter materiam communem et individualem. Sed tamen simpliciter non erit respondendum, quia erit distinguendum inter partes materiae et partes formae.”

<sup>81</sup> *In Metaph.* 7, l. 9, §1465: “Sed e contra videntur illa esse priora, scilicet rectus acuto, et homo digito. Et hoc dupliciter.”

<sup>82</sup> *In Metaph.* 7, l. 9, §1465 (cf. ARISTOTLE, *Metaphysica* Z.10, 1034b30–31): “Primo quidem secundum rationem. Per huic enim modum illa dicuntur esse priora, quae in eorum rationibus ponuntur, et non e contrario. Acutus enim et digitus dicuntur esse secundum rationem, idest definiuntur ex illis, scilicet homine et recto, ut dictum est. Unde videtur, quod homo et rectus angulus sint priores digito et acuto angulo.”

<sup>83</sup> *In Metaph.* 7, l. 10, §1482 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b4–6): “Oportet enim, quod omnes partes rationis, et in quas ratio dividitur, sint priores definito, vel omnes, vel quaedam. Et hoc dicitur propter hoc, quod partes formae quandoque non sunt de necessitate speciei, sed de perfectione; sicut visus et auditus, quae sunt partes animae sensibilis, non sunt de integritate vel necessitate animalis. Potest enim esse animal sine his sensibus. Sunt tamen de perfectione animalis, quia animal perfectum hos etiam sensus habet. Et sic universaliter est verum, quod illae partes quae ponuntur in definitione alicuius sunt universaliter priores eo.”

<sup>84</sup> *In Metaph.* 7, l. 10, §1483 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b11–14): “Dictum est enim supra, quod partes formae sunt partes rationis, non autem partes materiae. Si igitur solae partes rationis sunt priores, non autem materiae, sequitur quod quaecumque sint partes definiti, sicut materia, in quam scilicet resolvitur definitum ut compositum in materialia principia, sunt posteriora. Quaecumque vero sunt partes rationis et substantiae quae est secundum rationem, idest partes formae secundum quam sumitur ratio rei, sunt priora toto, aut omnia, aut quaedam, ratione superius dicta.”

parts of the (thing) defined that are as matter—i.e., (matter) into which the (thing) defined is resolved as the composite (is resolved) into (its) material principles—, are posterior; and whichever parts of the form, according to which the *ratio* of the thing is taken, are prior to the whole.

Hence, the acute angle, even though it is a part of the right (angle), is not posited in its definition.<sup>85</sup> Rather, conversely; for the *ratio* of *right (angle)* is not resolved into the definition of the *acute (angle)*, but conversely. Whoever defines *acute (angle)* uses *right (angle)* in defining (it); for an *acute (angle)* is *an angle that is less than a right angle* (► 4.4). Likewise, concerning the *semicircle*, which is defined through the circle; for it is *a half part of the circle* (► 4.4).<sup>86</sup> Likewise, concerning the finger and *man*, which is posited in the definition of *finger*; for *finger* is *such part of man*.<sup>87</sup>

2. Insofar as those are said to be prior *which can be without the other*; for those that can be without others, but not contrarily, are said to be prior (► 47.2).<sup>88</sup> For example, one (can be without) two (but two cannot be without one; whence, one is prior to two). And a man can be without a finger, but a finger cannot be without a man, because a cut-off finger is not a finger. Whence, it seems that man is prior to finger; and, for the same reason, the right (angle is seemingly prior to) the acute (angle).

On the other hand, we can moreover distinguish between common matter, which is a part of the species, and individual matter, which is a part of the individual.<sup>89</sup> If we consider the part of matter and not of the part of the species, the whole is necessarily prior to the part

---

<sup>85</sup> *In Metaph.* 7, l. 10, §1483 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b6–8): “acutus angulus, quamvis sit pars recti, non tamen ponitur in definitione eius, sed e converso; non enim ratio recti anguli resolvitur in definitionem acuti, sed e converso. Qui enim definit acutum, utitur recto definiendo. Angulus enim acutus est angulus minor recto.”

<sup>86</sup> *In Metaph.* 7, l. 10, §1483 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b9–10): “Et similiter est de circulo et semicirculo, qui definitur per circum. Est enim media pars circuli.”

<sup>87</sup> *In Metaph.* 7, l. 10, §1483 (cf. ARISTOTLE, *Metaphysica* Z.10, 1035b10–11): “Similiter est de digito et homine, qui ponitur in definitione digiti: definitur enim digitus, quod est talis pars hominis.”

<sup>88</sup> *In Metaph.* 7, l. 9, §1466 (cf. ARISTOTLE, *Metaphysica* Z.10, 1034b31–32): “Secundo vero prout dicuntur esse aliqua priora ex eo, quod est esse sine invicem. Quae enim possunt esse sine aliis, et non e contrario, dicuntur esse priora, ut in quinto est habitum, sicut unum duobus. Homo autem potest esse sine digito. Digitus autem non potest esse sine homine, quia digitus abscisus non est digitus, ut infra dicetur. Unde videtur, quod homo sit prior digito. Et eadem ratio est de recto et acuto.”

<sup>89</sup> *In Metaph.* 7, l. 10, §1500 (cf. ARISTOTLE, *Metaphysica* Z.10, 1036a24–25): “Si autem alia opinio sit vera, scilicet quod anima sit aliud quam animal, sic erit dicendum et non dicendum partes esse priores toto, sicut determinatum est prius. Secundum enim hanc opinionem docuit superius distinguere non solum inter materiam et formam, sed inter materiam communem quae est pars speciei, et inter materiam individuaem quae est pars individui.” *In Polit.* 4, l. 4, n. 2: “Necesse est totum esse prius parte, ordine scilicet naturae et perfectionis. Sed hoc intelligendum est de parte materiae, non de parte speciei, ut ostenditur in septimo *Metaphysicae*.” *In Metaph.* 7, l. 9, §1464 (cf. ARISTOTLE, *Metaphysica* Z.10, 1034b28–30): “Omnes enim partes videntur esse priores toto, sicut simplex composito. Acutus enim angulus est pars recti anguli. Dividitur enim rectus angulus in duos vel plures angulos acutos. Et similiter digitus est pars hominis. Unde videtur, quod acutus angulus sit naturaliter prior recto, et digitus prior homine.”

in the order of nature and perfection. In this mode, all parts seem to be prior to the whole as the simple (is prior) to the composite. For example, the acute angle is part of the right angle; for the right angle is divided into two or more acute angles. Likewise, a finger is part of man. Whence, it seems that the acute angle is prior to the right (angle), and (that) finger (is prior) to man.

### 13.19. Order among Integral Parts

An order to some part can be considered in two modes: *part to part*, and *whole to parts*, to which order is assimilated the order of that which is common according to proportionality (i.e., according to an analogy of the form  $a : b :: c : d$ ).<sup>90</sup>

All integral parts have some order to each other (i.e., *part to part*, ► 39.19):<sup>91</sup>

1. Some parts have an order only in site (*in situ*; ► 39.5), whether: (a) they are related consequently (*consequenter*), as the parts of an army; (b) they touch each other (*se tangant*), as the parts of a heap; (c) they are moreover joined (*colligentur*), as the parts of a house; or (d) they are moreover continuous (*continuentur*), as the parts of a line.<sup>92</sup>
2. Some parts have moreover an order of virtue, as the parts of an animal, of which there is a first one, and the others depend one on another according to some order of virtue.<sup>93</sup>
3. Some parts are ordered according to the order of time, as (are) the parts of time and of motion.<sup>94</sup>

### 13.20. Potential Whole

The **potential whole** (*totum potentiale, totum potestativum*) is divided into parts of virtue (*dividitur in partes virtutis*).<sup>95</sup> This whole is only in one of the parts according to its complete *ratio*, while in the other parts there is some participation in the *ratio* of the whole (► 26).

---

<sup>90</sup> *STh* II-II, q. 61 a. 1 co.: “Potest autem ad aliquam partem duplex ordo attendi. Unus quidem partis ad partem [...]. Alius ordo attenditur totius ad partes, et huic ordini assimilatur ordo eius quod est commune [...] secundum proportionalitatem.”

<sup>91</sup> *STh* III, q. 90 a. 3 ad 3: “omnes partes integrales habent ordinem quendam ad invicem.”

<sup>92</sup> *STh* III, q. 90 a. 3 ad 3: “quaedam [partes integrales] habent ordinem tantum in situ, sive consequenter se habeant, sicut partes exercitus; sive se tangant, sicut partes acervi; sive etiam colligentur, sicut partes domus; sive etiam continuentur, sicut partes lineae.”

<sup>93</sup> *STh* III, q. 90 a. 3 ad 3: “Quaedam vero [partes integrales] habent insuper ordinem virtutis, sicut partes animalis, quarum prima virtute est cor, et aliae quodam ordine virtutis dependent ab invicem.”

<sup>94</sup> *STh* III, q. 90 a. 3 ad 3: “Tertio modo ordinantur [partes integrales] ordine temporis, sicut partes temporis et motus.”

<sup>95</sup> *STh* I, q. 76 a. 8 co.: “Tertium autem totum est potentiale, quod dividitur in partes virtutis.” Cf. *In Sent.* 4, d. 24 q. 2 a. 1 qc. 1 ad 2: “distinctio [sacramenti] ordinum non est totius integralis in partes, neque totius universalis, sed totius potestativi; cuius haec est natura quod totum secundum completam rationem est in uno, in aliis autem est aliqua participatio ipsius.” *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “partes essentiae [...] semper habent ordinem naturae ad invicem.”

The potential whole is as a mean (*medium*) between the universal whole and the integral whole.<sup>96</sup> The universal is present (*adest*) in whichever of its subjective parts according to its whole essence, being, and (according) to its complete, perfect virtue (*secundum esse et perfectam virtutem, secundum essentiam et completam virtutem, secundum totam suam essentiam et virtutem*).<sup>97</sup> Whence, it is equally (*aequaliter*) and properly (*proprie*) predicated of any and each of its parts: e.g., *animal* (is present) in *man* and in *horse* (and is predicated of each of them properly and equally).

The integral whole, on the other hand, is not present in any of its parts: neither according to being or to its whole essence (*secundum esse, secundum essentiam*); nor according to the whole virtue (*secundum totam virtutem*).<sup>98</sup> Whence, in no mode is it predicated of the singular parts. For example, neither the being (or essence) of the whole house, nor its whole virtue, is in a wall; whence, (the whole *house*) is in no mode predicated of *wall*. But it is predicated—albeit improperly—of all (of the parts) at once (*simul*). For example, we say that *a house* is *walls, ceiling and foundation*.

Finally, the potential whole is present in whichever part according to itself, to its whole essence, to the *ratio* of its complete essence (*secundum se, secundum totam suam essentiam, secundum essentiae suae rationem*), and not according to its whole, perfect virtue (*secundum totam suam virtutem, secundum perfectam virtutem*), in whichever of its parts, but according to some of its virtue (*secundum aliquid virtutis*).<sup>99</sup> Whence, it is related in a mean mode in predicating; for it is sometimes improperly predicated of its parts.

---

<sup>96</sup> *In Sent.* 1, d. 3 q. 4 a. 2 ad 1: “Totum enim potentiale, quasi medium est inter integrale et universale.” *STh* I, q. 77 a. 1 ad 1: “medium est [totum potestativum] inter totum universale et totum integrale.” *In Sent.* 2, d. 9 q. 1 a. 3 ad 1: “totum [potentiale sive potestativum] est quasi medium inter totum universale et integrale.” *De spirit. creat.*, a. 11 ad 2: “totum potentiale [...] est medium inter haec duo [sc., *universale et integrale*].”

<sup>97</sup> *In Sent.* 1, d. 3 q. 4 a. 2 ad 1: “Universale enim [totum] adest cuilibet parti subjectivae secundum esse et perfectam virtutem, et ideo proprie praedicatur de parte sua.”

<sup>98</sup> *In Sent.* 1, d. 3 q. 4 a. 2 ad 1: “totum integrale non adest cuilibet parti, neque secundum esse, neque secundum virtutem. Non enim totum esse domus est in pariete, neque tota virtus; et ideo nullo modo praedicatur de parte.” *In Sent.* 2, d. 9 q. 1 a. 3 ad 1: “integrale [totum] nec est secundum essentiam nec secundum virtutem totam in unaquaque suarum partium, et ideo nullo modo de parte praedicatur.” *STh* I, q. 77 a. 1 ad 1: “Totum vero integrale non est in qualibet parte, neque secundum totam essentiam, neque secundum totam virtutem. Et ideo nullo modo de singulis partibus praedicatur; sed aliquo modo, licet improprie, praedicatur de omnibus simul, ut si dicamus quod paries, tectum et fundamentum sunt domus.”

<sup>99</sup> *De spirit. creat.*, a. 11 ad 2: “totum potentiale [...] adest enim suae parti secundum totam suam essentiam, sed non secundum totam suam virtutem. Unde medio modo se habet in praedicando: praedicatur enim quandoque de partibus, sed non proprie.” *STh* III, q. 90 a. 3 co.: “singulis partibus potentialibus adest totum secundum totam essentiam, sicut tota essentia animae adest cuilibet eius potentiae.” *In Sent.* 3, d. 33 q. 3 a. 1 qc. 1 co.: “potentialis vero pars neque praedicationem totius recipit, neque in constitutionem ipsius oportet quod veniat, sed aliquid de potentia totius participat.” *In Sent.* 1, d. 3 q. 4 a. 2 ad 1: “Totum autem potentiale adest cuilibet parti secundum se, et secundum aliquid virtutis, sed non secundum perfectam; immo secundum perfectam virtutem adest tantum supremae potentiae; et ideo praedicatur quidem, sed non adeo proprie sicut totum universale.” *In Sent.* 2, d. 9 q. 1 a. 3 ad 1:

### 13.21. Potential Parts

The part of a potential whole need not come into its constitution, but participates in some of the power of the whole (*aliquid de potentia totius participat*, i.e., it participates more or less of the whole virtue; ► 26).<sup>100</sup> According to its whole, perfect virtue, the potential whole is present only in the highest part or potency (*in parte suprema, suprema potentia*); in the others, some participation of it (is present); for it is in them partially; and so, it is present in a diminished way (*diminute*), because the higher power has in itself (*in se*) more completely (*completius*) those (perfections) that are in the inferior (parts). Hence, it is indeed predicated—in some mode—of any part but is not present properly (in every part), as is the universal whole. In potential parts, one of the parts (i.e., the prior) includes the virtue (*vis*) of the others, and the inferior power (*potentia inferior*) is found conjoined to the more perfect (potency).

For example, the whole essence of the soul is present in whichever of its potencies (i.e., vegetative, sensitive, and rational), but the whole virtue of the soul is found (only) in the rational (soul); in the sensible soul, however, it is found diminished; and, even more diminished, in the vegetative; for the sensible soul includes in itself the virtue of the vegetative soul, but not conversely.<sup>101</sup> Likewise, the potency (or power) of overseer (*potestas praepositi*) is much more excellent in the king.

Every form or nature that is received in diverse degrees of potencies is received according to prior and posterior.<sup>102</sup> But it is impossible for the nature of a species to be communicated

---

“totum potentiale adest quidem secundum essentiam cuilibet parti, sed secundum completam virtutem est in parte suprema, quia semper superior potentia habet in se completius ea quae sunt inferioris.” *STh* I, q. 77 a. 1 ad 1: “Totum vero potentiale adest singulis partibus secundum totam suam essentiam, sed non secundum totam virtutem. Et ideo quodammodo potest praedicari de qualibet parte; sed non ita proprie sicut totum universale.” *In Sent.* 4, d. 16 q. 1 a. 1 qc. 3 co.: “in partibus potentialibus totum adest secundum essentiae suae rationem cuilibet parti completae, sicut essentia animae cuilibet potentiae; sed tota ratio [...] secundum speciem non est in quolibet horum. Praeterea unum eorum non includit in se vim omnium aliorum, quod requiritur in partibus potentialibus; sed unumquodque ad suum officium servit.” *In Sent.* 2, d. 18 q. 2 a. 3 ad 4: “in omni enim toto potestativo potentia inferior superiori conjuncta perfectior invenitur; ut potestas praepositi multo excellentior est in rege.” *In Sent.* 4, d. 15 q. 2 a. 2 qc. 2 co.: “virtus totius potentialis [invenitur] in partibus ejus, quae quidem complete in una invenitur, et in aliis diminute: sicut tota virtus animae invenitur in rationali; sed in sensibili anima invenitur diminute, et adhuc magis diminute in vegetabili: quia anima sensibilis includit in se virtutem animae vegetabilis, et non convertitur.” *In Sent.* 4, d. 38 q. 1 a. 2 qc. 2 co.: “divisio [...], est divisio totius potestativi in partes suas, cujus perfecta virtus est in una suarum partium; in aliis autem quaedam ipsius participatio, sicut anima dividitur in rationalem, sensibilem, et vegetabilem.” *In Sent.* 4, d. 44 q. 3 a. 3 qc. 1 ad 4: “potentiae animae dicuntur partes ejus potentiales. Talium autem totorum ista est natura, quod tota virtus totius consistit in una partium perfecte, in aliis autem partialiter; sicut in anima virtus animae perfecte consistit in parte intellectiva, in aliis autem partialiter.”

<sup>100</sup> Taken from the places quoted in the previous note.

<sup>101</sup> *Idem.*

<sup>102</sup> *In Sent.* 2, d. 3 q. 1 a. 4 co.: “omnis forma vel natura quae recipitur in diversis gradibus potentialium, recipitur secundum prius et posterius secundum esse. Impossibile est autem naturam speciei communicari ab individuis per prius et posterius, nec secundum esse, nec secundum intentionem; quamvis hoc sit possibile in natura generis, ut dicitur in 3 Metaph.”

in individuals according to prior and posterior: neither according to the act of being (*secundum esse*), nor according to intention (*secundum intentionem*), even if this is possible in the nature of a genus.

### 13.22. Truncated

**Truncated** (*truncatum, mancum, defectivum* = κολοβόν) is the opposite of *whole* (► 13.2, ¶1).<sup>103</sup> For something to be truncated, there are requirements from the part of the whole and from the part of the deficient part.

ARISTOTLE posits seven requirements for some whole to be said (to be) *truncated*:<sup>104</sup>

1. That the whole be a *quantum* having parts into which it is divided according to quantity (► 13.8; 13.9); for the universal whole cannot be said (to be) *truncated* if one of its species is removed.<sup>105</sup>
2. The quantum must be *partible* (*partibile* = μεριστόν), that is, having distinction; and whole (*totum* = ὅλον), that is, integrated from diverse parts.<sup>106</sup> Whence, although the last parts into which a whole is resolved—e.g., flesh and nerve—have quantity, they cannot be said (to be) *truncated*.
3. Two (parts)—i.e., (of) something having two (equal) parts—are not truncated if one is removed from the other.<sup>107</sup> This is so because that which is removed from a truncated (whole) is equal to the remainder—but the remainder must always be greater.
4. No number can be truncated, regardless of how many parts it may have, because the substance (i.e., essence) of the truncated remains when a part has been subtracted.<sup>108</sup>

---

<sup>103</sup> *In Metaph.* 5, l. 21, §1109 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a11–28): “determinat [Philosophus] de eo, quod est oppositum toti, quod est colobon, pro quo alia translatio habet diminutum membro, sed non usquequaque convenienter. Nam colobon non dicitur solum in animalibus, in quibus solis sunt membra. Videtur autem esse colobon quod nos dicimus truncatum. Unde Boetius transtulit mancum, id est defectivum. Est ergo intentio Philosophi ostendere quid requiratur ad hoc quod aliquid dicatur colobon. Et primo quid requiratur ex parte totius; secundo quid requiratur ex parte partis deficientis.”

<sup>104</sup> *In Metaph.* 5, l. 21, §1110: “Ad hoc autem, quod aliquod totum dici possit colobon, septem requiruntur.”

<sup>105</sup> *In Metaph.* 5, l. 21, §1110 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a11): “Primum est, ut illud totum sit quantum habens partes in quas dividatur secundum quantitatem. Non enim totum universale potest dici colobon si una species eius auferatur.”

<sup>106</sup> *In Metaph.* 5, l. 21, §1111 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a11–12): “Secundum est quod non quodlibet quantum potest dici colobon, sed oportet quod sit partibile, idest distinctionem habens, et totum, idest ex diversis partibus integratum. Unde ultimae partes, in quas aliquod totum resolvitur, licet habeant quantitatem, non possunt dici colobae, sicut caro vel nervus.”

<sup>107</sup> *In Metaph.* 5, l. 21, §1112 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a12–14): “Tertium est, quod duo non sunt coloba, vel aliquid habens duas partes, si altera earum auferatur. Et hoc ideo quia nunquam colobonium, idest quod aufertur a colobon, est aequale residuo, sed semper oportet residuum esse maius.”

<sup>108</sup> *In Metaph.* 5, l. 21, §1113 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a14–16): “Quartum est, quod numerus nullus potest esse colobus quotcumque partes habeat; quia substantia colobi manet parte

For example, if a cup is truncated, it still remains a cup. But a number does not remain the same when any part is removed; for any unit added or subtracted varies the species of number (►16.7).

5. (The whole) must have unlike parts; for those (wholes) that are of like parts cannot be said (to be) *truncated* because the *ratio* of *whole* is preserved in whichever part; whence, if one of the parts should be removed, the other part would not be said (to be) *truncated*.<sup>109</sup> Nor can all (wholes) that are of unlike parts be said (to be) *truncated*; for a number cannot be said (to be) *truncated*, as has been said, even though in some mode it has unlike parts: e.g., twelve has two and three as parts (►3.2). However, in some mode, all numbers have like parts insofar as every number is constituted from units.

6. None of those (wholes) can be said (to be) *truncated* in which position (*positio* = θέσις) does not make a difference (►39.19): e.g., in water and fire; for truncated (wholes) must be such that they have a determinate position in their *ratio* of *substance*: e.g., *man* and *house*.<sup>110</sup>

7. A truncated (whole) must be continuous (►39).<sup>111</sup> Thus, a (whole) musical harmony, even though it is of unlike parts, cannot be said (to be) *truncated* when a note or a chord is subtracted; for (a whole harmony) is constituted from low- and high-pitch notes; and, although its parts have a determinate position, low- and high-pitch notes do not constitute a harmony when they are ordered in whatever way.

From the part of the diminished (part), according to ARISTOTLE, there are three conditions (for a whole to be) truncated:<sup>112</sup>

---

subtracta; sicut si calix truncetur, adhuc manet calix; sed numerus non manet idem, ablata quacumque parte. Quaelibet enim unitas addita vel subtracta, variat numeri speciem."

<sup>109</sup> *In Metaph.* 5, l. 21, §1114 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a16–18): "Quintum est, quia oportet quod habeat partes dissimiles. Ea enim, quae sunt similium partium, non possunt dici coloba, quia ratio totius salvatur in qualibet parte: unde, si auferatur aliqua partium, altera pars non dicitur coloba. Nec tamen omnia, quae sunt dissimilium partium, possunt dici coloba: numerus enim non potest dici colobus, ut dictum est, quamvis quodammodo habeat dissimiles partes, sicut duodenarius habet pro partibus dualitatem et Trinitatem. Aliquo tamen modo omnis numerus habet partes similes, prout omnis numerus ex unitatibus constituitur."

<sup>110</sup> *In Metaph.* 5, l. 21, §1115 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a18–20): "Sextum est quod nullum eorum potest dici colobon, in quibus positio non facit differentiam, sicut aqua aut ignis. Oportet enim coloba talia esse, quod in suae ratione substantiae habeant determinatam positionem, sicut homo vel domus."

<sup>111</sup> *In Metaph.* 5, l. 21, §1116 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a20–22): "Septimum est quod oportet esse continua coloba. Harmonia enim musicalis non potest dici coloba voce vel chorda subtracta, licet sit dissimilium partium: quia constituitur ex vocibus gravibus, et acutis; et licet partes eius habeant determinatam positionem: non enim qualitercumque voces graves et acutae ordinatae, talem constituunt harmoniam."

<sup>112</sup> *In Metaph.* 5, l. 21, §1117 (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a22–23): "ostendit [Philosophus] quae sunt conditiones colobi ex parte partis diminutae; et ponit tres: dicens quod sicut non quaelibet tota possunt dici coloba, ita nec cuiuslibet particulae ablatione potest aliquid dici colobon."

8. The part removed must not be a part of the principal substance: that is, the one that constitutes the substance (i.e., the essence) of the thing, without which substance it cannot be; for the truncated (whole) must remain when the part is removed.<sup>113</sup> Whence, man cannot be said (to be) truncated when the head is cut off.

9. The part subtracted must not be everywhere, but in an extremity.<sup>114</sup> Whence, if a cup is perforated close to the middle when some part of it is removed, it cannot be said (to be) *truncated*: rather, if the handle of the cup or any other extremity (is removed). Likewise, a man is not said (to be) truncated (i.e., mutilated) if he loses some (part) of flesh in his shin, forearm, or close to the middle of his body, or if he loses his spleen, or a part of it, but if he loses one of his extremities, as a hand or a foot.

10. Not when any particle is removed from an existing extremity is some (whole) said (to be) truncated: (only) the part is such that it is not regenerated again, as a hand or a foot.<sup>115</sup> When the whole hair is cut off, it is again regenerated. Whence, even if it is in an extremity, (a whole man) is not said (to be) *truncated* by its extraction. This is why bald (men) are not said (to be) *truncated* (i.e., mutilated).

---

<sup>113</sup> *In Metaph. 5, l. 21, §1117* (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a23–25): “Oportet enim primo quod pars ablata non sit pars substantiae principalis, quae scilicet rei substantiam constituit, et sine qua substantia esse non possit; quia, ut supra dictum est, colobon oportet manere ablata parte. Unde homo non potest dici colobus, capite abscisso.”

<sup>114</sup> *In Metaph. 5, l. 21, §1118* (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a24–27): “Secundo, ut pars subtracta non sit ubique, sed sit in extremitate. Unde si perforatur calix circa medium aliqua parte eius ablata, non potest dici colobus; sed, si accipiatur auris calicis, idest particula, quae est ad similitudinem auris, aut quaecumque alia extremitas. Et similiter homo non dicitur colobus, si amittat aliquid de carne, vel in tibia, vel in brachio, vel circa medium corporis; aut si amittens splenem, vel aliquam eius partem; sed si amittat aliquam eius extremitatem, ut manum aut pedem.”

<sup>115</sup> *In Metaph. 5, l. 21, §1118* (cf. ARISTOTLE, *Metaphysica* Δ.27, 1024a27–28): “Tertio vero, ut non omni particula in extremitate existente ablata, aliquid dicatur colobum; sed, si sit talis pars, quae non regeneratur iterum, si tota auferatur, sicut manus, aut pes. Capillus autem totus incisus iterum regeneratur. Unde per eorum subtractionem, licet in extremitate sint, non dicitur colobus. Et propter hoc calvi non dicuntur colobi.”

## 14. Genus

*Having determined what whole and part are, we turn our attention to the genus, which is a kind of whole. Of the greatest importance is the distinction between subject genus (which is used by the logician) and predicable genus (which is used by the philosopher-scientist).*

### 14.1. Distinction between Subject Genus and Predicable Genus

A **genus** (*genus* = γένος) is some whole (► 12).<sup>1</sup> ARISTOTLE distinguishes four modes in which *genus* is said, of which only the following two pertain to philosophical consideration:<sup>2</sup>

1. The **subject genus** (*genus subiectum* = τὸ γένος τὸ ὑποκείμενον): that which is the proper subject of accidents differing in species (*quod est proprium subiectum, specie differentium accidentium* < τὸ ὑποκείμενον ταῖς διαφοραῖς).<sup>3</sup>

<sup>1</sup> *In Metaph.* 5, l. 22, §1119: "Hic determinat [Philosophus] de quodam toto, scilicet de genere."

<sup>2</sup> *In Metaph.* 5, l. 22, §1119: "genus dicitur quatuor modis." Ibid., §1124: "Primi enim duo modi non multum pertinent ad philosophicam considerationem." The modes numbered (1) and (2) here are respectively (3) and (4) in the source. The two modes not discussed here refer to: (1) *The continuous generation of some (things) having the same species (generatio continua aliquorum habentium eandem speciem* = ἡ γένεσις συνεχῆς τῶν τὸ εἶδος ἐχόντων τὸ αὐτό). See *ibid.*, §1123 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b6–7): "Uno modo secundum generationem continuam in eadem specie, quod pertinet ad primum modum." According to St. Thomas, this is the first mode posited by PORPHYRY: namely, a multitude having a relation to one another and to one principle. For example, the genus of men (i.e., the *human genus*) for as long as it lasts. Cf. *ibid.*, §1119 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024a29–31): "Primo generatio continua aliquorum habentium eandem speciem. Sicut dicitur dum erit genus hominum, idest dum durabit generatio continua hominum. Iste est primus modus positus in Porphyrio, scilicet multitudo habentium relationem adinvicem et ad unum principium." (2) *A mover towards being—i.e., a generator—from which some things first proceed (illud a quo primo movente ad esse, idest a generante procedunt aliqua* = τὸ ἀφ' οὗ ἂν ὤσι πρώτου κινήσαντος εἰς τὸ εἶναι). See *ibid.*, §1123 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b7–8): "Alio modo secundum primum movens, quod pertinet ad secundum." For example, some are said to be of the genus of the Hellenes because they descend, as from a first generator, from someone named Hellen. According to St. Thomas, this is the second mode posited by PORPHYRY. See *ibid.*, §1120 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024a31–34): "Secundo modo dicitur genus illud a quo primo movente ad esse, idest a generante procedunt aliqua; sicut dicuntur Hellenes genere, quia descendunt a quodam Hellene nomine, et aliqui dicuntur Iones genere, quia descendunt a quodam Ione, sicut a primo generante. [...] Et iste est secundus modus generis in Porphyrio positus."

<sup>3</sup> *In Metaph.* 5, l. 22, §1121 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b3–4): "Tertio modo dicitur genus [...] quod est proprium subiectum, specie differentium accidentium." Ibid., "Genus autem hoc [...] est [...] quod est proprium subiectum, specie differentium accidentium." ARISTOTLE talks about this genus in many places, some of which were not commented by St. Thomas. For example, *De generatione et corruptione* A.7, 1024a29–31: "Τὴν μὲν γὰρ ὕλην λέγομεν ὁμοίως ὡς εἰπεῖν τὴν αὐτὴν εἶναι τῶν ἀντικειμένων ὀποτερουσῶν, ὡςπερ γένος ὄν, τὸ δὲ δυνάμενον θερμὸν εἶναι παρόντος τοῦ θερμαντικοῦ καὶ πλησιάζοντος ἀνάγκη θερμαίνεσθαι· διό, καθάπερ εἴρηται, τὰ μὲν τῶν ποιητικῶν ἀπαθῆ τὰ δὲ παθητικά." According to the anonymous continuation to St. Thomas's Commentary, in this passage ARISTOTLE says that, for each thing, there is one matter that is susceptible of contraries, which matter, although being one in subject (*una subiecto*), nevertheless differs according to being (*secundum esse*), wherefrom ARISTOTLE says, "so to say" (*ut ita dicam* = ὡς εἰπεῖν). And the same matter is said as a genus (< ὡςπερ γένος ὄν), not indeed predicabile: rather, it is said (to be a) *genus* insofar as the first subject, which underlies two or more contraries, is said (to be a) *genus*. And of the contraries, one is active, and the other is passive; hence, the matter of the active and of the passive is one. *In De gen. continuatio* 1, l. 20 n. 2: "Et dicit [Philosophus] quod dicitur esse una materia cuilibet, quae est susceptiva contrariorum; quae licet sit una subiecto, differt tamen secundum esse: et propter hoc dixit *ut ita dicam*. Et ipsa materia dicitur ut genus, non quidem praedicabile, sed dicitur genus secundum quod genus dicitur subiectum primum, quod substat duobus contrariis aut pluribus; contrariorum autem unum est in activo, alterum est in passivo: et ideo una materia est activi et passivi."

In this mode, for example, *surface* is the genus—and the subject—of all superficial figures; and *solid*—i.e., *body*—is said to be the genus of *solid*—i.e., *corporeal*—figures.<sup>4</sup>

This is not (to be confused with) the genus that signifies the essence of a species, as *animal* is the genus of *man* (i.e., the predicable genus, discussed next; ► 13.16).<sup>5</sup>

**2. The predicable genus (*genus praedicabile*):** that which is posited in the definition first, in which the essence is predicated (*quod primo ponitur in definitione, et praedicatur in eo quod quid* < ἐν τοῖς λόγοις τὸ πρῶτον ἐνυπάρχον, ὃ λέγεται ἐν τῷ τί ἐστι), and whose differences are qualities (*et differentiae sunt eius qualitates* < οὗ διαφοραὶ λέγονται αἱ ποιότητες).<sup>6</sup>

For example, in the definition of *man*, *animal* is posited first (i.e., according to the rational order, insofar as the more universal part of a *ratio* is prior to the less universal), and (then) *biped* or *rational* (i.e., as a difference), which is some substantial quality of man (► 13.16).<sup>7</sup>

The (predicable) genus is in one mode a whole (i.e., a universal whole; ► 13.5), insofar as it is predicated of many; and in another mode it is a part (i.e., an integral part; ► 13.16), insofar as a species is constituted from genus and difference.<sup>8</sup>

#### 14.2. Subject Genus and Predicable Genus Compared

The relation of (predicable) genus to differences is like that of subject to proper affections (► 15.17); for just as the genus is posited in the definition of a species (► 13.16), the proper subject is posited in the definition of an accident (► 18).<sup>9</sup> Whence, the proper subject is predicated of an accident in the likeness of a genus (*ad similitudinem generis*).

For example, any figured surface is *such* surface (*talis superficies*; e.g., a triangle is a surface *contained by three straight lines*, while a square is a surface *contained by four*

---

<sup>4</sup> *In Metaph.* 5, l. 22, §1121 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024a36–b3): “sicut superficies est genus figurarum superficialium, et «solidum,» idest corpus, dicitur esse genus figurarum solidarum, idest corporearum. [...] Superficies enim est subiectum omnium figurarum superficialium.”

<sup>5</sup> *In Metaph.* 5, l. 22, §1121: “Genus autem hoc non est quod significat essentiam speciei, sicut animal est genus hominis; sed quod est proprium subiectum, specie differentium accidentium.”

<sup>6</sup> *In Metaph.* 5, l. 22, §1122 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b4–6): “Quarto modo genus dicitur, quod primo ponitur in definitione, et praedicatur in eo quod quid, et differentiae sunt eius qualitates.”

<sup>7</sup> *In Metaph.* 5, l. 22, §1122: “Sicut in definitione hominis primo ponitur animal, et bipes sive rationale, quod est quaedam substantialis qualitas hominis.” In English, of course, the difference (signified by an adjective) is placed prior to the genus (signified by a noun), but this merely is a grammatical priority.

<sup>8</sup> *In Metaph.* 7, l. 13, §1569: “genus quodammodo est totum, in quantum praedicatur de pluribus, et quodammodo est pars, in quantum ex genere et differentia constituitur species.”

<sup>9</sup> *De sub. sep.*, c. 6, 48–50: “est similis habitudo generis ad differentias, sicut subiecti ad proprias passiones.” *In Metaph.* 5, l. 22, §1121: “Et habet [subiectum] similitudinem cum genere; quia proprium subiectum ponitur in definitione accidentis, sicut genus in definitione speciei. Unde subiectum proprium de accidente praedicatur ad similitudinem generis.” *In Metaph.* 5, l. 22, §1123: “Hoc enim modo se habet genus ad differentiam, sicut subiectum ad qualitatem.”

*equal straight lines*; ►4.4), and any solid figure is *such* solid (*tale solidum*; e.g., a cube is a solid *contained by six equal squares*; ►4.5), as if *figure* should be a difference qualifying *surface* or *solid*.<sup>10</sup> Hence, *surface* is related to *figured surfaces*—and *solid* to (*figured*) *solids*—as a genus that underlies (*subiicitur*, i.e., is subject to) contraries (e.g., subject to boundaries producing contrary figures; ►4.3); for the difference (e.g., *contained by three straight lines* or *contained by four equal straight lines*) is predicated in the qualified (*in eo quod quale*; thus, *figure*, whose subject genus is *continuous quantity*, is qualified by different containing boundaries). And because of this, just as *such* animal is signified when “*rational animal*” is said, so *such* surface is signified when “*square surface*” is said.

Whence, the subject genus and the predicable genus are comprehended as under one mode; for each is related according to the mode of matter (*sicut materia, per modum materiae* = ὡς ὕλη).<sup>11</sup> Although the predicable genus is not matter, it is taken from matter, as the difference (is taken) from the form (►13.16); for something is said to be an *animal* because it has a sensitive nature; and (the same thing is said to be) *rational* because it has a rational nature, which is related to sensitive (nature) as form (is related) to matter.

### 14.3. Diversity in Subject Genus

Those are said (to be) **diverse** (*diversa* = ἕτερα) **in (subject) genus** whose first subject is diverse (*eorum primum subiectum est diversum* < ὧν ἕτερον τὸ πρῶτον ὑποκείμενον).<sup>12</sup>

For example, the first subject of colors is *surface*, while the first subject of savors is *humor* (i.e., according to ancient science).<sup>13</sup> Whence, in respect of subject genus, color and savor are diverse in genus (i.e., according not only to ancient but also to present knowledge).

<sup>10</sup> *In Metaph.* 5, l. 22, §1121 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024a1–b4): “Unaquaeque enim figurarum haec quidem, idest superficialis, est talis superficies. Hoc autem, idest figura solida, est tale solidum, ac si figura sit differentia qualificans superficiem vel solidum. Superficies enim se habet ad figuras superficiales, et solidum ad solidas, sicut genus quod subiicitur contrariis. Nam differentia praedicatur in eo quod quale. Et propter hoc, sicut cum dicitur animal rationale significatur tale animal, ita cum dicitur superficies quadrata, significatur talis superficies.”

<sup>11</sup> *In Metaph.* 5, l. 22, §1123 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b6–9): “Patet ergo quod tot modis dicitur genus. Uno modo secundum generationem continuam in eadem specie, quod pertinet ad primum modum. Alio modo secundum primum movens, quod pertinet ad secundum. Alio modo sicut materia, quod pertinet ad tertium et quartum modum. Hoc enim modo se habet genus ad differentiam, sicut subiectum ad qualitatem. Et ideo patet quod genus praedicabile, et genus subiectum, quasi sub uno modo comprehenduntur, et utrumque se habet per modum materiae. Licet enim genus praedicabile non sit materia, sumitur tamen a materia, sicut differentia a forma. Dicitur enim aliquid animal ex eo quod habet naturam sensitivam. Rationale vero ex eo, quod habet rationalem naturam, quae se habet ad sensitivam sicut forma ad materiam.”

<sup>12</sup> *In Metaph.* 5, l. 22, §1124 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b9–10): “Primo igitur modo dicuntur aliqua genere diversa, quia eorum primum subiectum est diversum. Sicut primum subiectum colorum est superficies, primum autem subiectum saporum est humor. Unde quantum ad genus subiectum, sapor et color sunt diversa genere.”

<sup>13</sup> *In Metaph.* 5, l. 22, §1124: “Sicut primum subiectum colorum est superficies, primum autem subiectum saporum est humor. Unde quantum ad genus subiectum, sapor et color sunt diversa genere.”

For two (things) to be diverse in subject, it is necessary that they be such that:<sup>14</sup>

1. One of them is not resolvable into the other (*unum non resolvatur in alterum* < μὴ ἀναλύεται θάτερον εἰς θάτερον).<sup>15</sup>

For example, *solid* is—in some mode—resolved into *surface* (i.e., insofar as *surface* is the principle of *solid*).<sup>16</sup> Whence, solid figures and superficial figures are not diverse in genus.

2. And both cannot be resolved into something (that is the) same (*et... ambo non resolvantur in aliquod idem* < μηδ' ἄμφω εἰς ταυτόν).<sup>17</sup>

For example, species and matter are diverse in genus if they are considered according to their essence (► 13.10); for there is nothing (i.e., no subject) common to both.<sup>18</sup>

Those things that do not have matter in common do not have a (subject) genus in common.<sup>19</sup> And it is impossible for one (thing) to come to be converted into another if they do not have in common (one) matter and one genus.

For example, whiteness does not come to be from a line because they are of diverse genera.<sup>20</sup> Nor can an elementary body be converted into an incorruptible body or into an incorporeal substance, or conversely; for they do not agree (*convenient*) in matter. Thus, incorruptible and corruptible bodies are diverse in (subject) genus because they do not have a common matter (► 43.25).

#### 14.4. Diversity in Predicable Genus

Those are said (to be) **diverse in (predicable) genus** *which are said according to a diverse figure of predication of being (quae dicuntur secundum diversam figuram categoriae, idest praedicationis entis* = ὅσα καθ' ἕτερον σχῆμα κατηγορίας τοῦ ὄντος

---

<sup>14</sup> *In Metaph.* 5, l. 22, §1125: “Oportet autem quod duo diversa subiecta, talia sint, quorum [...]”

<sup>15</sup> *In Metaph.* 5, l. 22, §1125 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b11): “unum non resolvatur in alterum.”

<sup>16</sup> *In Metaph.* 5, l. 22, §1125: “Solidum enim quodammodo resolvitur in superficies. Unde figurae solidi, et figurae superficiales non sunt diversorum generum.”

<sup>17</sup> *In Metaph.* 5, l. 22, §1125 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b11): “Et iterum oportet quod ambo non resolvantur in aliquod idem.”

<sup>18</sup> *In Metaph.* 5, l. 22, §1125 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b12): “Sicut species et materia sunt diversa genere, si secundum suam essentiam considerentur, quod nihil est commune utrique.”

<sup>19</sup> *De veritate*, q. 8 a. 9 co.: “Ea enim quae non communicant in materia, non communicant in genere, ut patet per Philosophum in V *Metaphysic.*, et in X.” ScG 4, 31 n. 4: “Eorum quae non communicant in materia et in genere uno, impossibile est fieri conversionem in invicem.”

<sup>20</sup> ScG 4, 31 n. 4: “non enim ex linea fit albedo, quia sunt diversorum generum; neque corpus elementare potest converti in aliquod corporum caelestium, vel in aliquam incorpoream substantiam, aut e converso, cum non convenient in materia.” *In Metaph.* 5, l. 22, §1125: “Et similiter corpora caelestia et inferiora sunt diversa genere, inquantum non habent materiam communem.” According to ancient astronomy, celestial bodies, such as the sun, are incorruptible.

λέγεται).<sup>21</sup> Thus, *what (a thing) is* (*quid est* = τί ἐστι; i.e., *substance*), *how (it) is* (*quale* = ποιόν τι; i.e., *quality*), and other modes (of being), each signify diverse beings (*alia entia*).

These categories (► 33) are not resolved one into the other because one is not contained under the other.<sup>22</sup> Nor are they resolved into some one (predicable genus) because there is no genus common to all the categories (e.g., neither *being* nor *one* is a genus; ► 30.11).

#### 14.5. Rational Genus vs. Real Genus

From what has just been said, it is evident that some things are contained under one category, and are one in predicable genus insofar as they have in common (*communicant in*) the intention of a genus, and yet they are diverse in subject genus.<sup>23</sup> For example, incorruptible and corruptible bodies; and colors and savors.

Even if those things that have a diverse mode of being do not have something in common according to the (mode of) being that the natural (scientist) considers, they may have in common some intention that the logician considers.<sup>24</sup> Thus, according to the natural (scientist), corruptible and incorruptible bodies are not of one genus—but according to the logician, they are (e.g., even if they are not one in subject genus, colors and savors belong to the predicable genus of *quality*; corruptible and incorruptible bodies, to that of *body*).

The diversity in subject genus is considered more by the natural (scientist) and the (first) philosopher (i.e., the metaphysician) because it is more real (*est magis realis*; i.e., it pertains to the thing rather than to the *ratio*):<sup>25</sup> according to their consideration, nothing common is said of corruptible and incorruptible (bodies) except for the community of the

---

<sup>21</sup> *In Metaph.* 5, l. 22, §1126 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b12–14): “Alio modo dicuntur diversa genere, quae dicuntur secundum diversam figuram categoriae, idest praedicationis entis. Alia namque entia significant quid est, alia quale, alia aliis modis.”

<sup>22</sup> *In Metaph.* 5, l. 22, §1126 (cf. ARISTOTLE, *Metaphysica* Δ.28, 1024b14–16): “Istae enim categoriae nec resolvuntur invicem, quia una non continetur sub alia. Nec resolvuntur in unum aliquid, quia non est unum aliquid genus commune ad omnia praedicamenta.”

<sup>23</sup> *In Metaph.* 5, l. 22, §1127: “Patet autem ex dictis quod aliqua continentur sub uno praedicamento, et sunt unum genere hoc modo secundo, quae tamen sunt diversa genere primo modo. Sicut corpora caelestia et elementaria, et colores, et sapes.” *In Sent.* 2, d. 3 q. 1 a. 1 ad 2: “aliqua sunt unius generis logice loquendo, quae naturaliter non sunt unius generis, sicut illa quae communicant in intentione generis quam logicus inspicit, et habent diversum modum essendi: unde in 10 *Metaph.* dicitur, quod de corruptibilibus et incorruptibilibus nihil commune dicitur, nisi communitate nominis.” Likewise, although all figures belong to the category *quality*, square numbers (i.e., multitudes) and square surfaces (i.e., magnitudes) belong to diverse subject genera.

<sup>24</sup> *De potentia*, q. 7 a. 7 ad s.c. 1: “Ad primum ergo dicendum, quod in contrarium obiicitur [sc., *Sed contra. Est quod Philosophus dicit, quod aeterno et temporali nihil est commune nisi nomen*], dicendum, quod Philosophus loquitur de communitate naturaliter et non logice. Ea vero quae habent diversum modum essendi, non communicant in aliquo secundum esse quod considerat naturalis; possunt tamen communicare in aliqua intentione quam considerat logicus. Et praeterea etiam secundum naturalem corpus elementare et caeleste non sunt unius generis; sed secundum logicum sunt.”

<sup>25</sup> *In Metaph.* 5, l. 22, §1127: “Primus autem modus diversitatis secundum genus consideratur magis a naturali, et etiam a philosopho, quia est magis realis. Secundus autem modus consideratur a logico, quia est rationis.”

name (i.e., *body*). The diversity in predicable genus is considered by the logician because it is (a diversity) of *ratio* (*rationis*; i.e., it pertains to the *ratio* rather than to the thing).

#### 14.6. Subject of Predication

(Logically speaking) **subject** is said (to be) *that of which others are predicated* (*de quo alia dicuntur* = καθ' οὗ τὰ ἄλλα λέγεται), while the subject itself is not predicated of others (*ipsum autem subiectum non praedicatur de alio* < ἐκεῖνο δὲ αὐτὸ μηκέτι κατ' ἄλλου).<sup>26</sup>

This (i.e., that the subject itself is not predicated of others) is to be understood (as referring to predication) *by itself* (*per se*; ►17), since nothing prevents *Socrates* from being predicated by accident (*per accidens*) of *this white (thing)*, of *(this) animal*, or of *(this) man*; for that (individual) in which white, animal, or man is, is *Socrates*. However, (*Socrates*) is predicated by itself of itself when one says, “*Socrates is Socrates*.”

(Something is predicated of a subject) either:<sup>27</sup>

1. *As superiors (are predicated) of inferiors*: (that is), as (predicable) genera (are said of species and of individuals), species (are said of individuals), and differences (are said of species and of individuals).

2. *As an accident is predicated of a subject*: (that is), as common accidents (are predicated of any subject), and (as) proper (i.e., proper accidents or affections, also called *properties*, are predicated of their proper subjects).

For example, (the following are said) of *Socrates*: *man* (i.e., the species of *Socrates*), *animal* (i.e., the proximate genus of man), *rational* (i.e., the specific difference of man), *risible* (i.e., capable of laughing, a property of man), and *white* (i.e., an accident common to man and other subjects, and whose proper subject is the colored surface).<sup>28</sup>

#### 14.7. Subject-Matter

Properly speaking (i.e., in metaphysics), **subject** is *that which is in potency to accidental being* (*quod est in potentia ad esse accidentale*), while **matter** is *that which is in potency to substantial being* (*quod est in potentia ad esse substantiale*).<sup>29</sup>

---

<sup>26</sup> *In Metaph.* 7, l. 2, §1273 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b36–37): “Dicitur autem subiectum de quo alia dicuntur [...]; ipsum autem subiectum non praedicatur de alio. Quod est intelligendum per se. Per accidens enim nihil prohibet Socratem de hoc albo praedicari, vel de animali, vel de homine; quia id, cui inest album, aut animal, aut homo, Socrates est. De seipso autem praedicatur per se, cum dicitur, Socrates est Socrates.”

<sup>27</sup> *In Metaph.* 7, l. 2, §1273: “vel sicut superiora de inferioribus, ut genera et species et differentiae; vel sicut accidens praedicatur de subiecto, ut accidentia communia et propria.”

<sup>28</sup> *In Metaph.* 7, l. 2, §1273: “sicut de Socrate praedicatur homo, animal, rationale, risibile et album.”

<sup>29</sup> *De prin. nat.* §1, 20–23: “proprie loquendo quod est in potentia ad esse accidentale dicitur subiectum, quod uero est in potentia ad esse substantiale dicitur proprie materia.”

As ARISTOTLE says, those (things) that are according to nature (*secundum naturam* < φύσει) and are not substances, but accidents, do not have a **matter from which** they should be, but they have a substance (as their) **subject**.<sup>30</sup> And the subject has something like matter insofar as it is apt to receive an accident.

However, subject differs from matter in that a subject does not have (its act of) being (*esse*) from that which befalls it (*ex eo quod advenit*); for a subject is not constituted in being through an accident: rather, the subject has a complete being by itself (*per se*).<sup>31</sup> For example, man does not have being from whiteness. On the other hand, matter—of itself—has an incomplete being: it has (its act of) being from that which befalls it; for matter has being in act (*habet actu esse*) only through form (*per formam*). Whence, simply speaking, form gives (the act of) being to matter (*forma dat esse materiae*), while the subject (gives its act of being) to the accident, although sometimes one is taken for the other: that is, *matter* for *subject*, and conversely.

#### 14.8. Matter from Which vs. Matter in Which

Again, **matter from which** (*ex qua* = ἐξ οὗ, i.e., the material cause: ►9.3) is in potency toward substantial being (*in potentia ad esse substantiale*; e.g., sodium and chloride are in potency of becoming common salt, which has substantial being), while **matter in which** (*in qua*, i.e., the subject; ►14.7) is in potency toward accidental being (*in potentia ad esse accidentale*; e.g., substances—such as sodium, chloride, and common salt—are in potency of becoming hotter or whiter); for substance is the subject in which accidents (e.g., hotness or whiteness) exist.<sup>32</sup>

Substance (►15.1) and accident (►15.16) cannot be reduced into one matter; for matter is not a part of an accident (e.g., salt is not a part of hotness or of whiteness), and thus, they do not agree in a *matter from which*. However, accident and substance, in some

<sup>30</sup> *In Metaph.* 8, l. 4, §1743 (cf. ARISTOTLE, *Metaphysica* H.4, 1044b8–9): “Ostendit [Philosophus] quomodo materia attribuitur accidentibus; et dicit, quod illa, quae sunt secundum naturam, non tamen sunt substantiae, sed accidentia, non habent materiam ex qua sint, sed substantia est eis subiectum. Subiectum autem habet aliquid simile materiae, in quantum est receptibile accidentis.”

<sup>31</sup> *De prin. nat.* §1, 27–32: “Et secundum hoc differt materia a subiecto, quia subiectum est quod non habet esse ex eo quod aduenit, sed per se habet esse completum, sicut homo non habet esse ab albedine; sed materia habet esse ex eo quod ei aduenit, quia de se habet esse incompletum.” *In Metaph.* 8, l. 4, §1743: “Differt autem [subiectum] a materia, in quantum materia non habet actu esse nisi per formam; subiectum autem non constituitur in esse per accidens.” *De prin. nat.* §1, 32–35: “Vnde simpliciter loquendo forma dat esse materiae, sed subiectum accidenti, licet aliquando unum sumatur pro altero, scilicet materia pro subiecto et e conuerso.”

<sup>32</sup> *In Physic.* 1, l. 14, n. 8 (cf. ARISTOTLE, *Physica* A.8, 191b27–29): “contingit aliqua eadem dicere et secundum potentiam et secundum actum, ut certius determinatum est in aliis, scilicet in IX Metaphys. Ex ente igitur in potentia fit aliquid per se; ex ente autem in actu, vel ex non ente, fit aliquid per accidens. Hoc autem dicit [Philosophus] quia materia, quae est ens in potentia, est id ex quo fit aliquid per se: haec est enim quae intrat substantiam rei factae.” *De prin. nat.* §1, 16–19: “materia que est in potentia ad esse substantiale dicitur materia ex qua, que autem est in potentia ad esse accidentale dicitur materia in qua.”

mode, can be said to agree (*convenire*) in a *matter in which* insofar as the accident (e.g., hotness or whiteness) is *in* the substance (e.g., salt).<sup>33</sup>

#### 14.9. Object-Matter

Matter *from which* (►9.3) is moreover distinguished from the **matter in respect of which** (*materia circa quam*), or **object** (*objectum*).<sup>34</sup> The object is *the matter in respect of which an act is terminated* (*materia circa quam terminatur actus*), *the end of an act* (*finis actus*). Thus, it is the same as the *end* (►9.8), for it has the *ratio* of *end* insofar as the intention of the agent (i.e., that towards which the agent's action tends) is produced in it.

Although the object is *matter*—not indeed *from which* but *in respect of which*—, it also has—in some mode—the *ratio* of *form* insofar as it gives the species (►48.21).<sup>35</sup>

Some actions pass over into an external matter *in respect of which* some effect is operated.<sup>36</sup> This is evident in natural actions: e.g., fire heats wood (i.e., wood is the matter in respect of which fire acts); and in artificial things: e.g., a builder makes a house from matter. In such things, the action is received according to the mode of an affection (*per modum passionis*) in that which comes to be, insofar as motion is in the thing moved (*motus est in moto*) as in a subject. Thus, in such things, there must be found an action in the thing that is acting (*in re agente*); and an affection in the thing being affected (*in re patiente*, i.e., in the thing that is acted upon).

Other actions do not pass over into an external matter in such a way that they would produce some effect *in respect of* (*circa*) them.<sup>37</sup> This is evident in vision, which, being the act of he who sees, does not produce an effect in the thing seen. And such actions, which

---

<sup>33</sup> *In Sent.* 2, d. 12 q. 1 a. 5 co.: “Substantia enim et accidens non reducuntur in unam materiam, quia accidentis pars materia non est; et ideo non conveniunt in materia ex qua. Potest tamen dici aliquo modo accidens convenire cum substantia in materia in qua, secundum quod accidens est in substantia.”

<sup>34</sup> *In Sent.* 2, d. 36 q. 1 a. 5 ad 4: “duplex materia: ex qua, vel in qua, et materia circa quam: et primo modo materia dicta non incidit in idem cum fine: sed secundo modo est idem cum fine: quia objectum finis actus est.” *STh* I-II, q. 73 a. 3 ad 1: “objectum, etsi sit materia circa quam terminatur actus, habet tamen rationem finis, secundum quod intentio agentis fertur in ipsum.”

<sup>35</sup> *STh* I-II, q. 18 a. 2 ad 2: “objectum non est materia ex qua, sed materia circa quam, et habet quodammodo rationem formae, in quantum dat speciem.”

<sup>36</sup> *In Sent.* 1, d. 40 q. 1 a. 1 ad 1: “actionum quaedam transeunt in exteriorem materiam circa quam aliquem effectum operantur, ut patet in actionibus naturalibus sicut ignis calefacit lignum, et in artificialibus, sicut aedificator facit domum ex materia; et in talibus actio est recepta in eo quod fit, per modum passionis, secundum quod motus est in moto ut in subjecto: et ideo in talibus est invenire actionem in re agente, et passionem in re patiente.”

<sup>37</sup> *In Sent.* 1, d. 40 q. 1 a. 1 ad 1: “Quaedam vero sunt quae in exteriorem materiam non transeunt ut effectum aliquem circa ipsam producant, ut patet in visione, quae cum sit actio videntis, nullum effectum in re visa efficit; et tales actiones, quae proprie operationes dicuntur, in ipsis operantibus tantum sunt. Unde non potest fieri conversio passionis ad actionem acceptam a re exteriori, secundum quod in se est, sed solum secundum quod in operante est: etsi enim oculus videt lapidem, lapis tamen non videtur nisi secundum quod est in oculo per sui similitudinem.”

are properly called **operations** (*operationes*), exist only in those (agents) that realize the operations. Whence, a conversion cannot be made of *affection* into *action received from an external thing* insofar as it is in (the affected thing) itself, but only insofar as it is in that which produces the operation. Thus, even if the eye sees a stone, the stone is only seen insofar as it is in the eye by its likeness (*per sui similitudinem*).

(Objects have a diverse *ratio* depending on the act to which they are compared):

1. Objects have the *ratio* of **end** insofar as they are compared to *the internal act*.<sup>38</sup> It is from this that (objects) give species to the act (► 48.22, ¶1).
2. Objects have the *ratio* of **matter in respect of which** insofar as they are compared to *the external act*.<sup>39</sup> Objects have the *ratio* of *termini from which motions are specified* also insofar as they are matter *in respect of which*; for also the termini of motion give species to motions insofar as they have the *ratio* of *end* (e.g., motion that ends in a place receives the species of *locomotion*; motion that ends in heat receives that of *heating*; ► 48.21).

#### 14.10. From Which: Subject vs. Privation

Something is said to come to be *from something* in two (modes; ► 42; 48):<sup>40</sup>

1. **From a privation** (*ex privatione* = ἐκ τῆς στερήσεως).<sup>41</sup> For example, it is said that *the afflicted* (*laborans* = ὁ κάμνων; i.e., the man afflicted by a sickness) comes to be healthy (*fit sanus* = γίγνεται ὑγιής).
2. **From a subject** (*ex subiecto* = ἐκ τοῦ ὑποκειμένου), which is said (to be) *matter* (*quod dicitur materia* = ὃ λέγομεν τὴν ὕλην; ► 14.7).<sup>42</sup> For example, it is said that *the man* (*homo* = ὁ ἄνθρωπος) comes to be healthy.

Something is said to come to be **from a privation** more (*magis* = μᾶλλον) than *from a subject*.<sup>43</sup> For example, something is more (properly) said to come to be healthy *from the*

---

<sup>38</sup> *STh* I-II, q. 72 a. 3 ad 2: "obiecta [...] secundum quod comparantur ad actum interiorem voluntatis, habent rationem finium; et ex hoc habent quod dent speciem actui."

<sup>39</sup> *STh* I-II, q. 72 a. 3 ad 2: "obiecta, secundum quod comparantur ad actus exteriores, habent rationem materiae circa quam [...]. Quamvis etiam secundum quod sunt materia circa quam, habeant rationem terminorum; a quibus motus specificantur, ut dicitur in V Physic. et in X Ethic. Sed tamen etiam termini motus dant speciem motibus, inquantum habent rationem finis."

<sup>40</sup> *In Metaph.* 7, l. 5, §1415 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a8–10): "dupliciter dicitur aliquid fieri ex aliquo."

<sup>41</sup> *In Metaph.* 7, l. 5, §1415 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a8–10): "ex privatione [...] sicut dicitur [...] quod laborans fit sanus."

<sup>42</sup> *In Metaph.* 7, l. 5, §1415 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a8–10): "ex subiecto quod dicitur materia: sicut dicitur quod homo fit sanus."

<sup>43</sup> *In Metaph.* 7, l. 5, §1415 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a11–13): "Dicitur autem magis aliquid fieri ex privatione quam ex subiecto; sicut magis dicitur aliquid fieri sanus ex laborante, quam ex homine."

*afflicted* than *from the man*. On the other hand, we say (that) *this comes to be this* (*hoc fieri hoc*) more **in a subject** than *in a privation*. For example, we more properly say that *the man* comes to be healthy than *the afflicted*. Hence, it is not *the afflicted* who is more (properly) said (to be) *healthy*, but *the man*; and conversely, the man is said (to be) *healthy* (more properly than the afflicted). Therefore, *that which comes to be* (*id quod fit*) is predicated of a subject, but not of a privation.

#### 14.11. Matter vs. Unnamed Privation

In some (things) the privation is non-manifest and unnamed (*non manifesta et innominata* = ἄδηλος καὶ ἀνόνομος).<sup>44</sup> For example, the privation in bronze of whatever figure does not have a name; nor (does) the privation of *house* in *bricks and timber*. In such cases, we use *matter* simultaneously for *matter* and for *privation*. For this reason, just as we say that the healthy comes to be from the afflicted (i.e., from the privation of health), so do we say that the statue comes to be from bronze (i.e., from the matter of the statue, which is anonymously deprived of a figure); and the house, from stones and timber.

For the same reason, just as *that from which something comes to be as from a privation* is not said of a subject—for we do not say that the healthy (man) is an afflicted (man)—, so do we not say that *the statue is wood* (*lignum* = ξύλον): rather, the abstract is predicated in the concrete, saying that (the statue) is not *wood* but *wooden* (*lignea* = ξύλινος).<sup>45</sup> Likewise, the house is not *bricks* (*lateres* = πλίνθοι) but *of bricks* (*lateritia* = πλινθίνη).

This is also the reason why *that from which something comes* (or *is coming*) *to be*—as *from matter*—is sometimes predicated in a denominative—rather than abstract—way, for some (things) are not said (to be) *that* (*illud* = ἐκεῖνο)—i.e., (*that*) *matter*—but *of that* (*illiusmodi* = ἐκεῖνινον).<sup>46</sup> For example, a statue is not said (to be) *stone* (*lapis* = λίθος) but *of stone* (*lapidea* = λίθινος).

---

Sed hoc fieri hoc, magis dicimus in subiecto quam in privatione. Magis enim dicimus proprie quod homo fit sanus, quam quod laborans. Et ideo ille qui est sanus, non dicitur laborans, sed magis dicitur homo; et e converso homo dicitur sanus. Sic ergo id quod fit, praedicatur de subiecto, non autem de privatione.”

<sup>44</sup> *In Metaph.* 7, l. 5, §1416 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a13–16): “Sed in quibusdam privatio est non manifesta et innominata; sicut privatio cuiuscumque figurae in aere, non habet nomen, nec etiam privatio domus in lateribus et in lignis. Et ideo utimur materia, pro materia et privatione simul. Et propter hoc, sicut illic dicimus, quod sanus fit ex laborante, ita hic dicimus quod statua fit ex aere, et domus ex lapidibus et lignis.”

<sup>45</sup> *In Metaph.* 7, l. 5, §1416 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a16–18): “Et propter hoc etiam, sicut ibi id ex quo fit aliquid, sicut ex privatione, non praedicatur de subiecto, quia non dicimus quod sanus sit laborans, ita nec hic dicimus quod statua sit lignum; sed praedicatur abstractum in concreto, dicendo quod non est lignum, sed lignea, nec aes, sed aerea, nec lapis, sed lapidea. Et similiter domus non est lateres, sed lateritia.”

<sup>46</sup> *In Metaph.* 7, l. 5, §1414 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a5–7): “Illud enim ex quo aliquid fit ut ex materia, quandoque praedicatur non in abstracto, sed denominative. Quaedam enim dicuntur non esse «illud,» idest materia, sed «illiusmodi.» Sicut statua non dicitur lapis, sed lapidea.”

On the other hand, a convalescent man (*homo convalescens* = ὁ ἄνθρωπος ὁ ὑγιαίνων; i.e., one who is *actually becoming* healthy) is not said (to be) *that from which* (*illud ex quo* = ἐκεῖνο ἐξ οὗ).<sup>47</sup> That is, (a convalescent man) does not receive the predication of *that from which* (something) is said to come to be; for a convalescent (man) comes to be from a sick (man); yet, a convalescent (man) is not said (to be) *sick* (i.e., insofar as he is actually becoming healthy, the convalescent man is not said to be sick; for a man is said to be sick precisely insofar as he is deprived of health).

If one considers this diligently, neither the statue is made from wood, nor the house from bricks, *simply speaking* (*simpliciter loquendo* < οὐκ ἂν ἀπλῶς εἴπειεν), but *by some permutation* (*per aliquam permutationem* < διὰ τὸ δεῖν μεταβάλλοντος); and not as *from* (something) *permanent* (*ex permanente* = [ἐξ] ὑπομένοντος; e.g., not *from bricks*, which remain when the house is built).<sup>48</sup> This is the reason why such predication comes about.

#### 14.12. Common vs. Determinate Form

As just discussed, since a privation is (sometimes) unnamed, *matter with privation* is sometimes signified by the name of the matter.<sup>49</sup> For example, *bronze* (i.e., the matter) is taken for *figureless bronze* (i.e., the matter of the statue with the privation of form) when we say that the statue comes to be *from bronze* (i.e., for the statue does not come to be from bronze simply, but from such bronze that is deprived of the form of the statue: indeed, it is impossible for bronze to become the statue if it already has the form of the statue; and a statue can only come to be from a matter that is susceptible of the intended form).

Likewise, when a form is unnamed, what is understood by the simple name of the matter is the composite from matter and form.<sup>50</sup> not indeed a **determinate (form)**, but a **common (form)**. And it is in this way that (the name of the matter) is taken as a genus; for just as **species** is *the composite from (common) matter and determinate form*, so too **genus** is *the composite from matter and common form*.

<sup>47</sup> *In Metaph.* 7, l. 5, §1414 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a5–8): “Sed homo convalescens «non dicitur illud ex quo,» idest non recipit praedicationem eius ex quo fieri dicitur. Fit enim convalescens ex infirmo. Nec dicitur quod convalescens sit infirmus.”

<sup>48</sup> *In Metaph.* 7, l. 5, §1416 (cf. ARISTOTLE, *Metaphysica* Z.7, 1033a18–23): “Quia si quis diligenter inspiciat, nec fit statua ex ligno, nec domus ex lateribus simpliciter loquendo, sed per aliquam permutationem. Fiunt enim ista ex istis sicut ex aliquo permutato, et non sicut ex permanente. Aes enim figuratum non manet dum fit statua, nec lateres incompositi dum fit domus. Et propter hoc in praedictis ita dicitur, idest talis fit praedicatio.”

<sup>49</sup> *In Metaph.* 7, l. 12, §1546: “Sicut enim propter hoc quod est innominata privatio, aliquando simplici nomine materiae significatur materia cum privatione, ut supra dictum est, quod aes accipitur pro aere figurato, cum dicimus quod ex aere fit statua.”

<sup>50</sup> *In Metaph.* 7, l. 12, §1546: “ita etiam quando forma est innominata, simplici nomine materiae intelligitur compositum ex materia et forma, non quidem determinata, sed communi; et sic accipitur ut genus. Sicut enim compositum ex materia et forma determinata est species, ita compositum ex materia et forma communi est genus.”

This is evident in many (things).<sup>51</sup> For example, *body* is said in multiple modes, and can be taken as the *genus* or as the *matter* (or as a quantitative accident) of *animal*:

1. *Body* is the **genus** (i.e., a composite from common matter and common form) if in the understanding of *body* is understood (to be) a substance completed by a last form (*substantia completa ultima forma*) having in itself three dimensions (*habens in se tres dimensiones*).<sup>52</sup> Here, *body* signifies something that has a form such that, from it, three dimensions can be designated in the thing, whatever the form may be, and whether some ulterior perfection from it can proceed or not.

It may be possible for a thing that has one perfection to attain an ulterior perfection.<sup>53</sup> For example, man has a sensitive nature, but also an ulterior intellective (nature). Likewise, over the perfection of *having such a form that three dimensions can be designated in the thing*, another perfection can be added, such as *life*, or something like that. It is in this mode that the species (i.e., the composites from common matter and determinate form) of *body* will be the substances perfected by the last determinate forms, whatever these may be: for example, by the form of gold, silver, olive, or man.

Thus, in this mode, *body* is the genus of *animal*, since there will be nothing that can be taken in *animal* that is not contained implicitly in *body*, for the soul (of the animal) is the same form than *that by which three dimensions would be designated in the thing*.<sup>54</sup> And the form of *animal* is contained implicitly in the form of *body* insofar as *body* is its genus.

2. *Body* is **matter** if only *having three dimensions with an aptitude to an ultimate form* is taken in the understanding of *body*.<sup>55</sup> Here, *body* signifies something that has a form such

---

<sup>51</sup> *In Metaph.* 7, l. 12, §1547: "Et hoc in pluribus patet. Corpus enim potest accipi, et ut materia animalis, et ut genus." *De ente*, c. 2, 109–110: "Hoc igitur nomen quod est corpus multipliciter accipi potest."

<sup>52</sup> *In Metaph.* 7, l. 12, §1547: "Si enim in intellectu corporis intelligatur substantia completa ultima forma, habens in se tres dimensiones, sic corpus est genus." *De ente*, c. 2, 135–140: "Potest etiam hoc nomen corpus hoc modo accipi ut significet rem quandam que habet talem formam ex qua tres dimensiones in ea possunt designari, quecumque forma sit illa, siue ex ea possit provenire aliqua ulterior perfectio, siue non."

<sup>53</sup> *De ente*, c. 2, 115–123: "Contingit autem in rebus ut quod habet unam perfectionem, ad ulteriorem etiam perfectionem pertingat; sicut patet in homine, qui et naturam sensitivam habet, et ulterius intellectivam. Similiter etiam et super hanc perfectionem que est habere talem formam ut in ea possint tres dimensiones designari, potest alia perfectio adiungi, ut uita uel aliquid huiusmodi." *In Metaph.* 7, l. 12, §1547: "species eius erunt substantiae perfectae per has ultimas formas determinatas, sicut per formam auri, vel argenti, aut olivae, aut hominis." *De ente*, c. 2, 144–148: "et ideo cum dicebatur quod 'corpus est quod habet talem formam ex qua possunt designari tres dimensiones in eo', intelligebatur quecumque forma esset: siue anima, siue lapideitas, siue quecumque alia."

<sup>54</sup> *De ente*, c. 2, 135–150: "et hoc modo corpus erit genus animalis, quia in animali nichil erit accipere quod non implicite in corpore contineatur. Non enim anima est alia forma ab illa per quam in re illa poterant designari tres dimensiones." *Ibid.*, 135–150: "Et sic forma animalis implicite in forma corporis continetur, prout corpus est genus eius."

<sup>55</sup> *In Metaph.* 7, l. 12, §1547: "Si vero in intellectu corporis non accipiatur nisi hoc, quod est habens tres dimensiones cum aptitudine ad formam ultimam, sic corpus est materia." *De ente*, c. 2, 123–129: "Potest

that the designability of three dimensions follows from it in the thing, (but) *with precision* (*cum praecisione*): that is, such that no other perfection follows from that form; and if something were to be added over, it would be (some form having a) signification other than (*praeter*) *body* so-said.

In this mode, *body* will be an integral and material part of *animal* (► 13.8; 13.10); for, thus, the soul (i.e., the form) will be other than that which is signified by the name *body*, and will be coming over (*superveniens*) the body itself, such that, from these two—namely, soul and body (i.e., form and matter)—, an animal would be constituted as from parts.<sup>56</sup>

3. *Body* is (an accident) in the genus of **quantity** if it signifies the three dimensions that are designated in the body-substance (i.e., in the composite of matter and form).<sup>57</sup> *Body* is in the genus of substance insofar as it is composed of matter and a form (i.e., the form of corporeity), from which dimensions follow in corporeal matter.<sup>58</sup> However, the dimensions themselves—which pertain to the genus of quantity—are not substances but accidents whose subject is the substance composed from matter and form.

Quantity, which is the closest accident to substance (► 35.6), properly follows upon matter.<sup>59</sup> In turn, figure is a quality founded over (continuous) quantity: its *ratio* consists in the termination of magnitude; for **figure** is *that (magnitude) which is comprehended by a terminus or by termini* (► 4.3). Thus, figure is an (accidental) form that follows upon the (substantial) form and upon quantity; and among all accidents, it is closest to the form of the substance (► 36.14). (Whereby, *body* in this mode is the subject-matter of figures.)

---

ergo hoc nomen corpus significare rem quandam que habet talem formam ex qua sequitur in ipsa designabilitas trium dimensionum, cum precisione: ut scilicet ex illa forma nulla ulterior perfectio sequatur, sed si quid aliud superadditur, sit praeter significationem corporis sic dicti.”

<sup>56</sup> *De ente*, c. 2, 129–134: “Et hoc modo corpus erit integralis et materialis pars animalis: quia sic anima erit praeter id quod significatum est nomine corporis, et erit superueniens ipsi corpore, ita quod ex ipsis duobus, scilicet anima et corpore, sicut ex partibus constituetur animal.”

<sup>57</sup> *De ente*, c. 2, 110–115: “Corpus enim secundum quod est in genere substantie dicitur ex eo quod habet talem naturam ut in eo possint designari tres dimensiones; ipse enim tres dimensiones designate sunt corpus quod est in genere quantitatis.”

<sup>58</sup> *In Metaph.* 3, l. 13, §514: “In genere enim substantiae [corpus] est secundum quod componitur ex materia et forma, quam consequuntur dimensiones in materia corporali. Ipsae autem dimensiones pertinent ad genus quantitatis, quae non sunt substantiae, sed accidentia, quibus subiicitur substantia composita ex materia et forma.”

<sup>59</sup> *In Physic.* 3, l. 5, n. 15: “quantitas proprie consequitur materiam [...]; consequitur formam [...] praedicamentum qualitatis (unde et qualitates fundantur super quantitatem, sicut color in superficie, et figura in lineis vel in superficiebus).” *STh I*, q. 78 a. 3 ad 2: “Figura autem est qualitas circa quantitatem; cum consistat ratio figurae in terminatione magnitudinis.” *In Sent.* 4, d. 10 q. 1 a. 3 qc. 1 co.: “figura autem est qualitas circa quantitatem.” *STh I*, q. 7 a. 3 ad 3: “figura, quae consistit in terminatione quantitatis, est quaedam forma circa quantitatem.” *STh I*, q. 85 a. 1 ad 2: “quantitas propinqua est substantiae, et figura etiam consequitur quantitatem.” *In Physic.* 7, l. 5, n. 3: “figura importat terminationem quantitatis; est enim figura, quae termino vel terminis comprehenditur.” *In Physic.* 7, l. 5, n. 5: “sicut quantitas propinquissime se habet ad substantiam inter alia accidentia, ita figura, quae est qualitas circa quantitatem, propinquissime se habet ad formam substantiae.”

### 14.13. Genus vs. Matter

Although genus and matter can be the same according to the name (as just discussed), (they are) not the same (when) taken in the same mode; for matter is an integral part of the thing (► 13.8); and, therefore, it cannot be predicated of the thing.<sup>60</sup> For example, it cannot be said that man is *flesh and bone*. On the other hand, the genus is predicated of a species; whence, it must signify the whole in some mode (► 13.5).

### 14.14. No Genus Without Species

There is no genus apart from (*praeter*) those (things) that are species of the genus.<sup>61</sup> For example, no animal is found which is neither man nor ox nor something of this mode.

If something should be found which is a genus apart from species, thus taken—as apart from the species—it would not be taken as a genus, but as matter; for something can be both the genus and the matter of some things (as just discussed; ► 14.12; 14.13).<sup>62</sup>

For example, voice (*vox*) is the (subject) genus and the matter of phonemes (*literarum*).<sup>63</sup> Voice is evidently a genus because differences added to voice produce (*faciunt*) the species of phoneme voices (*species vocum literatarum*; i.e., by adding differences to voice, different species of simple phonemes and of voices composed from phonemes are produced). And voice is evidently matter because phonemes are produced from voice as something is produced from matter.

(Therefore, just as *body* can be taken as the genus and as the matter), it is likewise of *voice*.<sup>64</sup> Thus, if in the understanding of *voice* is included the formation itself of a voice in

---

<sup>60</sup> *In Metaph. 7*, l. 12, §1546: “Sciendum est autem quod, licet idem secundum nomen possit esse genus et materia, non tamen idem eodem modo acceptum. Materia enim est pars integralis rei, et ideo de re praedicari non potest. Non enim potest dici quod homo sit caro et os. Genus autem praedicatur de specie. Unde oportet quod significet aliquo modo totum.”

<sup>61</sup> *In Metaph. 7*, l. 12, §1545 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a5–6): “Genus enim non est praeter ea quae sunt species generis. Non enim invenitur animal, quod non sit nec homo, nec bos, nec aliquid aliud huiusmodi. Aut si inveniat quod est genus praeter species, sic acceptum ut est praeter species, non accipitur ut genus, sed ut materia. Contingit enim aliquod et esse genus aliquorum, et materiam.”

<sup>62</sup> *In Metaph. 7*, l. 12, §1545 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a5–6): “Genus enim non est praeter ea quae sunt species generis. Non enim invenitur animal, quod non sit nec homo, nec bos, nec aliquid aliud huiusmodi. Aut si inveniat quod est genus praeter species, sic acceptum ut est praeter species, non accipitur ut genus, sed ut materia. Contingit enim aliquod et esse genus aliquorum, et materiam.”

<sup>63</sup> *In Metaph. 7*, l. 12, §1545 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a6–8): “Sicut vox est genus literarum, et est materia. Et quod sit genus, patet per hoc quod differentiae additae voci faciunt species vocum literatarum. Et quod etiam sit materia, patet; quia «ex hac,» scilicet ex voce «faciunt elementa,» idest literas, sicut aliquid fit ex materia.”

<sup>64</sup> *In Metaph. 7*, l. 12, §1548: “Et similiter est de voce. Si enim in intellectu vocis includatur ipsa vocis formatio in communi secundum formam quae distinguitur in diversas formas literarum et syllabarum, sic vox est genus. Si autem in intellectu vocis accipitur solum substantia soni, cui possibile est advenire praedictam formationem, sic vox erit materia literarum.”

common, according to a form that is distinguished into diverse forms of phonemes (i.e., elementary voices) and of syllables (i.e., syllables composed from such elements), then *voice* is the (subject) genus (of phonemes and syllables). On the other hand, if in the understanding of *voice* is taken only the substance of sound, in which the aforesaid formation can come about, then *voice* is the matter of phonemes.

Whence, it is evident that *voice*, insofar as it is a genus, cannot be without species; for there cannot be a formed sound unless it has some determinate form, (be it) of *this* or of *that* phoneme.<sup>65</sup> But if it should altogether lack the form of a phoneme, insofar as it is matter, then it would be found without phonemes, just as bronze is found without those (artifacts) that come to be (or are produced, made) from bronze.

#### 14.15. Genus vs. Species

The essence of Sortes and the essence of man differ only according as the signed (differs from) the unsigned (► 13.12; 13.15).<sup>66</sup> The essence of the species and of the genus differ also only according to the signed and the unsigned (► 14.12), although the designation is diverse; for the designation of the individual with respect to the species is by matter determined by dimensions, while the designation of the species in respect of the genus is by a constitutive difference, which is taken from the form of the thing.<sup>67</sup>

This determination or designation that is in the species in respect of the genus, is not by something that exists in the essence of the species but in no way is in the essence of the genus.<sup>68</sup> On the contrary, whatever is in the species is also in the genus as non-determined. Thus, if *animal* should not be the whole of what man is but a part of it, (*animal*) would not be predicated of (*man*), since no integral part is predicated of its whole (► 13.8).

In what mode this may happen can be seen if one considers how *body* differs insofar as it is posited (as) a part of an animal and insofar as it is posited (as) a genus; for a genus

---

<sup>65</sup> *In Metaph.* 7, l. 12, §1548: “Ex quo etiam patet quod vox, secundum quod est genus, non potest esse sine speciebus. Non enim potest esse sonus formatus, quin aliquam determinatam formam habeat huius vel illius literae. Sed si omnino careret forma literali prout est materia, sic inveniretur sine literis, sicut aes invenitur absque his quae fiunt ex aere.”

<sup>66</sup> *De ente*, c. 2, 85–89: “essentia hominis et essentia Sortis non differt nisi secundum signatum et non signatum; unde Commentator dicit super VII Methaphisice «Sortes nichil aliud est quam animalitas et rationalitas, que sunt quiditas eius».”

<sup>67</sup> *De ente*, c. 2, 90–96: “Sic etiam essentia generis et speciei secundum signatum et non signatum differunt, quamvis alius modus designationis sit utrobique: quia designatio individui respectu speciei est per materiam determinatam dimensionibus, designatio autem speciei respectu generis est per differentiam constitutivam que ex forma rel sumitur.”

<sup>68</sup> *De ente*, c. 2, 96–104: “Hec autem determinatio uel designatio que est in specie respectu generis, non est per aliquid in essentia speciei existens quod nullo modo in essentia generis sit; immo quicquid est in specie est etiam in genere ut non determinatum. Si enim animal non esset totum quod est homo sed pars eius, non predicaretur de eo, cum nulla pars integralis de suo toto predicetur.”

cannot be posited in the mode of that which is an integral part (► 14.12; 14.13).<sup>69</sup> Such is the relation of *animal* to *man*; for if only something which has such perfection that it can sense and move by a principle existing in it should be named *animal* with precision (i.e., cutting-off) of other perfections, then whatever other ulterior perfection should come over it would be related to *animal* by the mode of a co-part, and not as contained implicitly in the *ratio* of *animal*.<sup>70</sup> And *animal* would not be a genus so. But it is a genus insofar as it signifies something from whose form—whatever it may be—can proceed sense and motion, whether it is only a sensible soul or at once sensible and rational.

#### 14.16. Genus vs. Difference

The difference is compared to the genus as form to matter insofar as (the difference) makes the genus be in act.<sup>71</sup> But the genus is also considered as more formal than the species insofar as it is more absolute and less contracted; whence, also the parts of the definition are reduced to the genus of formal cause; and according to this, the genus is a formal cause of the species—and it will be more formal the more it is common.

The difference is not more noble than the genus as one nature is nobler than another, or as one form is nobler than another; for the difference does not convey (*dicit*) any form that is not implicitly contained in the nature of the genus, since the genus does not signify a part of the essence of the thing, but the whole, as AVICENNA says.<sup>72</sup> Rather, (the difference) is said to be nobler than the genus as the determinate (is said to be nobler) than the indeterminate.

Again, the difference names the whole nature of the species; otherwise, it would not be predicated of the species, as AVICENNA says.<sup>73</sup> However, it does not name (it) from the

<sup>69</sup> *De ente*, c. 2, 105–109: “Hoc autem quomodo contingat uideri poterit, si inspiciatur qualiter differt corpus secundum quod ponitur pars animalis, et secundum quod ponitur genus; non enim potest esse eo modo genus quo est pars integralis.”

<sup>70</sup> *De ente*, c. 2, 151–163: “Et talis est etiam habitudo animalis ad hominem. Si enim animal nominaret tantum rem quandam que habet talem perfectionem ut possit sentire et moueri per principium in ipso existens, cum precisione alterius perfectionis, tunc quecumque alia perfectio ulterior superueniret haberet se ad animal per modum compartis, et non sicut implicite contenta in ratione animalis: et sic animal non esset genus. Sed est genus secundum quod significat rem quandam ex cuius forma potest prouenire sensus et motus, quecumque sit illa forma: siue sit anima sensibilis tantum, siue sensibilis et rationalis simul.”

<sup>71</sup> *STh* I-II, q. 18 a. 7 ad 3: “differentia comparatur ad genus ut forma ad materiam, in quantum facit esse genus in actu. Sed etiam genus consideratur ut formalius specie, secundum quod est absolutius, et minus contractum. Unde et partes definitionis reducuntur ad genus causae formalis, ut dicitur in libro *Physic*. Et secundum hoc, genus est causa formalis speciei, et tanto erit formalius, quanto communius.”

<sup>72</sup> *In Sent.* 2, d. 3 q. 1 a. 6 ad 1: “differentia non est nobilior genere, sicut natura una est nobilior altera, vel sicut forma una nobilior est alia: quia differentia nullam formam dicit, quae implicite in natura generis non contineatur, ut dicit Avicenna: genus enim non significat partem essentiae rei, sed totum. Sed dicitur genere nobilior, sicut determinatum indeterminato.”

<sup>73</sup> *In Sent.* 3, d. 5 q. 1 a. 2 ad 2: “sicut dicit Avicenna, differentia nominat totam naturam speciei; alias non praedicaretur de specie; sed non nominat ex toto, sed ex parte, scilicet formali principio: dicitur enim rationale habens rationem. Genus autem e converso nominat totum ex principio materiali. Unde

whole, but from a part: that is, (from) the formal principle; for that is said (to be) *rational* which has reason. The genus, conversely, names the whole from the material principle. Whence, a difference is not added to a difference because a nature is added to a nature, but because a further formal principle is added: e.g., the intellective (formal principle is added) over the sensitive (formal principle).

A genus signifies indeterminately the whole that is in the species; for it does not signify only matter (as just explained).<sup>74</sup> Likewise, also the difference signifies the whole; and it does not signify only the form. The definition or species also signifies the whole; but diversely; for the genus signifies the whole as some denomination determining that which is material in the thing without determination of the proper form; and so, the genus is taken from matter—although it is not matter, as is evident because *body* is said from its having such a perfection *that three dimensions can be designated*; and this perfection is related as matter (*materialiter*) to an ulterior perfection (► 14.12).

Conversely, a difference is as some denomination taken from a determinate form without there being a determinate matter in its first understanding, as is evident when *animate*—i.e., that which has a soul—is said; yet, what (that matter) should be is not determined: whether a body or something else.<sup>75</sup> Whence, AVICENNA says that the genus is not understood in the difference as a part of its essence, but only as a being outside of the essence, as also the subject belongs to the understanding of (its) affections.<sup>76</sup>

---

differentia non additur differentiae per hoc quod natura additur naturae, sed per hoc quod ulterius principium formale additur, sicut intellectivum supra sensitivum.”

<sup>74</sup> *De ente*, c. 2, 164–177: “Sic ergo genus significat indeterminate totum id quod est in specie, non enim significat tantum materiam. Similiter etiam et differentia significat totum, et non significat tantum formam; et etiam diffinitio significat totum, uel etiam species. Sed tamen diuersimode: quia genus significat totum ut quedam denominatio determinans id quod est materiale in re sine determinatione proprie forme, unde genus sumitur ex materia—quamuis non sit materia—; ut patet quia corpus dicitur ex hoc quod habet talem perfectionem ut possint in eo designari tres dimensiones, que quidem perfectio est materialiter se habens ad ulteriorem perfectionem.”

<sup>75</sup> *De ente*, c. 2, 177–187: “Differentia uero e conuerso est sicut quedam denominatio a forma determinata sumpta, preter hoc quod de primo intellectu eius sit materia determinata; ut patet cum dicitur animatum, scilicet illud quod habet animam, non enim determinatur quid sit, utrum corpus uel aliquid aliud: unde dicit Avicenna quod genus non intelligitur in differentia sicut pars essentie eius, sed solum sicut ens extra essentiam, sicut etiam subiectum est de intellectu passionum.”

<sup>76</sup> See AVICENNA, *The Metaphysics of The Healing*, ed. Daniel C. Peterson, trans. Michael E. Marmura, Islamic Translation Series Al-Hikma (Provo, Utah: Brigham Young University Press, 2005), 177, 11–17: “ونقول أيضا إن الجنس يحمل على النوع على أنه جزء من ماهيته، ويحمل على الفصل على أنه لازم له لا على أنه جزء من ماهيته. “ أمثاله الحيوان يحمل على الإنسان على أنه جزء من ماهيته، ويحمل على الناطق على أنه لازم له لا على أنه جزء من ماهيته. وإنما يعنى بالناطق شيء له نطق وشيء له نفس ناطقة من غير أن يتضمن نفس قولنا الناطق بيانا لذلك الشيء أنه جوهر أو غير جوهر. إلا أنه يلزم أن لا يكون هذا الشيء إلا جوهرًا وإلا جسمًا وإلا حساسًا، فتكون هذا الأمور مقولة عليه قول اللازم على الملزوم لأنها غير “داخلة في مفهوم الناطق أي الشيء ذي النطق. Cf. AVICENNA, *Liber de philosophia prima*, 5.6, 281.94–282.4: “Dicemus etiam quod genus praedicatur de specie, ita quod est pars quidditatis eius, et praedicatur de differentia, ita quod comitans eam, non pars quidditatis eius: verbi gratia, animal praedicatur de homine quoniam est pars quidditatis eius, et praedicatur de rationali, quoniam est comitans ipsum <...>. Non enim intelligimus rationale, nisi quod est habens rationalitatem et quod est habens animam rationalem, ita quod hoc nomen *rationale* non significat an illud sit substantia an non, sed comitatur ipsum non esse

Therefore, speaking by itself (►17), the genus is not predicated of the difference either: unless, perhaps, as a subject is predicated of an affection.<sup>77</sup> In turn, the definition or species comprehends both: that is, a determinate matter that the name of the genus designates, and a determinate form that the name of the difference designates.

As ARISTOTLE says (►16.5), the differences that divide some genus and constitute a species in that genus must divide it by themselves (*per se*); for if (the differences divide the genus) by accident, the division does not proceed correctly.<sup>78</sup> For example, if someone says, “of animals, one rational and the other irrational; and of irrational animals, one winged and another non-winged,” *winged* and *non-winged* are not determinative of that which is irrational. Instead, one must divide thus: “of animals, one having feet, another not having feet; and of (those) having feet, one has two, another four, another many”; for these determine by themselves the prior differences.

#### 14.17. Relation of Genus-Difference-Species to Matter-Form-Composite

Genus, difference, and species are related proportionately to matter, form, and composite in nature, although they are not the same; for neither the genus is the matter, but is taken from the matter as signifying a whole, nor is the difference the form, but is taken from the form as signifying a whole (concerning the species, see below; ►14.18).<sup>79</sup>

Whence, we say that man *is a rational animal*, and not (that it is) *from animal and rational*, as we say that (man) is *from soul and body*; for man is said to be *from soul and body* as if from two things were constituted a third thing that is neither of them; for man is neither soul nor body.<sup>80</sup> But if man is said to be, in some mode, *from animal and rational*, it is not

---

nisi substantiam et nisi corpus et nisi sensibile; haec igitur praedicantur de illo, sicut praedicatur comitans de suo comitato: non enim continetur in intellectu rationalis, scilicet rei habentis rationalitatem.”

<sup>77</sup> *De ente*, c. 2, 187–194: “Et ideo etiam genus non predicatur de differentia per se loquendo, ut dicit Philosophus in III Methaphisice et in IV Topicorum, nisi forte sicut subiectum predicatur de passione. Sed diffinitio uel species comprehendit utrumque, scilicet determinatam materiam quam designat nomen generis, et determinatam formam quam designat nomen differentie.”

<sup>78</sup> *STh* I-II, q. 18 a. 7 co.: “Oportet autem, ut Philosophus dicit in VII Metaphys. quod differentiae dividentes aliquod genus, et constituentes speciem illius generis, per se dividant illud. Si autem per accidens, non recte procedit divisio, puta si quis dicat, animalium aliud rationale, aliud irrationale; et animalium irrationalium aliud alatum, aliud non alatum, alatum enim et non alatum non sunt per se determinativa eius quod est irrationale. Oportet autem sic dividere, animalium aliud habens pedes, aliud non habens pedes; et habentium pedes, aliud habet duos, aliud quatuor, aliud multos, haec enim per se determinant priorem differentiam.”

<sup>79</sup> *De ente*, c. 2, 195–201: “Et ex hoc patet ratio quare genus, species et differentia se habent proportionaliter ad materiam et formam et compositum in natura, quamuis non sint idem quod illa: quia neque genus est materia, sed a materia sumptum ut significans totum; neque differentia forma, sed a forma sumpta ut significans totum.”

<sup>80</sup> *De ente*, c. 2, 201–217: “Et ex hoc patet ratio quare genus, species et differentia se habent proportionaliter ad materiam et formam et compositum in natura, quamuis non sint idem quod illa: quia neque genus est materia, sed a materia sumptum ut significans totum; neque differentia forma, sed a forma sumpta ut significans totum. Vnde dicimus hominem esse animal rationale, et non ex animali et rationali sicut dicimus eum esse ex anima et corpore: ex anima enim et corpore dicitur esse homo sicut

as a third thing (is constituted) from two things, but as a third understanding (is constituted) from two understandings (*sicut intellectus tertius ex duobus intellectibus*); for the understanding of *animal* is without the determination of a special form, expressing the nature of a thing from that which is material in respect of an ultimate perfection. On the other hand, the understanding of the difference *rational* consists in the determination of a special form. And from these two understandings is constituted the understanding of the species or definition.

Hence, just as a thing constituted from some things does not receive the predication of those things from which it is constituted (i.e., integrated), neither does an understanding receive the predication of those understandings from which it is constituted; for we do not say that the definition is the genus or the difference.<sup>81</sup>

Although the genus signifies the whole essence of the species, it is not necessary, however, for diverse species of the same genus to have one essence; for the unity of the genus proceeds from indetermination or indifference itself.<sup>82</sup> But not in such a way that that which is signified by the genus would be a numerically-one nature in diverse species, to which there should supervene (*superveniat*) another thing that would be its determining difference, as a form determines a matter that is one in number. Rather, this is because the genus signifies some form—not, however, determinately *this* or *that* (*form*)—that the difference expresses determinately, which is no other (form) than that which was signified indeterminately by the genus.

Hence, AVERROES says that first matter is said (to be) *one* by the removal of all forms, while the genus is said (to be) *one* by the community of the form signified.<sup>83</sup> Thus, it is

---

ex duabus rebus quedam res tertia constituta que neutra illarum est, homo enim neque est anima neque corpus. Sed si homo aliquo modo ex animali et rationali esse dicatur, non erit sicut res tertia ex duabus rebus, sed sicut intellectus tertius ex duobus intellectibus. Intellectus enim animalis est sine determinatione specialis forme, exprimens naturam rei ab eo quod est materiale respectu ultime perfectionis; intellectus autem huius differentie rationalis consistit in determinatione forme specialis: ex quibus duobus intellectibus constituitur intellectus speciei uel diffinitionis.”

<sup>81</sup> *De ente*, c. 2, 217–222: “Et ideo sicut res constituta ex aliquibus non recipit predicationem earum rerum ex quibus constituitur, ita nec intellectus recipit predicationem eorum intellectuum ex quibus eonstituitur: non enim dicimus quod diffinitio sit genus aut differentia.”

<sup>82</sup> *De ente*, c. 2, 223–236: “Quamuis autem genus significet totam essentiam speciei, non tamen oportet ut diuersarum specierum quarum est idem genus, sit una essentia, quia unitas generis ex ipsa indeterminatione uel indifferentia procedit. Non autem ita quod illud quod significatur per genus sit una natura numero in diuersis speciebus, cui superueniat res alia que sit differentia determinans ipsum, sicut forma determinat materiam que est una numero; sed quia genus significat aliquam formam—non tamen determinate hanc uel illam—, quam determinate differentia exprimit, que non est alia quam illa que indeterminate significabatur per genus.”

<sup>83</sup> *De ente*, c. 2, 236–242: “Et ideo dicit Commentator in XI Methaphisice quod materia prima dicitur una per remotionem omnium formarum, sed genus dicitur unum per communitatem forme significate. Vnde patet quod per additionem differentie remota illa indeterminatione que erat causa unitatis generis, remanent species per essentiam diuerse.”

evident that, when the indetermination that was the cause of the unity of the genus is removed by the addition of differences, there remain species diverse by (their) essence.

#### 14.18. Species vs. Individual

Just as the nature of the genus (is undetermined) in respect of a species, (so, too), the nature of the species is indeterminate in respect of an individual.<sup>84</sup> Thus, just as that which is a genus—insofar as it is predicated of a species—implies in its signification—although indistinctly—the whole that is in the species determinately, so too that which is a species—insofar as it is predicated of an individual—must signify the whole that is essentially in the individual—although indistinctly. In this mode, the essence of the species is signified by the name *man*; whence *man* is predicated of *Sortes*.

If, on the other hand, we should signify the nature of the species with precision (i.e., cutting off) of designated matter, which is the principle of individuation, (the species) would then be related according to the mode of part (►13.12).<sup>85</sup> And in this mode is signified the name *humanity*; for *humanity* signifies *that whence man is man (id unde homo est homo)*. Designated matter is not *that whence man is man*; and, hence, it is not contained in any mode among those (principles) from which *man* has its being *man*. Therefore, since *humanity* includes in its understanding only those (principles) from which *man* has its being *man*, it is evident that designated matter is excluded or cut-off (*praeciditur*) from the signification. And since the part is not predicated of the whole, hence, *humanity* is not predicated of *man*; nor (is *humanity* predicated) of *Sortes*.

Whence, AVICENNA says that the quiddity of the composite is not the composite itself of which the quiddity is, although the quiddity itself is a composite, too.<sup>86</sup> For example,

---

<sup>84</sup> *De ente*, c. 2, 243–254: “Et quia, ut dictum est, natura speciei est indeterminata respectu individui sicut natura generis respectu speciei: inde est quod, sicut id quod est genus prout predicabatur de specie implicabat in sua significatione, quamvis indistincte, totum quod determinate est in specie, ita etiam et id quod est species secundum quod predicatur de individuo oportet quod significet totum id quod est essentialiter in individuo, licet indistincte. Et hoc modo essentia speciei significatur nomine hominis, unde homo de Sorte predicatur.”

<sup>85</sup> *De ente*, c. 2, 254–267: “Si autem significetur natura speciei cum precisione materie designate que est principium individuationis, sic se habebit per modum partis; et hoc modo significatur nomine humanitatis, humanitas enim significat id unde homo est homo. Materia autem designata non est id unde homo est homo, et ita nullo modo continetur inter illa ex quibus homo habet quod sit homo. Cum ergo humanitas in suo intellectu includat tantum ea ex quibus homo habet quod est homo, patet quod a significatione excluditur uel praeciditur materia designata; et quia pars non predicatur de toto, inde est quod humanitas nec de homine nec de Sorte predicatur.”

<sup>86</sup> *De ente*, c. 2, 267–273: “Vnde dicit Avicenna quod quidditas compositi non est ipsum compositum cuius est quidditas, quamvis etiam ipsa quidditas sit composita; sicut humanitas, licet sit composita, non est homo: immo oportet quod sit recepta in aliquo quod est materia designata.” See AVICENNA, *The Metaphysics of The Healing*, 177, 1–4: “وأما الماهية فهي ما بها هي ما هي، وإنما هي ما هي بكون الصورة مقارنة للمادة، وهو أزيد من معنى الصورة. والمركب ليس هذا المعنى أيضاً، بل هو مجموع الصورة والمادة؛ فإن هذا هو ما هو المركب، والماهية هذا التركيب.” Cf. AVICENNA, *Liber de philosophia prima*, 5.5, 275.69–73: “quidditas vero est id quod est quicquid est, forma existente coniuncta materiae, quod quidem amplius est quam intentio formae;

although humanity is a composite, it is not a man. On the contrary, (humanity) must be received in something, which is designated matter.

As just said, the designation of the species in respect of the genus is by (a determinate) form, while the designation of the individual in respect of the species is by (designated) matter.<sup>87</sup> Therefore, the name that signifies *that whence the nature of the genus is taken*—with precision (i.e., cutting-off) of the determinate form that perfects the species—must signify a material part of the whole, as *body* is the material part of man (► 14.12). And the name that signifies *that whence the nature of the species is taken*, with precision (i.e., cutting-off) of designated matter, signifies the formal part.

Thus, humanity is signified as some form, and is said (to be) *the form of the whole*: not indeed as (if it were) added over the essential parts—i.e., form and matter—as the form of the house is added over its integral parts; rather, it is the form that is the whole that encompasses also matter, although with precision of those (principles) by which matter is naturally apt to be designated.<sup>88</sup>

Therefore, it is evident that the name *man* and the name *humanity* signify the essence of man—but diversely.<sup>89</sup> The name *man* signifies (the essence of man) as a whole: that is, insofar it does not cut off the designation of matter, but indistinctly contains it, too, as the genus contains the difference; whence, the name *man* is predicated of individuals. On the other hand, the name *humanity* signifies (the essence of man) as a part; for it only contains in its signification that which belongs to man insofar as it is a man; and cuts off all designation; whence, it is not predicated of individual men. And this is the reason why the name *essence* is sometimes found predicated of a thing; for we say that *Sortes* is some

---

compositio etiam non est haec intentio quia composita est ex forma et materia; haec enim est quidditas compositi et quidditas est haec compositio.”

<sup>87</sup> *De ente*, c. 2, 274–283: “Sed quia, ut dictum est, designatio speciei respectu generis est per formam, designatio autem individui respectu speciei est per materiam, ideo oportet ut nomen significans id unde natura generis sumitur, cum precisione forme determinate perficientis speciem, significet partem materialem totius, sicut corpus est pars materialis hominis; nomen autem significans id unde sumitur natura speciei, cum precisione materie designate, significat partem formalem.”

<sup>88</sup> *De ente*, c. 2, 283–291: “Et ideo humanitas significatur ut forma quedam, et dicitur quod est forma totius; non quidem quasi superaddita partibus essentialibus, scilicet forme et materie, sicut forma domus superadditur partibus integralibus eius: sed magis est forma que est totum, scilicet formam complectens et materiam, tamen cum precisione eorum per que nata est materia designari.”

<sup>89</sup> *De ente*, c. 2, 292–308: “Sic igitur patet quod essentiam hominis significat hoc nomen homo et hoc nomen humanitas, sed diuersimode, ut dictum est: quia hoc nomen homo significat eam ut totum, in quantum scilicet non precidit designationem materie sed implicite continet eam et indistincte, sicut dictum est quod genus continet differentiam; et ideo predieatur hoc nomen homo de individuis. Sed hoc nomen humanitas significat eam ut partem, quia non continet in significatione sua nisi id quod est hominis in quantum est homo, et precidit omnem designationem; unde de individuis hominis non predicatur. Et propter hoc nomen essentie quandoque inuenitur predicatum de re, dicimus enim Sortem esse essentiam quandam; et quandoque negatur, sicut dicimus quod essentia Sortis non est Sortes.”

essence; and sometimes it is negated, as when we say that the essence of Sortes is not Sortes.

#### 14.19. Order between Genus and Species

Supposing that genera are the principles of things, there is a question as to whether:<sup>90</sup>

1. The principles (of things) are the universals said of the most specific species (*species specialissimae*), which Platonists call *genera* because they contain under themselves multiple individuals, just as genera (contain under themselves) multiple species.
2. Or the first, most general (genera) are more the principles (of things).

For example, which is more a principle: *animal* or *man*? Which (universal), according to Platonists, is some principle more truly existing than the singular.

Since that which is the last terminus of division seems always to be the principle and element in composition, this question arises because of two divisions of *ratio*:

1. Insofar as we divide genera into species.
2. Insofar as we resolve species into genera.

According to the metaphorical *ratio* of *element* (► 12.12), it is evident that a genus is more an element than a species because they are more universal and more indivisible; for there is no *ratio* or definition of genera that could be composed from genus and difference: rather, definitions are properly given of species.<sup>91</sup> And if some genus is defined, it is not defined insofar as it is a genus, but insofar as it is a species. Thus, a species is divided into diverse (i.e., a species is divided into genus and difference, two principles that are

---

<sup>90</sup> *In Metaph.* 3, l. 3, §356 (cf. ARISTOTLE, *Metaphysica* B.1, 995b29–31): “*Secunda* quaestio est, supposito quod genera sint principia rerum, utrum principia sint universalia dicta de individuis, scilicet species specialissimae, quas genera appellat secundum Platoniorum consuetudinem, quia continent sub se plura individua, sicut genera plures species; aut magis sint principia prima generalissima, ut puta quid sit magis principium, utrum animal vel homo, qui est principium quoddam secundum Platonicos, et magis vere existens quam singulare. Oritur autem haec dubitatio propter duas divisiones rationis. Quarum una est secundum quam genera dividimus in species. Alia vero est secundum quam species resolvimus in genera. Semper enim videtur illud quod est ultimus terminus divisionis esse primum principium et elementum in componendo.”

<sup>91</sup> *In Metaph.* 5, l. 4, §805 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b9–11): “Hac autem transumptiva elementi ratione constituta, patet solutio cuiusdam quaestionis in tertio libro disputatae; scilicet quid sit magis elementum, utrum genus vel species, et utrum genus magis quam differentia. Patet enim consequi quod genera magis sunt elementa, quia genera magis sunt universalia et indivisibilia. Non enim est ratio eorum et definitio, quam oporteat componi ex genere et differentia; sed definitiones proprie dantur de speciebus. Et si aliquod genus definitur, non definitur in quantum est genus, sed in quantum est species; et ideo species dividitur in diversa, et propter hoc non habent rationem elementi. Genus autem non dividitur in diversa: et ideo dixerunt genera esse elementa magis quam species. Alia translatio habet «Una enim est eorum ratio» idest indivisibilis, quia genera, etsi non habeant definitionem, tamen id quod significatur per nomen generis, est quaedam conceptio intellectus simplex, quae ratio dici potest.”

diverse in species); and, because of this, they do not have the *ratio* of element (► 12.9, ¶4). On the other hand, the genus is not divisible into (principles) diverse (in species); whence, (Platonists) said that genera are more elements than species. Moreover, even if genera do not have a definition, that which is signified by the name of the genus is some simple conception of the intellect (► 19.1, ¶1), which can be said (to be a) *ratio* (► 8.1).

And just as the genus is more an element than the species; for it is simpler; so is it also more (an element) than the difference, even if (the difference) is simple, since (the genus) is more universal.<sup>92</sup> This is evident because, in whatever there is a difference, in it there is a genus, since differences by themselves (*per se*) do not transcend a genus; and it is not necessary for a difference to follow upon everything to which a genus befits (*convenit*).

(Therefore, to answer the above question, we must consider that) the principles of the genus precede the principles of the species.<sup>93</sup> Whence, absolutely considered, a genus is naturally prior to its species insofar as the latter are included in the former.<sup>94</sup> But insofar as the genus is compared to its species as potency to act (i.e., insofar as the genus, which is some whole, is divisible into its species and contains them only potentially), species are naturally prior to their genus (i.e., because act is prior to potency).

---

<sup>92</sup> *In Metaph.* 5, l. 4, §806 (cf. ARISTOTLE, *Metaphysica* Δ.3, 1014b11–14): “Et sicut genus est magis elementum quam species, quia est simplicius; ita etiam magis quam differentia, licet ipsa simplex sit, quia genus est universalius. Quod ex hoc patet: quia cuicumque inest differentia, inest genus, cum per se differentiae non transcendant genus: non tamen oportet quod ad omne id sequatur differentia cui convenit genus.”

<sup>93</sup> *In Sent.* 4, d. 14 q. 1 a. 2 qc. 3 co.: “principia generis praecedunt principia speciei.”

<sup>94</sup> *Quodlibet* 5, q. 10 a. 1 co.: “in consiliis necesse est ut includantur praecepta [...]; sed non convertitur. Erit ergo una comparatio consiliorum ad praecepta absolute considerata. Et sic hoc modo praecepta erunt ordine naturae priora consiliis, sicut genus est naturaliter prius specie; consilia autem e converso priora naturaliter praeceptis, sicut species sunt priores secundum naturam quam genera, ut patet per Philosophum, I Phys. Comparatur enim genus ad speciem sicut potentia ad actum.”

## 15. Substance and Accident

Since matter and subject are in potency to substantial and accidental being respectively (► 14.7, 14.8), and since the genus is taken from such matter or subject (► 14.12), we must determine what substance and accident are, and how they are related.

### 15.1. Substance

As ARISTOTLE says, there are at least four modes—if not more—in which **substance** (*substantia* = οὐσία) is said (we follow here the division posited in *Metaphysics* Z.3):<sup>1</sup>

1. The **essence, quiddity** or **nature** of a thing («*quod quid erat esse*,» *idest quidditas, vel essentia, sive natura rei* = τὸ τί ἦν εἶναι), whose *ratio* is the definition (► 8.1).<sup>2</sup> In this mode, substance—as also essence—is found in all the genera. This is what is signified when one asks, “What is whiteness? A color.”

It should be noted that *substance* is said (as per *Metaphysics* Δ.8; cf. Z.13) of *that which is the cause of being* (*quae est causa essendi* < ὃ ἂν ἦ αἴτιον τοῦ εἶναι) of particular substances (see number 4, below), which are not said of a subject (*quae non dicuntur de subiecto* < ὅσα μὴ λέγεται καθ’ ὑποκειμένου):<sup>3</sup> not indeed of extrinsic (causes), such as the efficient (or moving cause), but intrinsic to them (*intrinseca eis* < ἐνυπάρχον ἐν τοῖς τοιοῦτοις), as the form. For example, the soul is said (to be the) *substance* of *animal*.

Indeed, essence pertains to form (i.e., it is a formal part of the whole individual; ► 13.10).<sup>4</sup> However, the *quiddity* or *essence* of a thing—whose *ratio* is the definition—differs from

---

<sup>1</sup> *In Metaph.* 7, l. 2, §1270 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b33–34): “Dicit ergo [Philosophus] primo, quod substantia ad minus dicitur quatuor modis, si non dicatur «multiplicius,» idest pluribus modis. Sunt enim plures modi, quibus aliqui substantiam nominant; ut patet de dicentibus terminos corporis esse substantias, qui modus hic praetermittitur.” *In Metaph.* 5, l. 10, §898 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b10–26): “ostendit [Philosophus] quot modis dicitur substantia: [...] ponit quatuor modos.” *In Sent.* 1, d. 25 q. 1 a. 1 ad 7: “substantia dicitur quatuor modis.”

<sup>2</sup> *In Metaph.* 7, l. 2, §1270 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b34): “Quorum quidem modorum *primus* est secundum quod «quod quid erat esse,» idest quidditas, sive essentia, sive natura rei dicitur eius substantia.” *In Metaph.* 5, l. 10, §902 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b21–22): “Quartum modum [...] dicit [Philosophus] quod etiam quidditas rei, quam significat definitio, dicitur substantia uniuscuiusque.” <sup>2</sup> *In Metaph.* 7, l. 2, §1299 (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b1–3): “dicit [Philosophus], quod cum prius divisum sit, quot modis dicatur substantia, inter istos modos unus modus est prout quod quid erat esse, idest quidditas et essentia rei, dicitur substantia.” *In Metaph.* 7, l. 13, §1566 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b2–3): “Et alio modo dicitur substantia quod quid erat esse.” *In Sent.* 1, d. 25 q. 1 a. 1 ad 7: “Uno modo substantia idem est quod essentia; et sic substantia invenitur in omnibus generibus, sicut et essentia; et hoc significatur, cum quaeritur: quid est albedo? Color.”

<sup>3</sup> *In Metaph.* 5, l. 10, §899 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b14–16): “alio modo dicitur substantia quae est causa essendi praedictis substantiis quae non dicuntur de subiecto; non quidem extrinseca sicut efficiens, sed intrinseca eis, ut forma. Sicut dicitur anima substantia animalis.”

<sup>4</sup> *In Metaph.* 7, l. 13, §1566: “dicitur substantia quod quid erat esse, quod pertinet ad formam.” *In Metaph.* 5, l. 10, §902: “Haec autem quidditas sive rei essentia, cuius definitio est ratio, differt a forma quam dixit [Philosophus] esse substantiam in secundo modo, sicut differt humanitas ab anima. Nam forma est pars essentiae vel quidditatis rei. Ipsa autem quidditas vel essentia rei includit omnia essentialia principia.”

form—which ARISTOTLE (also) calls *substance* (in *Metaphysics* Δ.8)—as *humanity* differs from *soul*; for form is part of the essence or quiddity of the thing, and the quiddity or essence of the thing includes itself all essential principles (► 13.12; 14.18).

Thus, in this mode, the (predicable) genus and the species are said to be the substance of those things of which they are predicated, for genus and species do not signify only the form, but the whole essence of the thing.<sup>5</sup>

2. The **universal** (*universale* = τὸ καθόλου), in the opinion of those (Platonists) who posit Ideas (to be) the species (of things).<sup>6</sup> These are the universals predicated of singulars, and (these singular things) are their particular substances (¶4).

3. The **first genus** (*primum genus* < τὸ γένος) of each thing.<sup>7</sup> In this mode, *one* (*unum*) and *being* (*ens*) were posited (by Platonists; ► 30.11; erroneously) to be the substance of all things as the first genera of all.

4. The **subject** (*subiectum* = τὸ ὑποκείμενον), i.e., the *particular substance* (*substantia particularis*).<sup>8</sup> Particular substances are said (to be) *substances* because they are not said (i.e., predicated) of another subject: rather, others are said of them (► 14.6). For example, simple bodies such as elements (are said to be *substances*); and universally, all bodies, even if they are not simple, as compound bodies of like parts: for example, stone, blood, flesh, and other such; also, animals, and their parts, such as hands and feet.

5. Any of the (intrinsic) particles in the aforesaid (particular) substances that are their termini.<sup>9</sup> These, according to the opinion of Platonists and Pythagoreans, signify *this*

---

<sup>5</sup> In *Metaph.* 5, l. 10, §902: “Et ideo genus et species dicuntur esse substantia eorum, de quibus praedicantur, hoc ultimo modo. Nam genus et species non significant tantum formam, sed totam rei essentiam.”

<sup>6</sup> In *Metaph.* 7, l. 2, §1271 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b34): “Secundus modus est prout «universale» dicitur substantia esse, secundum opinionem ponentium ideas species, quae sunt universalis de singularibus praedicata, et sunt horum particularium substantiae.” In *Metaph.* 7, l. 13, §1566 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b3): “Et quarto modo dicitur substantia a quibusdam universale.”

<sup>7</sup> In *Metaph.* 7, l. 2, §1272 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b35): “Tertius modus est secundum quod «primum genus videtur esse substantia uniuscuiusque.» Et per hunc modum unum et ens ponebant substantias esse omnium rerum, tanquam prima omnium genera.”

<sup>8</sup> In *Metaph.* 7, l. 2, §1273 (cf. ARISTOTLE, *Metaphysica* Z.3, 1028b35–36): “Quartus modus est secundum quod «subiectum,» idest substantia particularis dicitur esse substantia.” In *Metaph.* 5, l. 10, §898 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b10–14): “primus est secundum quod substantiae particulares dicuntur substantiae, sicut simplicia corpora, ut terra et ignis et aqua et huiusmodi. Et universaliter omnia corpora, etiam si non sint simplicia, sicut mixta similium partium, ut lapis, sanguis, caro, et huiusmodi. Et iterum animalia quae constant et huiusmodi corporibus sensibilibus, et partes eorum, ut manus et pedes et huiusmodi [...]. Haec enim omnia praedicta dicuntur substantia, quia non dicuntur de alio subiecto, sed alia dicuntur de his.”

<sup>9</sup> In *Metaph.* 5, l. 10, §900 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b17–21): “ponit [Philosophus] tertium modum, secundum opinionem Platoniorum et Pythagoricorum, dicens, quod quaecumque particulae sunt in praedictis substantiis, quae sunt termini earum, et significant hoc aliquid secundum opinionem

*something*; and, if destructed, the whole is destructed too. For example, if the surface is destroyed, the body is destroyed; and if the line is destroyed, the surface is destroyed. Evidently, the surface is the terminus of the body; and the line (is the terminus) of the surface (►4). According to their position (i.e., according to the opinion of Platonists and Pythagoreans), the line is a part of the surface; and the surface (is a part of) of the body; for they posited bodies to be composed from surfaces; surfaces, from lines; and lines, from points; and so too of other (things). According to this position, number seems to wholly be the substance of all things because, if number is removed, nothing remains in things; for that which is not one is nothing; and likewise, those that are not many are not. Also, number is found to terminate all (things), since all (things) are measured by number.

However, this (fifth) mode is not true; for it is impossible for the substance of a thing to be that which is found commonly (*communiter*) in all (things) and without which the thing cannot be.<sup>10</sup> Rather, (that which is found commonly) can be some property that follows upon the substance of the thing, or a principle of the substance. Their error arises specially in respect to *one* and *number*; for they did not distinguish between the *one* that is convertible with being, and the *one* that is the principle of number (►38.1).

## 15.2. Reduction to First (Particular) and Second (Universal) Substance

ARISTOTLE reduces the aforesaid modes (►15.1) to two (modes):<sup>11</sup>

**1. First or particular substance, or hypostasis:**<sup>12</sup> that which ultimately underlies in propositions, such that it would not be predicated of others (*id quod ultimo subiicitur in*

---

eorum, in quibus destructis destruitur totum, dicuntur etiam substantiae. Sicut superficie destructa destruitur corpus, ut quidam dicunt, et destructa linea destruitur superficies. Patet etiam, quod superficies est terminus corporis, et linea terminus superficiei. Et secundum dictorum positionem, linea est pars superficiei, et superficies pars corporis. Ponebant enim corpora componi ex superficiebus et superficies ex lineis, et lineas ex punctis. Unde sequebatur, quod punctum sit substantia lineae, et linea superficiei, et sic de aliis. Numerus autem secundum hanc positionem videtur esse substantia totaliter omnium rerum, quia remoto numero nihil remanet in rebus: quod enim non est unum, nihil est. Et similiter quae non sunt plura, non sunt. Numerus etiam invenitur terminare omnia, eo quod omnia mensurantur per numerum.”

<sup>10</sup> *In Metaph.* 5, l. 10, §901: “Iste autem modus non est verus. Nam hoc quod communiter invenitur in omnibus, et sine quo res esse non potest, non oportet quod sit substantia rei, sed potest esse aliqua proprietas consequens rei substantiam vel principium substantiae. Provenit etiam eis error specialiter quantum ad unum et numerum, eo quod non distinguebant inter unum quod convertitur cum ente, et unum quod est principium numeri.”

<sup>11</sup> *In Metaph.* 5, l. 10, §898 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017b23–26): “reducit [Philosophus] omnes [modos] ad duos.” *Ibid.*, §903 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b23): “reducit [Philosophus] dictos modos substantiae ad duos; dicens, quod ex praedictis modis considerari potest, quod substantia duobus modis dicitur.” *De potentia*, q. 9 a. 1 co.: “Philosophus ponit substantiam dupliciter dici.” *In Sent.* 2, d. 37 q. 1 a. 1 co.: “substantia dupliciter dicitur, ut ex 5 Metaph. patet.”

<sup>12</sup> *In Metaph.* 5, l. 10, §903 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b23–24): “unus [modus] est secundum quod substantia dicitur id quod ultimo subiicitur in propositionibus, ita quod de alio non praedicetur, sicut substantia prima. Et hoc est, quod est hoc aliquid, quasi per se subsistens, et quod est separabile, quia est ab omnibus distinctum et non communicabile multis.” *In Sent.* 1, d. 25 q. 1 a. 1 ad 7: “Alio modo significat individuum in genere substantiae, quod dicitur substantia prima, vel hypostasis.”

*propositionibus, ita quod de alio non praedicetur* < τὸ ὑποκείμενον ἔσχατον, ὃ μῆκέτι κατ' ἄλλου λέγεται). This is that which *this something* is (*quod est hoc aliquid* = ὃ τὸδε τι ὄν), as subsisting by itself, and which is separable (*separabile* = χωριστόν, i.e., capable of existing apart), because it is distinct from all (others) and is not communicable to many.

**2. Second or universal substance:** *the form and the species of each thing (forma et species uniuscuiusque rei* = ἐκάστου ἢ μορφή καὶ τὸ εἶδος).<sup>13</sup> This is the form or nature of the subject: that which signifies the *what* in all things, as when we say that the definition signifies the substance of the thing. In this mode, whatever is positively said, in whatever genus it may be, either *is* a substance or *has* a substance; for, in this mode, *substance* is taken for **essence**.

### 15.3. Substance in Common

*Substance* can also be taken in common insofar as it abstracts from *first* and *second* substance.<sup>14</sup> In this way, *substance* is contracted (*trahitur*, lit., *is drawn*) by *individual*, as by a difference, to stand for *first substance*. This is just as when *animal*, in “rational, mortal animal,” signifies the nature of *animal* insofar as it is abstracted from all species; and it is contracted to a determinate species by an added difference (i.e., *rational, mortal*).

### 15.4. Distinction between First and Second Substance

The reason for the distinction between first and second substance is that multiple subjects are found to agree (*convenire*) in one nature.<sup>15</sup> For example, multiple men (are found to agree) in one nature of *man*. Whence, it is necessary to distinguish that which is one from that which is multiplied; for the common nature is what the definition signifies, indicating *what* the thing is. Whence, the common nature itself is said (to be the) *essence* or *quiddity*.

Therefore, anything that is in the thing pertaining to the common nature is contained under the signification of *essence*.<sup>16</sup> But not anything that is in the particular substance is of such

---

<sup>13</sup> *In Metaph.* 5, l. 10, §904 (cf. ARISTOTLE, *Metaphysica* Δ.8, 1017b24–26): “Sed etiam forma et species uniuscuiusque rei, dicitur tale, idest substantia.” *In Sent.* 1, d. 25 q. 1 a. 1 ad 7: “Tertio modo dicitur substantia secunda.” *De potentia*, q. 9 a. 1 co.: “alio modo dicitur substantia forma vel natura subiecti.” *In Sent.* 2, d. 37 q. 1 a. 1 co.: “Alio modo dicitur substantia illud quod significat quid in omnibus rebus, sicut dicimus, quod definitio significat rei substantiam: et hoc modo quidquid positive dicitur, in quocumque genere sit, substantia est vel substantiam habet; sic enim substantia pro essentia sumitur.”

<sup>14</sup> *In Sent.* 1, d. 25 q. 1 a. 1 ad 7: “Quarto modo dicitur substantia communiter prout abstrahit a substantia prima et secunda, et sic sumitur hic, et per individuum, quasi per differentiam, trahitur ad standum pro substantia prima; sicut cum dicitur animal rationale mortale, significat animal naturam animalis prout abstrahitur ab omnibus speciebus, et per differentiam additam trahitur in determinatam speciem.”

<sup>15</sup> *De potentia*, q. 9 a. 1 co.: “Huius autem distinctionis ratio est, quia inveniuntur plura subiecta in una natura convenire, sicut plures homines in una natura hominis. Unde oportuit distingui quod est unum, ab eo quod multiplicatur: natura enim communis est quam significat definitio indicans quid est res; unde ipsa natura communis, essentia vel quidditas dicitur.”

<sup>16</sup> *De potentia*, q. 9 a. 1 co.: “Quidquid ergo est in re ad naturam communem pertinens, sub significatione essentiae continetur, non autem quidquid est in substantia particulari, est huiusmodi. Si enim quidquid

a mode; for if anything that is in the particular substance were to pertain to the common nature, there could be no distinction between particular substances of the same nature.

In a particular substance, that which is other than the common nature is individual matter (► 13.12), which is the principle of singularity; and, consequently, (it consists in) individual accidents that determine the aforesaid matter.<sup>17</sup> Therefore, essence is compared to particular substance as its formal part, as *humanity* (is compared) to *Socrates*. Hence, in things composed from matter and form, the essence is not altogether the same as the subject; whence, it is not predicated of the subject: for example, it is not said that *Socrates* is *one humanity*.

On the other hand, in simple substances (i.e., those not composed from matter and form), there is no difference of essence and subject, since there is in them no individual matter that individuates the common nature: rather, the essence itself is in them a subsistence.<sup>18</sup> This is evident from ARISTOTLE; and from AVICENNA, who says in his *Metaphysics* that the quiddity of a simple (thing) is the simple (thing) itself.

### 15.5. First and Second Substance Compared

Particular substance differs from universal substance in three respects:<sup>19</sup>

1. Particular substance is not predicable—as (is) universal (substance)—of something inferior (e.g., *man* is predicable of *Peter*, but *Peter* is not predicable by itself of anything).<sup>20</sup>
2. Universal substance subsists only in the *ratio* of the singular that subsists by itself.<sup>21</sup>
3. Universal substance is in many; but not the singular (substance), which instead is separable from all and distinct.<sup>22</sup>

---

est in substantia particulari ad naturam communem pertineret, non posset esse distinctio inter substantias particulares eiusdem naturae.”

<sup>17</sup> *De potentia*, q. 9 a. 1 co.: “Hoc autem quod est in substantia particulari praeter naturam communem, est materia individualis quae est singularitatis principium, et per consequens accidentia individualia quae materiam praedictam determinant. Comparatur ergo essentia ad substantiam particularem ut pars formalis ipsius, ut humanitas ad Socratem. Et ideo in rebus, ex materia et forma compositis, essentia non est omnino idem quod subiectum; unde non praedicatur de subiecto: non enim dicitur quod Socrates sit una humanitas.”

<sup>18</sup> *De potentia*, q. 9 a. 1 co.: “In substantiis vero simplicibus, nulla est differentia essentiae et subiecti, cum non sit in eis materia individualis naturam communem individuans, sed ipsa essentia in eis est subsistentia. Et hoc patet per Philosophum et per Avicennam, qui dicit, in sua *Metaphysica*, quod quidditas simplicis est ipsum simplex.”

<sup>19</sup> *In Metaph.* 5, l. 10, §903: “Et quantum ad haec tria differt substantia particularis ab universali.”

<sup>20</sup> *In Metaph.* 5, l. 10, §903: “Primo quidem, quia substantia particularis non praedicatur de aliquo inferiori, sicut universalis.”

<sup>21</sup> *Ibid.*: “Secundo, quia substantia universalis non subsistit nisi ratione singularis quae per se subsistit.”

<sup>22</sup> *In Metaph.* 5, l. 10, §903: “Tertio, quia substantia universalis est in multis, non autem singularis, sed est ab omnibus separabilis et distincta.”

## 15.6. Accident Logically Speaking

**Accident** (*accidens* = συμβεβηκός) is taken by philosophers in two (modes):<sup>23</sup>

1. Insofar as it is co-divided with (first) substance and contains under itself nine genera of things (i.e., *quantity, quality, relation, etc.*).<sup>24</sup>

If *accident* is taken according as it is divided against *substance*, then there can be no mean between *substance* and *accident*; for *substance* and *accident* divide *being (ens)* by affirmation and negation: indeed, it is proper of substance **not to be in a subject** (*non esse in subiecto*), while it is (proper) of accident **to be in a subject** (*esse in subiecto*).<sup>25</sup>

2. Insofar as *accident* signifies an accidental relation of the predicate to the subject, or (an accidental relation) of the common to those that are contained under the common; but it does not signify what is common to the nine (accidental) genera (i.e., to be in a subject).<sup>26</sup> This is the accident that ARISTOTLE posits as one of four predicaments in *Topics* (i.e., ὄρος = definition, ἴδιον = proper, γένος = genus, and συμβεβηκός = accident); and PORPHYRY posits (it in his *Isagoge*) as one of the five universals (i.e., γένος = genus, διαφορά = difference, εἶδος = species, ἴδιον = proper, and συμβεβηκός = accident).

If this were the same acceptation as the former, since *accident* taken in this mode is divided against *genus* and *species*, it would follow that nothing that is in the nine (accidental) genera could be said (to be a) *genus* or *species*.<sup>27</sup> But this is evidently false; for color (which is in the genus of *quality*) is the genus of whiteness; and number (which is in the genus of *quantity*, is the genus) of two.

Taking *accident* in this mode, there is, therefore, some mean between *substance* and *accident*: that is, (something) between a substantial and an accidental predicate, which is

---

<sup>23</sup> *De spirit. creat.*, a. 11 co.: “accidens a philosophis dupliciter accipitur.”

<sup>24</sup> *De spirit. creat.*, a. 11 co.: “Uno modo, secundum quod condividitur substantiae, et continet sub se novem rerum genera.”

<sup>25</sup> *STh* I, q. 77 a. 1 ad 5: “si accidens accipitur secundum quod dividitur contra substantiam, sic nihil potest esse medium inter substantiam et accidens, quia dividuntur secundum affirmationem et negationem, scilicet secundum esse in subiecto et non esse in subiecto.” *De spirit. creat.*, a. 11 co.: “Non enim inter substantiam et accidens potest esse aliquid medium, cum substantia et accidens dividantur per affirmationem et negationem; cum proprium substantiae sit non esse in subiecto, accidentis vero sit in subiecto esse.”

<sup>26</sup> *De spirit. creat.*, a. 11 co.: “Alio modo accipitur accidens, secundum quod ponitur ab Aristotele unum de quatuor praedicamentis in I Topicorum, et secundum quod a Porphyrio ponitur unum quinque universalium. Sic enim accidens non significat id quod commune est novem generibus, sed habitudinem accidentalem praedicati ad subiectum, vel communis ad ea quae sub communi continentur.” See ARISTOTLE, *Topica* A.5, 101b38: “Λεκτέον δὲ τί ὄρος, τί ἴδιον, τί γένος, τί συμβεβηκός.” Cf. PORPHYRY, *Isagoge*, 1.4–5: “τί γένος καὶ τί διαφορά τί τε εἶδος καὶ τί ἴδιον καὶ τί συμβεβηκός.”

<sup>27</sup> *De spirit. creat.*, a. 11 co.: “Si enim haec esset eadem acceptio cum prima, cum accidens sic acceptum dividatur contra genus et speciem, sequeretur quod nihil quod sit in novem generibus posset dici vel genus vel species; quod patet esse falsum, cum color sit genus albedinis, et numerus binarii.”

the **proper** (*proprium* = ἴδιον; i.e., the *necessary accident* or *property*).<sup>28</sup> Indeed, whatever is essential to the thing pertains to substance. However, not everything that is outside the essence (of the thing) can be said (to be an) *accident*, but only that which is not caused from the essential principles of the species. Now, the *proper* is not of the essence of the thing; but is caused from the essential principles of the species (► 15.17). Whence, (the proper) is a mean between essence (i.e., second substance) and accident thus said.

The *proper* agrees (*convenit*) with the substantial predicate insofar as it is caused from the essential principles of the species.<sup>29</sup> Hence, the properties of the subject are demonstrated by the definition that signifies the essence. On the other hand, it agrees with the accidental predicate in that it is neither the essence nor a part of the essence of the thing, but something other than it (i.e., other than the essence of the thing).

On the other hand, the proper differs from the accidental predicate because the accidental predicate is not caused from the essential principles of the species: rather, it happens (*accidit*) to the individual as the proper (happens) to the species.<sup>30</sup> However, (it happens) sometimes in a separable, (and) sometimes in an inseparable, mode (► 15.18).

### 15.7. Logical vs. Real First Substance

It could seem to someone that, since ARISTOTLE posits all the modes in which *substance* is said, this would suffice to know what *substance* is.<sup>31</sup> For this reason, he adds that *what substance is*—namely, *that which is not predicated of a subject, but of which others are predicated*—has been said only *in universal* («*typo*,» *idest... in universali* = τύπω). It is necessary to know substance—and other things—not only by a universal and logical definition.<sup>32</sup> (A logical definition) is not sufficient to know the nature of a thing because that

---

<sup>28</sup> *STh* I, q. 77 a. 1 ad 5: “Si vero accipiatur accidens secundum quod ponitur unum quinque universalium, sic aliquid est medium inter substantiam et accidens. Quia ad substantiam pertinet quidquid est essenziale rei, non autem quidquid est extra essentiam, potest sic dici accidens, sed solum id quod non causatur ex principiis essentialibus speciei. Proprium enim non est de essentia rei, sed ex principiis essentialibus speciei causatur, unde medium est inter essentiam et accidens sic dictum.” *De spirit. creat.*, a. 11 co.: “Sic igitur accipiendo accidens, est aliquid medium inter substantiam et accidens, id est inter substantiale praedicatum et accidentale; et hoc est proprium.”

<sup>29</sup> *De spirit. creat.*, a. 11 co.: “Quod quidem [proprium] convenit cum substantiali praedicato, in quantum causatur ex principiis essentialibus speciei; et ideo per definitionem significantem essentiam demonstratur proprietas de subiecto. Cum accidentali vero praedicato convenit in hoc quod nec est essentia rei, nec pars essentiae, sed aliquid praeter ipsam.”

<sup>30</sup> *De spirit. creat.*, a. 11 co.: “Differt autem [proprium] ab accidentali praedicato, quia accidentale praedicatum non causatur ex principiis essentialibus speciei, sed accidit individuo sicut proprium speciei; quandoque tamen separabiliter, quandoque inseparabiliter.”

<sup>31</sup> *In Metaph.* 7, l. 2, §1280 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a7–9): “quia posset alicui videri, quod ex quo Philosophus ponit omnes modos, quibus dicitur substantia, quod hoc sufficeret ad sciendum quid est substantia; ideo subiungit dicens, quod nunc dictum est quid sit substantia «solum typo,» idest dictum est solum in universali, quod substantia est illud, quod non dicitur de subiecto, sed de quo dicuntur alia.”

<sup>32</sup> *In Metaph.* 7, l. 2, §1280 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a9–10): “sed oportet non solum ita cognoscere substantiam et alias res, scilicet per definitionem universalem et logicam: hoc enim non est sufficiens ad cognoscendum naturam rei, quia hoc ipsum quod assignatur pro definitione tali, est

which is assigned as a definition of such (a nature) is manifest; but the principles of the thing—from which the cognition of the thing depends—are not touched upon through such a definition: rather, (what) is touched upon (is) some common condition of the thing by which such a notification is given (i.e., *that it is not predicated of a subject* is as a sign whereby we can more readily determine whether something is a substance).

Thus, substance is not only the last subject that is not predicated of another (► 14.6), but also the particular or individual in the genus of substance.<sup>33</sup> In this mode, substance signifies the *ratio* of the first category (► 33.2). And this is either the form, the matter, or the composite, which (composite) is in the genus (of substance) by itself (► 29.9, ¶1).

### 15.8. Division of First Substance

ARISTOTLE subdivides the **subject** (*subiectum* = τὸ ὑποκείμενον), which is first, particular substance, into three (parts): matter, form, and the composite from them.<sup>34</sup>

**1. Matter** (*materia* = ὕλη) is that which of itself is not *this something* (*quae secundum se non est hoc aliquid* = ὁ καθ' αὐτὸ οὐκ ἔστι τόδε τι), but (is) only in potency of being *this something* (*in potentia tantum ut sit hoc aliquid* < ἔστι δ' ἡ μὲν ὕλη δύνάμις).<sup>35</sup>

**2. Form** (*forma* = ἡ μορφή), also named **ratio** (*ratio* = ὁ λόγος), because the *ratio* of the species (*species* = εἶδος) is taken from it, is *that whereby this something is already in act* (*secundum quam iam est hoc aliquid in actu* < καθ' ἣν ἤδη λέγεται τόδε τι...; ἔστι... τὸ δ' εἶδος ἐντελέχεια).<sup>36</sup> Form is as a being separable from matter according to *ratio* (*quasi ens separabile secundum rationem a materia* < τῷ λόγῳ χωριστόν ἐστιν), even if it is not separable (from matter) according to thing (*secundum rem*).

---

manifestum. Non enim huiusmodi definitione tanguntur principia rei, ex quibus cognitio rei dependet; sed tangitur aliqua communis conditio rei per quam talis notificatio datur.”

<sup>33</sup> *De potentia*, q. 9 a. 1 co.: “dicitur enim uno modo substantia ipsum subiectum ultimum, quod non praedicatur de alio: et hoc est particulare in genere substantiae.” *In Sent.* 2, d. 37 q. 1 a. 1 co.: “Uno enim modo dicitur substantia, secundum quod significat rationem primi praedicamenti: et hoc est vel forma, vel materia, vel compositum, quod per se in genere est.”

<sup>34</sup> *In Metaph.* 7, l. 2, §1276 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a2–3): “subdividit [Philosophus] quartum modum praemissae divisionis; hoc scilicet quod dixerat subiectum [...]. Dicit ergo primo, quod subiectum, quod est prima substantia particularis, in tria dividitur; scilicet in materiam, et formam, et compositum ex eis.” *In Metaph.* 8, l. 1, §1687 (cf. ARISTOTLE, *Metaphysica* H.1, 1042a26–31): “Sed sciendum est, quod materia aliter dicitur substantia, et aliter forma, et aliter compositum.” *In De anima* 2, c. 1, 96–97 (cf. ARISTOTLE, *De anima* B.1, 412a6–9): “substantia diuiditur in materiam et formam et compositum.”

<sup>35</sup> *In De anima* 2, c. 1, 99–100 (cf. ARISTOTLE, *De anima* B.1, 412a7–9): “materia quidem est que *secundum se non est hoc aliquid*, set est in potencia tantum ut sit hoc aliquid.” *In Metaph.* 8, l. 1, §1687 (cf. ARISTOTLE, *Metaphysica* H.1, 1042a27–28): “Materia enim dicitur substantia non quasi ens aliquid actu existens in se considerata, sed quasi in potentia, ut sit aliquid actu, haec dicitur esse hoc aliquid.”

<sup>36</sup> *In De anima* 2, c. 1, 100–101 (cf. ARISTOTLE, *De anima* B.1, 412a9–10): “forma autem est secundum quam iam est hoc aliquid in actu.” *In Metaph.* 8, l. 1, §1687 (cf. ARISTOTLE, *Metaphysica* H.1, 1042a28–29): “Forma vero, quae et ratio nominatur, quia ex ipsa sumitur ratio speciei, dicitur substantia quasi ens aliquid actu, et quasi ens separabile secundum rationem a materia, licet non secundum rem.”

**3. The composite substance** (*substantia composita* < τὸ ἐκ τούτων) is that which is *this something*, something designated (*aliquid demonstratum*), that is complete in being and in species (*completum in esse et specie*); and this belongs, in material things, only to the composite substance.<sup>37</sup> The composite is separable simply (*simpliciter* = ἀπλῶς): that is, it can exist by itself in the nature of things, to which generation and corruption pertain.

For example, among artifacts: (¶1) bronze is as matter; (¶2) the figure (or shape), as the form that gives (bronze) the species (of statue); (¶3) the statue (is as) the composite from them.<sup>38</sup> This example, however, should not be taken according to the truth (of the things), but according to a likeness of proportion; for the figure (of the statue) and other artificial forms are not substances, but accidents (of) some (sort).<sup>39</sup> Nevertheless, since figure is to bronze, in artifacts, as substantial form is to matter, in natural (things), this example is used to demonstrate the unknown through the manifest.

### 15.9. Order Among the Parts of First Substance

The aforesaid (sub)division of substance is not (a division) of genus into species, but of something predicated analogically, which is predicated according to prior and posterior (*per prius et posterius*) of those that are contained under it; for not only particular form and matter, but also the composite (from them), is said (to be a) *substance*, though not in the same order.<sup>40</sup> Hence, ARISTOTLE inquires which of them is substance priorly (*per prius*).

Although substance is said of form, of matter, and of the composite, the composite from matter and form—for example, man—is not a nature itself, but something *from nature* (*a natura* < φύσει); for *nature* has the *ratio* of *principle* (► 12.1), while *composite* has the *ratio* of *that which is from principle(s)* (*habet rationem principiati*).<sup>41</sup>

<sup>37</sup> *In De anima* 2, c. 1, 101–108: “substantia uero composita est que est hoc aliquid. Dicitur enim esse hoc aliquid aliquid demonstratum quod est completum in esse et specie, et hoc competit soli substantie compositae in rebus materialibus; nam substantie separate, quamuis non sint compositae ex materia et forma, sunt tamen hoc aliquid, cum sint subsistentes in actu et complete in natura sua.” *In Metaph.* 8, l. 1, §1687 (cf. ARISTOTLE, *Metaphysica* H.1, 1042a29–31): “Compositum uero ex his dicitur esse substantia quasi separabile simpliciter, idest separatim per se existere potens in rerum natura; et eius solius est generatio et corruptio.”

<sup>38</sup> *In Metaph.* 7, l. 2, §1277 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a3–5): “Exemplificat autem [Philosophus] hic membra in artificialibus, in quibus aes est ut materia, figura ut «forma speciei,» idest dans speciem, statua compositum ex his.”

<sup>39</sup> *In Metaph.* 7, l. 2, §1277: “Quae quidem exemplificatio non est accipienda secundum veritatem, sed secundum similitudinem proportionis. Figura enim et aliae formae artificiales non sunt substantiae, sed accidentia quaedam. Sed quia hoc modo se habet figura ad aes in artificialibus, sicut forma substantialis ad materiam in naturalibus, pro tanto utitur hoc exemplo, ut demonstret ignotum per manifestum.”

<sup>40</sup> *In Metaph.* 7, l. 2, §1276 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a2–3): “Quae quidem divisio non est generis in species, sed alicuius analogice praedicati, quod de eis, quae sub eo continentur, per prius et posterius praedicatur. Tam enim compositum quam materia et forma particularis substantia dicitur, sed non eodem ordine; et ideo posterius inquit quid horum per prius sit substantia.”

<sup>41</sup> *In Physic.* 2, l. 2, n. 4 (cf. ARISTOTLE, *Physica* B.1, 193b5–6): “Posset autem aliquis credere quod quia materia dicitur natura et etiam forma, quod compositum possit dici natura; quia substantia dicitur de

Form is prior to matter because matter is a being in potency, while the species (i.e., the form) is its act; and act is naturally prior to potency.<sup>42</sup> Simply (*simpliciter*) speaking, (act is) prior (to potency not only in the order of being but also) in time; for (something) is moved from potency into act only by a being in act, even if, in time, potency precedes act in one and the same (thing) that is sometimes in potency (and) sometimes in act (► 46.29). Whence, it is evident that form is prior to matter. And (form) is also more a being than (matter) because *that by which each (thing is, is) also more it (propter quod unumquodque et illud magis*; i.e., that by which each thing comes to be or is such, is also more such than that which comes to be or is such by it). Thus, matter comes to be a being in act only by form; whence, form must be more a being than matter.

It follows from this that, for the same reason, form is prior to the composite from one and the other (i.e., from matter and form) insofar as something of matter is in the composite.<sup>43</sup> And thus, (the composite) participates (in) some (mode or quantity) of that which is posterior according to nature—namely, of matter (► 26; 8.9).

Moreover, the composite substance is posterior—according to nature—to both matter and form for two reasons.<sup>44</sup> Firstly, (every) composite (whole) is posterior to (any of) the simple (parts) from which it is composed (► 13.2). It is evident that matter and form are principles of the composite (substance); and since the principles of something are prior to it, if form is prior to matter, it will be prior to the composite. Whence, the cognition of matter and of form precedes the cognition of the composite substance (*cognitio materiae et formae praecedit cognitionem substantiae compositae*).

---

forma et materia et de composito. Sed hoc excludit [Philosophus] dicens quod compositum ex materia et forma, ut homo, non est ipsa natura, sed est aliquid a natura; quia natura habet rationem principii, compositum autem habet rationem principii.

<sup>42</sup> *In Metaph.* 7, l. 2, §1278 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a5–6): “Dicit ergo [Philosophus] primo, quod species, idest forma, prior est materia. Materia enim est ens in potentia, et species est actus eius. Actus autem naturaliter prior est potentia. Et simpliciter loquendo prior tempore, quia non movetur potentia ad actum nisi per ens actu; licet in uno et eodem quod quandoque est in potentia, quandoque in actu, potentia tempore praecedat actum. Unde patet, quod forma est prior quam materia, et etiam est magis ens quam ipsa, quia propter quod unumquodque et illud magis. Materia autem non fit ens actu nisi per formam. Unde oportet quod forma sit magis ens quam materia.”

<sup>43</sup> *In Metaph.* 7, l. 2, §1279 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a6–7): “Et ex hoc ulterius sequitur, quod eadem ratione forma sit prior composito ex utrisque, in quantum est in composito aliquid de materia. Et ita participat aliquid de eo quod est posterius secundum naturam, scilicet de materia.”

<sup>44</sup> *In Metaph.* 7, l. 2, §1279 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a6–7): “Et iterum patet, quod materia et forma sunt principia compositi. Principia autem alicuius sunt eo priora. Et ita, si forma est prior materia, erit prior composito.” *Ibid.*, l. 2, §1294 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a30–31): “Ostendit [Philosophus] *quomodo sit procedendum circa partes huius divisionis* substantiae, quam prosecutus est, prout scilicet dividitur in materiam et in formam et compositum: et dicit, quod licet tam species quam compositum sit magis substantia quam materia, tamen ad praesens dimittenda est substantia quae «ex ambobus composita,» scilicet ex materia et forma. Et hoc propter duas rationes.” *Ibid.*, §1295: “Una ratio est, quia ipsa est posterior secundum naturam utraque, scilicet quam materia et quam forma; sicut compositum est posterius simplicibus, ex quibus componitur. Et ideo cognitio materiae et formae praecedit cognitionem substantiae compositae.”

Secondly, (the composite substance is naturally posterior to matter and form) because such a substance is evident, since it underlies sense (cognition).<sup>45</sup> Therefore, cognition concerning it cannot be hindered. Although form is a principle of cognition, while matter—according to its essence—does not have that whence it would be known, matter is known by some likeness of proportion; for just as sensible substances are related to artificial forms as wood (is related) to the form of the bench, so, too, first matter is related to sensible forms. Whence, ARISTOTLE says in the *Physics* that first matter is knowable according to analogy (►41.11, ¶1; 15.8; 46.6).

### 15.10. Properties of First Substance

The substance that is the subject has two proper(ities):<sup>46</sup>

1. It does not need an extrinsic foundation in which it would be sustained; rather, *it is sustained in itself*.<sup>47</sup> Whence, it is said **to subsist** (*subsistere*), as existing by itself (*per se*) and not in another (*in alio*). Insofar as it subsists, the substance that is the subject is called (in Greek) *ousiosis* (οὐσίωσις < οὐσία) or *subsistence* (*subsistentia* < *substantia*).
2. *It is the foundation of accidents* (*fundamentum accidentibus*), sustaining (*substantans*) them.<sup>48</sup> Whence, it is said **to underlie** (*substare*). Insofar as it underlies, the substance that is the subject is called *hypostasis* (ὑπόστασις), according to the Greeks; or *first substance* (*substantia prima*), according to the Latins.

Evidently, therefore, *hypostasis* and *substance* differ in *ratio*, but are the same in thing.<sup>49</sup> However, essence in material (things) is evidently not the same as them according to thing

<sup>45</sup> *In Metaph.* 7, l. 2, §1296 (cf. ARISTOTLE, *Metaphysica* Z.3, 1029a32–33; *Physica* A.7, 191a7–12): “Alia ratio est, quia huiusmodi substantia «est aperta,» idest manifesta, cum sensui subiaceat. Et ideo circa eius cognitionem non oportet immorari. Materia autem, licet non sit posterior sed quodammodo prior, tamen aliquantulum est manifesta. Dicit autem «aliquantulum» quia secundum essentiam suam non habet unde cognoscatur, cum cognitionis principium sit forma. Cognoscitur autem per quamdam similitudinem proportionis. Nam sicut huiusmodi substantiae sensibiles se habent ad formas artificiales, ut lignum ad formam scanni, ita prima materia se habet ad formas sensibiles. Propter quod dicitur primo Physicorum, quod materia prima est scibilis secundum analogiam.”

<sup>46</sup> *De potentia*, q. 9 a. 1 co.: “Substantia vero quae est subiectum, duo habet propria.”

<sup>47</sup> *De potentia*, q. 9 a. 1 co.: “primum est quod non indiget extrinseco fundamento in quo sustentetur, sed sustentatur in seipso; et ideo dicitur subsistere, quasi per se et non in alio existens. [...] Sic ergo substantia quae est subiectum, in quantum subsistit, dicitur ousiosis vel subsistentia.” Cf. BOETHIUS, *The Theological Tractates* (Cambridge, Massachusetts: Harvard University Press, 1968), *Contra Eutychem et Nestorium*, III.42–43: “quod Graeci οὐσίωσιν uel οὐσιῶσθαι dicunt, id nos subsistentiam uel subsistere appellamus.”

<sup>48</sup> *De potentia*, q. 9 a. 1 co.: “Aliud vero est quod est fundamentum accidentibus substantans ipsa; et pro tanto dicitur substare. Sic ergo substantia quae est subiectum [...] in quantum vero substare, dicitur hypostasis secundum Graecos, vel substantia prima secundum Latinos.” Cf. BOETHIUS, *The Theological Tractates, Contra Eutychem et Nestorium*, III.43–45: “quod uero illi [sc., Graeci] ὑπόστασιν uel ὑφίστασθαι [dicunt], id nos substantiam uel substare interpretamur.”

<sup>49</sup> *De potentia*, q. 9 a. 1 co.: “Patet ergo quod hypostasis et substantia differunt ratione, sed sunt idem re. Essentia uero in substantiis quidem materialibus non est idem cum eis secundum rem, neque penitus diversum, cum se habeat ut pars formalis; in substantiis uero immaterialibus est omnino idem secundum

(*secundum rem*); nor (is it) thoroughly diverse, since it is related as a formal part. And in immaterial substances, it is altogether the same according to thing, but differs in *ratio*. *Person*, in turn, adds over *hypostasis* a determinate nature; for it is a hypostasis (i.e., an individual substance or *suppositum*) of rational nature.

### 15.11. The Subject and its Forms

As discussed above (► 14.7), *subject* is said in two modes:<sup>50</sup>

1. As *that which is (this) something (id quod est aliquid < τόδε τι ὄν) and a being in act (ens actu)—as animal—underlies its affections (subiicitur suis passionibus < ὑπόκειται... τοῖς πάθεσιν); and (as) whatever particular substance (underlies) its accidents.*<sup>51</sup>

2. As the first matter (i.e., prime matter; ► 46.7) underlies (its) act, that is, (underlies) substantial forms (*sicut materia prima «subiicitur actui,» idest formae substantiali < ὑπόκειται... ἡ ὕλη τῆ ἐντελεχείᾳ).*<sup>52</sup>

### 15.12. Substantial vs. Accidental Form

Matter and form are to one another a cause of being (► 10.6), either *simply (simpliciter)* or *according to something (secundum quid)*:<sup>53</sup>

1. A **substantial form** gives (the act of) being to matter simply and causes (a being) to be in act simply (*facit esse actu simpliciter*).<sup>54</sup>

2. An **accidental form** does not make a being in act simply (*simpliciter*), but, insofar as it, too, is a form, (it gives an act of being to its subject-matter) according to something, making it to be *such* or *so much (tale vel tantum)* in act: for example, *white* or *great*, or something of this sort.<sup>55</sup>

---

rem, sed differens ratione. Persona vero addit supra hypostasim determinatam naturam: nihil enim est aliud quam hypostasis rationalis naturae.”

<sup>50</sup> *In Metaph.* 7, l. 13, §1568 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b4–6): “Dictum est enim [...] de subiecto, quod dicitur dupliciter.”

<sup>51</sup> *In Metaph.* 7, l. 13, §1568 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b5–6): “Uno modo sicut id quod est aliquid, et ens actu, sicut animal subiicitur suis passionibus, et quaecumque substantia particularis suis accidentibus.”

<sup>52</sup> *In Metaph.* 7, l. 13, §1568 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b6): “Alio modo sicut materia prima «subiicitur actui,» idest formae substantiali.”

<sup>53</sup> *In Metaph.* 5, l. 2, §775: “forma dat esse, materia autem recipit. [...] Forma autem et materia sibiinvicem sunt causa quantum ad esse. Forma quidem materiae in quantum dat ei esse actu; materia vero formae in quantum sustentat ipsam. Dico autem utrumque horum sibi invicem esse causam essendi vel simpliciter vel secundum quid.”

<sup>54</sup> *In Metaph.* 5, l. 2, §775: “forma substantialis dat esse materiae simpliciter.” *In De anima* 2, c. 1, 246–247: “forma autem substancialis facit [ens] esse actu simpliciter.”

<sup>55</sup> *In Metaph.* 5, l. 2, §775: “Forma autem accidentalis [dat esse materiae] secundum quid, prout etiam forma est.” *In De anima* 2, c. 1, 244–246: “forma accidentalis non facit ens actu simpliciter, set ens actu tale uel tantum, ut puta magnum uel album uel aliquid aliud huiusmodi.”

◀ Thus, substantial and accidental form agree (*conveniunt*) in that both are in act; and in that something is in act in some mode according to each of them.<sup>56</sup> However, they differ in two ways.

First, a substantial form makes (something) to be simply, while an accidental form does not make (something) to be simply, but to be *such*, or *so much*, or *related in some mode* (*aliquo modo se habens*).<sup>57</sup> Moreover, an accidental form befalls (*advenit*) a subject already existent in act, while a substantial form does not befall a subject that is already existent in act, but an existent in potency only: i.e., the first (i.e., prime) matter. Whence, it is evident that actuality (*actualitas*) is found priorly (*per prius*) in the substantial form than in its subject.<sup>58</sup> Since that which is first is the cause in any genus (▶ 27.4), the substantial form causes being in act in its subject. Conversely, however, actuality is found priorly in the subject of the accidental form than in the accidental form. Whence, the actuality of the accidental form is caused by the actuality of the subject.

Secondly, since the less principal is for the sake of (*propter*) the more principal, substantial and accidental form differ in that matter is for the sake of the substantial form, while, conversely, the accidental form is for the sake of the completion of the subject.<sup>59</sup>

### 15.13. Oneness of the Substantial Form

Every form gives some (act of) being; but it is impossible for one thing to have multiple substantial forms; for the first form that befalls matter gives to it a substantial (act of) being, making a being in act simply, while the second, supervenient form, as all others, give an accidental (act of) being, befalling a subject already existent in act.<sup>60</sup> Whence, the form by which fire is fire, is not—as AVICENNA would have it—other than that by which it is a body.

---

<sup>56</sup> *STh* I, q. 77 a. 6 co.: “forma substantialis et accidentalis partim conveniunt, et partim differunt. Conveniunt quidem in hoc, quod utraque est actus, et secundum utramque est aliquid quodammodo in actu. Differunt autem in duobus.”

<sup>57</sup> *STh* I, q. 77 a. 6 co.: “Primo quidem, quia forma substantialis facit esse simpliciter, et eius subiectum est ens in potentia tantum. Forma autem accidentalis non facit esse simpliciter; sed esse tale, aut tantum, aut aliquo modo se habens, subiectum enim eius est ens in actu.” *In De anima* 2, c. 1, 247–251: “unde forma accidentalis aduenit subiecto iam existenti in actu, forma autem substancialis non aduenit subiecto iam preexistenti in actu, set existenti in potencia tantum, scilicet materie prime.”

<sup>58</sup> *STh* I, q. 77 a. 6 co.: “Unde patet quod actualitas per prius invenitur in forma substantiali quam in eius subiecto, et quia primum est causa in quolibet genere, forma substantialis causat esse in actu in suo subiecto. Sed e converso, actualitas per prius invenitur in subiecto formae accidentalis, quam in forma accidentali, unde actualitas formae accidentalis causatur ab actualitate subiecti.”

<sup>59</sup> *STh* I, q. 77 a. 6 co.: “Secundo autem differunt substantialis forma et accidentalis, quia, cum minus principale sit propter principalius, materia est propter formam substantialem; sed e converso, forma accidentalis est propter completionem subiecti.”

<sup>60</sup> *In De anima* 2, c. 1, 251–257: “Ex quo [sc., forma accidentalis aduenit subiecto iam existenti in actu, forma autem substancialis aduenit subiecto existenti in potencia tantum] patet quod impossibile est unius rei esse plures formas substanciales, quia prima faceret ens actu simpliciter et omnes alie aduenirent subiecto iam existenti in actu; unde accidentaliter aduenirent: non enim facerent ens actu simpliciter, set secundum quid.” *In Sent.* 2, d. 18 q. 1 a. 2 co.: “cum omnis forma det aliquod esse, et impossibile sit

It is true that AVERROES says that the genus is not matter, but a mean form (*forma media*) between matter and the ultimate form.<sup>61</sup> However, this is not said to signify the order of forms according to thing (*secundum rem*), but according to *ratio* (*secundum rationem*; see the *form of corporeity*, which is the first form according to *ratio*; ► 46.11); for, although the genus signifies the whole, as AVICENNA says, it signifies (the whole) as indistinct; and, in this way, it is proximately related to the *ratio* of *matter* (► 14.12; 14.13).

Therefore, no substantial form is united to matter by means of another substantial form.<sup>62</sup> Rather, the more perfect form gives to matter whatever the inferior form gives—and then more. Matter, insofar as it is perfected by it (i.e., by the more perfect form) in that mode of perfection by which it is perfected by inferior forms, is considered as the proper matter also in the mode of perfection that the more perfect form adds over the others. However, this distinction is not understood in forms according to essence, but only according to the intelligible *ratio*.

Thus, it is one and the same substantial form by which *this individual* is *this something* or *this substance*, and by which it is a body, an animated body, and all the rest; for the more perfect form gives to matter what the less perfect form gives—and more.<sup>63</sup> In this way, therefore, matter itself is the proper subject of the soul insofar as it is understood as perfect(ed) in a corporeal (act of) being susceptible of life.

---

unam rem habere duplex esse substantiale, oportet, si prima forma substantialis adveniens materiae det sibi esse substantiale, quod secunda superveniens det esse accidentale: et ideo non est alia forma qua ignis est ignis, et qua est corpus, ut Avicenna vult.” See also *De spirit. creat.*, a. 1 ad 9 (vs. AVICEBRON).

<sup>61</sup> *In Sent.* 2, d. 18 q. 1 a. 2 co.: “Et si Commentator dicat in 2 Metaph. genus non esse materiam sed formam mediam inter materiam et ultimam formam: hoc non dicitur ad significandum ordinem formarum secundum rem sed secundum rationem: quia genus quamvis significet totum, ut Avicenna dicit, significat tamen ut indistinctum, et ita propinque se habet ad rationem materiae.”

<sup>62</sup> *Q. d. de anima*, a. 11 co.: “nulla forma substantialis unitur materiae mediante alia forma substantiali; sed forma perfectior dat materiae quidquid dabit forma inferior, et adhuc amplius.” *De spirit. creat.*, a. 3 ad 2: “cum forma perfectissima det omnia quae dant formae imperfectiores, et adhuc amplius; materia, prout ab ea perficitur eo modo perfectionis quo perficitur a formis imperfectioribus, consideratur ut materia propria, etiam illiusmodi perfectionis quam addit perfectior forma super alias; ita tamen quod non intelligatur haec distinctio in formis secundum essentiam, sed solum secundum intelligibilem rationem.”

<sup>63</sup> *De spirit. creat.*, a. 3 ad 2: “Sic ergo ipsa materia secundum quod intelligitur ut perfecta in esse corporeo susceptivo vitae, est proprium subiectum animae.” *In De anima* 2, c. 1, 265–270: “Oportet enim secundum premissa dicere quod una et eadem forma substantialis sit per quam hoc individuum est hoc aliquid siue substantia et per quam est corpus et animatum corpus et sic de aliis: forma erum perfectior dat materie et hoc quod dat forma minus perfecta et adhuc amplius.” St. Thomas says this after referring us to AVICEBRON’s *Fons vitae*, explaining (in *ibid.*, 258–264) that the opinion is false of those who posit that, in one and the same thing, there is an order of multiple substantial forms that follows upon the order of genera and species: for example, that in this individual human being there is a form by which it is a substance; another one by which it is a body; a third one by which it is an animated body; and so on of the other (with all the specific differences taken as though they were substantial forms added to one another). See Clemens BAEUMKER (ed.), *Avicembrolis (Ibn Gebirol) Fons Vitae*, Bd. 1, Heft 2-4 (Münster in Westfalen: Aschendorff, 1895), 4.3, 215.26–216.6: “Non putavi quod tu opponeres de dubitatione huiusmodi propter praemissas probationes de assignatione diuersitatis in aubstantiis simplicibus, tamquam si certum tibi non fuisset quod forma naturae est aliud a forma animae uegetabilis, et quod forma animae uegetabilis alia est a forma animae sensibilis, et quod forma animae sensibilis alia est a forma animae rationalis, et quod forma animae rationalis alia est a forma intelligentiae.”

#### 15.14. Conjunction of Matter and Form

Just as a substantial form does not have by itself (*per se*) an absolute (act of) being (*esse absolutum*) without matter, nor does the matter it befalls.<sup>64</sup> It is from the conjunction of one and the other that results that (act of) being in which the thing subsists by itself; (that something) one by itself (*unum per se*) is caused (*efficitur*) from it; and (that) some essence results from their conjunction (► 16.3). Hence, although, considered in itself, form does not have a complete *ratio* of *essence*, it is, however, a part of a complete essence.

On the other hand, that to which an accident befalls is a complete being in itself (*ens in se completum*), subsisting in its (act of) being (*subsistens in suo esse*), which (act of) being precedes that accident that befalls it.<sup>65</sup> Hence, from its conjunction with that which it befalls, the supervenient accident does not cause the (act of) being in which the thing subsists, by which the thing is a being by itself (*per quod res est ens per se*). Rather, it causes some second (act of) being without which the subsistent thing can be understood to be, as a first can be understood without a second.

#### 15.15. Form, Matter, and the Composite

In composite things, either one of the (parts) from which there is composition is in potency (in respect) to the other, as matter (is in potency in relation) to form, subject to accident, and genus to difference; or, at least, all the parts are in potency to the whole.<sup>66</sup>

Physical and natural composition is multiple.<sup>67</sup> There is a composition of the compound from elements, of which ARISTOTLE says that the form of the compound must altogether be other than the elements themselves. There is also a composition of substantial form and matter, from which a third (thing) results: i.e., the form of the species, which certainly is not altogether other than matter and form; rather, it is related to them as whole to parts.

---

<sup>64</sup> *De ente*, c. 6, 23–33: “Sed tamen inter formas substantiales et accidentales tantum interest quia, sicut forma substantialis non habet per se esse absolutum sine eo cui aduenit, ita nec illud cui aduenit, scilicet materia; et ideo ex coniunctione utriusque relinquitur illud esse in quo res per se subsistit, et ex eis efficitur unum per se: propter quod ex coniunctione eorum relinquitur essentia quedam. Vnde forma, quamvis in se considerata non habeat completam rationem essentie, tamen est pars essentie complete.”

<sup>65</sup> *De ente*, c. 6, 33–42: “Sed illud cui aduenit accidens est ens in se completum subsistens in suo esse, quod quidem esse naturaliter precedit accidens quod superuenit. Et ideo accidens superueniens ex coniunctione sui cum eo cui aduenit non causat illud esse in quo res subsistit, per quod res est ens per se; sed causat quoddam esse secundum sine quo res subsistens intelligi potest esse, sicut primum potest intelligi sine secundo.”

<sup>66</sup> *De potentia*, q. 7 a. 1 co.: “In compositis enim vel unum eorum ex quibus est compositio est in potentia ad alterum, ut materia ad formam, subiectum ad accidens, genus ad differentiam; vel saltem omnes partes sunt in potentia ad totum.”

<sup>67</sup> *De veritate*, q. 16 a. 1 ad 16: “compositio physica et naturalis est multiplex. Est enim compositio mixti ex elementis; et in hac compositione loquitur Philosophus quod oportet formam mixti esse aliud omnino ab ipsis elementis. Est etiam compositio formae substantialis et materiae, ex qua resultat tertium, scilicet forma speciei: quae quidem non est aliud omnino a materia et forma, sed se habet ad eas ut totum ad partes. Est etiam compositio subiecti et accidentis in qua non resultat aliquid tertium ex utroque.”

There is also a composition of subject to accident, in which some third (thing) does not result from one and the other.

Although forms and accidents do not have a part of their matter from which (*ex qua*) they should be, they have, however, a matter in which (*in qua*) they are (► 14.8), and from whose potency they are educed.<sup>68</sup> Whence, even when they cease to be, they are not altogether annihilated, but remain in the potency of matter, as before (they actually were).

For example, no matter could be assigned if one were to ask, “what is the cause of an eclipse?”<sup>69</sup> However, the moon is the subject that undergoes such an affection; for the *ratio of eclipse is the privation of light in the moon*. This is evident, likewise, in the accident of sleep, even if the first subject of sleep is not manifest: e.g., whether the organ of sleep is the brain; for it is evident that *animal* is the (ultimate) subject of this affection.<sup>70</sup> But if sleep is *the rest of sensible operations*, then its first subject must be posited in its definition, just as any accident is defined through its first, proper subject (► 18).

Sometimes, however, matter does not sustain a (substantial) form simply according to (its act of) being (*non sustentat formam secundum esse simpliciter*), but insofar as it is its form, having (its act of) being *in this* (*habens esse in hoc*, i.e., as *matter in which*, rather

---

<sup>68</sup> *De potentia*, q. 5 a. 4 ad 9: “formae et accidentia etsi non habeant materiam partem sui ex qua sint, habent tamen materiam in qua sunt et de cuius potentia educuntur; unde et cum esse desinunt, non omnino annihilantur, sed remanent in potentia materiae, sicut prius.”

<sup>69</sup> *In Metaph.* 8, l. 4, §1744 (cf. ARISTOTLE, *Metaphysica* H.4, 1044b9–11; 14): “Si ergo quaeratur quae sit causa eclipsis, non est assignare quae sit materia; sed luna est subiectum patiens talem passionem. [...] ratio eclipsis lunae est privatio luminis in luna.” ARISTOTLE adds other causes to this definition. As St. Thomas comments, the Earth—diametrically interposed between the Sun and the Moon—is the moving cause that blocks (lit., *corruptit*) light. A final cause might not be assigned, for those that pertain to defect are not for the sake of an end: rather, they proceed from the necessity of nature, or of the agent cause; and the consideration of causes concerning singular (things) that happen in celestial motions it is quite difficult. On the other hand, the formal cause of the eclipse is its definition; and this definition is not evident if no cause is posited in it. But if to this definition were added that this privation is *due to the earth being positioned diametrically between the sun and the moon*, then the definition will be with a cause. See *ibid.* (cf. ARISTOTLE, *Metaphysica* H.4, 1044b11–15): “Causa autem movens, quae corrumpit lumen, est terra interposita diametraliter inter solem et lunam. Causam vero finalem forsitan non est assignare. Ea enim, quae ad defectum pertinent, non sunt propter finem, sed magis proveniunt ex necessitate naturae, vel causae agentis. Dicit autem [Philosophus] forsitan, quia consideratio causarum circa singula quae contingunt in motibus caelestibus est valde difficilis. Causa vero formalis eclipsis est definitio eius. Sed haec definitio non est manifesta, nisi in ea ponatur causa; [...]. Sed, si addatur, quod ista privatio est a terra in medio obiecta inter solem et lunam diametraliter, haec definitio erit cum causa.”

<sup>70</sup> *In Metaph.* 8, l. 4, §1745 (cf. ARISTOTLE, *Metaphysica* H.4, 1044b15–20): “Similiter hoc patet in hoc accidente quod est somnus. Sed in somno non est manifestum quid est primum subiectum patiens hanc passionem; sed hoc est manifestum quod animal est subiectum somni. Sed secundum quid primo somnus insit animali, utrum sit cor, vel aliquid aliud tale, non est manifestum; cum quidam ponant primum instrumentum sensus esse cerebrum, quidam vero cor. Somnus autem est quies operationis sensibilis. Deinde oportet considerare, habito subiecto somni, a quo sicut a causa agente sit somnus; utrum ab evaporatione alimenti, aut labore, aut aliquo huiusmodi. Deinde oportet considerare quae passio sit somnus, illius scilicet secundum quod primo inest somnus animali, et non totius animalis; quia somnus est quaedam immobilitas; sed ea competit animali per aliquod primum, quod est subiectum talis passionis. Et illud primum oportet poni in definitione somni, sicut et quodlibet accidens definitur per proprium suum primum subiectum. Color enim definitur per superficiem et non per corpus.”

than *matter from which*; ► 14.8), as the human body is related to the rational soul (or *mind*).<sup>71</sup>

In contrast, the form of a house, as also (all) other artificial forms, is an accidental form.<sup>72</sup> Whence, it does not give the (act of) being and the species to the whole and to whichever part; nor is the whole (something) one simply (*simpliciter*), but (something) one according to aggregation (*aggregatione*; ► 13.11).

### 15.16. Causes of Accidents

Whatever is in something as in a subject, must have some cause.<sup>73</sup> Speaking **in common**, *the subject is the cause of all accidents insofar as accidents are sustained (sustentantur) upon the (act of) being of the subject*—not, however, in such a way that all accidents would be educed from the principles of the subject.

Whatever is in something that is other than its essence must be caused either from the principles of the essence, as proper accidents follow upon the species—as risible follows upon man and is caused from the essential principles of the species—or by something exterior, as heat is caused in water by fire.<sup>74</sup> Hence, whatever is in something as in a subject is caused either *from the principles of the subject or from some extrinsic cause*.

### 15.17. Proper Affection (Property), Natural Accident, Habit (Possession)

The **natural accident**, also called **proper affection** (*passio* = πάθος) or **habit** (*habitus* = ἔξις, i.e., possession) is caused from the principles of the subject, which are form and matter (► 15.8); for each thing is placed in a genus or in a species by its form; and is individuated by matter (► 13.10).<sup>75</sup>

---

<sup>71</sup> *In Metaph.* 5, l. 2, §775: “Materia etiam quandoque non sustentat formam secundum esse simpliciter, sed secundum quod est forma huius, habens esse in hoc, sicut se habet corpus humanum ad animam rationalem.”

<sup>72</sup> *Q. d. de anima*, 10 ad 16: “forma domus, sicut et aliae formae artificiales, est forma accidentalis: unde non dat esse et speciem toti et cuilibet parti; neque totum est unum simpliciter, sed unum aggregatione.”

<sup>73</sup> *ScG* 3, c. 13, n. 2: “Quicquid enim est in aliquo ut in subiecto, oportet quod habeat aliquam causam.” *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: “subjectum diversimode se habet ad diversa accidentia. [...] Tamen sciendum, quod omnibus accidentibus, communiter loquendo, subjectum est causa quodammodo, in quantum scilicet accidentia in esse subjecti sustentantur; non tamen ita quod ex principiis subjecti omnia accidentia educantur.”

<sup>74</sup> *STh* 1, q. 3 a. 4 co.: “quidquid est in aliquo quod est praeter essentiam eius, oportet esse causatum vel a principiis essentiae, sicut accidentia propria consequentia speciem, ut risibile consequitur hominem et causatur ex principiis essentialibus speciei; vel ab aliquo exteriori, sicut calor in aqua causatur ab igne.” *ScG* 3, c. 13, n. 2: “causatur enim vel ex subiecti principiis, vel ex aliqua extrinseca causa.” *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: “subjectum diversimode se habet ad diversa accidentia. Quaedam autem sunt accidentia naturalia quae creantur ex principiis subjecti [...]. Quaedam autem sunt quae quidem causantur ab extrinseco.” *De veritate*, q. 3 a. 7 co.: “Quaedam enim sunt accidentia propria ex principiis subiecti causata. [...] Quaedam vero sunt accidentia, quae non sequuntur inseparabiliter suum subiectum, nec ex eius principiis dependent.”

<sup>75</sup> *In Physic.* 4, l. 23, n. 2: “accidens autem consuevit [Philosophus] nomine *habitus* et *passionis* nominari.” Cf. ARISTOTLE, *Physica* Δ.15, 223a18–19: “πάθος ἢ ἔξις.” *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: “Quaedam autem sunt accidentia naturalia quae creantur ex principiis subjecti; et hoc dupliciter.” *In*

Accidents that follow upon form are the *proper affections* either **of the genus** or **of the species**.<sup>76</sup> Whence, they are found in all those (subjects) that participate (in) the nature of the genus or of the species (►26). For example, in the species *man*, *risible* follows upon the form; for laughter happens from some apprehension of man's soul.

Accidents that follow upon (individual) matter are accidents or affections **of the individual**, insofar as individuals—even of the same species—differ one from another.<sup>77</sup>

Some proper accidents, such as male and female, have a permanent cause in their subject, are produced into being in one operation with it, and are never separated—according to being (*secundum esse*; i.e., as opposed to according to *ratio*, *secundum rationem*)—from it.<sup>78</sup> There are, however, other (accidents) that do not have a permanent cause in the subject, and are, therefore, separable (►15.18). For example, *to sit down* or *to walk*.

### 15.18. Separable (Non-Necessary) vs. Inseparable (Necessary) Accident

ARISTOTLE posits two modes in which **accident** (*accidens* = συμβεβηκός) is said:<sup>79</sup>

1. The **non-necessary** or **separable accident** (►15.20): *that which is in something, and which can be truly affirmed [of it] (id quod inest alicui, et quod contingit vere affirmare < ὁ ὑπάρχει μὲν τινι καὶ ἀληθῆς εἶπειν); not, however, of necessity (non tamen ex necessitate < οὐ μέντοι οὔτ' ἐξ ἀνάγκης; ►9.9), nor as in most (nec... ut in pluribus = οὔτε <ὧς> ἐπὶ τὸ πολὺ) but as in fewer (sed ut in paucioribus).*<sup>80</sup>

---

*Physic.* 5, l. 3, n. 4: "Manifestum est enim quod propriae passiones causantur ex principiis subiecti, quae sunt materia et forma." *De ente*, c. 6, 87–89: "unaqueque res indiuiduatur ex materia et collocatur in genere uel specie per suam formam."

<sup>76</sup> *De ente*, c. 6, 92–95: "accidentia uero que consequuntur formam sunt proprie passiones uel generis uel speciei, unde inueniuntur in omnibus participantibus naturam generis uel speciei." *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: "vel causantur ex principiis speciei, et sic sunt propriae passiones, quae consequuntur totam speciem." *De ente*, c. 6, 95–97: "sicut risibile consequitur in homine formam, quia risus contingit ex aliqua apprehensione anime hominis." *Q. d. de anima*, a. 12 ad 7: "quaedam enim [accidentia] causantur ex principiis speciei, et dicuntur propria sicut risibile homini."

<sup>77</sup> *De ente*, c. 6, 89–92: "accidentia que consequuntur materiam sunt accidentia indiuidui, secundum que indiuidua etiam eiusdem speciei ad inuicem differunt." *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: "vel [causantur] ex principiis indiuidui, et sic sunt communia consequentia principia naturalia indiuidua."

<sup>78</sup> *Q. d. de anima*, a. 12 ad 7: "quaedam uero [accidentia] causantur ex principiis indiuidui. Et hoc dicitur quia, vel habent causam permanentem in subiecto, et haec sunt accidentia inseparabilia, sicut masculinum et femininum et alia huiusmodi; quaedam uero habent causam non permanentem in subiecto, et haec sunt accidentia separabilia, ut sedere et ambulare." *De ueritate*, q. 3 a. 7 co.: "Quaedam enim sunt accidentia propria ex principiis subiecti causata, quae secundum esse nunquam a suis subiectis separantur. Et huiusmodi una operatione in esse producuntur cum suo subiecto."

<sup>79</sup> *In Metaph.* 5, l. 22, §1139 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a14–34): "ponit [Philosophus] duos modos, quibus dicitur hoc nomen accidens." *In Physic.* 1, l. 6, n. 10 (cf. ARISTOTLE, *Physica* A.3, 186b18–23): "accidens dicitur dupliciter." *De prin. nat.* §2, 15: "duplex est accidens."

<sup>80</sup> *In Metaph.* 5, l. 22, §1139 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a14–15): "quorum *primus* est, quod accidens dicitur id quod inest alicui, et quod contingit vere affirmare, non tamen ex necessitate, nec «secundum magis,» idest ut in pluribus, sed ut in paucioribus."

2. The **necessary or inseparable accident**: that which is in something according to itself (*quod inest alicui secundum se* < ὅσα ὑπάρχει ἐκάστῳ καθ' αὐτὸ), and yet it does not belong to its substance (*et tamen non est de substantia eius* < μὴ ἐν τῇ οὐσίᾳ ὄντα). In this mode, (by) accident (*accidens*) is opposed to *substantially* (*substantialiter*).<sup>81</sup>

### 15.19. The Inseparable Accident

The **inseparable and by itself** (*inseparabile et per se*) **accident** is that (accident) in which is posited the subject it inheres (in cuius definitione ponitur subiectum cui accidit = οὗ ἐν τῷ λόγῳ ὑπάρχει τὸ ᾧ συμβέβηκεν); for (such an accident) is necessary (► 9.9, ¶1), since cannot be separated from the thing.<sup>82</sup>

For example, *snub* is an accident by itself of *nose*; for *nose* is posited in the definition of *snub*: indeed, *snub* is a *curved nose*. Likewise, *risible* (i.e., capable of laughing) is a necessary accident that is not separable from *man*.

Separable accidents differ from the inseparable in that the latter can be sempiternal.<sup>83</sup> Thus, a triangle always has three angles equal to two right (angles, =180°). No separable accidents can be sempiternal because they always are as in fewer (subjects); and their *ratio* is had in others (i.e., in their proper subjects, which are posited in their *ratio*).

That an accident that is not by itself is not necessarily in (a subject) can be had from this: if an accident (*accidens* = συμβεβηκός) is of necessity and always (*ex necessitate et semper*) in a subject (*insit subiecto*), it must have a cause in the subject; this posited, the accident cannot but be in it.<sup>84</sup> And this can happen in two modes: **(1)** when the accident is *caused from the principles of the species*; and such an accident is said to be an affection by itself or proper (► 15.17); **(2)** when the accident is *caused from the principles of the individual*, and this is an inseparable accident.

---

<sup>81</sup> *In Metaph.* 5, l. 22, §1142 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a30–32): “Secundo modo dicitur accidens, quod inest alicui secundum se, et tamen non est de substantia eius.” *In Metaph.* 5, l. 22, §1143: “Accidens vero secundo modo opponitur ad substantialiter.”

<sup>82</sup> *In Physic.* 1, l. 6, n. 10 (cf. ARISTOTLE, *Physica* A.3, 186b20; 22–23): “alio modo accidens inseparabile et per se. Et hoc est accidens in cuius definitione ponitur subiectum cui accidit: sicut simum est per se accidens nasi quia in definitione simi ponitur nasus; est enim simum nasus curvus.” *De prin. nat.* §2, 15–16: “accidens, scilicet necessarium quod non separatur a re, ut risibile hominis.”

<sup>83</sup> *In Metaph.* 5, l. 22, §1143 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a32–34): “Differt autem hic modus a primo, quia accidentia hoc secundo modo contingit esse sempiterna. Semper enim triangulus habet tres angulos aequales duobus rectis. Accidentium vero secundum primum modum, nullum contingit esse sempiternum, quia sunt semper ut in paucioribus: et huius ratio habetur in aliis, sicut infra in sexto huius, et in secundo Physicorum.”

<sup>84</sup> *In Post. an.* 1, l. 14, 29–39: “Quod autem accidens quod non est ‘per se’, non necessario insit, ex hoc potest haberi: Si enim aliquod accidens ex necessitate et semper insit subiecto, oportet quod causam habeat in subiecto, qua posita, non possit accidens non inesse. Quod quidem contingit dupliciter: uno modo, quando ex principiis speciei accidens causatur, et tale accidens dicitur per se passio uel proprium; alio modo quando accidens causatur ex principiis individui, et hoc est accidens inseparabile.”

## 15.20. The Separable Accident

The **separable accident** does not have a determinate cause, but a contingent (cause) or some indeterminate, fortuitous cause.<sup>85</sup> Thus, it is *that which may or may not be in a subject* (*quod contingit inesse et non inesse* = ὁ ἐνδέχεται ὑπάρχειν καὶ μὴ ὑπάρχειν). For example, (to be) *white*—or *sitting down*—is separable from *man*.

Just as something is in some determinate subject, so, too, is something considered to be in some determinate place and in some determinate time.<sup>86</sup> Therefore, in all (things), it is possible (for something) to be in (some subject) by accident (i.e., contingently) if it is not in (the subject) as such (*huiusmodi*): for example, if *white* is said of a musical (or musician), this is by accident; for (white) is not in a musician insofar as such (i.e., insofar as it is a musician or is musical).

Likewise, if there is abundance of rain in the summer, this is by accident; for it does not happen in the summer insofar as it is summer.<sup>87</sup> Also, if the heavy is on high, this is by accident; for it is not in such a place insofar as it is that place, but by some external cause.

Accidents that neither inseparably follow upon their subject nor depend upon its principles are produced into being by an operation other than the operation whereby the subject is produced.<sup>88</sup> For example, to be a grammarian does not follow upon there coming to be a man; rather, (the grammarian comes to be) from some other operation.

## 15.21. Separable in Respect of Being vs. in Respect of Coming-To-Be

*Separable accident* can be taken in respect of being (*quantum ad esse*) or in respect of coming-to-be (*quantum ad fieri*).<sup>89</sup>

---

<sup>85</sup> *In Metaph.* 5, l. 22, §1141 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a24–25): “Et sciendum, quod accidentis hoc modo dicti [sc., separabile, quod contingit inesse et non inesse], non est aliqua causa determinata, «sed contingens,» idest qualiscumque contingat, vel «quia forte,» idest causa fortuita, quae est causa indeterminata.” *In Physic.* 1, l. 6, n. 10 (cf. ARISTOTLE, *Physica* A.3, 186b19–22): “uno modo accidens separabile, quod contingit inesse et non inesse, ut sedere.” *De prin. nat.* §2, 15–18: “accidens [...] non necessarium quod separatur, ut album ab homine.”

<sup>86</sup> *In Metaph.* 5, l. 22, §1140 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a21–24): “Quia ergo sicut aliquid inest alicui subiecto determinate, ita et aliquid consideratur «esse alicubi,» idest in aliquo loco determinato, et «quandoque,» idest in aliquo tempore determinato, in omnibus contingit inesse per accidens, si non insit secundum quod huiusmodi. Sicut si album dicitur de musico, hoc est per accidens, quia non inest musico inquantum huiusmodi.”

<sup>87</sup> *In Metaph.* 5, l. 22, §1140 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a21–24): “Et similiter si sit abundantia pluviae in aestate, hoc est per accidens, quia non accidit in aestate inquantum est aestas; et similiter si grave sit sursum, hoc est per accidens, non enim est in tali loco secundum quod talis locus est, sed per aliquam causam extraneam.”

<sup>88</sup> *De veritate*, q. 3 a. 7 co.: “Quaedam vero sunt accidentia, quae non sequuntur inseparabiliter suum subiectum, nec ex eius principiis dependent. Et talia producuntur in esse alia operatione praeter operationem qua producitur subiectum; sicut non ex hoc ipso quod homo fit homo sequitur quod sit grammaticus, sed per aliquam aliam operationem.”

<sup>89</sup> *In Metaph.* 5, l. 22, §1139: “Differt autem hoc exemplum a primo. Nam in primo exemplo sumebatur accidens quantum ad fieri; in secundo vero quantum ad esse.”

1. **In respect of being** (*quantum ad esse*): for example, as when a musician (or musical) is said to be white; for this is not of necessity; nor does it come to be as in most (subjects); whence, we say this is by accident (►11.7).<sup>90</sup>

2. **In respect of coming-to-be** (*quantum ad fieri*): for example, if someone were to find a treasure (while) digging some fosse to plant some plant (►11.8).<sup>91</sup> Thus, to find a treasure (while) digging a fosse is some accident; for neither is one the cause of the other of necessity, nor does one follow the other of necessity, as day follows upon night although one is not a cause of the other; nor does it happen, according to more or as in most, that one who plants finds a treasure.

Likewise, it may happen (*accidit*) that someone comes into a town even if he does not begin to move in order to reach that terminus, but is led there due to some external cause: e.g., because he is pushed by a winter storm at sea; or is captured by thieves, and is led there against his intention.<sup>92</sup> Whence, it is evident that this is by accident; and can be caused from diverse causes. But that this (person) reaches that place (while) navigating is not insofar as he is navigating; for he intended to navigate to another place. Rather, this happens according to some other, external cause; for a winter storm—or thieves, or something such—is the cause of his coming.

## 15.22. The Subject by Itself

There are some accidents by themselves (*per se*; ►15.17) that always follow in act upon their subject.<sup>93</sup> Such accidents are caused from the essential principles according to a perfect act (*secundum actum perfectum*). For example, heat (follows) in fire, which is always hot (i.e., according to ancient science, this is a necessary property of the element).

---

<sup>90</sup> *In Metaph.* 5, l. 22, §1139 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a19–21): “Et simili modo musicus dicitur esse albus, sed tamen hoc non est ex necessitate, nec fit ut in pluribus; ideo dicimus hoc per accidens.”

<sup>91</sup> *In Metaph.* 5, l. 22, §1139 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a15–19): “sicut, si aliquis fodiens aliquam fossam ad plantandum aliquam plantam, inveniatur thesaurum. Hoc ergo, quod est fodientem fossam invenire thesaurum, est quoddam accidens. Neque enim unum est causa alterius ex necessitate, ut hoc sit ex hoc necessario. Neque etiam de necessitate se comitantur, ut hoc sit post hoc, sicut dies consequitur noctem, quamvis unum non sit causa alterius. Neque etiam secundum magis hoc contingit, sive ut in pluribus, hoc contingit, ut ille qui plantat, inveniatur thesaurum.”

<sup>92</sup> *In Metaph.* 5, l. 22, §1141 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a25–30): “Sicut accidit alicui quod «veniat Aeginam,» id est ad illam villam, si non propter hoc advenit «ut illuc veniat,» id est si non propter hoc incepit moveri ut ad hunc terminum perveniret, sed ab aliqua extranea causa illuc adductus est, sicut quia impulsus est ab hieme concitante tempestatem in mari, aut etiam captus est a latronibus, et illuc perductus praeter intentionem. Unde patet, quod hoc est per accidens, et causari potest ex diversis causis; sed tamen quod iste navigans ad hunc locum perveniat non est «inquantum ipsum,» id est inquantum erat navigans, cum intenderet ad alium locum navigare; sed hoc contingit «inquantum alterum,» id est secundum aliquam aliam causam extraneam. Hiems enim est causa veniendi «quo non navigabat,» id est ad Aeginam, aut latrones, aut aliquid aliud huiusmodi.”

<sup>93</sup> *In Sent.* 2, d. 26 q. 1 a. 2 ad 2: “quaedam accidentia sunt per se, quae semper actu consequuntur suum subjectum.” *De ente*, c. 6, 98–101: “Sciendum etiam est quod accidentia aliquando ex principiis essentialibus causantur secundum actum perfectum, sicut calor in igne qui semper est calidus.”

Whence, when that which is by itself in (a subject) is always in (it), the subject is said to be a **subject by itself** (*per se subjectum*) in respect of those accidents: e.g., as fire is the subject by itself of heat.<sup>94</sup> Such an accident is caused from the principles of the subject not only in respect of an aptitude, but also in respect of the essence of the accident.

### 15.23. Aptitude or Ability in a Subject

Some accidents do not always follow in act upon their subject; but are always caused from the essential principles of their subject *in ability, according to an aptitude (in habilitate, secundum aptitudinem)*, while a complement (*complementum*) supervenes (*accidit*) from an exterior agent.<sup>95</sup>

In such subjects, the aptitude is an inseparable accident; but the complement that supervenes (*advenit*) from some principle that is outside the essence of the thing or which does not enter the constitution of the thing—e.g., *to be moved*—is separable.<sup>96</sup>

For example, air, which is not always illuminated in act, is, however, always illuminable (*illuminabilis*).<sup>97</sup> This illuminability (*illuminabilitas*) is caused from the principles of the subject, even though light is caused from (something) extrinsic. Thus, transparency in air is completed (i.e., perfected) by an external luminous body.

### 15.24. Accidents Extrinsicly Caused

Since substantial forms are the principles of qualities and of all accidents, a quality is received in some subject according to a proper and natural (act of) being which disposes the subject to a natural form of which it is susceptible.<sup>98</sup>

---

<sup>94</sup> *In Sent.* 2, d. 26 q. 1 a. 2 ad 2: “Unde cum illud quod per se inest, semper inest, subjectum aliquando dicitur esse per se subjectum respectu ipsius accidentis, sicut ignis est per se subjectum caloris; et tale accidens ex principiis subjecti causatur, non solum quantum ad habilitatem, sed etiam quantum ad essentiam accidentis.”

<sup>95</sup> *In Sent.* 2, d. 26 q. 1 a. 2 ad 2: “quaedam autem [accidentia] non semper in actu [consequuntur suum subjectum], semper autem in habilitate. [...] aliquando respectu habilitatis tantum.” *De ente*, c. 6, 101–108: “aliquando uero [accidentia ex principiis essentialibus causantur] secundum aptitudinem tantum, sed complementum accidit ex agente exteriori.”

<sup>96</sup> *De ente*, c. 6, 104–108: “in talibus [subiectis] aptitudo est accidens inseparabile, sed complementum quod aduenit ex aliquo principio quod est extra essentiam rei, uel quod non intrat constitutionem rei, est separabile, sicut moueri et huiusmodi.”

<sup>97</sup> *In Sent.* 2, d. 26 q. 1 a. 2 ad 2: “sicut aer qui non semper illuminatur in actu, semper tamen illuminabilis est; et haec illuminabilitas ex principiis subjecti causatur, quamvis lumen ab extrinseco sit.” *De ente*, c. 6, 103–104: “sicut dyaphaneitas in aere que completur per corpus lucidum exterius.”

<sup>98</sup> *In De sensu* 1, c. 15, 229–234: “quia uero forme substantiales sunt principia qualitatum et omnium accidentium, illa qualitas recipitur in subiecto aliquo secundum esse proprium et naturale que disponit subiectum ad formam naturalem cuius est susceptiuum.” St. Thomas offers an example from ancient science: water—by reason of its matter—is susceptible of the substantial form of fire, which is a principle of heat. Hence, heat is received in water, disposing it to the form of fire; and when fire is removed, water still remains hot, (and) capable of heating. *Ibid.*, 234–238: “sicut aqua ratione sue materie est susceptiua forme substantialis ignis que est principium caloris, et ideo calor recipitur in aqua disponens ipsam ad formam ignis et remoto igne adhuc aqua remanet calida calefacere potens.”

The subject is susceptible of an accidental form insofar as it is in potency.<sup>99</sup> But insofar as it is in act, it is productive of the proper and by itself accident. In respect of the extraneous accident, the subject is only susceptible, while an external agent is productive of such an accident.

(Extrinsically caused accidents either):<sup>100</sup>

1. *Resist the principles of the subject (repugnantia principiis subjecti)* and are induced (in it) through violence, as heat (is violently induced) in water.
2. *Do not resist the principles of the subject: rather, they perfect it.* For example, light (is induced) in air (which is non-violently perfected by light).

---

<sup>99</sup> *STh* I, q. 77 a. 6 co.: "subiectum, in quantum est in potentia, est susceptivum formae accidentalis, in quantum autem est in actu, est eius productivum. Et hoc dico de proprio et per se accidente, nam respectu accidentis extranei, subiectum est susceptivum tantum; productivum vero talis accidentis est agens extrinsecum."

<sup>100</sup> *In Sent.* 1, d. 17 q. 1 a. 2 ad 2: "Sunt etiam quaedam accidentia per violentiam inducta, sicut calor in aqua, et ista sunt repugnantia principiis subjecti. Quaedam autem sunt quae quidem causantur ab extrinseco non repugnantia principiis subjecti, sed magis perficientia ipsa, sicut lumen in aere."

## 16. Essence and Definition

Before we determine what the principle in any genus is (► 27), we must delve deeper into the essence and definition of substances and of accidents.

### 16.1. Essence

That by which a thing is constituted in its proper genus or species is what is signified by the definition that indicates *what the thing is* (*quid est res*; ► 8.1).<sup>1</sup> Therefrom (i.e., from *quid, what*), the name *essence* has been changed (*mutatur*) by philosophers into the name **quiddity** (*quidditas*, i.e., *what-ness*).

This is also what ARISTOTLE frequently calls **what something was to be** (*quod quid erat esse* = τὸ τί ἦν εἶναι): i.e., that by which something is what it is (*hoc per quod aliquid habet esse quid*).<sup>2</sup>

It is also called **form** insofar as by *form* is signified the certitude (*certitudo* = حقيقة *ḥaqīqah*, i.e., *true nature, essence*) of any one thing (*uniuscuiusque rei*), as AVICENNA says.<sup>3</sup>

It is also called by another name **nature**, taking *nature* according to the first of the four modes that BOETHIUS assigns (to this name) in his *De duabus naturis*: that is, insofar as everything that can somehow be grasped (*capi*) by the intellect is called *nature*; for a thing is only intelligible by its definition and essence.<sup>4</sup>

In this way, ARISTOTLE, too, says that every substance is a nature (► 12.6).<sup>5</sup> However, the name *nature* taken in this mode seems to signify the essence of a thing insofar as it has

---

<sup>1</sup> *De ente*, c. 1, 26–31: “Et quia illud per quod res constituitur in proprio genere uel specie est hoc quod significatur per diffinitionem indicantem quid est res, inde est quod nomen essentie a philosophis in nomen quiditatis mutatur.”

<sup>2</sup> *De ente*, c. 1, 31–34: “et hoc est etiam quod Philosophus frequenter nominat quod quid erat esse, idest hoc per quod aliquid habet esse quid.”

<sup>3</sup> *De ente*, c. 1, 34–36: “Dicitur etiam forma, secundum quod per formam significatur certitudo uniuscuiusque rei, ut dicit Auicenna in II Methaphisice sue.” See AVICENNA, *The Metaphysics of The Healing*, 24, 9–10: “فإن لكل أمر حقيقة بها ما هو، فللمثلث حقيقة أنه مثلث، وللبياض حقيقة أنه بياض.” Ibid., 54, 15: “وهذه” Cf. AVICENNA, *Liber de philosophia prima*, 1.5, 34.55–57: “unaquaeque enim res habet certitudinem qua est id quod est, sicut triangulus habet certitudinem qua est triangulus, et albedo habet certitudinem qua est albedo.” Ibid., 2.2, 78.73: “haec certitudo <extrinsecus adueniens> est forma.”

<sup>4</sup> *De ente*, c. 1, 36–43: “Hoc etiam alio nomine natura dicitur, accipiendo naturam secundum primum modum illorum quatuor quod Boetius in libro De duabus naturis assignat secundum scilicet quod natura dicitur omne illud quod intellectu quoquo modo capi potest, non enim res est intelligibilis nisi per diffinitionem et essentiam suam.” See BOETHIUS, *De persona et duabus naturis* I: “Natura, est earum rerum quae, cum sint, quoquomodo intellectu capi possent. In hac igitur definitione et accidentia et substantiae definiuntur; haec enim omnia intellectu capi possunt.” (PL 64, 1341B).

<sup>5</sup> *De ente*, c. 1, 43–50: “et sic etiam Philosophus dicit in V Methaphisice quod omnis substantia est natura. Tamen nomen nature hoc modo sumpte uidetur significare essentiam rei secundum quod habet ordinem ad propriam operationem rei, cum nulla res propria operatione destituatur; quiditatis uero nomen sumitur ex hoc quod per difinitionem significatur.”

an order to the proper operation of the thing; for nothing is destitute of its proper operation. In contrast, the name *quiddity* is taken from its being signified by the definition.

In turn, **essence** (*essentia*) is said *insofar as a being (ens) has (its act of) being (esse) by it and in it*. However, *being (ens; ▶ 30.1)* is said absolutely (*absolute*) and firstly (*primo*) of substance; and posteriorly (*per posterius*) and as according to something (*quasi secundum quid*), of accidents (▶ 30.14, ¶1).<sup>6</sup> Whence, essence too, properly and truly, is in substances; but in accidents, it is in some mode (*quodammodo*) and according to something (*secundum quid; ▶ 18*).

### 16.2. Essence of Substances

Of substances, some are simple, and some composite.<sup>7</sup> There is essence in both; but, in simple (substances, there is essence) in a truer and nobler mode (*veriori et nobiliori modo*) insofar as they also have a nobler act of being (*esse nobilius habent*); for they are the cause of those that are composite—at least the first, simple substance that is God. But since the essences of those substances are more concealed to us, one must begin from the essences of composite substances, so that, in learning (▶ 66), one may proceed more conveniently from what is easier.

### 16.3. Essence of Composite Substances

In composite substances, form and matter have been noted (*nota est; ▶ 15.8; 15.15*): for example, soul and body in man. However, it cannot be said that one or the other alone is said to be the essence.<sup>8</sup>

That matter alone is not the substance of a thing is evident because a thing is both knowable and ordered in a species or a genus by its essence, while neither matter is a principle of cognition nor is anything determined to a genus or species according to it: rather, something (is knowable and determined) insofar as it is in act.<sup>9</sup>

---

<sup>6</sup> *De ente*, c. 1, 50–57: “Sed essentia dicitur secundum quod per eam et in ea ens habet esse. Sed quia ens absolute et primo dicitur de substantiis, et per posterius et quasi secundum quid de accidentibus, inde est quod etiam essentia proprie et uere est in substantiis, sed in accidentibus est quodammodo et secundum quid.”

<sup>7</sup> *De ente*, c. 1, 57–67: “Substantiarum uero quedam sunt simplices et quedam composite, et in utrisque est essentia; sed in simplicibus ueriori et nobiliori modo, secundum quod etiam esse nobilius habent: sunt enim causa eorum que composita sunt, ad minus substantia prima simplex que Deus est. Sed quia illarum substantiarum essentie sunt nobis magis occulte, ideo ab essentia substantiarum compositarum incipiendum est, ut a facillioribus conuenientior fiat disciplina.”

<sup>8</sup> *De ente*, c. 2, 1–4: “In substantiis igitur compositis forma et materia nota est, ut in homine anima et corpus. Non autem potest dici quod alterum eorum tantum essentia esse dicatur.”

<sup>9</sup> *De ente*, c. 2, 4–10: “Quod enim materia sola rei non sit essentia, planum est, quia res per essentiam suam et cognoscibilis est, et in specie ordinatur uel genere; sed materia neque cognitionis principium est, neque secundum eam aliquid ad genus uel speciem determinatur, sed secundum id quod aliquid actu est.”

Nor can form alone be said to be the essence of a composite substance, although some have ventured to assert this.<sup>10</sup> From what has been said, it is evident that essence is that which is signified by the definition of the thing. And the definition of natural substances does not contain only form, but also matter (i.e., sensible, common matter; ► 13.12; 13.13; 13.16). Otherwise, the definition of natural and mathematical (things) would not differ.

Nor can it be said that matter is posited in the definition of natural substances as (though it should be) added to its essence, or (as though it were) a being outside of its essence (*ens extra essentiam eius*); for this mode of definitions is proper of accidents (► 18), which do not have a perfect essence; whence, in their definition, they must receive a subject that is outside their genus (e.g., in the definition of figures, which are in the genus of quality, a continuous quantity is posited as their proper subject-matter; ► 14.2).<sup>11</sup>

Therefore, it is evident that the essence comprehends both matter and form.<sup>12</sup> However, it cannot be said that *essence* signifies the relation that is between matter and form (► 15.14), or something added to them, because this would necessarily be an accident, and extraneous to the thing; nor would the thing be known through them—all of which befit essence (*essentiae conveniunt*). By the form, which is the act of matter, matter becomes a being in act (*efficitur ens actu*), and *this something (hoc aliquid)*. Hence, that which comes over (it) does not give to matter being in act simply, but being *such* in act, as also accidents do (► 15.13). For example, whiteness makes (a subject to be) white in act. Therefore, also when such a form is acquired, (the thing) is not said to come to be simply (*simpliciter*), but according to something (*secundum quid*).

It remains, therefore, that the name **essence** in composite substances signifies *that which is a composite from matter and form*.<sup>13</sup> This is what the Greek οὐσία signifies. AVICENNA,

---

<sup>10</sup> *De ente*, c. 2, 10–17: “Neque etiam forma tantum essentia substantie composite dici potest, quamvis hoc quidam asserere conentur. Ex hiis enim que dicta sunt patet quod essentia est illud quod per diffinitionem rei significatur; diffinitio autem substantiarum naturalium non tantum formam continet sed etiam materiam, aliter enim diffinitiones naturales et mathematice non differrent.”

<sup>11</sup> *De ente*, c. 2, 18–24: “Nec potest dici quod materia diffinitione substantie naturalis ponatur sicut additum essentie eius uel ens extra essentiam eius, quia hic modus diffinitionum proprius est accidentibus, que perfectam essentiam non habent; unde oportet quod diffinitione sua subiectum recipiant, quod est extra genus eorum.”

<sup>12</sup> *De ente*, c. 2, 24–37: “Patet ergo quod essentia comprehendit et materiam et formam. Non autem potest dici quod essentia significet relationem que est inter materiam et formam, uel aliquid superadditum ipsis, quia hoc de necessitate esset accidens et extraneum a re, nec per eam res cognosceretur: que omnia essentie conueniunt. Per formam enim, que est actus materie, materia efficitur ens actu et hoc aliquid; unde illud quod superaduenit non dat esse actu simpliciter materie, sed esse actu tale, sicut etiam accidentia faciunt, ut albedo facit actu album. Vnde et quando talis forma acquiritur, non dicitur generari simpliciter sed secundum quid.”

<sup>13</sup> *De ente*, c. 2, 38–44: “Relinquitur ergo quod nomen essentie substantiis compositis significat id quod ex materia et forma compositum est. Et huic consonat uerbum Boetii in commento Predicamentorum, ubi dicit quod usya significat compositum; usya enim apud Grecos idem est quod essentia apud nos, ut ipsemet dicit in libro De duabus naturis.” This is not found in BOETHIUS, but in ALBERT the Great.

too, says that **the quiddity** (*quidditas* = ماهية *māhīyah*, i.e., *what-ness*)<sup>14</sup> of composite substances is *the composition* (*compositio* = تركيب *tarkīb*) *itself of matter and form*.<sup>15</sup>

AVERROES too, in his *Commentary* on (ARISTOTLE's) *Metaphysics*, says, "the nature that species have in generable things is a mean thing [شيء متوسط *šay' mutawassiṭ*]: that is, composed from matter and form (مركب من مادة وصورة *murakkab min māddah wa-ṣūrah*)."<sup>16</sup>

The *ratio* (of essence) agrees (*concordat*) with this, too; for **essence** is (*that*) *according to which a thing is said to be* (*secundum quam res esse dicitur*); and the (act of) being (*esse*, i.e., the *to be*) of a composite substance belongs neither to form alone nor to matter alone, but of the composite itself (► 15.14).<sup>17</sup> Whence, the essence, whereby a thing (*res*) is denominated *being* (*ens*), must not be form alone, nor matter alone, but one and the other, even though form alone is the cause of (the act of) being of this mode (i.e., form alone is the cause of being insofar as form gives the act of being to matter).

In this way, we see, in other (things) that are constituted from multiple principles, that the thing is not denominated from one or the other of its principles alone, but from that which encompasses one and the other.<sup>18</sup> (For example, a square is denominated neither from its boundary alone nor from its surface alone, but from one and the other.)<sup>19</sup>

---

<sup>14</sup> The abstract ماهية *māhīyah* derives from ما هي *mā hīya* (or perhaps is assimilated from ما هو *mā huwa*), meaning *what it is* (and, in questions, *what is it?*), just as كمية *kammīyah*, *quantity*, derives from كم *kamm*, meaning *quantum* (and, in questions, *how much?*). See Amélie Marie GOICHON, *Lexique de la Langue Philosophique d'ibn Sīnā (Avicenne)* (Paris: Desclée de Brouwer, 1938), 386: "MĀHĪYA, quiddité, substance seconde, substance-attribut. Mot qui semble un mot composé formé de *mā*, ce que, et de *hīya*, pronom personnel de la troisième personne ayant le sens de *elle est*; il a été choisi par Ḥimṣī et Kindī pour rendre le grec τὸ τί dans la prétendue *Théologie* d'Aristote."

<sup>15</sup> *De ente*, c. 2, 45–47: "Avicenna etiam dicit quod quidditas substantiarum compositarum est ipsa compositio forme et materie." See AVICENNA, *The Metaphysics of The Healing*, 188, 1–4: "وأما الماهية فهي: ما بها هي ما هي، وإنما هي ما هي بكون الصورة مقارنة للمادة، وهو أزيد من معنى الصورة. ولمركب ليس هذا المهني أيضاً، بل هو مجموع الصورة والمادة؛ فإن هذا هو ما هو المركب، والماهية هذا التركيب." Cf. AVICENNA, *Liber de philosophia prima*, 5.5, 275.69–73: "quidditas vero est id quod est quicquid est, forma existente coniuncta materiae, quod quidem amplius est quam intentio formae; compositio etiam non est haec intentio quia composita est ex forma et materia; haec enim est quidditas compositi et quidditas est haec compositio."

<sup>16</sup> *De ente*, c. 2, 47–50: "Commentator etiam dicit super VII Methaphisice «Natura quam habent species in rebus generabilibus est aliquod medium, id est compositum ex materia et forma»." See Maurice BOUYGES (ed.), *Averroès: tafsir ma ba'd at-tabī'at*, Bibliotheca Arabica Scholasticorum (Beirut: Dar El-Machreq, 1938–1952), Comm. 27 on Book VII (cf. ARISTOTLE, *Metaphysica* Z.8, 1033b14–16), Tome VI, 863.19–864.2: "الطبيعة التي تكون الانواع في الاشياء المتناسلة هي شيء متوسط اي مركب من مادة وصورة."

<sup>17</sup> *De ente*, c. 2, 50–57: "Huic etiam ratio concordat, quia esse substantie composite non est tantum forme neque tantum materie, sed ipsius compositi; essentia autem est secundum quam res esse dicitur: unde oportet ut essentia qua res denominatur ens non tantum sit forma, neque tantum materia, sed utrumque, quamvis huiusmodi esse suo modo sola forma sit causa."

<sup>18</sup> *De ente*, c. 2, 57–61: "Sic emm in aliis uidemus que ex pluribus principiis constituuntur, quod res non denominatur ex altero illorum principiorum tantum, sed ab eo quod utrumque complectitur."

<sup>19</sup> St. Thomas offers (in *ibid.*, 61–66) a different example in the order of savors, explaining that sweetness (according to ancient science) is caused from the action of the hot that digests the humid; and although, in this mode, heat is a cause of sweetness, a body is not denominated *sweet* due to heat, but due to the savor that hot and humid encompasses.

Since the principle of individuation is matter, it would perhaps seem that essence, which at once encompasses in itself (both) matter and form, is only particular and not universal.<sup>20</sup> From this, it would follow that universals would not have a definition, if *essence* is *that which is signified by the definition*. Hence, we must note that matter is not taken as the principle of individuation in whatever mode, but only *designated matter* (*materia signata*), which is considered under determined dimensions (► 13.12; 35.10, ¶2). This matter is not posited in the definition of *man* insofar as it is a man—through it would be posited in the definition of *Sortes* if *Sortes* had a definition. In the definition of *man*, undesignated matter (*materia non signata*) is posited; for, in the definition of *man*, *this bone* and *this flesh* are not posited, but *bone* and *flesh* absolutely, which are the undesignated matter of *man*.

#### 16.4. Definition of Substances

True definitions must be investigated first; for they signify the substances of things.<sup>21</sup> In such definitions, there is nothing other than *a first genus and differences*. There are also some definitions that do not signify the substance of a thing, which are given by some accidents or by some properties; or even by some extrinsic causes (► 18).

Sometimes, some intermediate genera are posited in (true) definitions between the first genus, which is the most general, and the last species that are defined.<sup>22</sup> However, those mean genera are nothing other than the first genus and the differences comprehended with the first genus in the understanding of the mean genera.

For example, if *animal*, which is an intermediate genus, is posited in the definition of *man*, it is evident that *animal* is nothing other than *substance*, which is the first genus, with some differences; for *animal* is a *sensible, animated substance* (*substantia animata sensibilis*;

<sup>20</sup> *De ente*, c. 2, 67–84: “Sed quia indiuiduationis principium materia est, ex hoc forte uideretur sequi quod essentia, que materiam in se complectitur simul et formam, sit tantum particularis et non uniuersalis: ex quo sequeretur quod uniuersalia diffinitionem non haberent, si essentia est id quod per diffinitionem significatur. Et ideo sciendum est quod materia non quolibet modo accepta est indiuiduationis principium, sed solum materia signata; et dico materiam signatam que sub determinatis dimensionibus consideratur. Hec autem materia in diffinitione que est hominis in quantum est homo non ponitur, sed poneretur in diffinitione Sortis si Sortes diffinitionem haberet. In diffinitione autem hominis ponitur materia non signata: non enim in diffinitione hominis ponitur hoc os et hec caro, sed os et caro absolute que sunt materia hominis non signata.”

<sup>21</sup> *In Metaph.* 7, l. 12, §1542 (cf. ARISTOTLE, *Metaphysica* Z.12, 1037b27–29): “Dicit ergo [Philosophus] primo, quod ad investigandum unitatem definitionum oportet primum intendere de definitionibus quae dantur secundum divisionem generis in differentias. Ista enim sunt definitiones verae, in quibus non est aliud quam primum genus et differentiae. Dantur enim et quaedam definitiones per aliqua accidentia, vel per aliquas proprietates, vel etiam per aliquas causas extrinsecas, quae non significant substantiam rei. Et ideo huiusmodi definitiones non sunt ad propositum, cum hic agatur de definitionibus ad substantias rerum investigandas.”

<sup>22</sup> *In Metaph.* 7, l. 12, §1543 (cf. ARISTOTLE, *Metaphysica* Z.12, 1037b29–32): “Ideo autem dico quod in definitione est primum genus cum differentiis, quia etsi aliquando in definitionibus ponantur aliqua genera intermedia inter genus primum quod est generalissimum, et species ultimas quae definiuntur, tamen illa genera media nihil aliud sunt quam genus primum, et differentiae comprehensae in intellectu generis medii «cum hoc,» idest cum genere primo.”

i.e., *substance* is the first genus; *animated* is a difference; and *sensible* is a posterior difference).<sup>23</sup> Likewise, (this is true) if we understand the first genus to be *animal*, (the second genus to be) *biped animal*, and the third genus (to be) *non-winged, biped animal*.

If some genus is determined by multiple differences, always the posterior genus comprehends the prior with some differences.<sup>24</sup> Whence, it is evident that every definition is resolved into a *first genus* and some differences. It makes no difference whether some defined (thing), is defined by many or by few (terms); or (even) by (only) two, such that one of them would be the genus, and the other a difference: for example, of *biped animal*, *animal* is the genus; and the other—namely, *biped*—is the difference.<sup>25</sup>

Hence, it is evident that a definition is some *ratio* that has (its) unity from differences, such that the whole essence of the definition is—in some mode—comprehended in the differences.<sup>26</sup>

Whence, *animal*, which is a genus, cannot be without species (► 14.14); for the forms of the species that are differences are not forms other than the form of the genus: rather, they are forms of the genus with determination (► 14.12).<sup>27</sup>

Thus, it is evident that *animal* is *that which has a sensitive soul*, while *man* is *that which has such a sensitive soul*—that is, (a soul) *with reason*.<sup>28</sup> And the same can be said of

---

<sup>23</sup> *In Metaph.* 7, l. 12, §1543 (cf. ARISTOTLE, *Metaphysica* Z.12, 1037b32–33): “Sicut si in definitione hominis ponatur animal, quod est genus intermedium, patet quod animal nihil aliud est quam substantia, quae est genus primum, cum aliquibus differentiis. Est enim animal substantia animata sensibilis. Et similiter si intelligamus primum genus esse animal, «habitum bipes;» et iterum tertium genus, «animal bipes non alatum.»”

<sup>24</sup> *In Metaph.* 7, l. 12, §1543 (cf. ARISTOTLE, *Metaphysica* Z.12, 1037b33–1038a1): “Et similiter si aliquod genus per plures differentias determinatur. Semper enim posterius genus comprehendit prius cum aliqua differentia. Et sic patet quod omnis definitio resolvitur in primum genus et aliquas differentias.”

<sup>25</sup> *In Metaph.* 7, l. 12, §1544 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a1–4): “Omnino autem non differt, utrum per plura aut per pauca definiatur aliquod definitum. Quare non differt, utrum per pauca, vel per duo, ita quod illorum duorum unum sit genus et aliud differentia. Sicut eius quod est animal bipes, animal est genus; et alterum, scilicet bipes, est differentia.”

<sup>26</sup> *In Metaph.* 7, l. 12, §1549 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a8–9): “Si ergo praedicta sunt vera, palam est quod definitio est quaedam ratio ex differentiis unitatem habens; ita quod tota essentia definitionis, in differentia quodammodo comprehenditur.”

<sup>27</sup> *In Metaph.* 7, l. 12, §1549: “Ex hoc enim animal, quod est genus, non potest esse absque speciebus, quia formae specierum quae sunt differentiae, non sunt aliae formae a forma generis, sed sunt formae generis cum determinatione. Si ergo praedicta sunt vera, palam est quod definitio est quaedam ratio ex differentiis unitatem habens; ita quod tota essentia definitionis, in differentia quodammodo comprehenditur. Ex hoc enim animal, quod est genus, non potest esse absque speciebus, quia formae specierum quae sunt differentiae, non sunt aliae formae a forma generis, sed sunt formae generis cum determinatione. Sicut patet quod animal est quod habet animam sensitivam. Homo autem est qui habet animam sensitivam «talem,» scilicet cum ratione. Leo vero qui «habet talem,» scilicet cum abundantia audaciae. Et sic de aliis.”

<sup>28</sup> *In Metaph.* 7, l. 12, §1549: “Sicut patet quod animal est quod habet animam sensitivam. Homo autem est qui habet animam sensitivam «talem,» scilicet cum ratione. Leo vero qui «habet talem,» scilicet cum abundantia audaciae. Et sic de aliis.”

*lion* and of other (animals): that they have *such* a sensitive soul (with their respective specific qualities).

Whence, when a difference is added to a genus, it is not added as some essence diverse from the genus, but as contained implicitly, as the determinate is contained in the indeterminate: as (the determinate) *white* (is contained) in (the indeterminate) *colored*.<sup>29</sup>

Therefore, nothing prevents the same genus from containing in itself diverse differences, as the indeterminate contains in itself diverse determinates.<sup>30</sup> Thus, a difference does not befall a genus according to the mode by which *white* befalls *man*, as an essence that is diverse from that (to which it befalls).

### 16.5. Order Among Substantial Differences

In those definitions in which there are multiple differences, not only must the genus be divided into differences, but also the first difference (must be divided) into a second difference.<sup>31</sup>

For example, a difference of *animal* is *footedness* (*pedalitas*), according to which an *animal* is said (to be) *that which has feet* (*habens pedes*), or (*that which*) *is able to walk* (*gressibile*).<sup>32</sup> But, since also this difference is found in multiple (modes), it is necessary, again, to know the difference of the footed animal, which is its difference insofar as it has feet—that is, (the difference) by itself and not by accident.

Hence, since *having wings* happens to *the footed*, if someone wants to correctly divide differences, he must not say, “of the footed, one is winged; and the other, non-winged.”<sup>33</sup>

---

<sup>29</sup> *In Metaph.* 7, l. 12, §1549: “Unde cum differentia additur generi, non additur quasi aliqua diversa essentia a genere, sed quasi in genere implicite contenta, sicut determinatum continetur in indeterminato, ut album in colorato.”

<sup>30</sup> *In Metaph.* 7, l. 12, §1550: “Per quod etiam solvitur ratio superius inducta; quia nihil prohibet idem genus in se continere diversas differentias, sicut indeterminatum continet in se diversa determinata. Et etiam propter hoc solvitur, quia non hoc modo advenit differentia generi, ut diversa essentia ab eo existens, sicut advenit album homini.”

<sup>31</sup> *In Metaph.* 7, l. 12, §1551 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a9–10): “Dicit ergo [Philosophus] primo, quod in definitionibus in quibus sunt multae differentiae, oportet non solum dividi genus in differentiam, sed etiam dividi differentiam primam in differentiam secundam.”

<sup>32</sup> *In Metaph.* 7, l. 12, §1551 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a10–11): “Sicut animalis differentia est *pedalitas*, secundum quam animal dicitur *habens pedes*, vel *gressibile*. Sed quia etiam haec differentia multipliciter invenitur, iterum oportet scire differentiam animalis habentis pedes, quae sit differentia eius, «inquantum est habens pedes,» scilicet per se et non per accidens.”

<sup>33</sup> *In Metaph.* 7, l. 12, §1552 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a12–14): “Et ideo, quia habenti pedes accidit habere alas, non est dicendum, dividendo differentiam, quod habentis pedes aliud est alatum, aliud non alatum, si homo bene velit dicere divisionem differentiarum. Sed tamen quandoque aliquis dividens differentias «facit hoc» ut scilicet dividat per ea quae sunt secundum accidens, propter hoc quod non potest invenire proprias et per se differentias. Aliquando enim necessitas cogit, ut utamur, loco per se differentiarum, differentis per accidens, inquantum sunt signa quaedam differentiarum essentialium nobis ignotarum.”

However, someone who is dividing differences sometimes does this—that is, he divides (a genus) by those (differences) that are according to accident—because he cannot find the proper and by themselves differences; for sometimes it is necessary to use differences by accident insofar as they are some (kind of) signs of the essential differences that are unknown to us.

Rather, the mode in which these differences ought to be divided is this: “of footed animal, one has cloven feet; and the other, non-cloven”; for these—i.e., cloven and non-cloven—are differences (by themselves) of foot.<sup>34</sup> Hence, having cloven feet divides by itself the difference of having feet; for a cloven foot is some (kind of) footedness: that is, the difference of having *cloven* feet is something contained under *having feet*; and (these) are related to each other as the determinate and the indeterminate—as has been said of the difference (which is a determinate form) and of the genus (which is indeterminate).

In the division of differences, one ought always to proceed until the last differences, which are not ultimately divided into other differences.<sup>35</sup> Thus, the species of *foot* will be as many as the differences; and the species of animals having feet (will be) equal to the (number of) differences; for any individual difference constitutes one, most-specific species.

#### 16.6. The Unity of a Substantial Definition Is Taken from Its Last Difference

It is evident that, if differences are always taken by themselves (*per se*), and not by accident (*per accidens*), the last difference will be the whole substance of the thing and (its) whole definition; for it includes in itself all the preceding particles (► 16.4).<sup>36</sup>

That the difference is included in the genus has been shown from this: that there is no genus without differences.<sup>37</sup> And that the last (difference) includes all the precedents is

---

<sup>34</sup> *In Metaph. 7*, l. 12, §1553 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a14–15): “Sed hoc modo est haec differentia dividenda «habens pedes:» scilicet: huiusmodi animalium, aliud est habens pedes scissos, et aliud non scissos. Ista enim «sunt differentiae pedis,» scilicet scissum et non scissum. Et ideo habens pedes scissos, per se dividet hanc differentiam quae est habens pedes. Scissio enim pedis «est quaedam pedalitas:» idest haec differentia quae est habere pedes scissos, est quoddam contentum sub hoc quod est habere pedes; et habent se adinvicem sicut determinatum et indeterminatum, sicut diximus de genere et differentia.”

<sup>35</sup> *In Metaph. 7*, l. 12, §1554 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a15–18): “Et ita semper procedendum est in divisione differentiarum, donec dividens «veniat ad non differentia,» idest ad ultimas differentias, quae non dividuntur ulterius in alias differentias; et tunc tot erunt species pedis quot differentiae: et species animalium habentium pedes aequales differentiis. Quaelibet enim individualis differentia constituet unam speciem specialissimam.”

<sup>36</sup> *In Metaph. 7*, l. 12, §1555 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a18–20): “Dicit ergo primo, quod si sic se habent differentiae acceptae in definitione «sicut dictum est,» scilicet quod semper sumantur per se differentiae et non per accidens, palam est quod ultima differentia erit tota substantia rei, et tota definitio. Includit enim in se omnes praecedentes particulas.”

<sup>37</sup> *In Metaph. 7*, l. 12, §1556 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a20–21): “Quod enim in differentia includatur genus, ostensum est, ex hoc quod genus non est sine differentiis. Sed quod ultima includat omnes praecedentes, palam est ex hoc quod nisi hoc dicatur, sequitur quod oporteat «in terminis,» idest definitionibus, multoties eadem dicere. Et hoc erit superfluum et nugatorium.”

evident from this: that, otherwise, it would follow that, in definitions, one would have to say the same multiple times, which is superfluous and nugatory.

Since these (consequences) would be unbefitting, it is, therefore, manifest that there will be a **last difference** that comprehends the substance and the species of the (thing) defined (► 8.8, ¶4); and, *from its unity, the definition will be one*.<sup>38</sup>

This cannot be said if, in dividing and defining, someone takes a difference according to accident.<sup>39</sup> For example, if one were to divide thus, “of those that have feet, one is white, and the other is black.” Then, the last differences would be as many as the divisions made; for one would not include the other. Such differences, taken by accident, would only be one in subject, which does not suffice for the unity of the definition.

From what has been said, it is evident that, although genus and difference are posited in the definition, the definition is nonetheless a *ratio* (constituted) *only from differences*; for the genus is not apart from (or other than, *praeter*) the differences, as has been said.<sup>40</sup> Although many differences are posited in the definition, nonetheless, the whole definition depends on—and is constituted from—the last (difference) when the division is done from the most common to the less common, descending according to differences by themselves, and not taking—as from a side—differences by accident.

A sign that the whole definition is constituted from the last difference is offered by ARISTOTLE: that, evidently, unbefitting (consequences) would follow if someone should transpose the parts of such definitions.<sup>41</sup> For example, if one should say that the definition

---

<sup>38</sup> *In Metaph. 7, l. 12, §1559* (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a25–26): “Et quia ista sunt inconvenientia, igitur manifestum est quod si in definitione accipiantur differentiae, una erit ultima, scilicet «quae est species et substantia,» id est quae substantiam et speciem definiti comprehendet, et ab eius unitate definitio erit una.”

<sup>39</sup> *In Metaph. 7, l. 12, §1560* (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a26–28): “Ostendit [Philosophus], quod *hoc non potest dici si differentiae per accidens sumantur*; dicens, quod si aliquis in dividendo et definiendo accipiat differentiam secundum accidens, sicut si dividatur quod habentium pedes, aliud est album, aliud est nigrum, tot erunt ultimae differentiae, quot factae sunt divisiones; quia una earum alteram non includet. [...] Huiusmodi enim differentiae sic per accidens acceptae non essent unum nisi subiecto; quod non sufficit ad unitatem definitionis.”

<sup>40</sup> *In Metaph. 7, l. 12, §1561* (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a28–30): “ponit [Philosophus] conclusionem; dicens, quod palam est ex praedictis quod quamvis in definitione ponatur genus et differentia, tamen definitio est ratio ex differentiis tantum, quia genus non est praeter differentias, ut supra dictum est. Et quamvis ponantur multae differentiae in definitione, tamen tota definitio dependet et constituitur ex ultima, quando fit divisio «secundum rectum,» id est a communi ad minus commune descendendo secundum per se differentias, et non accipiendo quasi a latere differentias per accidens.”

<sup>41</sup> *In Metaph. 7, l. 12, §1562* (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a30–33): “Secundo ibi, «palam autem» *Manifestat conclusionem inductam per quoddam signum*, dicens, «palam autem erit,» scilicet quod tota definitio constituatur ex ultima differentia, ex hoc quod, si quis transponat partes talium definitionum, sequetur inconveniens. Sicut si aliquis dicat definitionem hominis esse animal bipes, habens pedes. Ex quo enim dictum est bipes, superfluum est apponere, pedes habens. Sed si diceretur primo pedes habens, adhuc restaret inquirendum, utrum esset bipes, dividendo pedes habens.”

of *man* is *biped animal having feet*, it would be superfluous to add *having feet*, since *biped* has (already) been said; but if *having feet* should be said first (i.e., as the genus of *man*), one would still have to inquire whether (*man*) would be *biped* (by properly) dividing *having feet*.

Therefore, it is evident that those differences, insofar as they are many, have a determinate order among themselves.<sup>42</sup> However, one should not understand by this that there would be some order in the substance of the thing; for it cannot be said that *this substance* is prior, and *that (substance)* is posterior, since a substance is whole and simultaneous, and not by succession—except in some defective (beings; ► 30.14, ¶3), such as motion and time.

Whence, it is evident that the multiple parts of the definition do not signify multiple parts of the essence—from which the essence would be constituted as from diverse (material principles).<sup>43</sup> Rather, they all signify (something) one that is determined by the last difference.

This is also evident because there is only one substantial form of whichever species (► 15.13).<sup>44</sup> For example, of the (species of) *lion*, one is the form by which it is a substance, a body, and living body, an animal, and a lion; for, if there should be multiple forms, according to all the foresaid, they could not be comprehended by one difference; nor would (something) one be constituted from them.

### 16.7. Essences, Forms, Species, Definitions are Like Numbers

While PLATO posited forms (as the principles) and substances of things, reducing forms to numbers through some mode of assimilation, ARISTOTLE determines (the truth) concerning forms in comparison to numbers; for it is evident that, if numbers are in some mode the substances and forms of things, they are not, as Platonists say, *numbers of units (numeri unitatum = ἀριθμοὶ... μονάδων)*.<sup>45</sup>

---

<sup>42</sup> *In Metaph.* 7, l. 12, §1563 (cf. ARISTOTLE, *Metaphysica* Z.12, 1038a33–34): “Ex hoc patet quod illae differentiae, secundum quod sunt multae, habent inter se ordinem determinatum. Non autem hoc potest intelligi quod in substantia rei sit aliquis ordo. Non enim potest dici, quod hoc substantiae sit prius, et illud posterius; quia substantia est tota simul et non per successionem, nisi in quibusdam defectivis, sicut sunt motus et tempus.”

<sup>43</sup> *In Metaph.* 7, l. 12, §1564: “Unde patet quod multae partes definitionis non significant multas partes essentiae ex quibus essentia constituatur sicut ex diversis; sed omnes significant unum quod determinatur ultima differentia.”

<sup>44</sup> *In Metaph.* 7, l. 12, §1564: “Patet etiam ex hoc, quod cuiuslibet speciei est una tantum forma substantialis; sicut leonis una est forma per quam est substantia, et corpus, et animatum corpus, et animal, et leo. Si enim essent plures formae secundum omnia praedicta, non possent omnes una differentia comprehendi, nec ex eis unum constitueretur.”

<sup>45</sup> *In Metaph.* 8, l. 3, §1722 (cf. ARISTOTLE, *Metaphysica* H.3, 1043b32–34): “determinat [Philosophus] de formis per comparisonem ad numeros. Plato enim ponebat formas et substantias rerum, reducendo per modum cuiusdam assimilationis formas ad numeros. [...] Dicit ergo primo, quod manifestum est, quod si

(To understand this, we should note that) a *simple and absolute* (*simplex et absolutus*; ► 34.4, ¶1) number is said (to be a) **number of units** (*numerus unitatum*), while a number *applied to things* (*applicatus ad res*; ► 34.4, ¶2) is said (to be a) **number of things** (*numerus rerum*): for example, *four dogs*, or *four men*.<sup>46</sup>

There are four modes in which ARISTOTLE assimilates forms to numbers, such that the substances (i.e., essences) of things, which the definitions signify, can be said (to be) *numbers* according to the mode of the *number of things* (► 34.4, ¶2).<sup>47</sup>

**1. Number is divisible into indivisibles** (► 2.1; 3.5; 7.2).<sup>48</sup> A definition, in turn, is divisible into two, of which one is related as form and the other as matter. Yet, it is divisible into indivisibles, too; for the division of a definition must be terminated by some indivisibles (i.e., the differences), since definitions do not proceed indefinitely (*in infinitum*). Whence, the division of a definition is not assimilated to the division of continuous quantity (► 3.2), which is indefinite (*in infinitum*).

For example, if the definition of *man* is divided into *animal* and *rational*, (and) the definition of *animal* (is divided) into *animate* and *sensible*, this does not proceed indefinitely in material and formal causes (► 11.6).<sup>49</sup>

**2. If something is added to, or subtracted from, a number, even if it is minimal, it will not be the same according to species.**<sup>50</sup> This is so because **the last difference gives**

---

numeri aliquo modo sint substantiae rerum et formae, sic sunt, sicut ex praemissis accipi potest; non autem sunt numeri unitatum sicut Platonici dicunt.”

<sup>46</sup> *In Metaph.* 8, l. 3, §1722: “Dicitur autem numerus unitatum, numerus simplex et absolutus. Numerus autem applicatus ad res, dicitur numerus rerum, sicut quatuor canes vel quatuor homines.”

<sup>47</sup> *In Metaph.* 8, l. 3, §1722 (cf. ARISTOTLE, *Metaphysica* H.3, 1043b32–1044a11): “Et dividitur in quatuor, secundum quod quatuor modis assimilatur [Philosophus] formas numeris. [...] numerus rerum [...], quo quidem modo substantiae rerum, quas significant definitiones, possunt dici numeri.”

<sup>48</sup> *In Metaph.* 8, l. 3, §1722 (cf. ARISTOTLE, *Metaphysica* H.3, 1043b34–36): “Est enim definitio divisibilis in duo: quorum unum se habet ut forma, aliud ut materia, ut superius dictum est. Et iterum est in indivisibilia divisibilis. Divisio enim definitionis oportet quod per aliqua indivisibilia terminetur: non enim definitiones procedunt in infinitum. [...] Et sic definitionis divisio non assimilatur divisioni quantitatis continuae, quae est in infinitum; sed divisioni numeri, qui est divisibilis in indivisibilia.”

<sup>49</sup> *In Metaph.* 8, l. 3, §1722: “Putat, si definitio hominis dividatur in animal et rationale, definitio animalis in animatum et sensibile; non procedet hoc in infinitum, cum non sit procedere in infinitum in causis materialibus et formalibus, ut in secundo probatum est.” ARISTOTLE proves that causes do not proceed indefinitely in *Metaphysica* α.2, 994a11–b31 (cf. *In Metaph.* 2, l. 2–4, §§300–330).

<sup>50</sup> *In Metaph.* 8, l. 3, §1723 (cf. ARISTOTLE, *Metaphysica* H.3, 1043b36–38): “ponit [Philosophus] secundam assimilationem substantiae, quam significat definitio, ad numeros. Et dicit, quod si aliquid addatur vel subtrahatur alicui numero, etiam si sit minimum, non erit id idem numerus secundum speciem. [...] Et hoc ideo, quia illa ultima differentia dat speciem numero.” *In Metaph.* 8, l. 3, §1724 (cf. ARISTOTLE, *Metaphysica* H.3, 1043b38–1044a2): “Et similiter est in definitionibus, et in quod quid erat esse, quod significat definitio; quia quocumque minimo addito vel ablato, est alia definitio, et alia natura speciei.” St. Thomas refers to this principle in many places. For example, *In Sent.* 3, d. 2 q. 1 a. 3 qc. 1 co.: “secundum Philosophum 8 Metaph., definitio in hoc convenit cum numero, quod sicut in numeris contingit quod semper subtracta vel addita unitate, fit alius numerus; ita etiam in definitionibus, si addatur vel subtrahatur aliqua differentia, semper fit alia species. Cum ergo omnes differentiae sumantur ex

**the species** to a number. Likewise, in definitions, and in the essence that the definition signifies, if any minimal (difference) is added or removed, the definition is other—and other is the nature of the species.

Thus, in numbers, the minimum is *the unit*, which, if added to *three*, *four*—which is another species of number—arises; and if subtracted from it, *two*—which is also another species of number—results.<sup>51</sup>

Likewise, the definition of *animal* is *animated, sensible substance*.<sup>52</sup> And if *rational* is added to it, the species of *man* is constituted. But if *sensible* is subtracted, the species of *plant* is constituted, for—again—the last difference gives the species.

**3.** Number is that which is **one** (*numerus est id quod est unum < numerum oportet esse aliquid quo unus = τὸν ἀριθμὸν δεῖ εἶναι τι ᾧ εἷς*); for number is by itself one insofar as **the last unit gives** species and **unity** to the number, as also, in things composed from matter and form, something one—a *unity and a species*—results from the form.<sup>53</sup> Likewise, a *definition is one* (*definitio est una = ὁ ὀρισμὸς εἷς ἐστίν*) by itself (*per seipsam*; ► 16.6).

This is why those who speak of the unity of number, and (of) whether a number is not (something) one by itself (*unus per seipsum*), cannot say wherefrom it is one—if it is one.<sup>54</sup>

---

essentialibus principiis, oportet quod si homini subtrahatur aliquid de essentialibus ejus, non remaneat eadem species." ScG 1, 54 n. 3: "Ut enim Philosophus dicit, in VIII Metaph., formae et definitiones rerum, quae eas significant, sunt similes numeris. Nam in numeris, una unitate addita vel subtracta, species numeri variatur: ut patet in binario et ternario. Similiter autem est et in definitionibus: nam una differentia addita vel subtracta variat speciem; substantia enim sensibilis absque rationali, et rationali addito, specie differt." *De veritate*, q. 21 a. 6 ad 3: "secundum Philosophum in VIII Metaphys., sicut in numeris quaelibet unitas vel addita vel remota variat numeri speciem; ita in definitionibus quodlibet additum vel remotum diversam speciem constituit." *STh I*, q. 25 a. 6 co.: "Respondeo dicendum quod bonitas alicuius rei est duplex. Una quidem, quae est de essentia rei; sicut esse rationale est de essentia hominis. Et quantum ad hoc bonum, Deus non potest facere aliquam rem meliorem quam ipsa sit, licet possit facere aliquam aliam ea meliorem. Sicut etiam non potest facere quaternarium maiorem, quia, si esset maior, iam non esset quaternarius, sed alius numerus. Sic enim se habet additio differentiae substantialis in definitionibus, sicut additio unitatis in numeris, ut dicitur in VIII Metaphys. Alia bonitas est, quae est extra essentiam rei; sicut bonum hominis est esse virtuosum vel sapientem. Et secundum tale bonum, potest Deus res a se factas facere meliores. Simpliciter autem loquendo, qualibet re a se facta potest Deus facere aliam meliorem."

<sup>51</sup> *In Metaph.* 8, l. 3, §1723: "Minimum enim in numeris est unitas; quae si addatur in ternario, surgit quaternarius, quae est alia species numeri: si vero abstrahatur ab eodem, remanet binarius, qui est etiam alia species numeri."

<sup>52</sup> *In Metaph.* 8, l. 3, §1724: "Sicut enim substantia animata sensibilis tantum, est definitio animalis: cui si addas et rationale, constituis speciem hominis: si autem subtrahas sensibile, constituis speciem plantae, quia etiam ultima differentia dat speciem."

<sup>53</sup> *In Metaph.* 8, l. 3, §1725 (cf. ARISTOTLE, *Metaphysica* H.3, 1044a2–3): "ponit [Philosophus] tertiam assimilationem; et dicit, quod numerus est id quod est unum. Est enim per se unum numerus, in quantum ultima unitas dat numero speciem et unitatem; sicut etiam in rebus compositis ex materia et forma, per formam est aliquid unum, et unitatem et speciem sortitur." *In Metaph.* 8, l. 3, §1726 (cf. ARISTOTLE, *Metaphysica* H.3, 1044a5–6): "Et similiter definitio est una per seipsam."

<sup>54</sup> *In Metaph.* 8, l. 3, §1725 (cf. ARISTOTLE, *Metaphysica* H.3, 1044a3–5): "Et propter hoc loquentes de unitate numeri, ac si numerus non esset unus per seipsum, non possunt dicere quo est unus, si est unus. Cum enim componatur ex multis unitatibus, aut non est unus simpliciter, sed unitates aggregantur in eo

Since (a number) is composed from multiple units, either: **(a)** it is not (something) *one* simply (*simpliciter*), but the units are aggregated in it by the mode of a heap that does not make (from its parts something) *one* simply; (and), consequently, nor do (the aggregated units) constitute a being in some species; and, in this way, a number is not some species of being; or **(b)** if a number is (something) *one* simply, and not by itself (*non per seipsum*), one ought to say *what* makes it (something) *one* from multiple units—which they cannot assign.

Likewise, they do not have something to assign wherefrom a definition comes to be one.<sup>55</sup> This happens reasonably; for the substance (i.e., the essence) that the definition signifies is (something) *one* for the same reason that a number (is something one): that is, *by itself* (*per se*), because one of its parts is as the form of the other. And it is not (something) *one* as (something) indivisible—e.g., the unit and the point—, as some have said; rather, (it is something one) because any one of them is *one form* (*una forma*) and *some nature* (*natura quaedam*).

**4.** Just as number is **not susceptible of more or less** (*non suscipit magis aut minus* = οὐ... ἔχει τὸ μᾶλλον καὶ ἥττον), so (is this true of) the substance (i.e., essence) that is said according to species (*substantia quae dicitur secundum speciem* < ἡ κατὰ τὸ εἶδος οὐσία), although that which is said *according to matter* (*secundum materiam* < ἡ μετὰ τῆς ὕλης) may (be susceptible of more and less).<sup>56</sup>

Thus, just like the *ratio* of *number* consists in something determinate, to which (something) cannot be added or subtracted, so, too, the *ratio* of *form*.<sup>57</sup> On the other hand, *more and less* happen because matter participates more or less (in) form (► 26). Whence, *whiteness* (i.e., the form itself) is not susceptible of more or less either; but *the white*, is (i.e., that which participates in whiteness is susceptible of being more or less white, but whiteness itself, considered without a subject, is unlimited; ► 24.8, ¶2; 26.10).

---

per modum coacervationis, quae non facit simpliciter unum, et per consequens nec ens in aliqua specie constituunt: et sic numerus non est aliqua species entis; aut si numerus est unus simpliciter, et non per seipsum, dicendum est quid facit eum unum ex multis unitatibus: quod non est assignare.”

<sup>55</sup> *In Metaph.* 8, l. 3, §1726 (cf. ARISTOTLE, *Metaphysica* H.3, 1044a5–9): “Et similiter definitio est una per seipsam: et sic non habent aliquid assignare per quod fiat unum. Et hoc rationabiliter accidit: quia per eandem rationem substantia, quam significat definitio, est ita unum sicut et numerus, scilicet per se, ex hoc quod una pars eius est ut forma alterius. Et non est una ut indivisibile, sicut unitas ac punctum, sicut quidam dixerunt; sed quia unaquaeque earum est una forma et natura quaedam.”

<sup>56</sup> *In Metaph.* 8, l. 3, §1727 (cf. ARISTOTLE, *Metaphysica* H.3, 1044a9–11): “ponit [Philosophus] quartam assimilationem; et dicit quod sicut numerus non suscipit magis aut minus, ita nec substantia quae dicitur secundum speciem, licet forte illa quae dicitur secundum materiam.”

<sup>57</sup> *In Metaph.* 8, l. 3, §1727: “Sicut enim ratio numeri in aliquo determinato consistit, cui non est addere nec subtrahere, ut dictum est, ita et ratio formae. Sed magis et minus contingit ex hoc quod materia perfectius vel minus perfecte formam participat. Unde etiam albedo non suscipit magis et minus, sed album.”

## 16.8. Order in Considering the Essence of Things

The process and order in which the essences of things are to be considered is thus:<sup>58</sup>

1. The **principles** of the things.
2. The **substance** of the thing constituted from the principles.
3. The determination of the thing to its **proper species**, which is by the form.
4. The perfection of the thing follows upon the form: not only in the specific being (*in esse specifico*), but also in respect of the **proper operation and end**.
5. The diverse things that singularly have some perfection in themselves, **united** in some **order**, perfect (*perficiunt*) some **whole**.

## 16.9. From Substance to the Other Genera

The same proportion (*proportio*, i.e., analogical relation) that is found between genus and difference in the genus of substance is found in the other genera.<sup>59</sup> Just as in the genus of *substance* the difference, which is predicated of the genus and befalls it (*advenit ei*) in order to constitute a species, is compared to it (i.e., to the genus of substance) as an act and a form, so, too, in other definitions.

However, it should not be understood that the difference is a form or that the genus is matter; for the genus and the difference are predicated of the species, while matter and form are not predicated of the composite (► 14.13).<sup>60</sup> Rather, this is said because the genus is taken from that which is material in the thing, while the difference (is taken) from that which is formal (in the thing).

---

<sup>58</sup> *In De div. nom.*, c. 2, l. 5: "Circa primum [sc., causam eorum quae ad essentiam rerum pertinent], considerandum est quod, in rerum essentiis, talis quidem processus et ordo considerantur: nam, primo, sunt rerum principia; secundo, substantia rei, ex principiis constituta; tertio, determinatio rei ad propriam speciem quae est per formam; quarto, ex forma consequitur res perfectionem, non solum in esse specifico, sed etiam quantum ad propriam operationem et finem: quinto, res diversae quae singulae quamdam perfectionem habent in seipsis, quodam ordine adunatae, aliquod totum perficiunt."

<sup>59</sup> *In Metaph.* 8, l. 2, §1697: "Sicut enim in genere substantiae, differentia, quae praedicatur de genere, et advenit ei ad constitutionem speciei, comparatur ad ipsum ut actus et forma, ita etiam in aliis definitionibus." Cf. *ibid.*, §1696 (cf. ARISTOTLE, *Metaphysica* H.2, 1043a2–5): "Ostendit [Philosophus] quomodo praedictae differentiae se habeant ad substantias: et dicit: ex praedictis iam manifestum est, quod in praedictis differentiis est quaerendum, quae sit causa formalis essendi cuiuslibet praedictorum, quorum sunt differentiae, si ita est quod substantia formalis vel quod quid est, est causa cuiuslibet essendi, ut in septimo manifestum fuit. Praedictae enim differentiae significant formam, et quod quid est praedictarum rerum. Nulla autem differentiarum praedictarum est substantia, neque aliquid substantiae affine, quasi pertinens ad genus substantiae. Sed eadem proportio invenitur in eis, quae est in substantia."

<sup>60</sup> *In Metaph.* 8, l. 2, §1697: "Non enim est intelligendum, quod differentia sit forma, aut genus sit materia, cum genus et differentiae praedicentur de specie, materia autem et forma non praedicentur de composito: sed hoc dicitur, quia genus sumitur ab eo quod est materiale in re, differentia vero ab eo quod est formale."

For example, the genus of *man* is *animal* because it signifies something having a sensitive nature, which is materially related to the intellectual nature from which *rational*—which is the difference of *man*—is taken; and **rational** signifies *something having an intellectual nature*.<sup>61</sup>

It is thence that the genus has differences potentially (*potestate*), and that the genus and the difference are proportionate to matter and form, as PORPHYRY says.<sup>62</sup> And because of this, too, ARISTOTLE says that *act*—that is, the difference—*is predicated of potency*—that is, of the genus. And, likewise, (this is the true) in the other genera.

For example, if someone should want to define *threshold*, he would say that it is *stone or wood posited in such (a mode)*; in which definition, *stone or wood* is as matter, while *position (is)* as form.<sup>63</sup> Likewise, in the definition of *house*, *stones and wood* is as matter, and *such a mode of composition (is)* as form. Likewise, in the definition of (*ice*) *crystal*, *water* is as matter, while *congealing (is)* as form. And in the definition of *concord* (*symphonia* = συμφωνία), high-pitch and low-pitch (notes) are as matter, and the mode of mixing (is) as form (► 6.3).

Beyond that, in (the definition of) other (things), the end (*finis* = τὸ οὐ ἔνεκα)—upon which the necessity of the form depends—is added (► 14.9).<sup>64</sup> (In the practical order, e.g., if *firefighting* were defined in terms of *bringing fires under control*, this would be its end, upon which will necessarily depend the intended form of controlled fires in flammable matter.)

Thus, the act and form of diverse matters is diverse: in some, the act is a composition; in others, a compounding; or something (i.e., some form) of the aforesaid (► 13.11).<sup>65</sup>

---

<sup>61</sup> *In Metaph.* 8, l. 2, §1697: “Sicut genus hominis est animal, quia significat aliquid habens naturam sensitivam; quae quidem materialiter se habet ad naturam intellectivam, a qua sumitur rationale, quae est differentia hominis. Rationale vero significat aliquid habens naturam intellectivam.”

<sup>62</sup> *In Metaph.* 8, l. 2, §1697 (cf. ARISTOTLE, *Metaphysica* H.2, 1043a5–7; 11–12): “Et inde est quod genus habet differentias potestate, et quod genus et differentia proportionantur materiae et formae, ut Porphyrius dicit. Et propter hoc etiam hic dicitur «quod actus,» idest differentia, praedicatur «de materia,» idest de genere; et similiter est in aliis generibus.” See PORPHYRY, *Isagoge*, 11.12–17: “τῶν γὰρ πραγμάτων ἐξ ὕλης καὶ εἶδους συνεστώτων ἢ ἀνάλογόν γε ὕλη καὶ εἶδει τὴν σύστασιν ἐχόντων, ὡσπερ ὁ ἀνδριάς ἐξ ὕλης μὲν τοῦ χαλκοῦ, εἶδους δὲ τοῦ σχήματος, οὕτως καὶ ὁ ἄνθρωπος ὁ κοινός τε καὶ εἰδικός ἐξ ὕλης μὲν ἀναλόγου συνέστηκεν τοῦ γένους, ἐκ μορφῆς δὲ τῆς διαφορᾶς, τὸ δὲ ὅλον τοῦτο, ζῶον λογικὸν θνητόν, ὁ ἄνθρωπος, ὡς ἐκεῖ ὁ ἀνδριάς.”

<sup>63</sup> *In Metaph.* 8, l. 2, §1698 (cf. ARISTOTLE, *Metaphysica* H.2, 1043a7–12): “Si quis enim velit limen definire, dicet, quod est lapis vel lignum taliter positum: in qua definitione lapis vel lignum est ut materia, positio vero ut forma. Et similiter in definitione domus, lapides et ligna sunt materia, et talis modus compositionis est ut forma. [...] Et similiter in definitione crystalli, aqua est sicut materia, congelatio vero ut forma. Et in definitione symphoniae acutum et grave ut materia, et modus commixtionis ut forma; et ita est in omnibus aliis.”

<sup>64</sup> *In Metaph.* 8, l. 2, §1698: “Et etiam ulterius in quibusdam additur finis, a quo necessitas formae dependet.” Cf. ARISTOTLE, *Metaphysica* H.2, 1043a7: “ἢ ἔτι καὶ τὸ οὐ ἔνεκα ἐπὶ ἐνίων ἔστιν.”

<sup>65</sup> *In Metaph.* 8, l. 2, §1699 (cf. ARISTOTLE, *Metaphysica* H.2, 1043a12–14): “Concludit ergo [Philosophus] ex praedictis duo corollaria: quorum primum est quod diversarum materiarum diversi sunt actus et formae. In quibusdam enim est actus compositio, in quibusdam commixtio, aut aliquid dictorum.”

## 17. Predication by Itself vs. by Accident

*In order to determine how accidents are defined, we must first examine the modes in which the predicate and the subject are related by themselves (per se, such that one is posited in the definition of the other), and the modes in which they are related by accident.*

### 17.1. The Preposition *By* (*Per*)

The preposition *by* (*per*) designates a relation of cause (*designat habitudinem causae*), although sometimes it also designates a situation (*situs*), as when someone is said to be *by himself* (*per se*) when he is alone (*solitarius*; ► 17.6).<sup>1</sup>

When *by* (*per*) designates a relation of cause, sometimes it designates **(1)** a relation of **formal cause** (► 17.4), as when one says that the body lives *by the soul*.<sup>2</sup> Sometimes, **(2)** a relation of **material cause** (► 17.5), as when one says that the body is colored *by the surface*: i.e., because the surface is the proper subject of color. It also designates **(3)** a relation of **extrinsic cause** (► 17.7); and, above all, of an efficient (cause), as when one says that water is heated *by fire*.

### 17.2. According to (Something)

ARISTOTLE posits four modes in which *according to* (*secundum quod* = τὸ καθ' ὃ)—which is more common (i.e., applies to more things) than *according to itself* (► 17.3)—is said:<sup>3</sup>

1. Insofar as the **form** and **essence** («*species*,» *idest forma, et* «*substantia rei*,» *idest essentia* = τὸ εἶδος καὶ ἡ οὐσία ἐκάστου πράγματος) is *that according to which* (something) is said to be.<sup>4</sup> For example, according to the Platonists, the Idea of Good («*per se bonum*,» *idest idea boni* = αὐτὸ ἀγαθόν) is that *according to which* something is said (to be) good (<*est illud*,> *secundum quod* <*aliquid*> *bonum* <*dicitur*> = καθ' ὃ ἀγαθός).

---

<sup>1</sup> *In Post. an.* 1, l. 10, 8–11: “sciendum est quod hec prepositio ‘per’ designat habitudinem cause, designat etiam interdum et situm, sicut cum dicitur aliquis esse ‘per se’ quando est solitarius.” In English, *per* is often used to denote a causal relation in the genus of efficient causality (including instrumental causality), meaning “by the means or agency of,” or in that of formal causality (typically extrinsic), meaning “according to,” as in “per instructions.” However, it also has the sense of “for each,” somewhat akin to *alone* (see *Merriam-Webster Dictionary*, entry for *per*). Compare this to the use of prepositions derived from the Latin *per* in romance languages: e.g., *de por sí* in Spanish, *par lui même* in French, *di per sé* in Italian, *per si* in Catalan, etc.

<sup>2</sup> *In Post. an.* 1, l. 10, 11–19: “Cause autem habitudinem designat aliquando quidem formalis, sicut cum dicitur quod corpus uiuit per animam; quandoque autem habitudinem cause materialis, sicut cum dicitur quod corpus est coloratum per superficiem, quia scilicet proprium subiectum coloris superficies est; designat etiam habitudinem cause extrinsece, et precipue efficientis, sicut cum dicitur quod aqua calescit per ignem.”

<sup>3</sup> *In Metaph.* 5, l. 19, §1050 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a14–24): “determinat [Philosophus] de hoc, *quod dicitur secundum quod*; quod est communius quam secundum se. [...] ponit quatuor modos eius quod dicitur secundum quod.”

<sup>4</sup> *In Metaph.* 5, l. 19, §1050 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a14–16): “quorum *primus* est, prout «*species*,» *idest forma, et* «*substantia rei*,» *idest essentia, est id, secundum quod aliquid esse dicitur*; sicut secundum Platonicos, «*per se bonum*,» *idest idea boni, est illud, secundum quod aliquid bonum dicitur.*”

2. Insofar as the (proper) **subject**, in which something is first naturally apt to come to be (*in quo primo aliquid natum est fieri* = ἐν ᾧ πρώτῳ πέφυκε γίνεσθαι) is said (to be) *that according to which* (*secundum quod*).<sup>5</sup> For example, color comes to be in surface first. Whence, a body is said to be colored *according to surface*.

This latter mode (¶2) differs from the former (¶1) in that the former pertains to form, while the latter (pertains) to matter.<sup>6</sup>

3. Insofar as, universally, any cause is said (to be) *that according to which* (*secundum quod*).<sup>7</sup> Whence, *according to* (*secundum quod*) is said in as many (modes) as *cause* (is said); for it is the same to ask, “according to what does he come?” and “for what cause does he come?” Likewise, (it is the same to ask), “according to what has he reasoned incorrectly?” and, “by what cause have the reasonings come to be?”

4. Insofar as *according to* (*secundum quod*) signifies *position* and *place*.<sup>8</sup> For example, when one says, “this one stands according to this,” i.e., next to this, and “that one goes according to that,” all of which signify a position and a place. But this appears to be more manifest in the Greek idiom.

### 17.3. By Itself or According to Itself

Just as the preposition *by* (*per*) designates a relation of cause when something extrinsic is the cause of that which is attributed to the subject, so, too, *by itself* (*per se*) signifies that a subject—or something of it—is a cause of that which is attributed to it.<sup>9</sup>

Thus, *by itself* (*secundum se*) is opposed to the *separable accident* (i.e., *that which is in something, and which can be truly affirmed; not, however, of necessity, nor as in most but as in fewer*; ► 15.18).<sup>10</sup> (i.e., insofar as it does not have a determinate cause.)

---

<sup>5</sup> *In Metaph.* 5, l. 19, §1051 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a16–17): “*Secundus* modus est, prout subiectum, in quo primo aliquid natum est fieri, dicitur secundum quod, sicut color primo fit in superficie; et ideo dicitur, quod corpus est coloratum secundum superficiem.”

<sup>6</sup> *In Metaph.* 5, l. 19, §1051 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a17–19): “Hic autem modus differt a praedicto, quia praedictus pertinet ad formam, et hic pertinet ad materiam.”

<sup>7</sup> *In Metaph.* 5, l. 19, §1052 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a19–22): “*Tertius* modus est, prout universaliter quaelibet causa dicitur secundum quod. Unde toties dicitur secundum quod quoties et causa. Idem enim est quaerere secundum quod venit, et cuius causa venit; similiter secundum quod paralogizatum, aut syllogizatum est, et qua causa facti sunt syllogismi.”

<sup>8</sup> *In Metaph.* 5, l. 19, §1053 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a22–24): “*Quartus* modus est prout secundum quod significat positionem et locum; sicut dicitur, iste «stetit secundum hunc,» idest iuxta hunc, et ille «vadit secundum hunc,» idest iuxta hunc; quae omnia significant positionem et locum. Et hoc manifestius in Graeco idiomate apparet.”

<sup>9</sup> *In Post. an.* 1, l. 10, 19–24: “Sicut autem hec prepositio ‘per’ designat habitudinem cause quando aliquid extrinsecum est causa eius quod attribuitur subiecto, ita quando subiectum uel aliquid eius est causa eius quod attribuitur ei, et hoc significat ‘per se’.”

<sup>10</sup> *In Metaph.* 5, l. 22, §1143: “Accidens ergo secundum primum modum opponitur ad secundum se.”

Whence, ARISTOTLE posits four modes in which *by itself* or *according to itself* (*per se*, vel *secundum se* = καθ' αὐτό) is said:<sup>11</sup>

1. When that which is attributed to something pertains to its **form** (*quando id quod attribuitur alicui pertinet ad formam eius*; ► 17.4).<sup>12</sup> In this mode, *by itself* (*secundum se*) is said of something that is posited in the definition of the thing: e.g., *animal*, which (is posited in the definition of *man*, and) in no mode is an accident of *man*.
2. When the preposition *by* (*per*) signifies a relation of **material cause** (► 17.5): insofar as that to which something is attributed is its *proper matter* (*propria materia*) and *proper subject* (*proprium subiectum*).<sup>13</sup> This corresponds to the *inseparable accident* (► 15.20). Thus, *having two right angles* is *by itself* in *triangle*, but does not belong to its substance.
3. When *by itself* signifies **something alone** (*aliquid solitarium*; ► 17.6).<sup>14</sup>
4. When *by* signifies a **relation of (extrinsic) cause** (► 17.7), efficient or other.<sup>15</sup>

#### 17.4. First Mode: When *by Itself* Pertains to the Form

Since a definition signifies the form and essence of a thing (► 8.1), this first mode occurs when the definition—or something posited in the definition—is predicated of something, whether it is posited directly (*in recto*) or indirectly (*in obliquo*).<sup>16</sup>

ARISTOTLE adds that, universally, whatever is in the *ratio* that says *what* something is, is attributed by itself to it (< καὶ ἐν τῷ λόγῳ τῷ λέγοντι τί ἐστὶν ἐνυπάρχει).<sup>17</sup> But this may

---

<sup>11</sup> *In Metaph.* 5, l. 19, §1054 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a24–36): “Concludit [Philosophus] ex praedictis, *quatuor modos dicendi per se*, vel *secundum se*.”

<sup>12</sup> *In Post. an.* 1, l. 10, 25–27: “Primus ergo modus dicendi per se est quando id quod attribuitur alicui pertinet ad formam eius.” *In Metaph.* 5, l. 22, §1142: “primus [modus dicendi per se] erat prout secundum se dicitur de aliquo quod in eius definitione ponitur, ut animal de homine, quod nullo modo est accidens.”

<sup>13</sup> *In Post. an.* 1, l. 10, 51–54: “Secundus modus dicendi per se est, quando hec prepositio ‘per’ designat habitudinem cause materialis, prout scilicet id cui aliquid attribuitur est propria materia et proprium subiectum ipsius.” *In Metaph.* 5, l. 22, §1142 (cf. ARISTOTLE, *Metaphysica* Δ.30, 1025a32): “Et hic est secundus modus dicendi per se [...] triangulo inest per se duos rectos habere, et non est de substantia eius; unde est accidens.”

<sup>14</sup> *In Post. an.* 1, l. 10, 99–103: “ponit [Philosophus] alium modum eius quod est ‘per se’, prout ‘per se’ significat aliquid solitarium.”

<sup>15</sup> *In Post. an.* 1, l. 10, 122–125: “ponit [Philosophus] quartum modum, secundum quod hec prepositio ‘per’ designat habitudinem cause efficientis uel cuiuscunque alterius <extrinsece>.”

<sup>16</sup> *In Post. an.* 1, l. 10, 25–34 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a34–35): “Primus ergo modus dicendi per se est quando id quod attribuitur alicui pertinet ad formam eius, et quia diffinitio significat formam et essentiam rei, primus modus eius quod est ‘per se’ est quando predicatur de aliquo diffinitio uel aliquid in diffinitione positum. Et hoc est quod dicit quod *per se sunt quaecunque* insunt *in eo quod quid est*, idest in diffinitione indicante quid est, siue ponatur in recto siue in obliquo.”

<sup>17</sup> *In Post. an.* 1, l. 10, 48–50 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a36–37): “Et subiungit quod *quaecunque* uniuersaliter *insunt in ratione dicente quid est*, per se attribuuntur alicui.” *In Metaph.* 5, l. 19, §1054: “Et hi duo modi sub uno comprehenduntur. Nam eadem ratione, definitio et pars definitionis per se de unoquoque praedicantur.”

happen in two modes, which are comprehended under one (mode) because the (whole) definition and (any) part of the definition are predicated by themselves of each thing for the same reason:

1. When the (whole) definition that signifies that which is the being of each thing (*quid est esse uniuscuiusque* = τὸ τί ἦν εἶναι ἐκάστῳ) is said to be in it (*dicitur ei inesse*) according to itself (*secundum se*).<sup>18</sup>

For example, Callias and that which is to be Callias—i.e., the essence of the thing—are related in such a way that one (i.e., the essence of Callias) is in the other (i.e., in Callias, the individual) according to itself.<sup>19</sup>

2. When whatever (parts) that are in the definition (►13.16) that says what (the thing defined) is (*quaecumque insunt in definitione dicente quid est* < ὅσα ἐν τῷ τί ἐστιν ὑπάρχει), are predicated by themselves of the (thing) defined.<sup>20</sup> This responds to the first mode of that which is said *according to something* (*secundum quod*; ►17.2, ¶1).<sup>21</sup>

For example, Callias is, according to itself, an animal; for *animal* is in the *ratio* of Callias, since (*animal*) would be posited in his definition if singulars could have a definition.<sup>22</sup>

Likewise, *multitude* (*multitudo*) or *divisible* (*divisibile*) is predicated of *number* and is posited in its definition (i.e., number is defined as *multitude measurable by one* [πλήθος ἐνὶ μετρητόν], ►2.1; or as *finite multitude divisible into indivisibles*).<sup>23</sup> Hence, *multitude* (or *divisible*) is by itself in *number*.

Likewise, *line* is posited in the definition of *triangle*; hence, *line* is by itself in *triangle*.<sup>24</sup> And *point* is posited in the definition of *line*; hence, *point* is by itself in *line*. These are posited

<sup>18</sup> *In Metaph.* 5, l. 19, §1054 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a25–26): “Quorum *primus* est, quando definitio significans quid est esse uniuscuiusque, dicitur ei inesse secundum se. [...] Est enim hic primus modus per se, qui ponitur in libro Posteriorum.”

<sup>19</sup> *In Metaph.* 5, l. 19, §1054 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a26–27): “sicut Callias «et quod quid erat esse Calliam,» idest et essentia rei, ita se habent quod unum inest secundum se alteri.”

<sup>20</sup> *In Metaph.* 5, l. 19, §1054 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a27–28): “Non autem solum tota definitio dicitur de definito secundum se; sed aliquo modo etiam quaecumque insunt in definitione dicente quid est, praedicantur de definito secundum se.”

<sup>21</sup> *In Metaph.* 5, l. 19, §1054: “hic primus modus per se [...] respondet primo modo eius quod dicitur secundum quod.”

<sup>22</sup> *In Metaph.* 5, l. 19, §1054 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a28–29): “sicut Callias est animal secundum se. Animal enim inest in ratione Calliae. Nam Callias est quoddam animal; et poneretur in eius definitione, si singularia definitionem habere possent.”

<sup>23</sup> *In Post. an.* 1, l. 35, 56–59 (cf. ARISTOTLE, *Analytica Posteriora* A.22, 84a16–17): “*Multitudo* autem uel *diuisibile* predicatur de numero, et ponitur in diffinitione eius, unde huiusmodi predicantur per se de numero primo modo.”

<sup>24</sup> *In Post. an.* 1, l. 10, 34–41 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a35–36): “sicut in diffinitione trianguli ponitur linea, unde *linea* per se *inest triangulo*, et similiter in diffinitione lineae ponitur punctum, unde *punctum* per se inest *lineae*. Rationem autem quare ista ponantur in diffinitione subiungit, dicens:

in the definition because the essence (*substantia, idest essentia* < οὐσία) that the definition of *triangle* signifies is (composed) from (*ex*) *line*; and the definition of *line*, from *point*.

By this, however, one should not understand that the line is composed of points (► 34.23), but that *point* belongs to the *ratio* (*sit de ratione*) of *line*, as *line* (belongs to the *ratio*) of *triangle*.<sup>25</sup> ARISTOTLE says this (i.e., that the point is posited in the definition of the line) to exclude those (parts) that are parts of matter—which are not posited in the definition—and (are) not (parts) of the species: e.g., *semicircle* is not posited in the definition of *circle*, nor (is) *finger* (posited) in the definition of *man* (► 13.10).

### 17.5. Second Mode: When *by Itself* Pertains to Matter

The second mode occurs when that to which something is attributed is its *proper matter* (*propria materia*) and *proper subject* (*proprium subiectum*).<sup>26</sup>

Since the (act of) being (*esse*) of an accident depends on (its) subject (► 15.16), its definition, which signifies its being, must also contain within itself the subject.<sup>27</sup> Hence, this mode of saying something *by itself* occurs when the subject (e.g., the subject genus; ► 14.1, ¶1) is posited in the definition of the predicate; for the first and proper subject is posited in the definition of the proper accident (► 15.17). Thus, when something is shown to be in something as in (its) first subject (*quando aliquid ostenditur esse in aliquo, sicut in primo subiecto* < εἰ ἐν αὐτῷ δέδεκται πρώτῳ), then it is in it *by itself*.

This can happen in one of two (modes):<sup>28</sup>

1. The first subject of the accident is the whole subject itself of which it is predicated.<sup>29</sup>

---

*Substantia, idest essentia, quam significat diffinitio ipsorum, idest trianguli et lineae, est ex his, idest ex linea et punctis.*"

<sup>25</sup> *In Post. an.* 1, l. 10, 41–48: "(quod non est intelligendum quod linea ex punctis componatur, sed quod punctum sit de ratione lineae, sicut linea de ratione trianguli; et hoc dicit ad excludendum ea que sunt partes materie et non speciei, que non ponuntur in diffinitione, sicut semicirculus non ponitur in diffinitione circuli nec digitus in diffinitione hominis, ut dicitur in VII Metaphysice)."

<sup>26</sup> *In Post. an.* 1, l. 10, 51–54 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a37–38): "Secundus modus dicendi per se est, quando hec prepositio 'per' designat habitudinem cause materialis, prout scilicet id cui aliquid attribuitur est propria materia et proprium subiectum ipsius."

<sup>27</sup> *In Metaph.* 5, l. 19, §1055 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a29–30): "Secundus modus est, quando aliquid ostenditur esse in aliquo, sicut in primo subiecto, cum inest ei per se. [...] Et hic est secundus modus dicendi per se in Posterioribus positus, quando scilicet subiectum ponitur in diffinitione praedicati. Subiectum enim primum et proprium, ponitur in diffinitione accidentis proprii." *In Post. an.* 1, l. 10, 61–66: "Cuius quidem ratio est quia, cum esse accidentis dependeat a subiecto, oportet etiam quod diffinitio eius significans esse ipsius contineat in se subiectum. Vnde secundus modus dicendi per se est quando subiectum ponitur in diffinitione predicati quod est proprium accidens eius."

<sup>28</sup> *In Metaph.* 5, l. 19, §1055: "Quod quidem contingit dupliciter."

<sup>29</sup> *In Metaph.* 5, l. 19, §1055 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a29–31): "vel primum subiectum accidentis est ipsum totum subiectum de quo praedicatur."

For example, a surface is said to be colored or white according to itself, for the first subject of color is surface; and hence, a body is said to be colored by reason of (its) surface.<sup>30</sup>

Likewise, *straight* and *circular* are by themselves in *line*; for *line* is posited in their definition.<sup>31</sup> And, for the same reason, *even* and *odd* are by themselves in *number*, for *number* is posited in their definition (► 3.1): *even* is a *number that has a mean (numerus medium habens*: i.e., can be divided into two equal parts); and *odd* is a *number that lacks a mean (numerus medio carens)*.

Likewise, *first* (i.e., prime) and *composite* are predicated by themselves of *number*; and *number* is posited in their definition (► 3.3); for, in numbers, *first (primum = πρῶτον*, i.e. prime) is a number that is measured by no other number, but only by the unit: e.g., seven (*septenarius*); and *composite* is a number that is measured also by another number: e.g., nine (*novenarius*; i.e., nine is measured not only by the unit, but also by another number: i.e., by the number three).<sup>32</sup>

Likewise, *equilateral* and *scalene*, i.e., *three unequal sides*, are by themselves in *triangle*; and *triangle* is posited in their definition.<sup>33</sup>

Whence, ARISTOTLE adds that the subject in which the aforesaid accidents are (*insunt*) is in the *ratio* that says *what* it is: i.e., in their definition.<sup>34</sup> Thus, in some, there is *line*; in others, *number*.

2. (The first subject of the accident is) some part of it (*aliqua pars eius* < τῶν αὐτοῦ τινί [...] μέρος, i.e., some part of the subject itself of which it is predicated).<sup>35</sup>

---

<sup>30</sup> *In Metaph.* 5, l. 19, §1055 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a30–31): “sicut superficies dicitur colorata vel alba secundum seipsam. Primum enim subiectum coloris est superficies, et ideo corpus dicitur coloratum ratione superficiei.”

<sup>31</sup> *In Post. an.* 1, l. 10, 72–74 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a38–39): “sicut *rectum et circulare* insunt *linee* per se, nam *linea* ponitur in diffinitione eorum.” *In Post. an.* 1, l. 10, 74–76 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a39–40): “et eadem ratione *par et impar* per se insunt *numero*, quia *numerus* in eorum diffinitione ponitur, nam *par* est *numerus medium habens*.” Ibid., l. 35, 53–56 (cf. ARISTOTLE, *Analytica Posteriora* A.22, 84a14–16): “*impar* predicatur de *numero* per se secundo modo, quia *numerus* ponitur in diffinitione ipsius *inparis*: est enim *impar numerus medio carens*.”

<sup>32</sup> *In Post. an.* 1, l. 10, 77–83 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a40): “et similiter *primum et compositum* per se predicantur de *numero* et *numerus* in diffinitione eorum ponitur: est enim *primum* in *numeris* *numerus* qui nullo alio *numero* mensuratur, set sola *unitate*, ut *septenarius*, *compositus* autem *numerus* est quem etiam alius *numerus* mensurat, sicut *novenarius*.”

<sup>33</sup> *In Post. an.* 1, l. 10, 83–86 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a38–b1): “et similiter *ysopleuros*, id est *equilaterum*, et *scalenum*, id est *trium inequalium laterum*, et *altera parte longius*, per se insunt *triangulo* et *triangulus* ponitur in diffinitione eorum.”

<sup>34</sup> *In Post. an.* 1, l. 10, 83–90 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b1–3): “Et ideo subiungit [Philosophus] quod subiecta *que insunt omnibus* premissis accidentibus *in ratione dicente quid est*, id est in diffinitione, sicut alicui predictorum accidentium inest *linea*, alicui uero *numerus*.”

<sup>35</sup> *In Metaph.* 5, l. 19, §1055 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a31–32): “Vel etiam *aliqua pars eius*.”

For example, man is said to be a living (thing) according to itself because some part of it—namely, the soul—is the first subject of life.<sup>36</sup>

The proper subject must be posited in the definition of an accident.<sup>37</sup> However, sometimes it is posited indirectly (*in obliquo*), as when an accident is defined abstractly (*in abstracto*; ► 18.9). For example, when we say that *snubness* (*simitas*) is a *curvedness of the nose* (*curvitas nasi*). Sometimes, it is posited directly (*in recto*), as when an accident is defined concretely (*in concreto*). For example, when we say that a *snub nose* (*simum*) is a *curved nose* (*nasus curvus*).

### 17.6. Third Mode: When by *Itself* Signifies *Alone*

This (mode of) *by itself* is said according to the *ratio* of *aloneness* (*ratione solitudinis*); for this *according to itself* signifies something separated (*separatum* = κερχωρισμένον).<sup>38</sup> When *by itself* signifies something alone (*aliquid solitarium*), it is *something particular in the genus of substance*, which is not predicated of some subject (► 15.2, ¶1).<sup>39</sup>

This mode is (had) insofar as those are said to be in something according to themselves *which are alone as such* (*quae ei soli inquantum soli insunt* = ὅσα μόνῳ ὑπάρχει καὶ ἢ μόνον).<sup>40</sup> And this (i.e., *insofar as they are alone*) is said to differentiate (this mode) from the other modes, in which “to be in [something] by itself” was not said (precisely) because it is in (itself) by itself, even though (in the other modes) there should also be something alone in (another), as the definition (is alone) in the (thing) defined (► 17.4).

For example, man is said to be *according to itself* when it is (man) alone.<sup>41</sup> Thus, when we say *walker* (*ambulans*) or *white* (*album*), we do not signify *walker* or *white* as though it

---

<sup>36</sup> *In Metaph.* 5, l. 19, §1055 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a31–32): “sicut homo dicitur vivens secundum se, quia aliqua pars eius est primum subiectum vitae, scilicet anima.”

<sup>37</sup> *In Post. an.* 1, l. 10, 55–61 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a37–38): “Oportet autem quod proprium subiectum ponatur in diffinitione accidentis, quandoque quidem in obliquo, sicut cum accidens in abstracto diffinitur, ut cum dicimus quod simitas est curvitas nasi; quandoque uero in recto, ut cum accidens diffinitur in concreto, ut cum dicimus quod simus est nasus curuus.”

<sup>38</sup> *In Metaph.* 5, l. 19, §1057 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a35–36): “Hic autem secundum se dicitur ratione solitudinis. Nam hoc quod dico secundum se, significat aliquid separatum. [...] Et ad hunc reducitur tertius modus in Posterioribus positus.”

<sup>39</sup> *In Post. an.* 1, l. 10, 99–103 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b5–6): “ponit [Philosophus] alium modum eius quod est ‘per se’, prout ‘per se’ significat aliquid solitarium: sic enim dicitur ‘per se’ esse aliquod particulare quod est in genere substantie, quod *non* predicatur *de* aliquo *subiecto*.”

<sup>40</sup> *In Metaph.* 5, l. 19, §1057 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a35): “*Quartus* modus est, prout illa dicuntur secundum se inesse alicui, quae ei soli inquantum soli insunt. Quod dicit [Philosophus] ad differentiam priorum modorum, in quibus non dicebatur secundum se inesse ex eo quod est soli inesse. Quamvis etiam ibi aliquid soli inesset, ut definitio definito.”

<sup>41</sup> *In Metaph.* 5, l. 19, §1057: “sicut dicitur homo secundum se esse, quando solus est.” *In Post. an.* 1, l. 10, 103–112 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b6–8): “et huius ratio est quia, cum dico *ambulans* uel *album*, non significo ‘ambulans’ uel ‘album’ quasi aliquid per se solitarium existens, *cum* intelligatur aliquid aliud esse quod *sit ambulans* uel *album*; <set in substantiis,> et precipue in hiis que

should be something *by itself*, alone, since something else (i.e., man, the subject of the action of walking or of the quality of being white) is understood to be walking (*ambulans*) or (to be) white (*album*). But this does not happen in those names that signify (*significant* = σημαίνει) *this something* (*hoc aliquid* = τόδε τι): that is, in first substances (*in primis substantiis*). Thus, when we say *Sortes* or *Plato*, we do not understand that there is something else—other than what they truly are—which would be their subject.

In this mode, therefore, those are *by themselves* which are not predicated of a subject, while those that are said of a subject—i.e., as (things) existing in a subject—are accidents (*accidentia*); for those that are said of a subject as universals (are said) of inferiors, are not always accidents (e.g., *animal* and *white* are said of *Plato*, but *animal* is not an accident of *Plato*).<sup>42</sup>

This mode, however, is not a mode of predicating (*modus praedicandi*), but a mode of existing (*modus existendi*). Whence, in the beginning ARISTOTLE does not say, “those are said by themselves” (*per se dicuntur*), but “those are by themselves” (*per se sunt*).<sup>43</sup>

To this mode is reduced the fourth mode of saying *according to something* (*secundum quod*), which conveys (*importabat*) *position* (► 17.2, ¶4).<sup>44</sup>

### 17.7. Fourth Mode: When *by Itself* Pertains to an Extrinsic Cause

In this mode, that is said to be according to itself *of which there is not some other cause* (*cuius non est <aliqua> alia causa* = οὐ μὴ ἔστιν ἄλλο αἴτιον).<sup>45</sup>

This is insofar as the preposition *by* signifies a relation of extrinsic cause.<sup>46</sup> Hence, ARISTOTLE says that whatever is in (another) owing to itself (*quicquid inest unicuique*

---

*significant hoc aliquid*, scilicet in primis substantiis, hoc non contingit: cum enim dicitur *Sortes* uel *Plato*, non intelligitur quod sit *aliquid alterum quam* id quod ipsa *uere sunt*, quod scilicet sit subiectum eorum.”

<sup>42</sup> *In Post. an.* 1, l. 10, 112–117 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b8–10): “Sic igitur hoc modo que non predicantur de subiecto, per se sunt, que uero dicuntur de subiecto, scilicet sicut in subiecto existencia, accidentia sunt. Nam que dicuntur de subiecto sicut uniuersalia de inferioribus, non semper accidentia sunt.”

<sup>43</sup> *In Post. an.* 1, l. 10, 117–121 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73a34): “Sciendum est autem quod iste modus non est modus predicandi, sed modus existendi. Unde etiam in principio non dixit: «Per se dicuntur,» set: «Per se sunt.»”

<sup>44</sup> *In Metaph.* 5, l. 19, §1057: “Et ad hunc reducitur [...] quartus modus dicendi secundum quod, qui positionem importabat.”

<sup>45</sup> *In Metaph.* 5, l. 19, §1056 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a32–33): “Tertius modus est prout secundum se esse dicitur illud, cuius non est aliqua alia causa.”

<sup>46</sup> *In Post. an.* 1, l. 10, 122–128 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b10–11): “ponit [Philosophus] quartum modum, secundum quod hec prepositio ‘per’ designat habitudinem cause efficientis uel cuiuscunque alterius <extrinsece>. Et ideo dicit quod quicquid inest unicuique propter se ipsum, per se dicitur de eo, quod uero non propter ipsum inest alicui, per accidens dicitur.” *In Metaph.* 5, l. 19, §1056: “Et ad hunc modum reducitur quartus modus dicendi per se in Posterioribus positus, quando effectus praedicatur de causa; ut cum dicitur interfectus interiit propter interfectionem, vel infrigidatum infriguit vel refriguit propter refrigerium.”

*propter se ipsum* < τὸ μὲν δι' αὐτὸ ὑπάρχον ἐκάστω καθ' αὐτό) is said of it *by itself*; and whatever is in another, but not owing to itself, is said by accident (*per accidens* = συμβεβηκός).

Thus, something is *by itself* in this mode if that which is predicated is in the subject owing to itself.<sup>47</sup> For example, when one says, “the cooled was cooled owing to cooling,” this is so by itself. Likewise, when one says, “what is slaughtered dies” (*interfectum interiit* < εἴ τι σφαπτόμενον ἀπέθανε); for it is manifest that, because it is slaughtered, it dies; and it is no accident that that which is slaughtered should die. On the other hand, when we say, “while he was walking it lightened” (*ambulante coruscat* < εἰ βαδίζοντος ἤστραψε), this is said by accident; for it is not owing to someone walking that it should lighten.

Therefore, all immediate propositions (►54), which are not proven through some mean, are *by themselves*; for the mean is a cause of the predicate being in the subject (►55.7) in demonstrations *on account of something* (*propter quid*; ►64.2).<sup>48</sup> Whence, although *man* has many causes, such as *animal* and *biped*, which are its formal causes, however, there is no cause of the proposition “man is a man,” since it is immediate; and *on account of this* (*propter hoc*), a man is a man according to itself.

### 17.8. By Itself Reduced to Two Modes

Since something is said *by itself* by comparison to (its) subject, the above modes are reduced to two:<sup>49</sup>

#### 1. When predicates are posited in the definition of the subject.<sup>50</sup>

For example, when we say, “man is (an) animal”; for *animal* falls in the definition of *man*; and because that which is in the definition of something is in some mode its cause, the

---

<sup>47</sup> *In Post. an.* 1, l. 10, 128–135 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b11–16): “sicut cum dico: «Hoc ambulante coruscat»: non enim propter id quod ambulat, coruscauit, set hoc dicitur secundum accidens. Si uero quod predicatur insit subiecto propter seipsum, per se est, ut si dicamus quod interfectum interiit: manifestum est quod propter id quod interfectum est, interiit, et non est accidens quod interfectum interieat.” *In Metaph.* 5, l. 19, §1056: “ut cum dicitur interfectus interiit propter interfectionem, vel infrigidatum infriguit vel refriguit propter refrigerium.”

<sup>48</sup> *In Metaph.* 5, l. 19, §1056 (cf. ARISTOTLE, *Metaphysica* Δ.18, 1022a33–35): “sicut omnes propositiones immediatae, quae scilicet per aliquod medium non probantur. Nam medium in demonstrationibus propter quid est causa, quod praedicatum insit subiecto. Unde, licet homo habeat multas causas, sicut animal et bipes, quae sunt causae formales eius; tamen huius propositionis, homo est homo, cum sit immediata, nihil est causa; et propter hoc homo est homo secundum se.”

<sup>49</sup> *In Post. an.* 1, l. 35, 46–47 (cf. ARISTOTLE, *Analytica Posteriora* A.22, 84a12): “ponit [Philosophus] duos modos predicandi per se.” *Ibid.*, 59–60: “Alii autem modi quos supra posuit reducantur ad hos.” *In De anima* 2, c. 14, 42–43: “Per se autem dicitur dupliciter.” *In Post. an.* 1, l. 9, 58–60: “per se autem dicitur aliquid predicari per comparisonem ad ipsum subiectum, quia ponitur in eius diffinitione uel e conuerso.”

<sup>50</sup> *In Post. an.* 1, l. 35, 47–50 (cf. ARISTOTLE, *Analytica Posteriora* A.22, 84a13): “nam primo quidem predicantur per se *quecunque insunt* subiectis *in eo quod quid est*, scilicet cum predicata ponuntur in diffinitione subiecti.” *In De anima* 2, c. 14, 43–45: “Vno enim modo dicitur propositio per se cuius predicatum cadit in diffinitione subiecti.”

predicate is a cause of the subject in these (propositions) that are thus said by themselves.<sup>51</sup>

## 2. When **subjects** are posited in the definition of predicates.<sup>52</sup>

For example, when we say, “the nose is snub,” or “the number is even”; for *snub* (*nose*) is nothing other than a *curved nose*; and *even* is nothing than a *number having a mean* (► 3.1). In such (propositions), the subject is a cause of the predicate.<sup>53</sup>

### 17.9. Predication by Accident

Those are predicated *by accident* (as opposed to *by themselves*) which are neither posited in the definition of their subjects, nor are their subjects posited in their definitions.<sup>54</sup> For example, *musical* and *white* are predicated by accident of *animal*.

According to ARISTOTLE, there are three modes in which *being* (*ens*) is said by accident:<sup>55</sup>

1. When **an accident** is predicated **of an accident**, as in “the just is musical” (*iustus est musicus* < δίκαιον μουσικὸν εἶναι φαμεν; or, “the just is a musician”).<sup>56</sup>

2. When **an accident** is predicated **of a subject**, as in “the man is musical” (*homo est musicus* < τὸν ἄνθρωπον μουσικὸν εἶναι φαμεν]; or, “the man is a musician”), or in “the man is white” (*homo est albus* < τὸ λευκὸν ποτ’ ἐκεῖνό φαμεν εἶναι ἄνθρωπον).<sup>57</sup>

---

<sup>51</sup> *In De anima* 2, c. 14, 45–49: “sicut ista: Homo est animal; animal enim cadit in diffinitione hominis; et quia id quod est in diffinitione alicuius est aliquo modo causa eius, in hiis que sic per se dicuntur, predicatum est causa subiecti.”

<sup>52</sup> *In Post. an.* 1, l. 35, 50–53 (cf. ARISTOTLE, *Analytica Posteriora* A.22, 84a13–14): “secundo quando ipsa subiecta insunt predicatis in eo quod quid est, id est quando subiecta ponuntur in diffinitione predicatorum.” *In De anima* 2, c. 14, 49–51: “Alio modo dicitur propositio per se, cuius e contrario subiectum ponitur in diffinitione predicatorum.”

<sup>53</sup> *In De anima* 2, c. 14, 51–56: “sicut si dicatur: Nasus est simus, uel: Numerus est par; simum enim nichil aliud est quam nasus curuus, et par nichil aliud est quam numerus medietatem habens; et in istis subiectum est causa predicatorum.”

<sup>54</sup> *In Post. an.* 1, l. 10, 90–97 (cf. ARISTOTLE, *Analytica Posteriora* A.4, 73b3–5): “Et similiter in aliis, unicuique, inquam, ipsorum subiectorum, per se inesse dico suum accidens, que uero predicata neutraliter insunt, id est neque ita quod ponantur in diffinitione subiectorum neque subiecta in diffinitione eorum, sunt accidentia, id est per accidens predicantur, sicut musicum et album predicantur de animali per accidens.”

<sup>55</sup> *In Metaph.* 5, l. 9, §886 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a8–10): “Ostendit [Philosophus] quot modis dicitur ens per accidens; et dicit, quod tribus.” *In Post. an.* 1, l. 31, 86–87 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b25–29): “dupliciter autem aliquid secundum accidens predicatur.” In the latter work, ARISTOTLE does not consider the mode in which an accident is predicated of an accident. Also, the modes are inverted.

<sup>56</sup> *In Metaph.* 5, l. 9, §886 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a8–9): “quorum unus est, quando accidens praedicatur de accidente, ut cum dicitur, iustus est musicus.” Although St. Thomas does not say it here, it is evident that this is the most remote form of predication in relation to predication by itself.

<sup>57</sup> *In Metaph.* 5, l. 9, §886 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a9): “Secundus, cum accidens praedicatur de subiecto, ut cum dicitur, homo est musicus.” *In Post. an.* 1, l. 31, 89–91 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b25–26): “alio modo dissimiliter, quando accidens predicatur de subiecto, sicut cum dicitur: «Homo est albus».”

When an accident is predicated of a subject, one says, (e.g.), “the man is white” not because something else is white, but because the man itself is white.<sup>58</sup> Nevertheless, the proposition is by accident because *white* does not befit *man* according to its proper *ratio*; for neither is (*white*) posited in its definition nor conversely.

**3. When a subject is predicated of an accident**, as in “the musical is a man” (*musicus est homo* < τὸν μουσικὸν ἄνθρωπον; or, “the musician is a man”), or in “the white is a man” (*album est homo* < τὸν ἄνθρωπον λευκόν).<sup>59</sup>

On the other hand, when one says, “the white is a man,” this is not said because *man* is in *white* (as in a subject), but because being a man (*esse hominem*) is in the subject of white, which (subject) happens to be white (*accidit* [homini] *esse album* < συμβέβηκε τῷ ἀνθρώπῳ εἶναι λευκῷ).<sup>60</sup>

Mode (¶3) differs from mode (¶2) because it is more remote from predication by itself.<sup>61</sup>

### 17.10. By Accident: From Cause to Predication

It has already been manifested (► 11.7) in what mode a cause by accident differs from a cause by itself; and being by accident can be manifested through the cause by accident.<sup>62</sup>

Thus, when we assign a cause by accident saying that the musical (or the musician) builds—because (being) musical (or musician) happens to the builder, or contrarily—, it is evident that *this is this*—i.e., that *the musical builds*—signifies only that *this happens to this* (*hoc accidere huic* = συμβεβηκέναι τῷδε τόδε).<sup>63</sup>

Likewise, in the aforesaid modes of being by accident, when we say that the man is musical—predicating an accident of a subject—or that the musical is a man—predicating

<sup>58</sup> *In Post. an.* 1, l. 31, 92–98 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b27–29): “quando accidens predicatur de subiecto, dicitur: «Homo est albus», non quia *aliquid alterum sit album*, set quia ipse homo est albus, et tamen est propositio per accidens, quia album non conuenit homini secundum propriam rationem (neque enim ponitur in diffinitione eius neque e conuerso).”

<sup>59</sup> *In Metaph.* 5, l. 9, §886 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a9–10): “Tertius, cum subiectum praedicatur de accidente, ut cum dicitur *musicus est homo*.” *In Post. an.* 1, l. 31, 87–89 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b26–27): “uno modo, quando subiectum predicatur de accidente, puta cum dicimus: «Album est homo».”

<sup>60</sup> *In Post. an.* 1, l. 31, 98–103 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b28–29): “set quando dicitur: «Album est homo», *hoc* non dicitur quia esse hominem insit albo, set quia esse hominem inest subiecto albi, cui scilicet *accidit esse album*; unde hic modus est magis remotus a predicatione per se quam primus.”

<sup>61</sup> *In Post. an.* 1, l. 31, 91; 101–103 (cf. ARISTOTLE, *Analytica Posteriora* A.19, 81b26–29): “differt hic modus a primo, quoniam [...] hic modus est magis remotus a predicatione per se quam primus.”

<sup>62</sup> *In Metaph.* 5, l. 9, §886: “Et, quia superius iam manifestauit [Philosophus] quomodo causa per accidens differt a causa per se, ideo nunc consequenter per causam per accidens manifestat ens per accidens.”

<sup>63</sup> *In Metaph.* 5, l. 9, §887: “assignantes causam per accidens dicimus quod *musicus aedificat*, eo quod *musicum accidit aedificatori*, vel e contra, constat enim «quod hoc esse hoc,» idest *musicum aedificare*, nihil aliud significat quam «hoc accidere huic.»”

a subject of an accident—or that the white is a musical, or conversely—predicating an accident of an accident—, in all of these (cases), *to be* (*esse*) only signifies *to happen*.<sup>64</sup>

Thus, when an accident is predicated of an accident, (*is*) signifies that both accidents happen to the same subject.<sup>65</sup>

When an accident is predicated of a subject, *to be* is said because the accident happens to the subject.<sup>66</sup>

On the other hand, we say that the musical is a man because the predicate happens to be musical, which is posited in the subject.<sup>67</sup>

Now, when a subject is predicated of an accident, and (when) an accident (is predicated) of an accident, the reason for predicating is—as it were—alike.<sup>68</sup> For just as a subject is predicated of an accident because of that reason—because a subject is predicated of that to which an accident happens in the posited subject—, so an accident is predicated of an accident because it is predicated of the subject of an accident. Because of this, just as the musical is said to be a man, likewise, a musician is said to be white: namely, because that to which happens to be musical—namely, the subject—is white.

It is evident, therefore, that those (things) that are said to be *according to accident* are said (to be so) for three reasons:<sup>69</sup>

1. Because both—i.e., subject and predicate—are in the same (subject): e.g., when an accident is predicated of an accident.<sup>70</sup>

---

<sup>64</sup> *In Metaph. 5, l. 9, §887* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a10–15): “ita est etiam in praedictis modis entis per accidens, quando dicimus hominem esse musicum, accidens praedicando de subiecto: vel musicum esse hominem, praedicando subiectum de accidente: vel album esse musicum, vel e converso, scilicet musicum esse album, praedicando accidens de accidente. In omnibus enim his, esse, nihil aliud significat quam accidere.”

<sup>65</sup> *In Metaph. 5, l. 9, §887* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a15–16): “quando accidens de accidente praedicatur, significat quod ambo accidentia accidunt eidem subiecto.”

<sup>66</sup> *In Metaph. 5, l. 9, §887* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a16–17): “cum accidens praedicatur de subiecto, dicitur esse, «quia enti» idest subiecto accidit accidens.”

<sup>67</sup> *In Metaph. 5, l. 9, §887* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a17–18): “Sed musicum esse hominem dicimus, «quia huic,» scilicet praedicato, accidit musicum, quod ponitur in subiecto.”

<sup>68</sup> *In Metaph. 5, l. 9, §887* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a18–19): “Sed musicum esse hominem dicimus, «quia huic,» scilicet praedicato, accidit musicum, quod ponitur in subiecto. Et est quasi similis ratio praedicandi, cum subiectum praedicatur de accidente, et accidens de accidente. Sicut enim subiectum praedicatur de accidente ea ratione, quia praedicatur subiectum de eo, cui accidit accidens in subiecto positum; ita accidens praedicatur de accidente, quia praedicatur de subiecto accidentis. Et propter hoc, sicut dicitur musicum est homo, similiter dicitur musicum esse album, quia scilicet illud cui accidit esse musicum, scilicet subiectum, est album.”

<sup>69</sup> *In Metaph. 5, l. 9, §888* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a19–22): “Patet igitur, quod ea, quae dicuntur esse secundum accidens, dicuntur triplici ratione.”

<sup>70</sup> *In Metaph. 5, l. 9, §888* (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a20–21): “aut eo «quod ambo,» scilicet subiectum et praedicatum, insunt eidem, sicut cum accidens praedicatur de accidente.”

2. Because the predicate, such as *musical*, is in the subject, which is said to be musical: and this is when an accident is predicated of the subject.<sup>71</sup>

3. Because the subject posited in the predicate is that in which the accident is, of which the subject is predicated; and this is when a subject is predicated of an accident: e.g., when we say that the musical is a man.<sup>72</sup>

---

<sup>71</sup> *In Metaph.* 5, l. 9, §888 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a21): “aut «quia illud,» scilicet praedicatum, ut musicum, «inest enti,» idest subiecto, quod dicitur esse musicum; et hoc est cum accidens praedicatur de subiecto.”

<sup>72</sup> *In Metaph.* 5, l. 9, §888 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a21–22): “aut «quia illud,» scilicet subiectum in praedicato positum, est illud cui inest accidens, de quo accidente illud, scilicet subiectum, praedicatur. Et hoc est scilicet cum subiectum praedicatur de accidente, ut cum dicimus, musicum est homo.”

## 18. Essence and Definition in Accidents

Before we determine what the principle in any genus is (► 27), we must clarify how—if at all—there is essence and definition in accidents.

### 18.1. Whether Accidents Have Essence and Definition

ARISTOTLE posits two (seemingly contradictory) solutions to the question of whether accidents have essence and definition.<sup>1</sup> However, he shows that it makes no difference how one wants to answer it; for we can (truly) say either of the following:

1. **Accidents do not have a definition**, if by this we understand **priorly** and **simply** (*per prius et simpliciter*; ► 18.2).
2. Accidents **have a definition**, but **posteriorly** (and) **according to something** (*per posterius secundum quid*; ► 18.10; 18.11).

### 18.2. Accidents Have Neither Essence nor Definition (*Simply*)

As ARISTOTLE says, (according to the first solution), essence (*quod quid est* = τὸ τί ἐστι) and definition (*definitio* = ὁρισμός) does not pertain to accidents, but to substances.<sup>2</sup>

What must be known first about *essence* is that (logically speaking, λογικῶς) it must be predicated by itself (*secundum se*; ► 17.3); for those that are predicated of something by accident (*per accidens*; ► 17.9) do not pertain to its essence (*quod quid erat esse*).<sup>3</sup> We understand by *the essence of something* that which can conveniently answer the question “what is it?” And when we ask of something *what* it is, we cannot conveniently respond, “those that are in it by accident.”

For example, when we ask, “what is man?” we cannot answer that it is *white*, *sitting*, or *musical* (i.e., *musician*).<sup>4</sup> Hence, none of those (predicates) that are predicated by

---

<sup>1</sup> *In Metaph.* 7, l. 4, §1338 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b3–4): “Et quia posuerat [Philosophus] duas solutiones, subiungit quod nihil differt qualitercumque aliquis velit dicere de praemissa quaestione; sive dicatur quod accidentia non habent definitionem, sive quod habent, sed per posterius secundum quid. Quod tamen dicitur in prima solutione quod non habent definitionem accidentia, intelligitur per prius et simpliciter.”

<sup>2</sup> *In Metaph.* 7, l. 4, §1331: “ostendit [Philosophus] quomodo definitio et quod quid est invenitur in substantia et accidentibus. [...] Dicit ergo primo, quod dicendum est [...], quod quod quid est et definitio non sit accidentium, sed substantiarum.” Cf. ARISTOTLE, *Metaphysica* Z.4, 1030a16–17: “ὁρισμὸς δ’ οὐκ ἔσται οὐδὲ τὸ τί ἦν εἶναι.”

<sup>3</sup> *In Metaph.* 7, l. 3, §1309 (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b12–14; 15–16): “Hoc autem primo sciendum est de eo quod quid erat esse, quod oportet quod praedicetur secundum se. Illa enim quae praedicantur de aliquo per accidens, non pertinent ad quod quid erat esse illius. Hoc enim intelligimus per quod quid erat esse alicuius, quod convenienter responderi potest ad quaestionem de eo factam per quid est. Cum autem de aliquo quaerimus quid est, non possumus convenienter respondere ea quae insunt ei per accidens.”

<sup>4</sup> *In Metaph.* 7, l. 3, §1309 (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b14–15): “sicut cum quaeritur quid est homo, non potest responderi, quod sit album vel sedens vel musicus. Et ideo nihil eorum, quae

accident of something pertain to the essence of that thing; for *to be musical* is not *for you to be* (*non enim musicum esse, est tibi esse* < οὐ γάρ ἐστι τὸ σοὶ εἶναι τὸ μουσικῶ εἶναι).<sup>5</sup>

Indeed, the *to be musical* (or *musician*)—that is, the *what* that the musical is—does not pertain to the *what* that you are.<sup>6</sup> And if we should ask, “what are you?” one could not respond that you are a musical. It follows, then, that *to be musical* is not *for you to be*; for those that pertain to the quiddity of musical are outside your quiddity, even if *musical* is predicated of you; for *musical* is not predicated of you by itself (► 17.3), but by accident (► 17.9). Therefore, that which is predicated of you by itself and not by accident pertains to the *what* that you are: for example, *substance*, *rational*, *sensible*, and other such (predicates), all of which pertain to the *what* that you are (► 17.8, ¶1).

### 18.3. Proper Affections Do Not Have Essence (*Simply*)

ARISTOTLE (moreover) excludes from essence any affections that are predicated of a subject, even if they are predicated by themselves.<sup>7</sup>

He says that not everything that is predicated by itself of something pertains to its essence; for an affection is predicated by itself of (its) proper subject—as *color* (is predicated by itself) of *surface*—, and nonetheless, essence is not that which is in something by itself as white is in a surface; for *to be a surface* is not *to be white*: that is, the essence of surface is not the essence of white; for the quiddity of surface is other than (the quiddity) of whiteness.<sup>8</sup>

---

praedicantur per accidens de aliquo, pertinent ad quod quid erat esse illius rei: non enim musicum esse, est tibi esse.”

<sup>5</sup> Such expressions are notoriously difficult to translate. As St. Thomas observes, it should be known that when ARISTOTLE says, “to be this” (*hoc esse*; e.g., *musicum esse, to be musical* [or *musician*], translation of τὸ μουσικῶ εἶναι) or “for this to be” (*huic esse*; e.g., *\*musico esse*, which arguably would be a more accurate translation of τὸ μουσικῶ εἶναι: literally, *the to-be for the musical* [or *musician*]) he understands (by such expressions) the essence of that thing (compare τὸ μουσικῶ εἶναι and τὸ τί ἦν εἶναι). For example, (by) “for man to be” (*homini esse*) or “to be man” (*hominem esse*) he understands that which pertains to what man is. *In Metaph.* 7, l. 3, §1310: “Sciendum autem est, quod in omnibus sequentibus per hoc quod dicit [Philosophus] hoc esse, vel huic esse, intelligit quod quid erat esse illius rei; sicut homini esse vel hominem esse, intelligit id quod pertinet ad quod quid est homo.”

<sup>6</sup> *In Metaph.* 7, l. 3, §1310 (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b14–15): “Quod est autem «musicum esse,» idest hoc ipsum quod quid est musicus, non pertinet ad hoc quod quid es tu. Si enim quaeratur, tu quid sis, non potest responderi quod tu sis musicus. Et ideo sequitur quod musicum esse non est tibi esse; quia ea quae pertinent ad quidditatem musici, sunt extra quidditatem tuam, licet musicus de te praedicetur. Et hoc ideo, quia «tu non secundum teipsum es musicus,» idest quia musicum non praedicatur de te per se, sed per accidens. Illud ergo pertinet ad quod quid est tui, quod tu es «secundum teipsum,» idest quia de te praedicatur per se et non per accidens; sicut de te praedicatur per se homo, animal, substantia, rationale, sensibile, et alia huiusmodi, quae omnia pertinent ad quod quid est tui.”

<sup>7</sup> *In Metaph.* 7, l. 3, §1311: “Excludit [Philosophus] ab eo quod est quod quid est, quod praedicatur secundum se, sicut passiones de subiectis.”

<sup>8</sup> *In Metaph.* 7, l. 3, §1311 (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b16–18): “dicens: neque etiam hoc omne quod praedicatur secundum se de aliquo, pertinet ad hoc quod quid erat esse eius. Praedicatur enim per se passio de proprio subiecto, sicut color de superficie. Non tamen quod quid erat esse est, quod ita inest alicui secundum se, sicut superficiei inest album; quia non superficiei esse est «album esse,» idest

Not only the essence of white is not the essence of surface.<sup>9</sup> The composite from one and the other—i.e., the composite of surface and whiteness that is *to be a white surface* or *to be of white surface*—is not its essence either. Indeed, the quiddity or essence of *white surface* is not the quiddity or essence of *surface*. And if we should ask why, one could respond that because *this is present in it*. i.e., because when one says, “white surface,” one says that something adheres to surface as extrinsic, and not as entering into its essence. Whence, the whole *white surface* does not pertain to the essence of *surface*.

ARISTOTLE proves that those (predicates) that are predicated by themselves of something in the way that proper affections (are predicated) of (their) subject do not pertain to the essence (by) reducing (the argument) to a disagreement (*ad inconueniens*); for multiple, diverse affections may be predicated by themselves of the same subject.<sup>10</sup> For example, of the same subject is predicated by itself the proper affection *colored, rough* (i.e., uneven), and *light* (i.e., as opposed to heavy), which are affections of surface. And all such predicates pertain to the essence of the subject according to the same *ratio*.

Thus, if whiteness pertains to the essence of surface, for the same reason also lightness; for those that are the same to one are the same to each other (i.e., in this case, multiple affections have the same proper subject).<sup>11</sup> If it were always and universally true that the quiddity of proper affections should be the same with the quiddity of the proper subject, it would follow that *to be white* and *to be light* would be one and the same: that is, that the quiddity of *whiteness* and of *lightness* would be one and the same. But this is evidently false. It remains, therefore, that the essence of proper affections and the essence of the subject is not one and the same.

---

hoc ipsum quod quid est superficies, non est quod quid est album. Alia enim est quidditas superficiei et albedinis.”

<sup>9</sup> *In Metaph. 7, l. 3, §1312* (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b18–19): “Et non solum hoc quod est esse album non est quod quid est superficiei; sed nec ipsum compositum ex utrisque, scilicet superficiei et albedine, quod est esse superficiem albam vel esse superficiei albae. Quidditas enim vel essentia superficiei albae, non est quidditas vel essentia superficiei. Et si quaeratur quare? Responderi potest quia hoc adest ei, idest, quia cum dico superficiem albam, dicitur aliquid quod adhaeret superficiei tamquam extrinsecum, et non tamquam intrans essentiam eius. Unde hoc totum quod est superficiei alba, non est de essentia superficiei.”

<sup>10</sup> *In Metaph. 7, l. 3, §1314*: “Probat autem [Philosophus] deducendo ad inconueniens, quod ea quae praedicantur per se de aliquo sicut propria passio de subiecto, non pertineant ad quod quid est. Contingit enim de eodem subiecto plures passionis diversas per se praedicari; sicut per se praedicatur propria passio, coloratum et asperum et leve, quae sunt passionis superficiei. Eiusdem autem rationis est omnia huiusmodi praedicata ad quod quid est subiecti pertinere.”

<sup>11</sup> *In Metaph. 7, l. 3, §1314* (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b21–22): “Ergo si albedo pertinet ad quod quid est superficiei, pari ratione et levitas. Quae autem uni et eidem sunt eadem, sibiinvicem sunt eadem. Quare si superficiei album esse est superficiei esse semper, idest si semper et universaliter hoc verum est quod quidditas propriae passionis sit idem cum quidditate proprii subiecti, sequitur quod albo esse et levi esse, sit idem et unum, idest quod quidditas albedinis et levitas sit una et eadem. Hoc autem patet falsum esse. Relinquitur ergo quod quod quid erat esse propriae passionis et subiecti non est idem et unum.”

#### 18.4. Predicates Pertaining to Essence (*Simply*)

Affections are predicated of proper subjects because (their) proper subjects are posited in their definitions, as *nose* is posited in the definition of *snub*; and *number* (is posited) in the definition of *even* (► 17.5).<sup>12</sup> On the other hand, some (predicates) are predicated by themselves in such a way that (their) subjects are not posited in their definitions (► 17.8), as *animal* (is predicated) by itself of *man*, and *man* is not posited in the definition of *animal*.

Since those (predicates) do not pertain to essence which are predicated by accident, or which are predicated by themselves and yet (their) subjects are posited in their definitions, it remains, therefore, that those (predicates) pertain to essence *in whose definitions are not posited subjects* (i.e., ► 17.8, ¶1; but not ¶2).<sup>13</sup>

Whence, ARISTOTLE concludes that the *ratio* of essence in each (thing) will be that descriptive *ratio* in whose predicate there is no subject, as *man* is not in the *ratio* of *animal*; whence, *animal* pertains to the essence of *man*.<sup>14</sup>

#### 18.5. Definition by Addition

(Definitions, properly speaking, are only of species; ► 13.16.) And it belongs to the *ratio* of species to be related to a genus by addition.<sup>15</sup> However, something can be added to a genus in two modes:

1. *As that which pertains by itself (per se) to it and is contained virtually (virtute) in it.* Such an addition produces a true species of some genus. For example, *rational* is added to *animal* (to produce the true species of *man*).
2. *As something external (extraneum) is added to its ratio.* Such an addition does not produce a true species of the genus in the way that we commonly speak of genus and species. For example, if *white*—or something of this mode—should be added to *animal*.

---

<sup>12</sup> *In Metaph. 7, l. 3, §1313*: “Praedicantur autem passiones de propriis subiectis ea ratione, quia propria subiecta in earum definitionibus ponuntur, sicut nasus ponitur in definitione simi, et numerus in definitione paris. Quaedam vero ita praedicantur per se, quod subiecta in eorum definitionibus non ponuntur, sicut animal per se de homine; nec homo ponitur in definitione animalis.”

<sup>13</sup> *In Metaph. 7, l. 3, §1313*: “Cum ergo ea quae praedicantur per accidens non pertineant ad quod quid est, nec illa quae praedicantur per se in quorum definitionibus ponuntur subiecta, relinquitur quod illa pertineant ad quod quid est, in quorum definitionibus non ponuntur subiecta.”

<sup>14</sup> *In Metaph. 7, l. 3, §1313* (cf. ARISTOTLE, *Metaphysica* Z.4, 1029b19–21): “Et ideo concludit dicens, quod haec erit ratio in singulis, quod quid erat esse, in qua ratione dicente ipsum, idest describente praedicatum non inerit ipsum, idest subiectum; sicut in ratione animalis, non inest homo. Unde animal pertinet ad quod quid est homo.”

<sup>15</sup> *STh I, q. 3 a. 5 co.*: “ad rationem speciei pertinet quod se habeat ex additione ad genus. Sed generi potest aliquid addi dupliciter. Uno modo, quod per se ad ipsum pertinet, et virtute continetur in ipso, sicut rationale additur animali. Et talis additio facit veras species alicuius generis, ut per Philosophum patet, in VII et VIII Metaphys. Aliquid vero additur generi quasi aliquid extraneum a ratione ipsius, sicut si album animali addatur, vel aliquid huiusmodi. Et talis additio non facit veras species generis, secundum quod communiter loquimur de genere et speciebus.”

There is a **definition by addition** (*definitio per additionem, ex additione* = [ὀρισμὸς] ἐκ προσθέσεως) whenever a subject is posited—in whatever way—in the definition of an accident (► 17.8, ¶2).<sup>16</sup>

Whence, a **definition** is said (to be) **by addition** *when something is posited in the definition which is outside the essence of that which is defined*; and this is so on account of the natural dependency of an accident upon a subject (► 15.16).<sup>17</sup> For example, *nose* is posited in the definition of *snub*.

## 18.6. Simple vs. Coupled Accidents

Some accidents are *simple*, while others are *coupled*.<sup>18</sup>

1. Those accidents are said (to be) **simple** (*simplicia* < ὀρισμὸς τῶν ἀπλῶν) *which do not have a determinate subject that should be posited in their definition*.<sup>19</sup> For example, *curved*, *concave*, and other mathematical (accidents).

2. Those accidents are said (to be) **coupled** (*copulata* < ὀρισμὸς τῶν οὐχ ἀπλῶν ἀλλὰ συνδευασμένων) *which have a determinate subject without which they cannot be defined*.<sup>20</sup>

## 18.7. Definition of Simple and of Coupled Accidents

For simple and coupled accidents to be defined, it is necessary that their definitions be made by addition, since they cannot be defined without their proper subjects.<sup>21</sup>

For example, if we take **nose** (*nasus* = ῥίς), **concavity** (*concauitas* = κοιλότης), and **snubness** (*simitas* = σιμότης):

---

<sup>16</sup> *Quodlibet* 9, q. 3 ad 1: “qualitercumque ponatur subiectum in definitione accidentis, intelligitur esse definitio per additionem, ut probatur in VII Metaph.” For the origin of this discussion, see *In Metaph.* 7, l. 4, §1342 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b14–27): “quidam dicebant nullam definitionem esse «ex additione,» idest quod in nulla definitione ponitur aliquid, quod sit extra essentiam definiti. Et videbantur pro se habere hoc, quod definitio significat essentiam rei. Unde illud quod est extra essentiam rei, non debet poni in eius definitione, ut videtur.”

<sup>17</sup> *Quodlibet* 9, q. 3 ad 1: “Et dicitur definitio per additionem, quando in definitione ponitur aliquid quod est extra essentiam definiti, sicut nasus ponitur in definitione simi. Hoc autem est propter naturalem dependentiam accidentis a subiecto.”

<sup>18</sup> *In Metaph.* 7, l. 4, §1343: “quaedam accidentia sunt simplicia, et quaedam copulata.”

<sup>19</sup> *In Metaph.* 7, l. 4, §1343: “Simplicia [accidentia] dicuntur, quae non habent subiectum determinatum, quod in eorum definitione ponatur, sicut curvum et concavum et alia mathematica.”

<sup>20</sup> *In Metaph.* 7, l. 4, §1343: “Copolata autem [accidentia] dicuntur, quae habent determinatum subiectum, sine quo definiri non possunt.”

<sup>21</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b14–17): “Est ergo dubitatio, si aliquis velit dicere quod ratio, quae est ex additione, non est definitio illorum accidentium quae sunt simplicia, sed copulatum erit definitio. Videtur enim, quod nullius eorum possit esse definitio. Palam est ergo, quod si illa definiuntur, necesse est eorum definitionem ex additione facere, cum sine propriis subiectis definiri non possint. Sicut si accipiamus haec tria, idest nasus, et concavitas, et simitas.”

1. **Concavity** is an accident simply (*simpliciter*); and above all, in comparison to nose, since **nose** does not belong to the understanding of *concave*.<sup>22</sup>

2. **Snubness**, on the other hand, is a composite accident, since **nose** belongs to its understanding.<sup>23</sup> And thus, *snubness* will be something said from both (i.e., from *concavity* and *nose*), insofar as it signifies *this in this* (*hoc in hoc* = τόδε ἐν τῷδε): that is, a determinate accident (i.e., concavity) in a determinate subject (i.e., in a nose).<sup>24</sup>

3. Neither **concavity** nor **snubness** is an affection of **nose** by accident (*secundum accidens*) in the way that *white* is in *Callias* and in *man* by accident: that is, insofar as Callias, who happens (*accidit*) to be a man, is white.

4. **Snub** (*simum*) or **aquiline** (*aquilinum*) is, instead, an *affection by itself* of **nose**; for it befits (*competit*) a nose as such to be snub; and *nose* is posited in the definition of *aquiline*.<sup>25</sup> In the same way, *male* by itself befits (*competit*) *animal*, and *equal* (befits) *quantity*.<sup>26</sup>

◀ Likewise, any other (accidents) are said to exist *by themselves* in something because of the same reason: the name of that in which the affection exists—i.e., (their) substance—is posited in their *ratio*.<sup>27</sup> And (not only the name, but) also the *ratio*; for the *ratio* can always be posited in definitions instead of the name: for example, when it is said that *man* is an *animated, sensible, rational, mortal substance*.<sup>28</sup> Likewise, if we should say that *male* is an *animal that can generate in another*, we can also say that *male* is an *animated sensible substance that can generate in some other*.

---

<sup>22</sup> *In Metaph.* 7, l. 4, §1344: “concauitas est simpliciter accidens, praecipue in comparatione ad nasum, cum non sit nasus de intellectu concavi.”

<sup>23</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b17–20): “Simitas autem est accidens compositum, cum sit nasus de intellectu eius. Et ita simitas erit quoddam dictum ex duobus, in quantum significat «hoc in hoc,» idest determinatum accidens in determinato subiecto.”

<sup>24</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b20–21): “nec concauitas nec simitas est passio nasi secundum accidens, sicut album inest Calliae et homini per accidens, in quantum Callias est albus, cui accidit hominem esse.”

<sup>25</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b19–20): “Sed simum est passio nasi secundum se. Naso enim in quantum huiusmodi competit esse simum.” St. Thomas reports another translation that has *aquiline* instead of *that which is concave*, “and the sense is clearer, for *nose* is posited in the definition of *aquiline*.” Ibid.: “Alia autem translatio loco eius quod est concauum, habet aquilinum. Et est planior sensus; quia in definitione aquilini ponitur nasus, sicut in definitione simi.”

<sup>26</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b21–22): “Sed sicut masculinum per se competit animali, et aequale quantitati.”

<sup>27</sup> *In Metaph.* 7, l. 4, §1344 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b22–24): “et omnia alia quaecumque secundum se dicuntur existere in aliquo, quia de omnibus est eadem ratio, et «huiusmodi sunt in quibus,» idest in quorum rationibus existit nomen eius «cuius est passio,» idest substantia.”

<sup>28</sup> *In Metaph.* 7, l. 4, §1344: “aut etiam ratio eius. Semper enim in definitionibus potest poni ratio loco nominis: sicut si dicimus quod homo est animal rationale mortale, potest poni loco nominis animalis definitio, ut dicatur quod homo est substantia animata sensibilis rationalis mortalis. Similiter si dicam quod masculus est animal potens generare in alio, possum etiam dicere quod masculus est substantia animata sensibilis potens generare in aliquo alio.”

## 18.8. Alternative Solution to the Question

ARISTOTLE concludes, from the aforesaid, that it is evident that there is definition, which is the *ratio* of *essence*, and essence itself, only of substances, as in the first solution.<sup>29</sup> Or, alternatively, there is definition and essence first and simply of substances; and of accidents, posteriorly and according to something, as in the second solution.

Thus, it is evident that coupled accidents cannot be manifested separately in the way that *white* can be manifested without positing *man* in its definition or *ratio*.<sup>30</sup> Likewise, *female* cannot be so manifested without *animal*; for *animal* must be posited in the definition of *female*, as also in the definition of *male*. Whence, it is evident that there is no true essence and definition of the aforesaid coupled accidents if no definition is by addition, as happens in the definitions of substances.

Alternatively, if there is some definition of them, since they can only be defined by addition, their definition will be diverse from that of substances.<sup>31</sup> And thus, in his conclusion ARISTOTLE hints at the solution to the proposed question: that *no definition is by addition* is true of definition insofar as it is found in substances; for the aforesaid accidents do not have a definition in this mode, but in another mode: that is, *posteriorly* (*per posterius*). It is evident, therefore, as it seems, that there is definition only of substance.<sup>32</sup> And if there is definition of the other categories, it must be by addition to a subject, as the definition of *equality* and the definition of *odd* must be taken from the definition of their subjects; for there is no definition of *odd* without *number*; nor is there a definition of *female*, which signifies some quality of *animal*, without *animal*.

---

<sup>29</sup> *In Metaph.* 7, l. 4, §1355 (cf. ARISTOTLE, *Metaphysica* Z.5, 1031a11–14): “Ultimo concludit [Philosophus] ex praedictis, quod palam est, quod definitio quae est ratio eius quod quid erat esse, et ipsum quod quid erat esse, solum est substantiarum, sicut prima solutio habebat. Vel est primo et simpliciter earum, et per posterius et secundum quid accidentium, ut in secunda solutione dicebatur.”

<sup>30</sup> *In Metaph.* 7, l. 4, §1345 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b24–26): “Et sic patet, quod non contingit separatim «ostendere,» id est notificare aliquod praedictorum accidentium quae diximus copulata, sicut contingit notificare album sine hoc quod in eius definitione sive ratione ponatur homo. Sed non contingit ita notificare femininum sine animali; quia oportet quod animal ponatur in definitione feminini sicut et in definitione masculini. Quare patet, quod non est alicuius praedictorum accidentium copulatum quod quid erat esse et definitio vera, si nulla definitio est ex additione, sicut contingit in definitionibus substantiarum.”

<sup>31</sup> *In Metaph.* 7, l. 4, §1346 (cf. ARISTOTLE, *Metaphysica* Z.5, 1030b26–27): “Aut si est aliqua definitio eorum, cum non possint nisi ex additione definiri, aliter erit definitio eorum quam substantiarum, quemadmodum diximus in solutione secunda. Et sic in hac conclusione innuit solutionem dubitationis praemissae. Quod enim dicebatur, quod nulla definitio est ex additione, verum est de definitione prout invenitur in substantiis. Sic autem praedicta accidentia non habent definitionem, sed alio modo per posterius.”

<sup>32</sup> *In Metaph.* 7, l. 4, §1350 (cf. ARISTOTLE, *Metaphysica* Z.5, 1031a1–4): “Palam est itaque, ut videtur, quod solius substantiae est definitio. Si enim esset aliorum praedicamentorum, oporteret quod esset ex additione subiecti, sicut definitio aequalitatis et definitio imparis oporteret quod sumeretur ex definitione suorum subiectorum. Non enim definitio imparis est sine numero; nec definitio feminini, quod significat quamdam qualitatem animalis, est sine animali.”

From what has been said, there will only be definition and essence, simply and priorly, of substance.<sup>33</sup> But according to something, and posteriorly, there will also be (definition and essence) of the other (categories). Substance, which has an absolute quiddity, does not depend in its quiddity upon another. An accident, on the other hand, depends on a subject, even though the subject does not pertain to the essence of the accident.

Accidents only have an (act of) being because they are in a subject (► 15.16).<sup>34</sup> Whence, their quiddity depends on a subject; and, because of this, a subject must be posited in the definition of accidents: sometimes directly (*in recto*), and sometimes indirectly (*in obliquo*).

### 18.9. Concrete vs. Abstract Definition of Accidents

A subject must be posited in the definition of an accident; for, in whatever mode the accident is signified, it has a dependency upon a subject according to its *ratio*; but diversely.<sup>35</sup>

1. An accident signified **abstractly** (*in abstracto*) conveys a relation to a subject (*importat habitudinem ad subiectum*) that begins from the accident and is terminated in the subject.<sup>36</sup> Whence, that is said (to be) **whiteness** (*albedo*) whereby something is white (*qua aliquid est album*).

Taken in this mode, the accident is considered according to its proper *ratio*; for it is in this mode that we assign in accidents a genus and a species.<sup>37</sup> Thus, when an accident is

---

<sup>33</sup> *In Metaph.* 7, l. 4, §1352 (cf. ARISTOTLE, *Metaphysica* Z.5, 1031a10–11): “Quare «sic quidem,» idest simpliciter per prius, nullius erit definitio nisi substantiae, nec etiam quod quid erat esse. «Sic autem,» idest secundum quid et posterius, erit etiam aliorum. Substantia enim quae habet quidditatem absolutam, non dependet in sua quidditate ex alio. Accidens autem dependet a subiecto, licet subiectum non sit de essentia accidentis; sicut creatura dependet a creatore et tamen creator non est de essentia creaturae, ita quod oporteat exteriorem essentiam in eius definitione poni.”

<sup>34</sup> *In Metaph.* 7, l. 4, §1352: “Accidentia vero non habent esse nisi per hoc quod insunt subiecto: et ideo eorum quidditas est dependens a subiecto: et propter hoc oportet quod subiectum in accidentis definitione ponatur, quandoque quidem in recto, quandoque vero in obliquo.”

<sup>35</sup> *In De sensu* 1, c. 5, 173–175: “Est autem considerandum quod semper oportet subiectum ponere in diffinitione accidentis, ut dicitur in VII Methaphisice, differenter tamen.” *In Peri.* 1, l. 4, 61–62: “Cum autem in diffinitione omnium accidentium oporteat poni subiectum [...]” *STh* I-II, q. 53 a. 2 ad 3: “quocumque modo significetur accidens, habet dependentiam ad subiectum secundum suam rationem, aliter tamen et aliter.” *De veritate*, q. 3 a. 7 ad 2: “accidens dupliciter potest accipi.”

<sup>36</sup> *STh* I-II, q. 53 a. 2 ad 3: “accidens significatum in abstracto, importat habitudinem ad subiectum quae incipit ab accidente, et terminatur ad subiectum, nam albedo dicitur qua aliquid est album.”

<sup>37</sup> *De veritate*, q. 3 a. 7 ad 2: “accidens [...] potest accipi. Uno modo in abstracto; et sic consideratur secundum propriam rationem; sic enim assignamus in accidentibus genus et speciem; et hoc modo subiectum non ponitur in definitione accidentis ut genus, sed ut differentia, ut cum dicitur: simitas est curvitas nasi.” *In Metaph.* 7, l. 4, §1353: “Quando vero accidens significatur per modum substantiae in abstracto, tunc subiectum ponitur in definitione eius in obliquo, ut differentia; sicut dicitur, simitas est concavitas nasi.” *STh* I-II, q. 53 a. 2 ad 3: “Et ideo in definitione accidentis abstracti non ponitur subiectum quasi prima pars definitionis, quae est genus; sed quasi secunda, quae est differentia; dicimus enim quod simitas est curvitas nasi.” *In Peri.* 1, l. 4, 62–66: “necesse est quod, si qua nomina accidens in abstracto significant, quod in eorum diffinitione ponatur accidens in recto quasi genus, et subiectum in obliquo quasi differentia, ut cum <dicitur>: «Simitas est curvitas nasi.»” *In De sensu* 1, c. 5, 176–180: “si accidens diffiniatur in abstracto, subiectum ponitur [in] loco differentie, id autem quod pertinet ad

signified abstractly, by the mode of a substance, the subject is not posited as the first part of the definition, which is the genus. Instead, the subject is posited **indirectly** (*in obliquo*) as the second part of the definition, which is the difference; and that which pertains to the essence of the accident is posited directly (*in recto*) as the genus. For example, we say that *snubness* is *a concavity of the nose*.

2. An accident signified **concretely** (*in concreto*) conveys a relation to a subject that begins from the subject and is terminated in the accident.<sup>38</sup> Whence, that is said (to be) **white** (*album*) which has whiteness (*quod habet albedinem*).

In this mode, the accident is taken insofar as it is one, with the subject, by accident (*per accidens*; ► 18.14); and neither a genus nor a species is assigned to it.<sup>39</sup> Thus, when an accident is signified concretely by the mode of an accident, the matter or subject is posited **directly** (*in recto*) as the genus, which is the first part of the definition; and the accident is posited as the difference. This is done to designate that accidents only have subsistence from the subject. For example, we say that *snub* is *a concave nose*.

It is, therefore, evident that when we say *snub nose* (i.e., when the accident is signified concretely with its proper subject), it is not necessary to take *concave nose* instead of *snub* as pertaining to its essence, but as added to its essence.<sup>40</sup> Whence, *snub* and *concave* are the same by essence (*per essentiam*); but *snub* adds over *concave* a relation to a determinate subject; and, in this way, having determined that the subject is *nose*,

---

essenciam accidentis ponitur loco generis, sicut cum dicitur: «Simitas est curvitas nasi.» *De veritate*, q. 3 a. 7 ad 2: “accidens [...] potest accipi. Uno modo in abstracto; [...] sic enim assignamus in accidentibus genus et speciem; et hoc modo subiectum non ponitur in definitione accidentis ut genus, sed ut differentia, ut cum dicitur: simitas est curvitas nasi.”

<sup>38</sup> *STh* I-II, q. 53 a. 2 ad 3: “Sed in concretis incipit habitudo a subiecto, et terminatur ad accidens, dicitur enim album quod habet albedinem.”

<sup>39</sup> *De veritate*, q. 3 a. 7 ad 2: “Alio modo possunt accipi in concreto; et sic accipiuntur secundum quod sunt unum per accidens cum subiecto; unde sic non assignantur eis nec genus nec species, et ita verum est quod subiectum ponitur ut genus in definitione accidentis.” *In Metaph.* 7, l. 4, §1353: “In recto quidem, quando accidens significatur ut accidens in concreione ad subiectum: ut cum dico, simus est nasus concavus. Tunc enim nasus ponitur in definitione simi quasi genus, ad designandum quod accidentia non habent subsistentiam, nisi ex subiecto.” *STh* I-II, q. 53 a. 2 ad 3: “Propter quod in definitione huiusmodi accidentis ponitur subiectum tanquam genus, quod est prima pars definitionis, dicimus enim quod simum est nasus curvus.” *In Peri.* 1, l. 4, 67–70: “si qua uero nomina accidens significant in concreto, in eorum diffinitione ponitur materia uel subiectum quasi genus, et accidens quasi differentia, ut cum dicitur: «Simum est nasus curuus.»” *In De sensu* 1, c. 5, 180–182: “cum autem accidens diffinitur in concreto, e conuerso subiectum ponitur loco generis, sicut cum dicitur: «Simus est nasus curuus.»” *De veritate*, q. 3 a. 7 ad 2: “Alio modo possunt accipi in concreto; et sic accipiuntur secundum quod sunt unum per accidens cum subiecto; unde sic non assignantur eis nec genus nec species, et ita verum est quod subiectum ponitur ut genus in definitione accidentis.”

<sup>40</sup> *In Metaph.* 7, l. 4, §1354: “Patet igitur quod cum dico, nasum simum, non oportet loco simi accipere nasum concavum; quia nasus non ponitur in definitione simi, quasi sit de essentia eius; sed quasi additum essentiae. Unde simum et concavum per essentiam idem sunt. Sed simum addit supra concavum, habitudinem ad determinatum subiectum: et sic determinato subiecto quod est nasus, nihil differt simus a concavo; nec oportet aliquid loco simi ponere nisi concavum: et sic non erit dicere loco eius, nasus concavus, sed solum concavus.”

*snub* differs in nothing from *concave*; and it is not necessary to posit something instead of *snub* other than *concave*. Thus, there will be no need to say, “concave nose” in its stead, but only “concave.”

### 18.10. Accidents Have Essence and Definition *Posteriorly*

We can, therefore, say that *essence* and *definition* is said in multiple modes, such that *essence* (*quod quid est* = τὸ τί ἐστίν) itself signifies:<sup>41</sup>

1. **Substance and *this something*** (*substantiam et hoc aliquid* = οὐσίαν καὶ τὸ τὸδε τι).<sup>42</sup>

2. **Each of the other categories** (*singula aliorum praedicamentorum* = ἕκαστον τῶν κατηγορουμένων), such as *quality*, *quantity*, and the others.<sup>43</sup>

(As already explained), ARISTOTLE proves that definition and essence pertain first and simply to substances; but not only to substances, since also accidents have—in some mode—definition and essence—though not first.<sup>44</sup>

Thus, *being* is predicated of all categories, but not likewise (► 30.14).<sup>45</sup> (It is predicated) **first** (*primum*) of *substance* and **posteriorly** (*per posterius*) of the other categories. And in the same way, *essence* simply (*simpliciter*) befits (*convenit*) substance. But (it befits) the other (categories) in another mode: that is, according to something (*secundum quid*).

### 18.11. Accidents Have Essence and Definition *According to Something*

That essence befits the other (categories) in some mode—that is, according to something—is evident, because in each of the categories something is responded to the question posed by “what?”<sup>46</sup> Thus, we ask of a qualified (thing) or quality (*de quali sive*

---

<sup>41</sup> *In Metaph.* 7, l. 4, §1331: “aut oportet secundum alium modum solvendi dicere, quod definitio dicitur multipliciter sicut et quod quid est. Ipsum enim quod quid est, uno modo significat [...]. Alio modo significat [...].” Cf. ARISTOTLE, *Metaphysica* Z.4, 1030a17–19: “ἢ καὶ ὁ ὀρισμὸς ὡσπερ καὶ τὸ τί ἐστὶ πλεοναχῶς λέγεται· καὶ γὰρ τὸ τί ἐστὶν ἓνα μὲν τρόπον σημαίνει [...], ἄλλον δὲ [...].”

<sup>42</sup> *In Metaph.* 7, l. 4, §1331 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a18–19): “Ipsium enim quod quid est, uno modo significat substantiam et hoc aliquid.”

<sup>43</sup> *In Metaph.* 7, l. 4, §1331 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a19–20): “Alio modo significat singula aliorum praedicamentorum, sicut qualitatem et quantitatem et alia huiusmodi talia.”

<sup>44</sup> *In Metaph.* 7, l. 4, §1339 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b4–7): “Probat [Philosophus] secundo positam solutionem, dicens, illud palam esse quod definitio et quod quid erat esse, primo et simpliciter est substantiarum, non tamen solum et substantiarum, cum etiam accidentia aliquo modo habeant definitionem et quod quid erat esse, non tamen primum.”

<sup>45</sup> *In Metaph.* 7, l. 4, §1331: “Sicut autem ens praedicatur de omnibus praedicamentis, non autem similiter, sed primum de substantia, et per posterius de aliis praedicamentis, ita et quod quid est, simpliciter convenit substantiae, aliis autem alio modo, idest secundum quid.” Cf. ARISTOTLE, *Metaphysica* Z.4, 1030a21–23: “ὡσπερ γὰρ καὶ τὸ ἔστιν ὑπάρχει πᾶσιν, ἀλλ’ οὐχ ὁμοίως ἀλλὰ τῷ μὲν πρῶτως τοῖς ὀ ἐπομένως, οὕτω καὶ τὸ τί ἐστὶν ἀπλῶς μὲν τῇ οὐσίᾳ πῶς δὲ τοῖς ἄλλοις.”

<sup>46</sup> *In Metaph.* 7, l. 4, §1332 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a23–24): “Quod enim aliquo modo, idest secundum quid aliis conveniat quid est, ex hoc patet, quod in singulis praedicamentis respondetur aliquid ad quaestionem factam per quid. Interrogamus enim de quali sive qualitate quid est, sicut quid

*qualitate*) what it is (*quid est*). For example, “what is whiteness?” And we respond that (whiteness) is a color. Whence, it is evident that quality is counted among those (things) in which there is essence.

In quality, however, the *what-is* (*quid est*, i.e., essence) is not (found) simply: rather, (what is found is) the *what-is of quality* (*quid est qualitatis*).<sup>47</sup> When we ask, “what is man?” and one responds, “an animal,” this *animal*, since it is in the genus of substance, not only says *what* man is, but also absolutely signifies a *what*, i.e., a *substance*. On the other hand, when we ask, “what is whiteness?” and one responds, “a color,” although (*color*) signifies *what* whiteness is, it does not signify a *what* absolutely, but a *how*. And thus, quality does not have a *what* simply, but according to something; for a *what* is found in quality in such a mode as when we say that color is *the what* of whiteness. And this *what* is more a *substantial* (i.e., something pertaining to substance) than a *substance*.

All other categories have the *ratio* of *being* from *substance*.<sup>48</sup> Hence, the mode of entity of substance—i.e., *to be a what* (*esse quid*)—is participated according to some likeness of proportion in all other categories (► 33.1). For example, just as we say that *animal* is *the what* of *man*, so *color* (is *the what*) of *whiteness*, and *number* (is *the what*) of *two*; and thus, we say that quality has a *what* not simply, but of *this*. Just as some say, speaking logically of non-being, “non-being is,” not because non-being simply is, but because non-being is non-being, so, too, quality does not have a *what* simply, but *the what of quality*.

### 18.12. Analogical Predication of *Essence* and *Definition*

ARISTOTLE shows in what mode *essence* and *definition* are predicated of that which is found in substances and accidents.<sup>49</sup> He says that, because definition and essence is

---

est albedo, et respondemus quod est color. Unde patet, quod qualitas est de numero eorum, in quibus est quod quid est.”

<sup>47</sup> *In Metaph.* 7, l. 4, §1333 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a24–25): “Non tamen simpliciter in qualitate est quid est, sed quid est qualitatis. Cum enim quaero quid est homo, et respondetur, animal; ly animal, quia est in genere substantiae, non solum dicit quid est homo, sed etiam absolute significat quid, id est substantiam. Sed cum quaeritur quid est albedo, et respondetur, color, licet significet quid est albedo, non tamen absolute significat quid, sed quale. Et ideo qualitas non habet quid simpliciter, sed secundum quid. Invenitur enim in qualitate quid huiusmodi, ut cum dicimus quod color est quid albedinis. Et hoc quid, magis est substantiale quam substantia.”

<sup>48</sup> *In Metaph.* 7, l. 4, §1334 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a25–27): “Propter hoc enim quod omnia alia praedicamenta habent rationem entis a substantia, ideo modus entitatis substantiae, scilicet esse quid, participatur secundum quamdam similitudinem proportionis in omnibus aliis praedicamentis; ut dicamus, quod sicut animal est quid hominis, ita color albedinis, et numerus dualitatis; et ita dicimus qualitatem habere quid non simpliciter, sed huius. Sicut aliqui dicunt logice de non ente loquentes, non ens est, non quia non ens sit simpliciter, sed quia non ens est non ens. Et simpliciter qualitas non habet quid simpliciter, sed quid qualitatis.”

<sup>49</sup> *In Metaph.* 7, l. 4, §1335 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a27–28): “Ostendit [Philosophus] quomodo quod quid est et definitio praedicetur de eo quod invenitur in substantiis et accidentibus; et dicit, quod ex quo definitio et quod quid est invenitur aliquo modo in accidentibus et in substantia, oportet igitur intendere ad considerandum quomodo oportet «dicere,» id est praedicare definitionem circa

found—in some mode—in accidents and in substance, it is therefore necessary to intend to consider in what mode *definition* must be predicated of each: not, however, more than in what mode they are had (*quomodo se habent* < τὸ πῶς ἔχει). (He says this), evidently, so that we do not say that those (things) of which the *ratio* is not one *in being* (*in essendo*) are predicated univocally (► 14.5).

Now, what has been said of *definition* and *essence* in substance and in accidents is manifest: i.e., that essence—first and simply—is in (*inest*) substance; and in other (categories), consequently (► 18.5).<sup>50</sup> Not indeed in such a way that *essence simply* would be in other (categories), but *the essence of quantity* or (*the essence*) of *quality* (► 18.11).

Hence, it is manifest that *definition* and *essence* must be predicated either **(a) equivocally** (*aequivoce* = ὁμωνύμως) in substance and in accidents; or **(b) by adding and removing** (*addentes et auferentes* = προστιθέντας καὶ ἀφαιροῦντας), according to more and less (*secundum magis et minus*), or according to prior and posterior (*secundum prius et posterius*): e.g., as *being* is said of *substance* and of *accident*; and as we say that the non-knowable (*non scibile* = μὴ ἐπιστητόν) is knowable according to something (*scibile secundum quid*): that is, posteriorly (*per posterius*); for we can know of the non-knowable that it is not known; and likewise, we can say of non-being that it is not.<sup>51</sup>

What is right (*rectum* = ὀρθόν) is for *essence* and *definition* to be said of substance and of accidents neither equivocally nor simply and univocally, but as *medical* (*medicabile* = ἰατρικόν) is said of diverse particulars in respect of one and the same (*per respectum ad unum et idem* = πρὸς τὸ αὐτὸ... καὶ ἓν); yet, it neither signifies one and the same of all those of which they are said; nor is it said equivocally.<sup>52</sup> Thus, (1) a body (*corpus* = σῶμα) is said (to be) *medical* because it is the subject of (the art of) medicine; (2) an operation (*opus* = ἔργον), e.g., a purgation, (is said to be) *medical* because it is exerted by (the art

---

singula; non tamen magis quam quomodo se habent; ut videlicet, non ea dicamus univoce praedicari quorum non est una ratio in essendo.”

<sup>50</sup> *In Metaph.* 7, l. 4, §1336 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a28–32): “Quapropter id quod dictum est de definitione et quod quid est in substantia et accidentibus, est manifestum: scilicet quod quid erat esse primo et simpliciter inest substantiae, et consequenter aliis: non quidem ita quod in aliis sit simpliciter quod quid erat esse, sed «quod quid erat esse huic vel illi,» scilicet quantitati vel qualitati.”

<sup>51</sup> *In Metaph.* 7, l. 4, §1336 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a32–34): “Manifestum est enim quod oportet definitionem et quod quid est vel aequivoce praedicari in substantia et accidentibus, vel addentes et auferentes secundum magis et minus, sive secundum prius et posterius, ut ens dicitur de substantia et accidente. Et sicut dicimus, quod «non scibile est scibile secundum quid,» idest per posterius, quia de non scibili hoc scire possumus quod non scitur; sic et de non ente hoc dicere possumus, quia non est.”

<sup>52</sup> *In Metaph.* 7, l. 4, §1337 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030a34–b2): “Non enim est rectum quod quod quid est et definitio dicatur de substantia et de accidentibus, neque aequivoce, neque simpliciter et eodem modo, idest univoce. Sed sicut medicabile dicitur de diversis particularibus per respectum ad unum et idem, non tamen significat unum et idem de omnibus de quibus dicitur, nec etiam dicitur aequivoce. Dicitur enim corpus medicabile, quia est subiectum medicinae; et opus medicabile, quia exercetur a medicina, ut purgatio et vas medicinale, quia eo utitur medicina, ut clystere.”

of) medicine; and (3) a vessel (*vas* = σκεῦος), e.g., a syringe, (is said to be) *medical* because it is used in (the art of) medicine.

Thus, it is evident that *medical* is not said altogether equivocally of these three; for, in equivocal (things), no respect is had to something *one*.<sup>53</sup> Nor is it said univocally, according to one *ratio*; for the *ratio* (of *medical*) is not the same insofar as *that which is used in medicine* and *that which medicine does* is said (to be) *medical*. Rather, (*medical*) is said *analogically* (*analogice*) in respect of one (*per respectum ad unum* = πρὸς ἓν): namely, (in respect) of (the art of) *medicine*.

Likewise, *essence* or *definition* is said neither equivocally nor univocally of substance and accident, but **(analogically) in respect of one** (►20); for it is said of accident in respect of substance.<sup>54</sup>

### 18.13. Certitude (Precision) in Definition

If coupled accidents have terms—i.e., some *ratios*—, they must have terms in some mode other than (that mode in which) definitions (have terms); or (else) definition and essence, which is what is signified by the definition, are said in multiple modes (*multipliciter* = πολλαχῶς; ►18.10).<sup>55</sup> Indeed, the *ratios* of accidents are not said with **certitude** (*certitudinaliter* = ἀκριβῶς, i.e., with precision), as those that are said univocally: rather, they are said according to prior and posterior (*secundum prius et posterius*).

### 18.14. A Definition Signifies (Something) One

Not every *ratio* by which a name is expounded (*exponitur*) is the same as a definition; nor is the name expounded by whatever *ratio* always a (name of a thing) defined.<sup>56</sup> Rather, it

---

<sup>53</sup> In *Metaph.* 7, l. 4, §1337 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b2–3): “Et sic patet quod non dicitur omnino aequivoce medicinale de his tribus, cum in aequivocis non habeatur respectus ad aliquod unum. Nec iterum univoce dicitur secundum unam rationem. Non enim est eadem ratio secundum quam dicitur medicinale id quo utitur medicina, et quod facit medicinam. Sed dicitur analogice per respectum ad unum, scilicet ad medicinam. Et similiter quod quid est et definitio, non dicitur nec aequivoce nec univoce, de substantia et accidente, sed per respectum ad unum. Dicitur enim de accidente in respectu ad substantiam, ut dictum est.”

<sup>54</sup> In *Metaph.* 7, l. 4, §1337: “Et similiter quod quid est et definitio, non dicitur nec aequivoce nec univoce, de substantia et accidente, sed per respectum ad unum. Dicitur enim de accidente in respectu ad substantiam, ut dictum est.”

<sup>55</sup> In *Metaph.* 7, l. 4, §1351 (cf. ARISTOTLE, *Metaphysica* Z.5, 1031a6–10): “Solvit [Philosophus] praemissam quaestionem; dicens, quod moventem praedictam quaestionem latet, quod rationes, non dicuntur «certe,» idest certitudinaliter, quasi ea quae dicuntur univoce, sed dicuntur secundum prius et posterius, ut supra dictum est. Si autem praedicta accidentia copulata habent terminos, idest rationes aliquas, oportet quod alio modo sint illi termini quam definitiones: aut quod definitio et quod quid erat esse, quod significatur per definitionem, dicatur multipliciter.”

<sup>56</sup> In *Metaph.* 7, l. 4, §1339 (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b7–9): “Et hoc sic patet. Non enim omnis ratio, qua nomen per rationem exponitur, idem est quod definitio; nec nomen expositum per quamcumque rationem, semper est definitum; sed alicui determinatae rationi competit quod sit definitio; illi scilicet quae significat unum. Si enim dicam quod Socrates est albus et musicus et crispus, ista ratio non significat unum, sed multa, nisi forte per accidens, et ideo talis ratio non est definitio.”

befits some determinate *ratio* to be a definition: i.e., that (*ratio*) which signifies (*something*) *one*. Thus, if one says that Socrates is *white*, *musical*, and *curly-headed*, this *ratio* does not signify (*something*) *one*—except perhaps by accident (► 17.9; 38.17)—, but *many*. Hence, such a *ratio* is not a definition.

However, it would not suffice for there to be a definition if that which is signified by the *ratio* is (something) *one* in continuity (*in continuitate* < τῷ συνεχεῖ; ► 38.5, ¶1; 39); for the *Iliad*—i.e., the poem about the Trojan war—would then be a definition (just) because that war was carried out in some continuity of time.<sup>57</sup>

Nor would it suffice (for there to be a definition) if (that which is signified by the *ratio*) is (something) *one* by binding (*per colligationem* < συνδέσμῳ).<sup>58</sup> For example, if we should say, “a house is stones, cement, and wood,” this *ratio* would not be a definition of *house*.

The *ratio* that signifies (something) *one* will be a definition if it signifies something *one* according those modes in which *one* is said by itself (*per se*; ► 17.3; 38.4); for *one* is said in multiple modes (► 38), like *being* (*ens*; ► 30), too: and *this being* signifies *this something* (i.e., substance); another (*being* signifies) *quantity*; another (*being* signifies) *quality*; and so on in the other (categories signified by *being*).<sup>59</sup> Yet, (*being* signifies) substance priorly (*per prius*); and consequently (*consequenter*), the other (categories). Therefore, *one* will simply be priorly in substance; and posteriorly (*per posterius*), in the other (categories).

If it pertains to the *ratio* of *definition* to signify (something) *one*, it follows that the *ratio* of *white man* will be a definition, since *white man* is in some mode (something) *one*.<sup>60</sup> But the *ratio* of *white* will be a definition in a mode other than (that of) the *ratio* of *substance*, since the *ratio* of *substance* will be a definition priorly (*per prius*), while the *ratio* of *white* (will be a definition) posteriorly (*per posterius*), just as *one* is said of them according to prior and posterior (*per prius et posterius*).

---

<sup>57</sup> *In Metaph. 7, l. 4, §1340* (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b9): “Non tamen sufficit quod sit unum in continuitate illud quod per rationem significatur, ad hoc quod sit definitio. Sic enim «Ilias,» idest poema de bello Troiano esset definitio, quia illud bellum in quadam continuitate temporis est peractum.”

<sup>58</sup> *In Metaph. 7, l. 4, §1340* (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b9–10): “Aut etiam non sufficit quod sit unum per colligationem; sicut haec ratio non esset definitio domus, si dicerem, quod domus est lapides et cementum et ligna.”

<sup>59</sup> *In Metaph. 7, l. 4, §1340* (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b10–12): “Sed tunc ratio significans unum erit definitio, si significet unum aliquod illorum modorum, quorum quoties unum per se dicitur. Unum enim dicitur multipliciter sicut et ens. Ens autem hoc quidem significat hoc aliquid, aliud quantitatem, aliud qualitatem, et sic de aliis; et tamen per prius substantiam et consequenter alia. Ergo simpliciter unum per prius erit in substantia, et per posterius in aliis.”

<sup>60</sup> *In Metaph. 7, l. 4, §1341* (cf. ARISTOTLE, *Metaphysica* Z.4, 1030b12–13): “Si igitur ad rationem definitionis pertinet quod significet unum, sequitur quod erit ratio albi hominis definitio, quia albus homo est quodammodo unum. Sed alio modo erit definitio ratio albi, et ratio substantiae; quia ratio substantiae erit definitio per prius, ratio albi per posterius, sicut unum per prius et posterius de utroque dicitur.”

### 18.15. Metaphysical Unity of Substance and of Accident

What is caused (*efficitur*) from an accident and a subject is not (something) *one by itself* (*per se*; ►17.3; 38.4), but *one by accident* (*unum per accidens*; ►38; 38.17).<sup>61</sup> Hence, from their conjunction does not result some essence as from the conjunction of (substantial) form and (first) matter (►15.14).

On account of this, an accident neither has a complete *ratio* of essence nor is it a part of a complete essence: rather, just as it is a being according to something (*est ens secundum quid*), so, too, it has an essence according to something (*essentiam secundum quid habet*; ►18.11).<sup>62</sup>

Since essence is that which is signified by the definition, accidents must have an essence in the same mode that they have a definition.<sup>63</sup> And accidents have an incomplete definition because they can only be defined if a subject is posited in their definition.

(Accidents can only be defined if a subject is posited in their definition) because they do not have by themselves an absolute (act of) being from their subject (*non habent per se esse absolutum a subiecto*).<sup>64</sup> Just as a substantial (act of) being (*esse substantiale*) results (*relinquitur*) from (substantial) form and (first) matter when they are composed (►15.14), so from accident and subject results an accidental (act of) being (*esse accidentale*) when an accident happens to (*advenit*) a subject.

Likewise, neither substantial form nor (first) matter have a complete essence; for, even in the definition of a substantial form, that of which the form is (i.e., its proper matter) must be posited.<sup>65</sup> Hence its definition is *by addition to something which is outside its genus* (i.e., insofar as substantial form and matter are causes in diverse genera; ►9.2), as is the definition of an accidental form. Whence, also in the definition of *soul* (i.e., *the first act of*

---

<sup>61</sup> *De ente*, c. 6, 42–46: “Vnde ex accidente et subiecto non efficitur unum per se sed unum per accidens. Et ideo ex eorum coniunctione non resultat essentia quedam sicut ex coniunctione forme ad materiam.”

<sup>62</sup> *De ente*, c. 6, 46–49: “propter quod accidens neque rationem complete essentie habet neque pars complete essentie est, sed sicut est ens secundum quid, ita et essentiam secundum quid habet.”

<sup>63</sup> *De ente*, c. 6, 3–8: “quia, ut dictum est, essentia est id quod per diffinitionem significatur, oportet ut eo modo habeant essentiam quo habent diffinitionem. Diffinitionem autem habent incompletam, quia non possunt diffiniri nisi ponatur subiectum in eorum diffinitione.”

<sup>64</sup> *De ente*, c. 6, 8–13: “quia, ut dictum est, essentia est id quod per diffinitionem significatur, oportet ut eo modo habeant essentiam quo habent diffinitionem. Diffinitionem autem habent incompletam, quia non possunt diffiniri nisi ponatur subiectum in eorum diffinitione; et hoc ideo est quia non habent esse per se absolutum a subiecto, sed sicut ex forma et materia relinquitur esse substantiale quando componuntur, ita ex accidente et subiecto relinquitur esse accidentale quando accidens subiecto aduenit.”

<sup>65</sup> *De ente*, c. 6, 13–22: “Et ideo etiam nec forma substantialis completam essentiam habet nec materia, quia etiam in diffinitione forme substantialis oportet quod ponatur illud cuius est forma, et ita diffinitio eius est per additionem alicuius quod est extra genus eius sicut et diffinitio forme accidentalis; unde et in diffinitione anime ponitur corpus a naturali qui considerat animam solum in quantum est forma phisici corporis.”

a physical body that has life in potency),<sup>66</sup> body is posited by the natural (scientist), who considers the soul only insofar as it is the form of a physical body.

### 18.16. Genus in Accidents

*Genus*, *difference*, and *species* are not taken in the same mode in accidents as (they are) in substances.<sup>67</sup> In substances, (something) *one* is caused (*efficitur*) from a substantial form and (its corresponding) matter: one nature (of) some (kind) that results from their conjunction, (and) that is properly placed in the category of substance. Thus, in substances, concrete names that signify the composite are properly said to be in a genus as species or genera: for example, *man* (i.e., a species), and *animal* (i.e., a genus). But in this mode, form—like matter—is in a category only by reduction, as principles are said to be in a genus (► 29.10).

On the other hand, (something) *one* by itself (*unum per se*) does not come to be from an accident and a subject.<sup>68</sup> Whence, from their conjunction does not result some nature to which the intention of *genus* or *species* could be attributed. Wherefrom, accidental names concretely said—e.g., *white*, *musical*—are posited in a category as species or genera only by reduction; but only insofar as they are signified abstractly: e.g., *whiteness*, *music*.

Since accidents are not composed from matter and form, in them a genus cannot be taken from matter, or a difference (taken) from form, as in composite substances.<sup>69</sup> Instead, the first genus must be taken from the mode of being itself, insofar as *being* (*ens*) is diversely said—according to prior and posterior—of the ten genera of categories. For example, quantity is said (to be a *being*) because it is a *measure of substance*; quality (is said to be a *being*) insofar as it is a *disposition of substance*; and so on of the other (categories).

---

<sup>66</sup> See ARISTOTLE, *De anima* B.1, 412a27–28: “ἡ ψυχὴ ἐστὶν ἐντελέχεια ἢ πρώτη σώματος φυσικοῦ δυνάμει ζῶντων ἔχοντος.” Cf. *In De anima* 2, c. 1, 314–315: “actus primus corporis phisici potencia uitam habentis.”

<sup>67</sup> *De ente*, c. 6, 109–111: “Sciendum est etiam quod in accidentibus modo alio sumitur genus, differentia et species quam in substantiis. Quia enim in substantiis ex forma substantiali et materia efficitur per se unum, una quadam natura ex earum coniunctione resultante que proprie in predicamento substantie collocatur, ideo in substantiis nomina concreta que compositum significant proprie in genere esse dicuntur, sicut species uel genera, ut homo uel animal. Non autem forma uel materia est hoc modo in predicamento nisi per reductionem, sicut principia in genere esse dicuntur.”

<sup>68</sup> *De ente*, c. 6, 120–128: “Sed ex accidente et subiecto non fit unum per se; unde non resultat ex eorum coniunctione aliqua natura cui intentio generis uel speciei possit attribui. Vnde nomina accidentalium concretie dicta non ponuntur in predicamento sicut species uel genera, ut album uel musicum, nisi per reductionem, sed solum secundum quod in abstracto significantur, ut albedo et musica.”

<sup>69</sup> *De ente*, c. 6, 128–138: “Et quia accidentia non componuntur ex materia et forma, ideo non potest in eis sumi genus a materia et differentia a forma sicut in substantiis compositis; sed oportet ut genus primum sumatur ex ipso modo essendi, secundum quod ens diuersimode secundum prius et posterius dicitur de decem generibus predicamentorum, sicut dicitur quantitas ex eo quod est mensura substantie et qualitas secundum quod est dispositio substantie, et sic de aliis, secundum Philosophum in IX Methaphisice.”

Differences in accidents are taken from the diversity of principles from which they are caused.<sup>70</sup> Proper affections are caused from the proper principles of the subject. Hence, if (accidents) are defined abstractly (► 18.9), a subject is posited in their definition instead of differences insofar as they are in a genus properly. For example, snubness is said to be *a curvedness of the nose*.

It is conversely if their definition is taken insofar as they are said concretely (► 18.9).<sup>71</sup> In this way, a subject would be posited in their definition as the genus; for, then, they would be defined by the mode of composite substances, in which the *ratio* of *genus* is taken from matter, as we say that snub is *a curved nose*.

It is likewise when an accident is a principle of another accident, as the principle of relation is action and affection, and quantity.<sup>72</sup> Hence, ARISTOTLE divides *relation* according to these (► 37.1). But, because the proper principles of accidents are not always manifest, we sometimes take the differences of accidents from their effects, as *congregative* and *segregative* are said to be differences in colors that are caused from abundance or paucity of light, from which the diverse species of colors are caused.

### 18.17. Removal of Differences in Definitions: Substance vs. Accident

(As just discussed), the mode in which accidents are defined is other than the mode in which substances are defined; for substances are not defined through something that should be outside their essence.<sup>73</sup> Whence, that which is posited first in the definition of a substance is a genus, in which is predicated the *what* (*quid*, i.e., the essence) of the (thing) defined. An accident, on the other hand, is defined through something that is outside its essence: i.e., through (its) subject, upon which it depends according to its being

---

<sup>70</sup> *De ente*, c. 6, 139–152: “Differentie uero in eis [sc., in accidentibus] sumuntur ex diuersitate principiorum ex quibus causantur. Et quia proprie passiones ex propriis principiis subiecti causantur, ideo subiectum ponitur in diffinitione eorum loco differentie si in abstracto diffiniuntur, secundum quod sunt proprie in genere, sicut dicitur quod simitas est curuitas nasi.”

<sup>71</sup> *De ente*, c. 6, 139–145: “Sed e conuerso esset si eorum diffinitio sumeretur secundum quod concretiue dicuntur; sic enim subiectum in eorum diffinitione poneretur sicut genus, quia tunc diffinirentur per modum substantiarum compositarum in quibus ratio generis sumitur a materia, sicut dicimus quod simum est nasus curuus.”

<sup>72</sup> *De ente*, c. 6, 145–162: “Similiter etiam est si unum accidens alterius accidentis principium sit, sicut principium relationis est actio et passio et quantitas; et ideo secundum hec diuidit Philosophus relationem in V Methaphisice. Sed quia propria principia accidentium non semper sunt manifesta, ideo quandoque sumimus differentias accidentium ex eorum effectibus, sicut congregatiuum et disgregatiuum dicuntur differentie coloris que causantur ex habundantia uel paucitate lucis, ex quo diuerse species coloris causantur.”

<sup>73</sup> *De potentia*, q. 8 a. 4 ad 5: “alius est modus quo definiuntur accidentia, et quo definiuntur substantiae. Substantiae enim non definiuntur per aliquid quod sit extra essentiam eorum: unde id quod primo ponitur in definitione substantiae est genus, quod praedicatur in eo quod quid de definito. Accidens uero definitur per aliquid quod est extra essentiam eius, scilicet per subiectum, a quo secundum suum esse dependet. Unde id quod ponitur in definitione eius, loco generis, est subiectum; sicut cum dicitur: simum est nasus curuus.”

(*secundum suum esse*). Whence, that which is posited in its definition, instead of a genus, is a subject: for example, when we say, “snub is a curved nose” (i.e., where the subject is *nose*, and the difference is *curved*).

Therefore, just as the genus remains in the definitions of substances when differences are removed, so, when the accident—which is posited instead of a difference—is removed from the definition of an accident, the subject remains.<sup>74</sup> But (this happens) diversely:

1. When the difference is removed (in the definition of a substance), the genus remains, but *not the same in number*.<sup>75</sup> For example, when *rational* is removed (from the definition of man, *rational animal*), the *animal* that is a rational animal does not remain the same in number.

2. When that which is posited instead of a difference in the definitions of accidents is removed, the subject remains *the same in number*.<sup>76</sup> For example, when *curved* or *concave* is removed, *nose* remains the same in number.

This is so because the accident does not complete the essence of the subject like the difference completes the essence of the genus.<sup>77</sup>

### 18.18. Definition of Natural and of Mathematical Things Compared

There are some (things) whose (act of) being (*esse*) depends on matter and cannot be defined without matter.<sup>78</sup> And there are some (things) that, even though they can only be in sensible matter, however, sensible matter does not fall in their definition. The former (things) differ from the latter as *snub* (differs from) *curved* or *concave*.

The snub is in sensible matter; and it is necessary for sensible matter to fall in its definition, since snub is *a curved or concave nose*.<sup>79</sup> All natural (things) are such: e.g., man, stone.

---

<sup>74</sup> *De potentia*, q. 8 a. 4 ad 5: “Sicut ergo in definitionibus substantiarum, remotis differentiis, remanet genus; ita in definitione accidentium, remoto accidente, quod ponitur loco differentiae, remanet subiectum; aliter tamen et aliter.”

<sup>75</sup> *De potentia*, q. 8 a. 4 ad 5: “Remota enim differentia remanet genus, sed non idem numero: remoto enim rationali, non remanet idem numero animal, quod est animal rationale.”

<sup>76</sup> *De potentia*, q. 8 a. 4 ad 5: “sed remoto eo quod ponitur loco differentiae in definitionibus accidentium, remanet idem subiectum numero: remoto enim curvo vel concavo, remanet idem nasus numero.”

<sup>77</sup> *De potentia*, q. 8 a. 4 ad 5: “Et hoc est, quia accidens non complet essentiam subiecti sicut differentia complet essentiam generis.”

<sup>78</sup> *In Metaph.* 6, l. 1, §1157 (cf. ARISTOTLE, *Metaphysica* E.1, 1025b28–34): “Sciendum est autem, quod eorum quae diffiniuntur, quaedam definiuntur sicut definitur simum, quaedam sicut definitur concavum; et haec duo differunt.” *In Physic.* 1, l. 1, n. 2: “Sciendum est igitur quod quaedam sunt quorum esse dependet a materia, nec sine materia definiri possunt: quaedam vero sunt quae licet esse non possint nisi in materia sensibili, in eorum tamen definitione materia sensibilis non cadit. Et haec differunt ad invicem sicut curvum et simum.”

<sup>79</sup> *In Metaph.* 6, l. 1, §1157: “definitio simi est accepta cum materia sensibili. Simum enim nihil aliud est quam nasus curvus vel concavus.” *In Physic.* 1, l. 1, n. 2: “Nam simum est in materia sensibili, et necesse

On the other hand, the curved or concave, even if it can only be in sensible matter, however, sensible matter does not fall in its definition; for concave is *that whose mean stands out from its extremes (cuius medium exit ab extremis)*.<sup>80</sup> And such are all mathematical (things): e.g., numbers, magnitudes, and figures.

Thus, in mathematical (things), whose *ratio* abstracts from sensible matter, *straight* is related (to its matter) as *snub* (is related to its matter).<sup>81</sup> That is, mathematical (things) have matter as do natural (things); for *straight* is (something) mathematical, while *snub* is (something natural); and the *ratio* of *straight* is with (the matter) *continuum*, just as the *ratio* of *snub* is with (the matter) *nose*. Hence, the continuum is intelligible matter, while the nose is sensible matter (► 13.13). And it is manifest that, in mathematical (things), the thing is other than the essence (of the thing), as *the straight* and *to be straight*.

Indeed, as ARISTOTLE says, in all those things that exist by nature or by art, the form itself considered in itself is diverse, according to our consideration, from the same form insofar as it is taken as it is conjoined with matter.<sup>82</sup>

For example, in mathematical (things), in which this is more manifest because sensible matter is not posited in their *ratio* according to our consideration, the species itself of sphere is other than the form of sphere in sensible matter insofar as it is signified when *golden* or *bronze sphere* is said.<sup>83</sup> Likewise, the form itself of circle is other than what is said (to be a) *golden* or *bronze circle*. ARISTOTLE manifests this because, when we say

---

est quod in eius definitione cadat materia sensibilis, est enim simum nasus curvus; et talia sunt omnia naturalia, ut homo, lapis.”

<sup>80</sup> *In Metaph.* 6, l. 1, §1157: “Sed concavitas definitur sine materia sensibili. Non enim ponitur in definitione concavi vel curvi aliquod corpus sensibile, ut ignis aut aqua, aut aliquod corpus huiusmodi. Dicitur enim concavum, cuius medium exit ab extremis.” *In Physic.* 1, l. 1, n. 2: “curvum vero, licet esse non possit nisi in materia sensibili, tamen in eius definitione materia sensibilis non cadit; et talia sunt omnia mathematica, ut numeri, magnitudines et figurae.”

<sup>81</sup> *In De anima* 3, c. 2, 199–204 (cf. ARISTOTLE, *De anima* Γ.4, 429b18–20): “*iterum in hiis que sunt per abstractionem, id est in mathematicis, quorum ratio abstrahit a materia sensibili, rectum se habet sicut simum, hoc est mathematica habent materiam sicut et naturalia (rectum enim mathematicum est, simum autem naturale): ratio enim recti est cum continuo sicut ratio simi cum naso; continuum autem est materia intelligibilis sicut nasus materia sensibilis. Vnde manifestum est quod aliud est in mathematicis res et quod quid erat esse, ut rectum et recto esse.*”

<sup>82</sup> *In De caelo* 1, l. 19 n. 4 (cf. ARISTOTLE, *De caelo* A.9, 277b30–33): “Dicit ergo primo quod in omnibus existentibus et *generatis*, id est factis, vel a natura vel ab arte, alterum est secundum nostram considerationem ipsa forma secundum seipsam considerata; et alterum est ipsa forma *mixta cum materia*, id est secundum quod accipitur prout est coniuncta cum materia.”

<sup>83</sup> *In De caelo* 1, l. 19 n. 4 (cf. ARISTOTLE, *De caelo* A.9, 277b33–278a4): “Et hoc primo manifestat per exemplum in mathematicis, in quibus est magis manifestum, eo quod in ratione eorum non ponitur materia sensibilis. Alterum est enim secundum considerationem nostram ipsa species sphaerae, et alterum forma sphaerae in materia sensibili, prout significatur cum dicitur aurea vel aerea sphaera: et similiter aliud est ipsa forma circuli, et aliud est quod dicitur aereus aut ligneus circulus. Et hoc manifestat quia, cum dicimus *quod quid erat esse*, id est definitivam rationem, sphaerae aut circuli, non ponimus in eius ratione aureum aut aereum; tanquam hoc quod dicimus aureum aut aereum, non sint de eorum substantia, quam scilicet significat definitio.”

the definitive *ratio* of the sphere or the circle, we do not posit *golden* or *bronze* in its *ratio*, so that golden and bronze are not of their essence, which the definition signifies.

### **18.19. Things Defined Without Matter**

There are some (things) that do not depend upon matter, neither according to (their act of) being (*secundum esse*) nor according to (their) *ratio* (*secundum rationem*), either:<sup>84</sup>

1. Because they are never in matter. For example, God and other separate substances.
2. Because they are not universally in matter. For example, substance, potency, act, and being (*ens*) itself.

---

<sup>84</sup> *In Physic.* 1, l. 1, n. 2: “Quaedam vero sunt quae non dependent a materia nec secundum esse nec secundum rationem; vel quia nunquam sunt in materia, ut Deus et aliae substantiae separatae; vel quia non universaliter sunt in materia, ut substantia, potentia et actus, et ipsum ens.”

## 19. Universal Predication

*In order to determine the diverse modes in which one is predicated of many (►20.1), we turn our attention first to how any universal is predicated of many—or of one.*

### 19.1. Enunciative Speech or Proposition

Speech is not the instrument of some power (of the mind) that operates naturally (hence, all speech is artificial and conventional, *secundum placitum* = κατὰ συνθήκην).<sup>1</sup> It is nonetheless an instrument of reason. Every instrument (►46.16) must be defined from its end, which is the use of the instrument. And the use of speech—as of every significative voice—is *to signify a conception of the intellect*.

As ARISTOTLE says, the operations of the intellect are two:<sup>2</sup>

1. The **understanding of indivisibles** (*indivisibilium intelligentia* = ἡ τῶν ἀδιαίρετων νόησις), by which the intellect apprehends the essence of any one thing in itself: for example, when it understands *man*, *ox*, or some other uncomplex (essence).<sup>3</sup>

In this operation, truth and falsehood are not found, both because uncomplex (essences) are neither true nor false, and because the intellect is not deceived in (respect of) an essence (*quod quid est*).<sup>4</sup>

2. The operation of the intellect that **composes and divides** the (essences) understood: e.g., as when the intellect composes many priorly-separated, uncomplex (essences), and makes from them one understanding.<sup>5</sup>

---

<sup>1</sup> *In Peri.* 1, l. 7, 21–28: “oratio, quamvis non sit instrumentum alicuius uirtutis naturaliter operantis, est tamen instrumentum rationis, ut supra dictum est; omne autem instrumentum oportet definiri ex suo fine, qui est usus instrumenti; usus autem orationis, sicut et omnis uocis significantiue, est significare conceptionem intellectus.” As St. Thomas explains, speech and its parts are not natural things, but some artificial effect; whence, ARISTOTLE says that speech signifies according to the human institution of reason and will, as all artificial things are also caused from human will and reason. See *In Peri.* 1, l. 6, 189–195 (cf. ARISTOTLE, *De interpretatione* 4, 17a1–2): “oratio autem et partes eius non sunt res naturales, sed quidam artificiales effectus. Et ideo subdit [Aristoteles] quod oratio significat secundum placitum, id est secundum institutionem humane rationis et uoluntatis, ut supra dictum est, sicut et omnia artificialia causantur ex humana uoluntate et ratione.”

<sup>2</sup> *In Peri.* 1, l. 7, 28–31: “operationes autem intellectus due sunt, in quarum una non inuenitur ueritas et falsitas, in alia autem inuenitur uerum uel falsum.” Ibid., l. 1, 1–36: “Sicut Philosophus dicit in III De anima, duplex est operatio intellectus: una quidem que dicitur indiuisibilium intelligencia, per quam scilicet intellectus apprehendit essenciam uniuscuiusque rei in seipsa; alia est autem operatio intellectus componentis et diuidentis.”

<sup>3</sup> *In De anima* 3, c. 5, 7–10 (cf. ARISTOTLE, *De anima* Γ.6, 430a26): “Dicit ergo [Philosophus] primo quod una operatio intellectus est secundum quod intelligit indiuisibilia, puta cum intelligit hominem aut bouem aut aliquid aliud incomplexorum.”

<sup>4</sup> *In De anima* 3, c. 5, 10–13 (cf. ARISTOTLE, *De anima* Γ.6, 430a26–27): “et hec intelligencia est in hiis circa que non est falsum, tum quia incomplexa neque sunt uera neque falsa, tum quia intellectus non decipitur in quod quid est.”

<sup>5</sup> *In De anima* 3, c. 5, 13–17 (cf. ARISTOTLE, *De anima* Γ.6, 430a27–28): “set in illis intelligibilibus in quibus falsum et uerum est, est iam quedam compositio intellectuum, id est rerum intellectarum, sicut quando

In this composition, sometimes there is truth, and sometimes falsehood.<sup>6</sup> There is truth when (the intellect) composes those (essences) that are one—or composite—in the thing (*in re*). For example, when (the intellect) composes *incommensurable* and *diameter*; for the diameter of the square is incommensurable with the side.

The composition is false when (the intellect) composes those (essences) that are not composite in the things (*in rebus*): for example, when it composes *commensurable* with *diameter*, saying that the diameter of the square is commensurable with the side.

Hence, the intellect sometimes understands *commensurable* and *diameter* separately, and then there are two understandings.<sup>7</sup> But when it composes (them), there comes to be one understandable (*intelligibile*), and it is simultaneously understood by the intellect.

Whence, ARISTOTLE defines *propositional speech* from the signification of the true and the false:<sup>8</sup> a **proposition** (*enunciatio* = ἀποφαντικὸς [λόγος]) is a *speech* (*oratio* = λόγος) in which is the true or the false (*in qua verum vel falsum est* = ἐν ᾧ τὸ ἀληθεύειν ἢ ψεύδεσθαι ὑπάρχει).

## 19.2. Division of Proposition

ARISTOTLE posits three divisions of proposition, into:<sup>9</sup>

1. **One simply** (*una simpliciter* < εἷς) and **one by conjunction** (*coniunctione una* = συνδέσμῳ εἷς, i.e. one by binding; ► 19.3).

---

ex multis fit aliquid *unum*.” Ibid., 38–39 (cf. ARISTOTLE, *De anima* Γ.6, 430a30–31): “intellectus multa incomplexa prius *separata* componit et facit ex eis unum intellectum.”

<sup>6</sup> In *De anima* 3, c. 5, 39–49 (cf. ARISTOTLE, *De anima* Γ.6, 430a31): “in qua compositione quandoque est ueritas quandoque falsitas, ueritas quidem quando componit ea que in re sunt unum uel composita, sicut cum componit *assimetron*, hoc est incommensurable, et dyametron (nam dyameter quadrati est incommensurabilis lateri), falsa autem est compositio quando componit ea que non sunt composita in rebus, sicut cum componit *symetrum* dyametro, dicens quod dyameter quadrati est symeter, id est commensurabilis lateri.”

<sup>7</sup> In *De anima* 3, c. 5, 49–53: “symetrum ergo et dyametrum aliquando separatim et seorsum intelligit intellectus et tunc sunt duo intelligibilia; quando autem componit, fit unum intelligibile et simul intelligitur ab intellectu.”

<sup>8</sup> In *Peri.* 1, l. 7, 31–40 (cf. ARISTOTLE, *De interpretatione* 4, 17a2–3): “et ideo orationem enunciatuam diffinit [Aristotiles] ex significatione ueri et falsi, dicens quod *non omnis oratio est enunciatua, set in qua uerum et falsum est*. Vbi considerandum est quod Aristotiles, mirabili breuitate usus, et diuisionem orationis innuit in hoc quod dicit: «non omnis oratio est enunciatua», et definitionem enunciationis in hoc quod dicit: «set in qua uerum uel falsum est», ut intelligatur hec esse diffinitio enunciationis: «Enunciatio est oratio in qua est uerum uel falsum».”

<sup>9</sup> In *Peri.* 1, l. 8, 6–8 (cf. ARISTOTLE, *De interpretatione* 5, 17a8–9): “Aristotiles sub breuiloquio duas diuisiones enunciationis ponit.” Ibid., l. 10, 178–180: “Prima namque fuit quod enunciationum quedam est una simpliciter, quedam coniunctione una.” Ibid., l. 8, 9–10 (cf. ARISTOTLE, *De interpretatione* 5, 17a8–9): “una [diuisio enunciationis] est quod enunciationum quedam est una simplex, quedam est coniunctione una.” Ibid., 17–18 (cf. ARISTOTLE, *De interpretatione* 5, 17a8–9): “Alia uero subdiuisio enunciationis est quod, si enunciatio sit una, aut est affirmatiua aut negatiua.” Ibid., l. 10, 183–184: “Alia uero fuit diuisio enunciationis in affirmationem et negationem.” Ibid., 177–178 (cf. ARISTOTLE, *De interpretatione* 6, 17b1–3): “Est autem hec tercia diuisio enunciationis quam Philosophus ponit.”

2. **Affirmation** (*affirmatio* = κατάφασις) and **negation** (*negatio* = ἀπόφασις; ► 19.4).

3. **Universal** (*universale* = καθόλου) and **singular** (*singulare* = καθ' ἕκαστον; ► 19.5).

### 19.3. Division of Proposition into One Simply and One by Conjunction

In things that are outside the mind, some things are *one simply*—for example, the indivisible (e.g., the unit or the point), and the continuum (e.g., insofar as it is undivided, a line is something one simply, and not one by composition, as a house; ► 13.11)—, while some things are *one by binding (colligatione)*, *by composition (compositione)* or *by order (ordine)*.<sup>10</sup> Since *being* and *one* are convertible (*ens et unum convertuntur*), it is likewise necessary that every proposition, just like every being, be equally *one*.

Hence, this (division of a proposition into *one simply* and *one by conjunction*) is the division of an analog into those of which it is predicated *according to prior and posterior (secundum prius et posterius)*; for also in this way *one* is divided into *simple* and *composite* (i.e., a simple proposition is prior to a proposition that is composed by conjunction).<sup>11</sup>

### 19.4. Affirmative vs. Negative Proposition

Since a vocal sound (*vox* = φωνή) is a sign of an understanding (*signum intellectus*), and an understanding is a sign of a thing (*signum rei*), the affirmative proposition (which is a significative vocal sound) is prior to the negative (proposition) for three reasons:<sup>12</sup>

1. From the part of *the vocal sound*, because it is simpler, since negation adds over affirmation a negative particle (e.g., *no*, *not*, *non*, etc.).

2. From the part of *the understanding*, because affirmation signifies the composition of the intellect, while negation signifies its division; and division is naturally posterior to composition (► 13.2, ¶2).

3. From the part of *the thing*, affirmation, which signifies *to be (esse)*, is prior to negation, which signifies *not to be (non esse)*, just as habit is naturally prior to privation (► 42.11).

---

<sup>10</sup> *In Peri.* 1, l. 8, 11–16: “Sicut etiam in rebus que sunt extra animam aliquid est unum simpliciter, sicut indivisibile uel continuum, aliquid est unum colligatione aut compositione aut ordine: quia enim ens et unum conuertuntur, necesse est sicut omnem rem, ita et omnem enunciationem aliquam esse unam.”

<sup>11</sup> *In Peri.* 1, l. 10, 180–183: “que quidem est diuisio analogi in ea de quibus predicatur secundum prius et posterius: sic enim unum diuiditur in simplex et compositum.”

<sup>12</sup> *In Peri.* 1, l. 8, 19–34: “Enunciatio autem affirmatiua prior est negatiua, triplici ratione, secundum tria que supra posita sunt, ubi dictum est quod <uox> est signum intellectus et intellectus est signum rei; ex parte igitur uocis, affirmatiua enunciatio est prior quia est simplicior: negatiua enim enunciatio addit supra affirmatiuam particulam negatiuam; ex parte intellectus etiam affirmatiua enunciatio, que significat compositionem intellectus, est prior negatiua, que significat diuisionem eiusdem: diuisio enim naturaliter posterior est compositione, nam non est diuisio nisi compositorum, sicut non est corruptio nisi generatorum; ex parte etiam rei, affirmatiua enunciatio, que significat esse, prior est quam negatiua, que significat non esse, sicut habitus naturaliter prior est priuatione.”

However, this is (a division) of a genus into (its) species; for it is taken *according to a difference of the predicate*, in relation to which a negation is said (*ad quod fertur negatio*).<sup>13</sup> Since the predicate is the formal part of the proposition, such a division is said to pertain to the *quality of the proposition*: that is, to an essential quality, insofar as the difference signifies something qualified (*quale quid*; i.e., *affirmative* and *negative divide proposition* in the same way that the quality *rational* and its negation *non-rational* divide *animal*; note that *quality* is from the part of the *predicate*, while *quantity* is from the part of the *subject*).

### 19.5. Universal vs. Singular Proposition

The subject of the proposition is a name, or something taken in the place of a name.<sup>14</sup> A **name** is a *vocal sound that signifies—by convention—a simple understanding* (*vox significativa ad placitum simplicis intellectus*), which is a likeness of a thing (►21.4).

Hence, ARISTOTLE distinguishes the subject by a division of things, saying that, of things (πραγμάτων), some are universals, while others are singulars; and he defines them thus:<sup>15</sup>

**1. Universal** (*universale* = καθόλου) is that which is naturally apt to be predicated of many (*quod natum est de pluribus praedicari* = ὁ ἐπὶ πλειόνων πέφυκε κατηγορεῖσθαι).<sup>16</sup>

**2. Singular** (*singulare* = καθ' ἕκαστον) is that which is not (ὁ μὴ) naturally apt to be predicated of many, but only of one (*sed de uno solo*).<sup>17</sup>

For example, *man* is universal, while *Plato* is singular.<sup>18</sup>

◀ Thus, this division is taken *according to a difference in the subject*, which is predicated of many or of only one.<sup>19</sup> Whence, it is said to pertain to the *quantity* of the proposition; for quantity too follows upon matter.

<sup>13</sup> *In Peri.* 1, l. 10, 184–191: “que quidem est [diuisio] generis in species, quia sumitur secundum differentiam predicati, ad quod fertur negatio, predicatum autem est pars formalis enunciationis; et ideo huiusmodi diuisio dicitur pertinere ad qualitatem enunciationis, qualitatem, inquam, essencialem, secundum quod differentia significat quale quid.”

<sup>14</sup> *In Peri.* 1, l. 10, 18–21: “Subiectum autem enunciationis est nomen uel aliquid sumptum loco nominis; nomen autem est uox significatiua ad placitum simplicis intellectus, quod est similitudo rei.”

<sup>15</sup> *In Peri.* 1, l. 10, 18–26 (cf. ARISTOTLE, *De interpretatione* 7, 17a38–39): “et ideo subiectum enunciationis distinguit [Aristotilis] per diuisionem rerum. Et dicit quod *rerum* quedam *sunt uniuersalia*, quedam *uero singularia*. Manifestat autem membra diuisionis dupliciter: primo quidem per diffinitionem.”

<sup>16</sup> *In Peri.* 1, l. 10, 26–27 (cf. ARISTOTLE, *De interpretatione* 7, 17a39–40): “*uniuersale* est *quod natum est de pluribus predicari*, *singulare uero quod non est aptum natum predicari de pluribus, set de uno solo*.”

<sup>17</sup> *In Peri.* 1, l. 10, 27–28 (cf. ARISTOTLE, *De interpretatione* 7, 17a40): “*singulare uero quod non est aptum natum predicari de pluribus, set de uno solo*.”

<sup>18</sup> *In Peri.* 1, l. 10, 28–30 (cf. ARISTOTLE, *De interpretatione* 7, 17a40–b1): “Manifestat autem [Aristotilis] membra diuisionis [...] secundo per exemplum, cum subdit quod ‘homo’ est *uniuersale*, ‘Plato’ *uero* *singulare*.”

<sup>19</sup> *In Peri.* 1, l. 10, 191–195 (cf. ARISTOTLE, *De interpretatione* 6, 17b1–3): “Tercia autem est hec diuisio, que sumitur secundum differentiam subiecti, quod predicatur de pluribus uel de uno solo; et ideo dicitur pertinere ad quantitatem enunciationis, nam et quantitas consequitur materiam.”

## 19.6. Understanding and Naming Singulars

A difficulty arises concerning this division (of a proposition into universal and singular according to a difference in the subject) because, as ARISTOTLE shows, the universal is not something that exists outside things (*extra res*).<sup>20</sup> What is more, he also says that second substances exist only in first substances, which are singular (► 15.5, ¶2). Hence, the division of things into *universals* and *singulars* is apparently inadequate; for it seems that there are no universal things—and that all existing things are singulars.

However, things are here divided insofar as they are signified by names that underly in propositions; and names signify things only by means of an understanding.<sup>21</sup> Hence, this division of things must be taken insofar as things fall in an understanding; and an understanding can distinguish those (essences) that are conjoined in things when one of them does not fall in the *ratio* of the other (e.g., *body* does not fall in the ratio of *surface*; whence, *surface* can be understood without *body*, even though they always *are* together).

Thus, in any singular thing, one can consider something that is proper to the thing insofar as it is *this thing*: for example, of Sortes—or of Plato—insofar as he is *this man*.<sup>22</sup> And one can consider something in it, in which it agrees with some other things: for example, that Sortes is a man (i.e., of some species), an animal (i.e., of some genus), rational (i.e., having some specific difference), risible (i.e., having some proper, inseparable accident), or white (i.e., having some contingent, separable accident; ► 15.18).

Therefore, when a thing is denominated from that which befits the thing only insofar as it is *this thing*, such a name is said to signify something singular.<sup>23</sup> On the other hand, when the thing is denominated from that which is common to it and to many others, such a name is said to signify a universal; for (such a) name signifies a nature or some disposition that is common to many.

---

<sup>20</sup> *In Peri.* 1, l. 10, 31–39: “Accidit autem dubitatio circa hanc diuisionem quia, sicut Philosophus probat in VII Metaphysice, uniuersale non est aliquid extra res existens; et in Predicamentis dicitur quod secunde substancie non sunt nisi in primis, que sunt singulares; non ergo uidetur esse conueniens diuisio rerum per uniuersalia et singularia, quia nulle res uidentur esse uniuersales, set omnes sunt singulares.”

<sup>21</sup> *In Peri.* 1, l. 10, 40–48: “Dicendum est autem quod hic diuiduntur res secundum quod significantur per nomina que subiiciuntur in enunciationibus; dictum est autem supra quod nomina non significant res nisi mediante intellectu, et ideo oportet quod diuisio ista rerum accipiatur secundum quod res cadunt in intellectu. Ea uero que sunt coniuncta in rebus, intellectus potest distinguere, quando unum eorum non cadit in ratione alterius.”

<sup>22</sup> *In Peri.* 1, l. 10, 48–54: “In qualibet autem re singulari est considerare aliquid quod est proprium illi rei in quantum est hec res, sicut Sorti uel Platoni in quantum est hic homo; aliquid autem est considerare in eo, in quo conuenit cum aliis quibusdam rebus, sicut quod Sortes est homo uel animal aut rationalis aut risibilis aut albus.”

<sup>23</sup> *In Peri.* 1, l. 10, 54–62: “Quando igitur res denominatur ab eo quod conuenit illi soli rei in quantum est hec res, huiusmodi nomen dicitur significare aliquid singulare; quando autem denominatur res ab eo quod est commune sibi et multis aliis, nomen huiusmodi dicitur significare uniuersale, quia scilicet nomen significat naturam siue dispositionem aliquam que est communis multis.”

### 19.7. The Universal Exists by an Act of the Intellect

Since ARISTOTLE gives this division (into *universal* and *singular*) concerning things, though not absolutely insofar as they are outside the soul, but insofar as they are referred to an understanding, he does not define the universal and the singular according to something that pertains to the thing.<sup>24</sup>

Thus, (it is not as though) ARISTOTLE would say that the universal (exists) outside singulars, which pertains to platonic opinions, but (that they exist) by an act of the intellectual soul, which (act) is *to be predicated of many or of only one*.<sup>25</sup>

### 19.8. Aptitude of an Essence to Be Predicated of Many

We ought to consider that the intellect apprehends the thing understood according to (its) proper *ratio* or definition.<sup>26</sup> Whence, ARISTOTLE says that the proper object of the intellect is the essence (*quod quid est*).

However, sometimes it happens that the proper *ratio* of some understood-form does not preclude it from being in many.<sup>27</sup> Instead, this is prevented by something else, whether it should be something that happens accidentally—for example, if one man were to remain, all (others) having died—or be due to a condition of matter—for example, that there is one sun (i.e., some individual incorruptible body) does not preclude the *ratio* of *sun* to be in many according to the consideration of the form itself, but because there is no other matter susceptible of such a form. Therefore, ARISTOTLE does not say that **universal** is “that which is predicated of many,” but *that which is naturally apt to be predicated of many*.

Since every form, which is of itself naturally (apt) to be received in matter, is communicable to multiple matters, there are two modes in which that which is signified by a name may not be naturally apt to be predicated of many.<sup>28</sup>

---

<sup>24</sup> *In Peri.* 1, l. 10, 62–66: “Quia igitur hanc diuisionem dedit de rebus non absolute secundum quod sunt extra animam, set secundum quod referuntur ad intellectum, non definiuit uniuersale et singulare secundum aliquid quod pertinet ad rem.”

<sup>25</sup> *In Peri.* 1, l. 10, 66–70: “puta si diceret quod uniuersale extra singularia, quod pertinet ad opiniones Platonicas, set per actum anime intellectiue, quod est predicari de multis uel de uno solo.”

<sup>26</sup> *In Peri.* 1, l. 10, 71–85: “Est autem considerandum quod intellectus apprehendit rem intellectam secundum propriam rationem seu diffinitionem: unde et in III De anima dicitur quod obiectum proprium intellectus est quod quid est.”

<sup>27</sup> *In Peri.* 1, l. 10, 71–75: “Contingit autem quandoque quod propria ratio alicuius forme intellecte non repugnat ei quod est esse in pluribus, set hoc impeditur ab aliquo alio, siue sit aliquid accidentaliter adueniens, puta si, omnibus hominibus morientibus, unus solus remaneret, siue sit propter conditionem materie, sicut est unus tantum sol, non quod repugnet rationi solari esse in pluribus secundum considerationem forme ipsius, set quia non est alia materia susceptiua talis forme. Et ideo non dixit quod uniuersale est quod predicatur de pluribus, set quod aptum natum est de pluribus predicari.”

<sup>28</sup> *In Peri.* 1, l. 10, 75–91: “Cum autem omnis forma, que nata est recipi in materia, quantum est de se, communicabilis sit multis materiis, dupliciter potest contingere quod id quod significatur per nomen non sit aptum natum de pluribus predicari.”

1. Because the name signifies a form insofar as it is determined to *this* matter.<sup>29</sup>

For example, the name *Sortes*—or *Plato*—signifies human nature insofar as it is in *this* matter.<sup>30</sup>

2. Insofar as the name signifies a form that is not naturally apt to be received in matter; whence, it must remain singular by itself.<sup>31</sup> This is why ARISTOTLE says that if the species of things were separate, as PLATO posited (them), they would be some (sort of) individuals.

For example, if whiteness should be a form not existing in matter, it would be one—hence, it would be singular.<sup>32</sup>

### 19.9. Things—Not Names—Are Universal

One could object that the name *Sortes*—or *Plato*—is naturally (apt) to be predicated of many, since nothing prevents many to be called by this name.<sup>33</sup> But the response to this is evident if we attend to ARISTOTLE's words; for he does not divide *names* into universal and particular, but *things*.

Therefore, we must understand that (something) is said (to be) universal not when only *the name* can be predicated of many, but (when) *that which is signified by the name* is naturally (apt) to be found in many: and this does not happen in the aforesaid names; for the name of *Sortes*—or of *Plato*—signifies human nature insofar as it is in *this* matter.<sup>34</sup> If this name should be imposed on another man, it would signify human nature in *another*

---

<sup>29</sup> *In Peri.* 1, l. 10, 91–93: “uno modo, quia nomen significat formam secundum quod est determinata ad hanc materiam.”

<sup>30</sup> *In Peri.* 1, l. 10, 93–95: “sicut hoc nomen ‘Sortes’ uel ‘Plato’, quod significat naturam humanam prout est in hac materia.”

<sup>31</sup> *In Peri.* 1, l. 10, 95–98; 100–103: “alio modo, secundum quod nomen significat formam que non est nata in materia recipi, unde oportet quod per se remaneat una et singularis [...]; et propter hoc Philosophus dicit in VII Metaphysice quod, si essent species rerum separate sicut Plato posuit, essent indiuidua quedam.” Cf. ARISTOTLE, *Metaphysica* Z.15, 1040a8–9: “οὐδὲ δὴ ἰδέαν οὐδεμίαν ἔστιν ὀρίσασθαι. τῶν γὰρ καθ’ ἕκαστον ἢ ἰδέα, ὡς φασί, καὶ χωριστή.” *In Metaph.* 7, l. 15, §1612: “Si igitur singulare definiri non potest, itaque nec ideam possibile est definire. Ideam enim oportet esse singularem, secundum ea quae ponuntur de idea. Ponunt enim quod idea est quoddam per se existens ab omnibus aliis separatum. Haec autem est ratio singularis.”

<sup>32</sup> *In Peri.* 1, l. 10, 98–100: “alio modo, secundum quod nomen significat formam que non est nata in materia recipi, unde oportet quod per se remaneat una et singularis, sicut albedo, si esset forma non existens in materia, esset una sola, unde esset singularis; et propter hoc Philosophus dicit in VII Metaphysice quod, si essent species rerum separate sicut Plato posuit, essent indiuidua quedam.”

<sup>33</sup> *In Peri.* 1, l. 10, 104–110: “Potest autem obiici quod hoc nomen ‘Sortes’ uel ‘Plato’ est natum de pluribus predicari, quia nihil prohibet esse multos qui uocentur hoc nomine. Set ad hoc patet responsio, si attendantur uerba Aristotilis: ipse enim non diuisit nomina in uniuersale et particulare, set res.” Cf. ARISTOTLE, *De interpretatione* 7, 17a38–b1: “ἔστι τὰ μὲν καθόλου τῶν πραγμάτων τὰ δὲ καθ’ ἕκαστον.”

<sup>34</sup> *In Peri.* 1, l. 10, 110–120: “ideo intelligendum est quod uniuersale dicitur quando non solum nomen potest de pluribus predicari, set id quod significatur per nomen est natum in pluribus inueniri; hoc autem non contingit in predictis nominibus: nam nomen Sortis uel Platonis significat naturam humanam secundum quod est in hac materia; si uero hoc nomen imponatur alteri homini, significabit naturam humanam in alia materia, et sic eius erit alia significatio, unde non erit uniuersale, set equiuocum.”

matter; and, in this way, it will be another signification; whence, it will not be universal, but equivocal (►20.1, ¶2).

### 19.10. The Universal as Nature vs. the Universal as Universal

**Universal** can be taken in two modes:<sup>35</sup>

1. For the *nature* itself, to which the intellect attributes the intention of universality.<sup>36</sup> In this mode, universals, such as genera and species, signify the substances of things as they are predicated in essence (*ut praedicantur in quid*). For example, *animal* (i.e., a genus) signifies the substance of that of which it is predicated (e.g., *animal* signifies the substance or essence of Plato, or of some other subject). And likewise, *man* (e.g., the species *man*, when predicated of Plato, also signifies his substance or essence).

2. Insofar as the aforesaid nature is universal, and insofar as it underlies the intention of universality: that is, insofar as *animal*—or *man*—is considered as *one in many*.<sup>37</sup> It is in this mode that Platonists posited *animal* and *man*, in their universality, to be substances.

### 19.11. The Universal as Universal is Not a Substance

ARISTOTLE proves that *common animal*—or *common man* (i.e., the universal as universal, the Idea or separate genus or species, e.g., of *animal* or of *man*)—is not a substance among the things of nature.<sup>38</sup> Rather, the form of *animal* or of *man* has this community (of universality) insofar as it is in the intellect, which takes a form as common to many insofar as it abstracts it from all individuating (principles; ►49.11). For this purpose, he posits two reasons.

1. Firstly, it seems to be impossible for any of those that are predicated universally to be a substance insofar as it is taken in its universality, because the substance of each thing is proper (*propria* = ἰδιος) to it and is not in another, while the universal is common to many; for *that* is said (to be) **universal** *which is naturally apt to be in many* (*quod natum*

---

<sup>35</sup> *In Metaph.* 7, l. 13, §1570 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b1–1039a23): “Sciendum est autem, ad evidentiam huius capituli, quod universale dupliciter potest accipi.”

<sup>36</sup> *In Metaph.* 7, l. 13, §1570: “Uno modo pro ipsa natura, cui intellectus attribuit intentionem universalitatis: et sic universalis, ut genera et species, substantias rerum significant, ut praedicantur in quid. Animal enim significat substantiam eius, de quo praedicatur, et homo similiter.”

<sup>37</sup> *In Metaph.* 7, l. 13, §1570: “Alio modo potest accipi universale inquantum est universale, et secundum quod natura praedicta subest intentioni universalitatis: idest secundum quod consideratur animal vel homo, ut unum in multis. Et sic posuerunt Platonici animal et hominem in sua universalitate esse substantias.”

<sup>38</sup> *In Metaph.* 7, l. 13, §1571 (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b1–1039a23): “Quod [sc., animal et hominem in sua universalitate esse substantias] Aristoteles in hoc capitulo intendit reprobare, ostendens quod animal commune vel homo communis non est aliqua substantia in rerum natura. Sed hanc communitatem habet forma animalis vel hominis secundum quod est in intellectu, qui unam formam accipit ut multis communem, inquantum abstrahit eam ab omnibus individuantibus. Ponit ergo ad propositum duas rationes.”

*est multis inesse* = ὃ πλείοσιν ὑπάρχειν πέφυκεν) and to be predicated of many (*et de multis praedicari*).<sup>39</sup> Therefore, if the universal is a substance, it must be the substance of something. Of what, then, will it be the substance? For it must be either the substance of all those in which it is, or of one:

**(a)** It is not possible, on the one hand, (for the universal) to be the substance of all (the things in which it is) because one cannot be the substance of many; for *many* are *those whose substances are multiple and diverse*.<sup>40</sup>

**(b)** On the other hand, if it should be said that (the universal) is the substance of one of those (things) in which it is, it would follow that all the others in which it is would be that one of which it is posited to be the substance; and, for the same reason, it must also be the substance of them, since it is likewise in them.<sup>41</sup> It remains, therefore, that since (the universal) cannot be the substance of all of those of which it is said, nor of one of them, it is the substance of none.

**2.** According to ARISTOTLE, that is said (to be a) *substance* which is not (said) of a subject (*quae non <est> de subiecto* = τὸ μὴ καθ' ὑποκειμένου [λέγεται]; ► 14.6); but the universal is always said of some subject; therefore, (the universal) is not a substance.<sup>42</sup>

It would seem, however, that this reason is not valid; for in his *Categories*, ARISTOTLE says that *not to be in a subject* belongs to the *ratio* of *substance*—and to predicate of a subject is not against the *ratio* of *substance*.<sup>43</sup> Whence, there (i.e., in the *Categories*) are posited second substances that are predicated of a subject.

---

<sup>39</sup> *In Metaph. 7, l. 13, §1572* (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b8–13): “Circa quarum *primam* dicit, quod videtur ex sequentibus rationibus impossibile esse, quodcumque eorum, quae universaliter praedicantur, esse substantiam, secundum scilicet quod in sua universalitate accipitur. Quod primo probatur ex hoc, quod substantia uniuscuiusque, est propria ei, et non inest alii. Sed universale est commune multis, hoc enim dicitur universale, quod natum est multis inesse et de multis praedicari. Si ergo universale est substantia, oportet quod sit alicuius substantia. Cuius ergo substantia erit? Aut enim oportet quod sit substantia omnium, quibus inest, aut unius.”

<sup>40</sup> *In Metaph. 7, l. 13, §1572* (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b13): “Non est autem possibile quod sit substantia omnium: quia unum non potest esse substantia pluribus. Plura enim sunt quorum substantiae sunt plures et diversae.”

<sup>41</sup> *In Metaph. 7, l. 13, §1573* (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b13–15): “Sed si dicatur, quod sit substantia unius eorum quibus inest, sequetur quod omnia alia, quibus inest, sint illud unum, quibus ponitur esse substantia. Oportet enim quod pari ratione, eorum etiam sit substantia, cum et eis similiter insit. Quorum autem substantia est una, et quod quid erat esse unum, oportet et ipsa esse unum. Relinquitur ergo, quod ex quo universale non potest esse substantia omnium, de quibus dicitur, nec unius alicuius, quod nullius sit substantia.”

<sup>42</sup> *In Metaph. 7, l. 13, §1575* (cf. ARISTOTLE, *Metaphysica* Z.13, 1038b15–16): “*Secundam* rationem ponit [Philosophus...] Dicit quod substantia dicitur, quae non est de subiecto: et dicitur universale semper de aliquo subiecto: ergo universale non est substantia.”

<sup>43</sup> *In Metaph. 7, l. 13, §1575*: “Videtur autem ratio haec non valere. Dictum est enim in Praedicamentis, quod de ratione substantiae est, quod non sit in subiecto. Praedicari vero de subiecto non est contra rationem substantiae. Unde ponuntur ibi secundae substantiae quae praedicantur de subiecto.”

However, it ought to be said that ARISTOTLE speaks in his *Categories* according to logical consideration; and the logician considers the things insofar as they are in reason.<sup>44</sup> Hence, (the logician) considers substances insofar as they underlie the intention of universality according to the acceptance of the intellect. Therefore, in respect of predication, which is an act of reason, (the logician) says that (substance) is predicated of a subject—that is, of a substance that exists outside the mind.

The first philosopher (*philosophus primus*, i.e., the metaphysician), on the other hand, considers things insofar as they are beings (*secundum quod sunt entia*).<sup>45</sup> Therefore, in his consideration, *being in a subject* (*esse in subiecto*) and *(being) of a subject* (*de subiecto*) do not differ. Hence, (ARISTOTLE) takes here, said of a subject, that it is something in itself; (that) it is in some subject that exists in act; and it is impossible for this to be a substance; for it would, then, have (its act of) being in a subject, which is also against the *ratio* of *substance* that is had in the *Categories*.

---

<sup>44</sup> *In Metaph. 7, l. 13, §1576*: “Sed dicendum quod secundum logicam considerationem loquitur Philosophus in Praedicamentis. Logicus autem considerat res secundum quod sunt in ratione; et ideo considerat substantias prout secundum acceptionem intellectus subsunt intentioni universalitatis. Et ideo quantum ad praedicationem, quae est actus rationis, dicit quod praedicatur de subiecto, idest de substantia subsistente extra animam.”

<sup>45</sup> *In Metaph. 7, l. 13, §1576*: “Sed philosophus primus considerat de rebus secundum quod sunt entia; et ideo apud eius considerationem non differt esse in subiecto et de subiecto. Hic enim accipit dici de subiecto, quod est in se aliqua res et inest alicui subiecto existenti in actu. Et hoc impossibile est esse substantiam. Sic enim haberet esse in subiecto. Quod est contra rationem substantiae: quod etiam in Praedicamentis est habitum.”

## 20. Analogical Predication

*We have determined that essence and definition are predicated analogically of accidents in relation to substance (► 18.12). We must therefore clarify what analogical predication is and how it compares to other modes of predication.*

*Before we begin, however, we remind the reader that the terminology used in Latin to refer to analogy or proportion—and ratio—has not always been consistent (► 5; 6). St. Thomas is not an exception (presumably, because he himself draws from inconsistent sources).<sup>1</sup> Thus, sometimes proportio is equivalent to ἀναλογία, following the Ciceronian tradition.<sup>2</sup> More often, nonetheless, proportio is equivalent to λόγος, while proportionalitas takes the place of ἀναλογία.<sup>3</sup> This corresponds to the Boethian tradition (grounded on NICOMACHUS; ► 6.10), which St. Thomas clearly prefers.*

---

<sup>1</sup> The most thorough treatment of the terminology concerning analogy we could find is in RAMÍREZ, *De analogia*, especially 56–65 and footnotes. However, RAMÍREZ does not reach back to ARCHYTAS, our oldest and most reliable source, nor is he able to correctly account for the use of ἀναλογία as it relates to the various means. In the following footnotes we add to his observations on St. Thomas the results of our own research.

<sup>2</sup> This is most evident, for example, in *De prin. nat.* §6, 42–44: “secundum analogiam, id est in proportione uel comparatione uel conuenientia,” where *comparatio* and *proportio* are precisely the two alternatives proposed by CICERO to translate the Greek term ἀναλογία (as already discussed and cited in Chapter 6, “Ἀναλογία, [...], *comparatio, proportio*-ue, dici potest”), while *conuenientia* (which we often render here as *agreement*) typically refers in St. Thomas to a commensurate order, as we will see; cf. *ibid.*, 72–73: “secundum analogiam tantum siue proportionem.” This usage is also evident whenever the Greek term underlies the commented text, as *In Physic.* 1, l. 10, n. 7 (cf. ARISTOTLE, *Physica* A.5, 188b36–189a1): “secundum analogiam, id est proportionem,” for ἀνάλογον; *ibid.*, l. 13, n. 9 (cf. ARISTOTLE, *Physica* A.7, 191a7–12): “secundum analogiam, id est secundum proportionem,” for κατ’ ἀναλογίαν; *ibid.* 4, l. 12, n. 3 (cf. ARISTOTLE, *Physica* Δ.8, 215b3): “secundum aliquam analogiam, id est proportionem,” for κατὰ τὴν ἀναλογίαν; *ibid.* 7, l. 9, n. 2 (cf. ARISTOTLE, *Physica* H.5, 250a8): “eadem analogia, id est eadem proportio,” for ἀνάλογον; *In Meteor.* 1, l. 3, n. 7 (cf. ARISTOTLE, *Meteorologica* A.3, 340a4): “aequalitatem analogiae, id est proportionis,” for τὴν ἰσότητα τῆς κοινῆς ἀναλογίας; *In Metaph.* 3, l. 10, §465: “analogia sive proportione”; *ibid.* 4, l. 1, §535: “analogice praedicari, id est proportionaliter”; *ibid.* 5, l. 8, §879 (cf. ARISTOTLE, *Metaphysica* Δ.6, 1016b32; 34): “Proportione uero uel analogia,” for κατ’ ἀναλογίαν; *In Metaph.* 12, l. 4, §2470 (cf. ARISTOTLE, *Metaphysica* Λ.4, 1070b26): “secundum analogiam, id est proportionem,” for κατ’ ἀναλογίαν; *In Post. an.* 2, l. 17, 95–96 (cf. ARISTOTLE, *Analytica Posteriora* B.14, 98a20): “secundum analogiam, id est proportionem,” for κατὰ τὸ ἀνάλογον; *In De caelo* 1, l. 12, n. 11 (cf. ARISTOTLE, *De caelo* A.6, 273b32): “analogia, id est proportio,” for τὴν ἀναλογίαν; *ibid.* 2, l. 11, n. 4 (cf. ARISTOTLE, *De caelo* B.8, 289b16): “analogice, id est proportionaliter,” for ἀνάλογον. The same terminology is used by St. Thomas even when he is not commenting on works directly translated from Greek sources, as *In Sent.* 1, d. 31 q. 2 a. 1 ad 2: “similitudo analogiae uel proportionis”; *ibid.* 3, d. 1 q. 1 a. 1 co.: “unum analogia sive proportione”; *ibid.* 4, d. 1 q. 1 a. 4 qc. 4 co.: “secundum proportionem sive analogiam”; *STh* I, q. 13 a. 5 co.: “secundum analogiam, id est proportionem”; *ibid.*, q. 93 a. 1 ad 3: “secundum analogiam uel proportionem”; *ibid.* I-II, q. 20 a. 3 ad 3: “secundum analogiam uel proportionem”; *Comp. th.* 1, c. 27, 18–19: “secundum analogiam, id est secundum proportionem”; *In De causis*, l. 10: “analogiam, id est secundum proportionem.” In contrast, other places suggest a Boethian usage, as *In Ethic.* 1, l. 7, 98–108 (cf. ARISTOTLE, *Ethica Nicomachea* A.4, 1096a17–19): “secundum analogiam, id est proportionem eandem,” for κατ’ ἀναλογίαν. But such usage is ambiguous even when commenting on BOETHIUS, as *In De Trin.*, q. 4 a. 2 co., 95–96: “per analogiam siue per proportionem.”

<sup>3</sup> It is clear that *proportio* is equivalent to λόγος (*ratio*) mostly—but not exclusively—in quantitative contexts, such as *In De anima* 1, c. 9, 143 (cf. ARISTOTLE, *De anima* A.4, 408a9; 18): “eandem rationem, id est proportionem,” for λόγος, as in other places of the same work; *In Physic.* 7, l. 7, n. 9 (cf. ARISTOTLE, *Physica* H.4, 248b8): “ratio dupli [...], quod est proportio duorum ad unum,” for τὸ γε διπλάσιον ταῦτο (ἄλλο γὰρ πρὸς ἓν); *In Metaph.* 1, l. 16, §242 (cf. ARISTOTLE, *Metaphysica* A.9, 991b17): “quaedam ratio uel proportio in numeris aliquorum,” for λόγος ἐν ἀριθμοῖς; *In Post. an.* 2, l. 1, 228–229 (cf. ARISTOTLE,

## 20.1. Modes of Predicating One of Many

Something can be common to some (things) in three modes: **univocally, equivocally or analogically.**<sup>4</sup> Whence, something is predicated of many (*de pluribus*; also, *de diversis*, i.e., of diverse [subjects]) in three modes:

1. That is predicated **univocally** (*univoce*) which is predicated *according to the same name and according to a ratio—i.e., a definition—that is altogether the same.*<sup>5</sup>

For example, *animal* is (univocally) predicated of man, of horse, of ox, and of ass, because each of them is said (to be an) *animal*, and each is an *animated, sensible substance*, which is the definition of *animal*.<sup>6</sup>

2. That is predicated **equivocally** (*aequivoce*) which is predicated of some (multiple things) *according to the same name but according to altogether diverse ratios.*<sup>7</sup>

For example,<sup>8</sup> *dog* (*canis*) is said of *that which is capable of barking*, and of a constellation (i.e., of *Canis Major*, “Greater Dog,” containing Sirius; or, perhaps, of *Canis Minor*, “Lesser

---

*Analytica Posteriora* B.1, 90a19): “*ratio*, idest proportio numerorum,” for λόγος ἀριθμῶν; *In De caelo* 1, l. 26, n. 4 (cf. ARISTOTLE, *De caelo* A.12, 281b6): “sic enim sequetur quod proportio diametri ad latus sit sicut proportio numeralis, quae est ratio commensurabilis,” where St. Thomas is explaining the mode in which it is false to say that the diameter of a square is commensurate (ἡ διάμετρος σύμμετρος) with the side, yet the Greek does not mention any λόγος; *In De div. nom.*, c. 4, l. 19: “*ratio*, idest proportio.” In turn, it is evident that **proportionalitas** takes the place of **ἀναλογία** in certain places, such as *In Sent.* 4, d. 49 q. 2 a. 1 ad 6: “proportionalitas quae est similitudo proportionum”; *De veritate*, q. 2 a. 3 ad 4: “est enim proportionalitas similitudo proportionum”; *In Post. an.* 2, l. 12, 96–97: “proportionalitas uero est collectio duarum proportionum.” This usage patently derives from BOETHIUS, *De institutione arithmetica*, 2.40, 137.8–17: “Est igitur proportionalitas duarum vel trium vel quotlibet proportionum adsumptio ad unum atque collectio. Ut etiam communiter definiamus: proportionalitas est duarum vel plurium proportionum similis habitudo, etiamsi non eisdem quantitibus et differentiis constitutae sint. Differentia uero est inter numeros quantitas. Proportio est duorum terminorum ad se invicem quaedam habitudo et quasi quodammodo continentia, quorum compositio quod efficit, proportionale est. Ex iunctis enim proportionibus proportionalitas fit.” BOETHIUS draws this doctrine almost literally (barring his terminological peculiarities) from NICOMACHUS, *Introductio arithmeticae*, 2.21, 120.2–10: “ἔστιν οὖν ἀναλογία κυρίως δυεῖν ἢ πλειόνων λόγων σύλληψις ἐς τὸ αὐτό, κοινότερον δὲ δυεῖν ἢ πλειόνων σχέσεων, κἂν μὴ λόγῳ τῷ αὐτῷ ὑποτάσσωνται, διαφορὰ δὲ ἢ τινι ἑτέρῳ. λόγος μὲν οὖν ἐστὶ δύο ὄρων πρὸς ἀλλήλους σχέσις, σύνθεσις δὲ τῶν τοιούτων ἢ ἀναλογία, ὥστε ἐν ἐλαχίστοις ὅροις τρισὶν αὕτη συμμέμικται, δύναται γε μὴν καὶ ἐν πλείοσι κατὰ τὸ αὐτὸ διάστημα ἢ κατὰ τὸν αὐτὸν λόγον προχωρεῖν.”

<sup>4</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “tribus modis contingit aliquid aliquibus commune esse; vel univoce, vel aequivoce, vel analogice.” *In Metaph.* 4, l. 1, §535: “aliquid praedicatur de diversis multipliciter.” *De prin. nat.* §6, 20–21: “tripliciter aliquid predicatur de pluribus: uniuoce, equiuoce et analogice.”

<sup>5</sup> *De prin. nat.* §6, 21–23: “Uniuoce predicatur quod predicatur secundum idem nomen et secundum rationem eandem, id est diffinitionem.” *In Metaph.* 4, l. 1, §535: “quandoque quidem [aliquid praedicatur de diversis] secundum rationem omnino eandem, et tunc dicitur de eis univoce praedicari.”

<sup>6</sup> *De prin. nat.* §6, 23–26: “sicut animal predicatur de homine et de asino: utrumque enim dicitur animal, et utrumque est substantia animata sensibilis, quod est diffinitio animalis.” *In Metaph.* 4, l. 1, §535: “sicut animal de equo et bove.”

<sup>7</sup> *De prin. nat.* §6, 27–29: “Equiuoce predicatur quod predicatur de aliquibus secundum idem nomen et secundum diuersam rationem.” *In Metaph.* 4, l. 1, §535: “Quandoque uero [aliquid praedicatur de diversis] secundum rationes omnino diuersas; et tunc dicitur de eis aequivoce praedicari.”

<sup>8</sup> *De prin. nat.* §6, 29–33: “sicut canis dicitur de latrabili et de celesti, quae conueniunt solum in nomine et non in diffinitione siue significatione; id enim quod significatur per nomen est diffinitio, sicut dicitur in IV Methaphisice.” *In Metaph.* 4, l. 1, §535: “sicut canis de sidere et animali.” See ARISTOTLE, *Metaphysica*

Dog,” containing Procyon), which agree only in name, but not in definition or signification; for the definition is what is signified by the name.

Hence, those (things) are (purely) **equivocal** (*aequivoca* = ὁμώνυμα) *which agree only in name—i.e., whose name alone is common—but whose ratio of substance (i.e., the definition of its essence; ► 15.5) is totally diverse.*<sup>9</sup>

**3.** What is predicated **according to analogy** (*secundum analogiam*)—or **analogically** (*analogice*)—is said neither altogether univocally nor purely equivocally, but *according to proportion* (*secundum proportionem*).<sup>10</sup>

Agreement (*convenientia*) according to proportion can be in (one of) two (possible modes, barring imitation, since it is opposed to agreement; ► 20.4); and the community of analogy is considered according to these two (modes): namely, **agreement of proportion** and **agreement of proportionality** (► 20.11).<sup>11</sup>

## 20.2. Proportion

**Proportion** is nothing other than *some habitude* (i.e., *relation*) *to each other of two (things) that agree in something, insofar as they agree or differ* (*quaedam habitudo duorum ad invicem convenientium in aliquo, secundum hoc quod conveniunt aut differunt*).<sup>12</sup>

*Proportion* is said in two (modes), insofar as (the two things) can be understood to agree:<sup>13</sup>

**1.** As a **certitude of mensuration of two quantities** (► 5), insofar as they agree in the same genus of quantity or of quality (► 22.1; 28.6; 37.7).<sup>14</sup> For example, the habitude of a surface to a surface, or of a number to a number, or even of a heat to a heat, *insofar as one exceeds the other or is equal to it.*

---

Γ.7, 1012a22–24: “ὀρισμὸς δὲ γίννεται ἐκ τοῦ σημαίνειν τι ἀναγκαῖον εἶναι αὐτοῦς· ὁ γὰρ λόγος οὗ τὸ ὄνομα σημείον ὀρισμὸς ἔσται.”

<sup>9</sup> Cf. *In De anima* 2, c. 2, 92–93: “aequivoca sunt quorum nomen solum commune est et ratio substantie diuersa.” *In Physic.* 5, l. 7, n. 1 (cf. ARISTOTLE, *Physica* E.4, 228a25; *Categoriae* 1, 1a1–4): “aequivoca [ὁμώνυμα], idest non convenientia in nomine et ratione.” *STh* I, q. 13 a. 5 co.: “Neque enim in his quae analogice dicuntur, est una ratio, sicut est in univocis; nec totaliter diversa, sicut in aequivocis.”

<sup>10</sup> *De veritate*, q. 2 a. 11 co.: “dicendum est, quod nec omnino univoce, nec pure aequivoce [...]; sed secundum analogiam, quod nihil est dictu quam secundum proportionem.”

<sup>11</sup> *De veritate*, q. 2 a. 11 co.: “Convenientia autem secundum proportionem potest esse dupliciter: et secundum haec duo attenditur analogiae communitas. [...] Prima ergo convenientia est proportionis, secunda autem proportionalitatis.”

<sup>12</sup> *In De Trin.*, q. 1 a. 2 ad 3, 143–146: “proportio nichil aliud est quam quedam habitudo duorum ad invicem conuenientium in aliquo secundum hoc quod conueniunt aut differunt.”

<sup>13</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “proportio dicitur dupliciter.” *In De Trin.*, q. 1 a. 2 ad 3, 146–147: “Possunt autem intelligi esse conuenientia dupliciter.”

<sup>14</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “Uno modo idem est proportio quod certitudo mensurationis duarum quantitatum.” *In De Trin.*, q. 1 a. 2 ad 3, 147–152: “uno modo ex hoc quod conueniunt in eodem genere quantitatis aut qualitatis, sicut habitudo superficiei ad superficiem aut numeri ad numerum, in quantum unum excedit aliud aut equatur ei; uel etiam caloris ad calorem.”

Such a proportion can only be of two finite (quantities) of which one exceeds (the other) according to something certain and determinate.<sup>15</sup>

**2.** As a **relation of order** (► 8.2; 8.5), insofar as they agree in some order.<sup>16</sup> In this mode is considered the proportion between matter and form, producer and (thing) produced, and other such (► 37.9). And such a proportion is required between the knowing potency and the knowable (object), since the knowable is as the act of the knowing power.

For example, we say that there is a proportion between matter and form because it is had in an order such that matter is perfected by form. This is (moreover) according to some proportionality (► 20.11); for just as form can give (an act of) being (*esse*), so can matter receive the same (act of) being.<sup>17</sup>

Likewise, the mover and the moved must be proportionable.<sup>18</sup> And, also, the agent and the patient: that is, just as the agent can impress some effect, so can the patient receive the same (effect).

### **20.3. Commensuration According to Number and According to Intention**

It is not necessary for the passive power of a recipient to be commensurate to the active potency of the agent either according to number or according to intention.<sup>19</sup> For example:

**1. According to number**, one artificer can, through his art, induce multiple forms in wood: e.g., as the form of a box and the form of a saw; but wood can only receive one of these (i.e., one part of wood can only receive one form; hence, wood is not commensurate to the active potency of the artificer, who can impress multiple forms).<sup>20</sup>

**2. According to intention**, the artificer can produce through his art a beautiful statue that knotty wood cannot receive (i.e., such wood cannot receive the form intended by the

---

<sup>15</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “talī proportio non potest esse nisi duorum finitorum, quorum unum excedit secundum aliquid certum et determinatum.”

<sup>16</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “Alio modo dicitur proportio habitudo ordinis.” *In De Trin.*, q. 1 a. 2 ad 3, 154–160: “Alio modo possunt intelligi conuenientia ita quod conueniant in aliquo ordine, et sic attenditur proportio inter materiam et formam, faciens et factum et alia huiusmodi; et talis proportio requiritur inter potentiam cognoscentem et cognoscibile, cum cognoscibile sit quasi actus potentie cognoscentis.”

<sup>17</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “sicut dicimus esse proportionem inter materiam et formam, quia se habet in ordine, ut perficiatur materia per formam, et hoc secundum proportionabilitatem quamdam: quia sicut forma potest dare esse, ita et materia potest recipere idem esse.”

<sup>18</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “et hoc modo etiam movens et motum debent esse proportionabilia, et agens et patiens, ut scilicet sicut agens potest imprimere aliquem effectum, ita patiens possit recipere eundem.”

<sup>19</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “Nec oportet ut commensuretur potentia passiva recipientis ad potentiam activam agentis nec secundum numerum [...] nec etiam secundum intentionem.”

<sup>20</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “nec secundum numerum (sicut unus artifex per artem suam potest in ligno inducere plures formas, ut formam arcae, et formam serrae; sed lignum non potest recipere nisi unam illarum).”

artificer; hence, such wood is not commensurate to the active potency of the artificer, who can impress a more perfect form).<sup>21</sup>

#### 20.4. Agreement vs. Imitation

In those (things) that are produced in imitation of another (e.g., as a statue is produced in imitation of the form intended by the artificer), sometimes that which imitates the other imitates it perfectly (for example, when wood is not knotty, it can commensurably receive the form intended by the artificer).<sup>22</sup> Then, the operative intellect—which preconceives the form of that which is operated—has, as an idea, the form itself of the thing imitated insofar as it is (the form) of that imitated thing.

Sometimes, however, that which is (produced) in imitation of another does not perfectly imitate it.<sup>23</sup> Then, the operative intellect would not take—absolutely—the form of the thing imitated as an idea or exemplar (►9.6) of the thing operated; rather, (the operative intellect would take the form) with some determinate proportion (i.e., quantitative relation), according to which the thing produced in imitation of the exemplar (*exemplatum*) would fall short (*deficeret*) of—or would *imitate*—the principal exemplar.

#### 20.5. Analogy According to Agreement vs. According to Imitation

Thus (from what has just been said), analogy (of proportion) is twofold (in respect of commensuration):<sup>24</sup>

1. According to an **agreement in something one** (*secundum convenientiam in aliquo uno*), which (one-thing) befits (*convenit*) them according to prior and posterior (*per prius et posterius*; e.g., the statue is first in the mind of the artificer and then in wood, but there is a perfect agreement between them).<sup>25</sup>

2. According as **one imitates the other** as much as it can (*secundum quod unum imitatur aliud quantum potest*), not attaining it perfectly.<sup>26</sup>

---

<sup>21</sup> *In Sent.* 3, d. 1 q. 1 a. 1 ad 3: “nec etiam secundum intentionem: quia artifex per suam artem potest producere pulchram sculpturam, quam tamen lignum nodosum non potest recipere.”

<sup>22</sup> *De veritate*, q. 3 a. 2 co.: “In his autem quae ad imitationem alterius producuntur, quandoque quidem id quod alterum imitatur, perfecte imitatur ipsum; et tunc intellectus operativus praeconciens formam operati, habet ut ideam ipsam formam rei imitatae, prout est illius rei imitatae.”

<sup>23</sup> *De veritate*, q. 3 a. 2 co.: “quandoque vero quod est ad imitationem alterius, non perfecte imitatur illud; et tunc intellectus operativus non acciperet formam rei imitatae absolute ut ideam vel exemplar rei operandae; sed cum proportione determinata, secundum quam exemplatum a principali exemplari deficeret vel imitaretur.”

<sup>24</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “duplex est analogia.”

<sup>25</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “Quaedam secundum convenientiam in aliquo uno, quod eis per prius et posterius convenit.”

<sup>26</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “Alia analogia est, secundum quod unum imitatur aliud quantum potest, nec perfecte ipsum assequitur.”

## 20.6. Proportional Order to One in Analogical Predication

Something can be predicated analogically—that is, neither univocally nor equivocally—according to an order or respect to something one (*secundum ordinem vel respectum ad aliquid unum*) in two modes:<sup>27</sup> **(1)** according as **one has a proportion to the other**; or **(2)** according as **multiple (things) have a proportion or respect to one** (►20.9).

Whence, in the community of analogy that is taken according to some determinate relation of one (thing) to another (i.e., as opposed to an incommensurate relation; ►20.2), either:<sup>28</sup> **(1)** *one (of them) is posited in the definition of the other* (because one has a proportion to the other), as *substance* is posited in the definition of *accident* (►20.7); or **(2)** *something one (is posited) in the definition of the two*, because both are said due to a (determinate) relation to one, as *substance* is posited in the definition of *quantity* and of *quality* (►20.9).

## 20.7. Agreement of Proportion

Agreement of proportion is of those (things) between which there is a proportion to each other because they have a determinate distance—or another relation—to each other.<sup>29</sup> For example, two (has a relation) with unity because it is its *double*.

According to this mode of agreement, we find something said analogically of two (subjects) of which one has a relation (*habitudinem habet*) to the other.<sup>30</sup> For example, *being* is said of substance (priorly) and of accident (posteriorly) due to the relation that an accident has to substance (►15). Likewise, *healthy* is said of animal (priorly) and of urine (posteriorly) because urine has some relation to the health of the animal.

---

<sup>27</sup> ScG 1, 34 n. 1: “Sic igitur ex dictis relinquitur quod ea [...], praedicantur neque univoce neque aequivoce, sed analogice: hoc est, secundum ordinem vel respectum ad aliquid unum. Quod quidem dupliciter contingit: uno modo, secundum quod multa habent respectum ad aliquid unum [...]. Alio modo, secundum quod duorum attenditur ordo vel respectus, non ad aliquid alterum, sed ad unum ipsorum.” *STh* I, q. 13 a. 5 co.: “huiusmodi nomina dicuntur [...] secundum analogiam, idest proportionem. Quod quidem dupliciter contingit in nominibus, vel quia multa habent proportionem ad unum [...]; vel ex eo quod unum habet proportionem ad alterum.”

<sup>28</sup> *De veritate*, q. 2 a. 11 ad 6: “Ad sextum [sc., in omnibus analogiis ita est, quod vel unum ponitur in definitione alterius, sicut ponitur substantia in definitione accidentis, et actus in definitione potentiae; vel aliquid idem ponitur in definitione utriusque, sicut sanitas animalis ponitur in definitione sani, quod dicitur de urina et cibo, quorum alterum est conservativum, alterum significativum sanitatis] dicendum, quod ratio illa procedit de communitate analogiae quae accipitur secundum determinatam habitudinem unius ad alterum: tunc enim oportet quod unum in definitione alterius ponatur, sicut substantia in definitione accidentis; vel aliquid unum in definitione duorum, ex eo quod utraque dicuntur per habitudinem ad unum, sicut substantia in definitione quantitatis et qualitatis.”

<sup>29</sup> *De veritate*, q. 2 a. 11 co.: “Est enim quaedam convenientia inter ipsa quorum est ad invicem proportio, eo quod habent determinatam distantiam vel aliam habitudinem ad invicem, sicut binarius cum unitate, eo quod est eius duplum. [...] in his quae primo modo analogice dicuntur, oportet esse aliquam determinatam habitudinem inter ea quibus est aliquid per analogiam commune.”

<sup>30</sup> *De veritate*, q. 2 a. 11 co.: “secundum modum primae convenientiae invenimus aliquid analogice dictum de duobus quorum unum ad alterum habitudinem habet; sicut ens dicitur de substantia et accidente ex habitudine quam accidens ad substantiam habet; et sanum dicitur de urina et animali, ex eo quod urina habet aliquam habitudinem ad sanitatem animalis.”

That which is predicated of some things according to prior and posterior is certainly not predicated univocally; for the prior is included in the definition of the posterior, as *substance* (is included) in the definition of *accident* insofar as it is a being (*secundum quod est ens*).<sup>31</sup> Hence, if *being* should be said univocally of substance and of accident, substance would have to be posited in the definition of *being* insofar as it is predicated of substance—which is evidently impossible.

### 20.8. Order in a Proportion of One to Another

This mode of proportion occurs insofar as an order or respect of two (things) is considered, not to something else, but *to one of them*.<sup>32</sup>

For example, *being* is said of substance and of accident insofar as accident has a respect to substance—not that substance and accident would be referred to some third thing (e.g., *being*).<sup>33</sup> Likewise, *healthy* is said of (the art of) medicine and of animal insofar as medicine is a cause of the health that is in the animal (i.e., not that medicine and animal would be referred to some third thing).

In an analogical predication of this mode, sometimes the same order is considered according to name and to thing.<sup>34</sup> However, sometimes (it is) not the same (order); for the order of the name follows upon the order of cognition, since it is a sign of intelligible conceptions (► 8.10; 8.11). Thus,

1. When that which is prior according to thing is found (to be) **prior also in cognition** (► 49), the same is found (to be) prior both according to the *ratio* of the name and according to the nature of the thing.<sup>35</sup>

For example, substance is prior to accident both in nature—insofar as the substance is a cause of an accident—and in cognition—insofar as *substance* is posited in the definition

---

<sup>31</sup> ScG 1, 32 n. 7: “Quod praedicatur de aliquibus secundum prius et posterius, certum est univoce non praedicari: nam prius in definitione posterioris includitur: sicut substantia in definitione accidentis secundum quod est ens. Si igitur diceretur univoce ens de substantia et accidente, oporteret quod substantia etiam poneretur in definitione entis secundum quod de substantia praedicatur. Quod patet esse impossibile.”

<sup>32</sup> ScG 1, 34 n. 1: “Alio modo, secundum quod duorum attenditur ordo vel respectus, non ad aliquid alterum, sed ad unum ipsorum.” *STh* I, q. 13 a. 5 co.: “vel ex eo quod unum habet proportionem ad alterum.”

<sup>33</sup> ScG 1, 34 n. 1: “sicut ens de substantia et accidente dicitur secundum quod accidens ad substantiam respectum habet, non quod substantia et accidens ad aliquid tertium referantur.” *STh* I, q. 13 a. 5 co.: “sicut sanum dicitur de medicina et animali, inquantum medicina est causa sanitatis quae est in animali.”

<sup>34</sup> ScG 1, 34 n. 2: “In huiusmodi autem analogica praedicatione ordo attenditur idem secundum nomen et secundum rem quandoque, quandoque vero non idem. Nam ordo nominis sequitur ordinem cognitionis: quia est signum intelligibilis conceptionis.”

<sup>35</sup> ScG 1, 34 n. 2: “Quando igitur id quod est prius secundum rem, invenitur etiam cognitione prius, idem invenitur prius et secundum nominis rationem et secundum rei naturam.”

of *accident*.<sup>36</sup> Thus, *being* is said priorly of substance than of accident both according to the nature of the thing and according to the *ratio* of the name.

2. When that which is prior according to nature is **posterior according to cognition** (►49), then, in analogical (things), the order is not the same according to thing and according to the *ratio* of the name.<sup>37</sup>

For example, the virtue (*virtus*) of healing that is in things that cause healing (*in sanativis*) is prior—as cause (is prior) to (its) effect—to the health that is in the animal.<sup>38</sup> However, since we know this power by its effect (►57.5, ¶2), we name it from the effect. Whereby, that which causes healing (*sanativum*) is prior in the order of the thing; and yet, the animal, according to the *ratio* of the name, is priorly said (to be) *healthy* (*sanum*).

### 20.9. Order in a Proportion of Many to One

In this mode, that is said to be predicated analogically—that is, proportionately—which is predicated of many *whose ratios are diverse but are attributed to some one same (thing), to which each is referred according to its (own) relation*.<sup>39</sup>

What is predicated analogically (in this mode) is predicated according to *ratios* that are *in part diverse* and *in part nondiverse*.<sup>40</sup> They are *diverse* insofar as they convey diverse relations (*important diversas habitudines*). They are *one* (i.e., nondiverse) insofar as these diverse relations are referred to something one and the same (*ad unum aliquid et idem*).

For example, in respect to *one health*, *healthy* (*sanativum vel salubre* = ὑγιεινόν) is said of animal, of urine, of food or diet, of (the art of) medicine, and of medication (*de potione*).<sup>41</sup>

---

<sup>36</sup> ScG 1, 34 n. 2: “sicut substantia est prior accidente et natura, inquantum substantia est causa accidentis; et cognitione, inquantum substantia in definitione accidentis ponitur. Et ideo ens dicitur prius de substantia quam de accidente et secundum rei naturam et secundum nominis rationem.”

<sup>37</sup> ScG 1, 34 n. 2: “Quando vero id quod est prius secundum naturam, est posterius secundum cognitionem, tunc in analogicis non est idem ordo secundum rem et secundum nominis rationem.”

<sup>38</sup> ScG 1, 34 n. 2: “sicut virtus sanandi quae est in sanativis, prior est naturaliter sanitate quae est in animali, sicut causa effectui; sed quia hanc virtutem per effectum cognoscimus, ideo etiam ex effectu nominamus. Et inde est quod sanativum est prius ordine rei, sed animal dicitur per prius sanum secundum nominis rationem.”

<sup>39</sup> *De prin. nat.* §6, 33–35: “Analogice dicitur predicari quod predicatur de pluribus quorum rationes diuerse sunt, sed attribuuntur uni alicui eidem.” *In Metaph.* 4, l. 1, §535: “et illud dicitur analogice praedicari, idest proportionaliter, prout unumquodque secundum suam habitudinem ad illud unum refertur.”

<sup>40</sup> *In Metaph.* 4, l. 1, §535: “Quandoque vero [aliquid praedicatur de diversis] secundum rationes quae partim sunt diversae et partim non diversae: diversae quidem secundum quod diversas habitudines important, unae autem secundum quod ad unum aliquid et idem istae diversae habitudines referuntur.”

<sup>41</sup> *In Metaph.* 4, l. 1, §537 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003a34–b1): “Ponit enim [Philosophus] primo unum exemplum, quando multa comparantur ad unum sicut ad finem, sicut patet de hoc nomine sanativum vel salubre. Sanativum enim non dicitur univoce de diaeta, medicina, urina et animali. Nam ratio sani secundum quod dicitur de diaeta, consistit in conservando sanitatem. Secundum vero quod dicitur de medicina, in faciendo sanitatem. Prout vero dicitur de urina, est signum sanitatis. Secundum vero quod dicitur de animali, ratio eius est, quoniam est receptivum vel susceptivum sanitatis.” *De prin.*

However, (*healthy*) does not entirely (*ex toto*) signify the same in all, i.e., it is not said univocally; for it is said: of animal, as the *subject (of health)*, i.e., what is receptive or susceptible of health; of urine, as a *sign of health*; of food or diet, as *that which preserves health*; of medicine and of medication, as a *cause of health* (i.e., of medicine, as a virtue that produces health; of medication, as an instrumental agent of health). However, all these *ratios* are attributed *to one end*: namely, *to health* (< τὸ ὑγιεινὸν ἅπαν πρὸς ὑγίειαν).

Thus, the analogical mode of community is a **mean** between pure equivocation and simple univocity; for, in those that are said analogically, there is neither one *ratio*—as in univocal (predications)—, nor is there a totally diverse (*ratio*)—as in equivocal (predications).<sup>42</sup> Instead, the name that is analogically said (to be) in multiple (subjects) signifies diverse proportions to something one.

### 20.10. The One to Which Many Refer

The *one* to which diverse relations are referred in analogical (predications) is one (nature) in number, and not only in *ratio*—unlike that which is designated by a univocal name, which is one in *ratio*.<sup>43</sup>

Those that agree (*conveniunt*) according to analogy—that is, in proportion (*in proportione*), in comparison (*comparatione*) or in agreement (*convenientia*, i.e., to one and the same nature)—can be attributed:<sup>44</sup>

**1. To one end**, as in the example of *health*.<sup>45</sup> Thus, every (thing) is said (to be) *healthy* in respect of one and the same health; for the health of which the animal is susceptible is the same health that urine signifies, that medicine produces, and that diet preserves.

---

*nat.* §6, 36–41: “sicut sanum dicitur de corpore animalis et de urina et de potione, sed non ex toto idem significat in omnibus: dicitur enim de urina ut de signo sanitatis, de corpore ut de subiecto, de potione ut de causa. Sed tamen omnes iste rationes attribuuntur uni fini, scilicet sanitati.” ScG 1, 34 n. 1: “sicut secundum respectum ad unam sanitatem animal dicitur sanum ut eius subiectum, medicina ut eius effectivum, cibus ut conservativum, urina ut signum.” *STh* I, q. 13 a. 5 co.: “sicut sanum dicitur de medicina et urina, in quantum utrumque habet ordinem et proportionem ad sanitatem animalis, cuius hoc quidem signum est, illud vero causa.”

<sup>42</sup> *STh* I, q. 13 a. 5 co.: “Et iste modus communitatis [sc., analogiae] medius est inter puram equivocacionem et simplicem univocationem. Neque enim in his quae analogice dicuntur, est una ratio, sicut est in univocis; nec totaliter diversa, sicut in equivocis; sed nomen quod sic multipliciter dicitur, significat diversas proportiones ad aliquid unum.”

<sup>43</sup> *In Metaph.* 4, I. 1, §536: “illud unum ad quod diversae habitudines referuntur in analogicis, est unum numero, et non solum unum ratione, sicut est unum illud quod per nomen univocum designatur.” Cf. ARISTOTLE, *Metaphysica* Γ.2, 1003a33–35: “Τὸ δὲ ὄν λέγεται μὲν πολλαχῶς, ἀλλὰ πρὸς ἓν καὶ μίαν τινὰ φύσιν καὶ οὐχ ὁμωνύμως ἄλλ’ ὥσπερ καὶ τὸ ὑγιεινὸν ἅπαν πρὸς ὑγίειαν.”

<sup>44</sup> *De prin. nat.* §6, 42–44: “Aliquando enim ea quae conveniunt secundum analogiam, id est in proportione uel comparatione uel convenientia, attribuuntur [...]”

<sup>45</sup> *In Metaph.* 4, I. 1, §537 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003a33–b1): “Sic igitur omne sanativum vel sanum dicitur ad sanitatem unam et eandem. Eadem enim est sanitas quam animal suscipit, urina significat, medicina facit, et diaeta conservat.” *De prin. nat.* §6, 44–45: “uni fini, sicut patet in predicto exemplo.”

**2. To one agent.**<sup>46</sup> In this mode, for example, diverse things are said (to be) *medical*: e.g., one who possesses the habit of medicine, as a skilled physician; another, in turn, because he is well apt to having the art of medicine, as are such men who are disposed to easily acquire the art of medicine; whence, it happens that by their own ingenuity they perform some medicinal actions, as a midwife does; another is said (to be) *medicinal* because its action is towards medicine, as the instruments that some physicians use can be said (to be) *medical*, and also medications which physicians use to produce health; and, likewise, other (things) can be taken which are said in multiple (modes), as are these.

**3. To one subject.**<sup>47</sup> For example, *being (ens)* is said of substance, of quality, of quantity, and of the other categories. However, the *ratio* whereby substance is a being and (the *ratio* whereby) quantity is a being is not wholly the same—nor is the *ratio* of the other (categories) the same. Rather, all (these) are said (to be beings) insofar as they are attributed to substance, which is the subject of the others. And so, *being (ens)* is said priorly (*per prius*) of substance, and posteriorly (*per posterius*) of the others. Hence, *being* is not the genus of substance and of quantity because no genus is predicated according to prior and posterior of their species; rather, it is predicated analogically (►27.2, ¶2). Thus, substance and quantity differ in genus, but are the same in analogy.

### 20.11. Agreement of Proportionality

Agreement of *proportionality*, rather than a consideration of the agreement of two things to each other that have a proportion,<sup>48</sup> is an agreement of proportions of two (things) to each other, in which no determinate relation is considered between those of which there is something common by analogy (i.e., instead of comparing one thing to another in proportion, only the relations are compared; and they are not considered insofar as they

---

<sup>46</sup> In *Metaph.* 4, l. 1, §538 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b1–5): “Secundo ponit [Philosophus] exemplum quando multa comparantur ad unum sicut ad principium efficiens. Aliquid enim dicitur medicativum, ut qui habet artem medicinae, sicut medicus peritus. Aliquid vero quia est bene aptum ad habendum artem medicinae, sicut homines qui sunt dispositi ut de facili artem medicinae acquirant. Ex quo contingit quod ingenio proprio quaedam medicinalia operantur. Aliquid vero dicitur medicativum vel medicinale, quia eo opus est ad medicinam, sicut instrumenta quibus medici utuntur, medicinalia dici possunt, et etiam medicinae quibus medici utuntur ad sanandum. Et similiter accipi possunt alia quae multipliciter dicuntur, sicut et ista.” *De prin. nat.* §6, 45–49: “aliquando uni agenti, sicut medicus dicitur et de eo qui operatur per artem et de eo qui operatur sine arte, ut uetula, et etiam de instrumentis, sed per attributionem ad unum agens quod est medicina.”

<sup>47</sup> *De prin. nat.* §6, 49–62: “aliquando autem per attributionem ad unum subiectum, sicut ens dicitur de substantia, de qualitate et quantitate et aliis predicamentis: non enim ex toto est eadem ratio qua substantia est ens et quantitas et alia, sed omnia dicuntur ex eo quod attribuuntur substantie, quod est subiectum aliorum. Et ideo ens dicitur per prius de substantia et per posterius de aliis; et ideo ens non est genus substantie et quantitatis, quia nullum genus predicatur per prius et posterius de suis speciebus, sed predicatur analogice. Et hoc est quod diximus, quod substantia et quantitas differunt genere sed sunt idem analogia.”

<sup>48</sup> *De veritate*, q. 2 a. 11 co.: “convenientia etiam quandoque attenditur non duorum ad invicem inter quae sit proportio sed magis duarum ad invicem proportionum [...]. Sed in alio modo analogiae nulla determinata habitudo attenditur inter ea quibus est aliquid per analogiam commune.”

agree in some genus; whence, e.g., a relation between numbers can be compared to a relation between magnitudes).

For example, six agrees with four because, just as six is the double of three, so four (is the double) of two.<sup>49</sup>

We also find something said analogically according to this mode of agreement.<sup>50</sup> For example, the name *sight* (*visus*, i.e., the act of seeing) is said of corporeal sight and of understanding because just as sight is in the eye, so (is) understanding in the mind (i.e., as when we say, “I see it now” for “I understand it now”).

## 20.12. Division of the Equivocal, the Univocal, and the Analogous

The univocal, the equivocal, and the analogous are divided diversely:<sup>51</sup>

### 1. The **univocal** is divided according to *differences* (► 27.2, ¶1).<sup>52</sup>

Thus, any one genus is divided univocally (by its differences; ► 16.4; 16.5; 16.6) into the species contained under the genus; and hence, a proper mode of predicating is not owed to a species.<sup>53</sup>

### 2. The **equivocal** is divided according to *things signified*.<sup>54</sup>

In those (things) that are purely equivocal by chance or fortune, no order or respect of one to the other can be considered.<sup>55</sup> Instead, it is altogether by accident that one name is attributed to diverse things; for the name imposed to one does not signify its having an order to the other (for example, it happened by chance that the same name, *bat*, has been

---

<sup>49</sup> *De veritate*, q. 2 a. 11 co.: “sicut senarius convenit cum quaternario ex hoc quod sicut senarius est duplum ternarii, ita quaternarius binarii.”

<sup>50</sup> *De veritate*, q. 2 a. 11 co.: “Quandoque vero dicitur aliquid analogice secundo modo convenientiae; sicut nomen visus dicitur de visu corporali et intellectu, eo quod sicut visus est in oculo, ita intellectus in mente.”

<sup>51</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “aliter dividitur aequivocum, analogum et univocum.”

<sup>52</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “univocum vero dividitur secundum differentias.”

<sup>53</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “Unumquodque autem genus dividitur univoce in species contentas sub genere, et ideo speciebus non debetur proprius modus praedicandi.”

<sup>54</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “Aequivocum enim dividitur secundum res significatas.” Consequently, a species can be divided against its genus according to the division of a name that is equivocal in that which is signified (e.g., if we divide the genus *animal* into *animal*, *ox*, and *man*, these three do not signify one ratio). See *In Sent.* 3, d. 33 q. 3 a. 4 qc. 5 ad 1: “Ad primum [sc., *species non debet dividi contra genus*] ergo dicendum, quod species potest dividi contra genus divisione quae est nominis aequivoci in suo significato.”

<sup>55</sup> *ScG* 1, 33 n. 2: “in his quae sunt a casu aequivoca, nullus ordo aut respectus attenditur unius ad alterum, sed omnino per accidens est quod unum nomen diversis rebus attribuitur: non enim nomen impositum uni significat ipsum habere ordinem ad aliud.” *In Sent.* 1, d. 35 q. 1 a. 4 co.: “in his quae sunt pure aequivoca per casum et fortunam, ex uno non cognoscitur alterum, ut quando idem nomen duobus hominibus convenit.”

imposed on a kind of club and on any chiropteran; for the latter is an alteration of the Middle English *bakke*, of Scandinavian origin, while the former comes from the Old English *batt*, and there is no essential order between the two). Whence, one of them is not known from the other, as when two human beings agree in (having) the same name (e.g., from our knowing a kind of club we do not come to know a chiropteran, just like we do not know one Peter just because we know another).

3. The **analogous** is divided according to *diverse modes* (► 27.2, ¶2).<sup>56</sup>

For example, since *being* is predicated analogically of the ten genera, it is divided into them according to diverse modes.<sup>57</sup> Whence, to each one genus is owed its proper mode of predicating (► 33.1).

---

<sup>56</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “analogum dividitur secundum diversos modos.”

<sup>57</sup> *In Sent.* 1, d. 22 q. 1 a. 3 ad 2: “cum ens praedicetur analogice de decem generibus, dividitur in ea secundum diversos modos. Unde unicuique generi debetur proprius modus praedicandi.”

## 21. Logical Intention and Real Being

*Having determined the modes in which one thing is predicated of many, we turn our attention to the relation between what is predicated and what is.*

### 21.1. Reason

**Reason** (*ratio*) can be taken in two (modes):<sup>1</sup>

1. Sometimes, that which is in the reasoning (subject) is said (to be a) *reason*: namely, **(a) the act** itself of reason (i.e., the act of reasoning); or **(b) the power** that reason is (i.e., the faculty of reason, a power of the human mind).<sup>2</sup>
2. Sometimes, *reason* is the name of an **intention**, whether **(a)** insofar as it signifies the **definition** of a thing, according as a reason (i.e., what we have been calling *ratio*; ► 8.1) is a definition; or **(b)** insofar as an **argumentation** is said (to be a) *reason*.<sup>3</sup>

### 21.2. The Intention in the Mind Responds to a Nature in the Thing

In all intentions (i.e., both *ratios* or definitions, and argumentations) this is true in common: that the intentions themselves are not in things, but only in the soul.<sup>4</sup> However, (intentions, when they are truly attributed to things) have something that responds (to them) in the thing: a nature, to which the intellect attributes such intentions.

For example, the intention of *genus* is not in the ass, but (what is in the ass is) the nature of *animal*, to which the intellect attributes this intention (i.e., the intention of *genus*).<sup>5</sup> And there is in the thing something that responds to it, in which it is founded: *the truth of that thing to which such an intention is attributed*.

### 21.3. How a *Ratio* is Said to Be in a Thing-Outside-The-Mind

A *ratio* is said to be in a thing outside the mind (*in re extra animam*)<sup>6</sup> insofar as that which is signified by the name—i.e., that to which it befalls to be a *ratio*—is in the thing.<sup>7</sup>

---

<sup>1</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 3: “Sciendum est autem, quod ratio sumitur dupliciter.”

<sup>2</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 3: “quandoque enim ratio dicitur id quod est in ratiocinante, scilicet ipse actus rationis, vel potentia quae est ratio.”

<sup>3</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 3: “quandoque autem ratio est nomen intentionis, sive secundum quod significat definitionem rei, prout ratio est definitio, sive prout ratio dicitur argumentatio.”

<sup>4</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 3: “In omnibus autem intentionibus hoc communiter verum est, quod intentiones ipsae non sunt in rebus sed in anima tantum, sed habent aliquid in re respondens, scilicet naturam, cui intellectus hujusmodi intentiones attribuit.”

<sup>5</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 3: “sicut intentio generis non est in asino, sed natura animalis, cui per intellectum haec intentio attribuitur: [...] est in re aliquid respondens ei in quo fundatur, scilicet veritas illius rei cui talis intentio attribuitur.”

<sup>6</sup> The human mind is a *rational soul*. See, e.g., *Super Cor.* 2, c. 5 l. 1: “mens seu anima rationalis.”

<sup>7</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “ratio dicitur esse in re, in quantum significatum nominis, cui accidit esse rationem, est in re: et hoc contingit proprie, quando conceptio intellectus est similitudo rei.”

Hence, a *ratio* is not said to be in a thing as though the intention that the name of the *ratio* signifies were in it; nor as though the conception that belongs to that intention were outside the mind, since that conception is in the mind (*in anima*) as in a subject (*sicut in subjecto*).<sup>8</sup>

Instead, a *ratio* is said to be in a thing insofar as there is something in the thing outside the mind that responds to the conception of the mind *as that which is signified (responds) to the sign*.<sup>9</sup> And this properly happens when the conception of the intellect is a likeness (*similitudo*) of the thing outside the mind.

However, a *ratio* is not always *properly* said to be in a real thing; for the conception of the intellect can be related to the thing outside the mind in one of three ways:<sup>10</sup> **(1)** properly, again, as a likeness of the real thing outside the mind (► 21.4); **(2)** as something that follows upon our way of understanding the real thing (► 21.5); or **(3)** as neither (► 21.13).

#### 21.4. The Likeness of the Thing-Outside-The-Mind

Whenever the intellect apprehends something that is in the thing according to (the same mode in) which it is apprehended, what the intellect conceives is *a likeness of the thing that exists outside the mind*.<sup>11</sup> Such a conception of the intellect has its foundation immediately in the thing, insofar as the thing itself, due to its conformity with the intellect, causes the intellect to be true and causes the name—that signifies the understanding—to be properly said (i.e., truly predicated) of the thing.<sup>12</sup>

Thus, of those (natures) that are signified by names, there are some that, according to being (*secundum esse*), are a complete whole outside the soul.<sup>13</sup> And of such a mode are

---

<sup>8</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Et ex hoc patet [...] qualiter ratio dicatur esse in re. Non enim hoc dicitur, quasi ipsa intentio quam significat nomen rationis, sit in re; aut etiam ipsa conceptio, cui convenit talis intentio, sit in re extra animam, cum sit in anima sicut in subjecto.”

<sup>9</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Et ex hoc patet [...] qualiter ratio dicatur esse in re. [...] dicitur esse in re, in quantum in re extra animam est aliquid quod respondet conceptioni animae, sicut significatum signo.”

<sup>10</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “sciendum, quod ipsa conceptio intellectus tripliciter se habet ad rem quae est extra animam.” *In Sent.* 1, d. 30 q. 1 a. 3 co.: “Sciendum tamen est, quod ratio in intellectu rerum tripliciter se habet. Quandoque enim apprehendit aliquid quod est in re secundum quod apprehenditur [...]. Quandoque vero apprehendit aliquid quod nullo modo in re est [...]. Aliquando autem apprehendit aliquid cui subest in re natura quaedam, non tamen secundum rationem qua apprehenditur.” *In Sent.* 1, d. 19 q. 5 a. 1 co.: “eorum quae significantur nominibus, invenitur triplex diversitas. Quaedam enim sunt quae secundum esse totum completum sunt extra animam [...]. Quaedam autem sunt quae nihil habent extra animam [...]. Quaedam autem sunt quae habent fundamentum in re extra animam, sed complementum rationis eorum quantum ad id quod est formale, est per operationem animae.”

<sup>11</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Aliquando enim hoc quod intellectus concipit, est similitudo rei existentis extra animam.” *In Sent.* 1, d. 30 q. 1 a. 3 co.: “Quandoque enim [intellectus] apprehendit aliquid quod est in re secundum quod apprehenditur.”

<sup>12</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “talis conceptio intellectus habet fundamentum in re immediate, in quantum res ipsa, ex sua conformitate ad intellectum, facit quod intellectus sit verus, et quod nomen significans illum intellectum, proprie de re dicatur.”

<sup>13</sup> *In Sent.* 1, d. 19 q. 5 a. 1 co.: “eorum quae significantur nominibus, invenitur triplex diversitas. Quaedam enim [eorum quae significantur nominibus] sunt quae secundum esse totum completum sunt extra animam; et huiusmodi sunt entia completa, sicut homo et lapis.” *In Sent.* 1, d. 2 q. 1 a. 3 co.:

complete beings, such as a man or a stone. Whence, when the form (of man) is apprehended, that which is conceived from the name *man* (*homo*, i.e., human being) is a likeness of the human being that exists outside the mind.

### 21.5. Intentions Founded in a Thing-Outside-The-Mind

Sometimes, the conception that the name signifies is not a likeness of a thing that exists outside the mind, but *something that follows upon the mode of understanding the thing that is outside the mind*.<sup>14</sup> Such are the intentions that our intellect discovers (*adinvenit*; i.e., *finds out*; *devises*).<sup>15</sup>

For example, what is signified by the name *genus* is not a likeness of something existing outside the mind: rather, the intellect attributes (e.g.) to *animal*, the intention of *genus* because it understands *animal* as existing in multiple species.<sup>16</sup>

Although the proximate foundation of such intentions is not in the thing, but in the intellect, nevertheless, the remote foundation is the thing itself.<sup>17</sup> Hence, the intellect that discovers them is not false. And it is likewise of all other (intentions) that follow upon the mode of understanding, as the abstractions of mathematicians (►49.10).

(According to this mode), the intellect apprehends something that some nature in the thing underlies, but not according to the *ratio* whereby it is apprehended (►21.6).<sup>18</sup> This is evident when it apprehends the intention of the genus of *substance* (as) non-determined—according to itself—to *this* or *that* species, which in the thing is some (determinate) nature; and it attributes the *ratio* of *genus*—which *ratio* is not in the thing—to *this* nature apprehended according to the mode by which it is in the apprehending intellect, which takes some common one essence (*unum quid*) in which that nature is found.

---

“Aliquando enim hoc quod intellectus concipit, est similitudo rei existentis extra animam, sicut hoc quod concipitur de hoc nomine homo.” *In Sent.* 1, d. 30 q. 1 a. 3 co.: “ut quando apprehenditur forma lapidis.”

<sup>14</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Aliquando autem hoc quod significat nomen non est similitudo rei existentis extra animam, sed est aliquid quod consequitur ex modo intelligendi rem quae est extra animam: et hujusmodi sunt intentiones quas intellectus noster adinvenit.”

<sup>15</sup> See LEWIS and SHORT, *A Latin Dictionary*, entry for *ādivněňo*.

<sup>16</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “sicut significatum hujus nominis genus non est similitudo alicujus rei extra animam existentis; sed ex hoc quod intellectus intelligit animal ut in pluribus speciebus, attribuit ei intentionem generis.”

<sup>17</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “hujusmodi intentionis licet proximum fundamentum non sit in re sed in intellectu, tamen remotum fundamentum est res ipsa. Unde intellectus non est falsus, qui has intentiones adinvenit. Et simile est de omnibus aliis qui consequuntur ex modo intelligendi, sicut est abstractio mathematicorum et hujusmodi.”

<sup>18</sup> *In Sent.* 1, d. 30 q. 1 a. 3 co.: “Aliquando autem apprehendit aliquid cui subest in re natura quaedam, non tamen secundum rationem qua apprehenditur; sicut patet quando apprehendit intentionem generis substantiae, quae in re est natura quaedam non determinata secundum se ad hanc vel ad illam speciem; et huic naturae apprehensae, secundum modum quo est in intellectu apprehendente, qui ex omnibus accipit unum quid commune in quibus invenitur natura illa, attribuit rationem generis, quae quidem ratio non est in re.”

Those (intentions) that have a foundation in the thing outside the soul have a complement of *ratio*—in respect to that which is formal—through the operation of the soul, as is evident in (the case of) the universal (►19.7).<sup>19</sup>

For example, humanity is something in the thing, but it does not have there (i.e., in the thing outside the mind) the *ratio* of universal; for outside the soul there is no humanity (that is) common to many; rather, insofar as it is received in the intellect, an intention is added to it through an operation of the intellect, according to which it is said (to be a) *species*.<sup>20</sup>

Likewise, time (which is defined as *the number of motion according to prior and posterior*) has a foundation in motion: namely, the prior and the posterior in motion itself.<sup>21</sup> However, in respect of that which is formal in time—namely, numeration—it is completed through the operation of the numbering intellect (►62.6; 34.4).

## 21.6. Reception in the Intellect of the Likeness of a Thing

The likeness of a thing is received in the intellect according to the mode of the intellect, and not according to the mode of the thing (►26.3).<sup>22</sup> Whence, something responds (in the thing) to the composition and the division of the intellect (i.e., to a true proposition; ►19.1); but (the composition itself) is not had in the intellect as (it is had) in the thing.

The proper object of the human intellect is the quiddity of the material thing that falls under sense and imagination; but there is a twofold composition in the material thing (►15.14):<sup>23</sup>

**1. Composition of form to matter** (*compositio formae ad materiam*).<sup>24</sup> To this responds the composition of the intellect by which the universal whole is predicated of its part; for the genus is taken from common matter, while the completive difference (is taken) from the form (►13.16); and the particular (is taken) from individual matter (►13.12).

---

<sup>19</sup> *In Sent.* 1, d. 19 q. 5 a. 1 co.: “Quaedam autem sunt quae habent fundamentum in re extra animam, sed complementum rationis eorum quantum ad id quod est formale, est per operationem animae, ut patet in universali.”

<sup>20</sup> *In Sent.* 1, d. 19 q. 5 a. 1 co.: “Humanitas enim est aliquid in re, non tamen ibi habet rationem universalis, cum non sit extra animam aliqua humanitas multis communis; sed secundum quod accipitur in intellectu, adiungitur ei per operationem intellectus intentio, secundum quam dicitur species.”

<sup>21</sup> *In Sent.* 1, d. 19 q. 5 a. 1 co.: “et similiter est de tempore, quod habet fundamentum in motu, scilicet prius et posterius ipsius motus; sed quantum ad id quod est formale in tempore, scilicet numeratio, completur per operationem intellectus numerantis.”

<sup>22</sup> *STh* I, q. 85 a. 5 ad 3: “similitudo rei recipitur in intellectu secundum modum intellectus, et non secundum modum rei. Unde compositioni et divisioni intellectus respondet quidem aliquid ex parte rei; tamen non eodem modo se habet in re, sicut in intellectu.”

<sup>23</sup> *STh* I, q. 85 a. 5 ad 3: “Intellectus enim humani proprium obiectum est quidditas rei materialis, quae sub sensu et imaginatione cadit. Invenitur autem duplex compositio in re materiali.”

<sup>24</sup> *STh* I, q. 85 a. 5 ad 3: “Prima quidem [compositio in re materiali], formae ad materiam, et huic respondet compositio intellectus qua totum universale de sua parte praedicatur; nam genus sumitur a materia communi, differentia vero completiva speciei a forma, particulare vero a materia individuali.”

For example, *animal* signifies *that which has a sensitive nature*; *rational* (signifies) *that which has an intellective nature*; *man* (signifies) *that which has one and the other*; and *Socrates* (signifies) *that which has all these with individual matter*.<sup>25</sup>

And according to this identity of *ratio* (i.e., univocally; ► 20.1), our intellect composes one (proposition) predicating (a universal whole, i.e., a genus, a species, or a difference) of another (i.e., of a subjective part, as a species or an individual).<sup>26</sup>

**2. Composition of accident to subject** (*compositio accidentis ad subiectum*).<sup>27</sup> To this real composition responds the composition of the intellect according to which an accident is predicated of a subject, as when we say, “a man is white.”

Here, the composition of the intellect differs from the composition of the thing.<sup>28</sup> Those that are composed in the thing are diverse (i.e., they are not one in genus), while the composition of the intellect (i.e., the proposition; ► 19.1) is a sign of the identity of those that are composed; for the intellect does not compose in such a way that it would say that a man is whiteness; rather, it says that a man is white—i.e., having whiteness—, while *the subject* that is a man *is the same* than *that which has whiteness*.

### 21.7. Relations of *Ratio*

Just as a real relation (*realis relatio*) consists in an order of a thing to a thing, a relation of *ratio* (*relatio rationis*) consists in an order of understandings.<sup>29</sup>

A relation of *ratio* can happen in two modes:<sup>30</sup>

**1.** Insofar as this order is discovered (*adinventus*) by the intellect and attributed to that which is said relatively.<sup>31</sup>

---

<sup>25</sup> *STh* I, q. 85 a. 5 ad 3: “Et simile est de compositione formae et materiae, nam animal significat id quod habet naturam sensitivam, rationale vero quod habet naturam intellectivam, homo vero quod habet utrumque, Socrates vero quod habet omnia haec cum materia individuali.”

<sup>26</sup> *STh* I, q. 85 a. 5 ad 3: “et secundum hanc identitatis rationem, intellectus noster unum componit alteri praedicando.”

<sup>27</sup> *STh* I, q. 85 a. 5 ad 3: “Secunda vero compositio est accidentis ad subiectum, et huic reali compositioni respondet compositio intellectus secundum quam praedicatur accidens de subiecto, ut cum dicitur, homo est albus.”

<sup>28</sup> *STh* I, q. 85 a. 5 ad 3: “Tamen differt compositio intellectus [secundum quam praedicatur accidens de subiecto] a compositione rei, nam ea quae componuntur in re, sunt diversa; compositio autem intellectus est signum identitatis eorum quae componuntur. Non enim intellectus sic componit, ut dicat quod homo est albedo; sed dicit quod homo est albus, idest habens albedinem, idem autem est subiecto quod est homo, et quod est habens albedinem.”

<sup>29</sup> *De potentia*, q. 7 a. 11 co.: “sicut realis relatio consistit in ordine rei ad rem, ita relatio rationis consistit in ordine intellectuum.”

<sup>30</sup> *De potentia*, q. 7 a. 11 co.: “relatio rationis [...] dupliciter potest contingere.”

<sup>31</sup> *De potentia*, q. 7 a. 11 co.: “uno modo secundum quod iste ordo est adinventus per intellectum, et attributus ei quod relative dicitur.”

Reason discovers these relations by considering the order of that which is in the intellect to the things that are outside; or, also, the order of understandings to one another.<sup>32</sup>

Of such mode are the relations that are attributed by the intellect to the things understood insofar as they are understood (*prout sunt intellectae*), such as a relation of genus and species.<sup>33</sup>

2. Insofar as such relations (of *ratio*) follow upon the mode of understanding: i.e., that the intellect understands something in an order to another, even if the intellect does not discover (that order; ►21.8); instead, (such an order) follows, of some necessity, upon the mode of understanding; and the intellect does not attribute such relations to that which is in the intellect, but to that which is in the thing (*in re*).<sup>34</sup>

### 21.8. Non-Discovered Relations of *Ratio*

(That an order follows, of some necessity, upon the mode of understanding) happens insofar as some (things) that do not have an order according to themselves (*secundum se*) are understood ordinately, even though the intellect does not understand that they have an order; for in such a way (the understanding) would be false.<sup>35</sup>

For some (things) to have an order, each must be a being, and each must be distinct; for there is no order of the same to the same, and each must be orderable to the other (►8.5).<sup>36</sup> However, sometimes the intellect:

1. Takes some two (understandings) as beings, of which only one or neither (of them) is a being.<sup>37</sup> For example, when it takes two future (things), or one present and another future, and understands one with an order to the other, saying that one is prior to the other; whence, these relations are only of *ratio*, insofar as they follow upon the mode of understanding.

---

<sup>32</sup> *De potentia*, q. 7 a. 11 co.: “has enim relationes ratio adinvenit considerando ordinem eius quod est in intellectu ad res quae sunt extra, vel etiam ordinem intellectuum ad invicem.”

<sup>33</sup> *De potentia*, q. 7 a. 11 co.: “huiusmodi sunt relationes quae attribuuntur ab intellectu rebus intellectis, prout sunt intellectae, sicut relatio generis et speciei.”

<sup>34</sup> *De potentia*, q. 7 a. 11 co.: “Alio modo secundum quod huiusmodi relationes consequuntur modum intelligendi, videlicet quod intellectus intelligit aliquid in ordine ad aliud; licet illum ordinem intellectus non adinveniat, sed magis ex quadam necessitate consequatur modum intelligendi. Et huiusmodi relationes intellectus non attribuit ei quod est in intellectu, sed ei quod est in re.”

<sup>35</sup> *De potentia*, q. 7 a. 11 co.: “Et hoc quidem contingit secundum quod aliqua non habentia secundum se ordinem, ordinate intelliguntur; licet intellectus non intelligat ea habere ordinem, quia sic esset falsus.”

<sup>36</sup> *De potentia*, q. 7 a. 11 co.: “Ad hoc autem quod aliqua habeant ordinem, oportet quod utrumque sit ens, et utrumque distinctum (quia eiusdem ad seipsum non est ordo) et utrumque ordinabile ad aliud.”

<sup>37</sup> *De potentia*, q. 7 a. 11 co.: “Quandoque autem intellectus accipit aliqua duo ut entia, quorum alterum tantum vel neutrum est ens: sicut cum accipit duo futura, vel unum praesens et aliud futurum, et intelligit unum cum ordine ad aliud, dicens alterum esse prius altero; unde istae relationes sunt rationis tantum, utpote modum intelligendi consequentes.”

2. Takes one (thing) as two (things) and understands them with some order. For example, when we say that something is the same as itself; and in this way, the relation is of *ratio* only.<sup>38</sup>

3. Takes two (things) as orderable to one another, between which there is no mean order; instead, one of them is essentially an order.<sup>39</sup> For example, when it says that a relation happens to a subject; whence, such a relation of a relation—to whatever other (thing)—is only of *ratio*.

4. Takes something with an order to another insofar as it is the terminus of an order of another to it, even if it is not ordered to the other (► 37.21, ¶2).<sup>40</sup> For example, taking that which is knowable as a terminus of the order of knowledge to it; and in this way, with some order to knowledge, the name *knowable* signifies relatively; and it is a relation of *ratio* only.

### 21.9. Comparability

Diversities of relations—even of those that are of diverse genera—can be referred to one another; for those that are of diverse genera are diverse to each other.<sup>41</sup> Moreover, there can be some relation (between them), as between those-that-are-from-a-principle and the principle (*inter principiata et principium*). However, not all (things) that are related can be compared: only those that have a relation according to one quantity or one quality, such that—from this—one can be said to be greater, better, whiter, or something of this sort.

Thus, those that are of one order seem to be comparable to each other—and being *prior* or *posterior* conveys a comparison.<sup>42</sup> However, there are three requirements for things to be **comparable** (*comparabilia* = συμβλητά):<sup>43</sup>

---

<sup>38</sup> *De potentia*, q. 7 a. 11 co.: “Quandoque vero accipit unum ut duo, et intelligit ea cum quodam ordine: sicut cum dicitur aliquid esse idem sibi; et sic talis relatio est rationis tantum.”

<sup>39</sup> *De potentia*, q. 7 a. 11 co.: “Quandoque vero accipit aliqua duo ut ordinabilia ad invicem, inter quae non est ordo medius, immo alterum ipsorum essentialiter est ordo: sicut cum dicit relationem accidere subiecto; unde talis relatio relationis ad quodcumque aliud rationis est tantum.”

<sup>40</sup> *De potentia*, q. 7 a. 11 co.: “Quandoque vero accipit aliquid cum ordine ad aliud, in quantum est terminus ordinis alterius ad ipsum, licet ipsum non ordinetur ad aliud: sicut accipiendo scibile ut terminum ordinis scientiae ad ipsum; et sic cum quodam ordine ad scientiam, nomen scibilis relative significat; et est relatio rationis tantum.”

<sup>41</sup> *De potentia*, q. 7 a. 8 ad 2: “non omnium est comparatio quorum est relatio ad invicem, sed solum illorum quorum est relatio secundum unam quantitatem vel qualitatem, ut ex hoc possit unum altero dici maius aut melius, vel albius vel aliquid huiusmodi. Relationum autem diversitates possunt ad invicem referri etiam quae diversorum generum sunt: ea enim quae diversorum generum sunt, sunt ad invicem diversa. [...] potest esse aliqua relatio [...] sicut inter principiata et principium.”

<sup>42</sup> *In Physic.* 7, l. 1, n. 1: “ea quae sunt unius ordinis, habent aliquam comparisonem ad invicem.” *Ibid.*, l. 7, n. 1: “ea quae sunt unius ordinis videntur comparabilia esse, et hoc ipsum quod est prius et posterius comparisonem importat.”

<sup>43</sup> *In Physic.* 7, l. 7, n. 12: “oportet ea quae sunt comparabilia, non solum non esse aequivoca, quod erat primum; sed etiam non habere differentiam, neque ex parte subiecti primi in quo aliquid recipitur, quod erat secundum; neque ex parte eius quod recipitur, quod est forma vel natura; et hoc est tertium.”

1. Those that are comparable must not be (purely) equivocal.

For example, *acute* (*acutum* = ὀξύ) is taken equivocally:<sup>44</sup> **(a)** in one mode, it is said in magnitudes, according to which an angle is said (to be) *acute*, and a stylus is said (to be) *acute* (i.e., sharp; in both cases, some magnitudes make an angle that is less than a right angle); **(b)** in another mode, *acute* is said in savors, as wine is said (to be) *acute* (i.e., acid, pungent); **(c)** in another mode, it is said in voices, according to which the highest voice in melodies, or in the strings of a lyre, is said (to be) *acute*. Therefore, it would be impossible to compare a stylus, a wine and a high voice in order to tell which one is acuter; for *acute* is predicated equivocally of them. On the other hand, a high voice can be compared in acuteness to that which is on a par with it (*iuxta ipsam*) in the order of melodies, because *acute* is not predicated equivocally of one and of the other, but according to the same *ratio*.

Those things that are the same in definition are the same simply.<sup>45</sup> Hence, it is the proper definition of a thing by which we can discern whether things are the same or other: for example, white or sweet. But *other* can be taken in two modes, as also *prior* (can be taken in two modes): **(a)** as white is said (to be) *other than* sweet because in the white is found (some) other subjected nature than in the sweet; **(b)** because they differ not only according to a subjected nature, but they are altogether not the same; for it is manifest that the *ratio* of *identity* and of *diversity* is the same both in species and in definition (►41).

Hence, we must consider that many things that are not equivocal according to the abstract consideration of the logician or of the mathematician, are nonetheless said equivocally in some mode according to the concrete *ratio* of the natural (philosopher) because they are not received in whatever matter according to the same *ratio* (►21.11).<sup>46</sup> For example,

---

<sup>44</sup> *In Physic. 7, l. 7, n. 8* (cf. ARISTOTLE, *Physica* H.4, 248b7–10): “Sicut *acutum* aequivoce sumitur: uno enim modo dicitur in magnitudinibus, secundum quem modum angulus dicitur acutus, et stylus acutus; alio modo dicitur in saporibus, secundum quem modum vinum dicitur acutum; tertio modo dicitur in vocibus, secundum quem modum vox *ultima*, idest suprema, in melodiis, vel chorda in cythara dicitur acuta. Ideo ergo non potest fieri comparatio ut dicatur quid sit acutius, utrum stylus aut vinum aut vox ultima, quia acutum de eis aequivoce praedicatur: sed vox ultima potest comparari secundum acuitatem, ei quae est iuxta ipsam in ordine melodiae, propter hoc quod acutum non aequivoce, sed secundum eandem rationem praedicatur de utraque.”

<sup>45</sup> *In Physic. 7, l. 8, n. 9* (cf. ARISTOTLE, *Physica* H.4, 249a25–29): “quia ea quae sunt idem definitione, sunt idem simpliciter, ideo [...] illud est propria definitio rei, quo possumus discernere utrum sit idem aut aliud, puta album vel dulce. Et hoc quod dico *aliud*, potest duobus modis accipi, sicut et prius: uno scilicet modo ut album dicatur aliud a dulci, quia in albo invenitur alia natura subiecta quam in dulci; alio modo, quia non solum secundum naturam subiectam differunt, sed omnino non sunt idem. [...] Manifestum est enim quod eadem est ratio identitatis et diversitatis, et in specie et in definitione.”

<sup>46</sup> *In Physic. 7, l. 7, n. 9*: “Est autem considerandum, quod multa quidem secundum abstractam considerationem vel logici vel mathematici non sunt aequivoca, quae tamen secundum concretam rationem naturalis ad materiam applicantis, aequivoce quodammodo dicuntur, quia non secundum eandem rationem in qualibet materia recipiuntur.”

even if the *ratio* of *double* consists in being of the ratio (*proportio*) *two-to-one* (2 : 1), this *ratio* contains an equivocation; for it could perhaps be said that *one* itself is equivocal (► 38.1); and if *one* is said equivocally, it follows that *two* is also said equivocally; for *two* is nothing other than *twice one*.<sup>47</sup> Thus, we cannot say that water is the double of air—or conversely—because air and water are not comparable (i.e., insofar as *double* is not received in air and in water according to the same *ratio*; on the other hand, they would be comparable according to the abstract consideration of the mathematician, who abstracts from sensible matter).<sup>48</sup> Likewise, *equal*—i.e., *that which is of one quantity*—is equivocal because the *ratio* of *one quantity* is not the same in all (subjects).<sup>49</sup>

2. Hence, there must be no difference on the part of the first subject in which something is received.<sup>50</sup> If one nature is received in diverse things *according to one, first subject* (*secundum unum primum subiectum* < ἐν ᾧ πρῶτον, τὸ αὐτό), these are comparable.

For example, horse and dog can be compared according to whiteness in order to tell which one is whiter because not only is the nature of whiteness the same in one and in the other, but there is also one, first subject in which whiteness is received: *surface*.<sup>51</sup> Likewise, magnitude is comparable in one and in the other in order to tell which one is greater because the subject of magnitude is the same in one and in the other: namely, the *substance of a compound body* (*substantia corporis mixti*).

On the other hand,<sup>52</sup> water and voice are not comparable according to magnitude in order to tell whether voice is greater than water—or conversely—because, although magnitude

<sup>47</sup> *In Physic. 7, l. 7, n. 9* (cf. ARISTOTLE, *Physica* H.4, 248b12–15): “Quamvis enim ratio dupli sit, quod est proportio duorum ad unum, tamen ista etiam ratio continet aequivocationem: quia forte potest dici quod ipsum unum est aequivocum; et si unum aequivoce dicitur, sequitur quod duo, quia duo nihil aliud est quam bis unum.”

<sup>48</sup> *In Physic. 7, l. 7, n. 8* (cf. ARISTOTLE, *Physica* H.4, 248b13–15): “Inveniuntur enim aliqua non aequivoca, quae tamen non sunt comparabilia; sicut hoc ipsum quod est *multum*, secundum eandem rationem dicitur de aqua et de aere, et tamen non sunt comparabilia aer et aqua secundum multitudinem. Si autem non velit aliquis hoc concedere quod multum idem significet propter eius communitatem, saltem concedet quod *duplum*, quod est species multiplicis, idem significat in aere et aqua: utrobique enim significat proportionem duorum ad unum. Et tamen non sunt comparabilia aer et aqua secundum duplum et dimidium, ut dicatur quod aqua est duplum aeris, aut e converso.”

<sup>49</sup> *In Physic. 7, l. 7, n. 9* (cf. ARISTOTLE, *Physica* H.4, 248b17–19): “*aequale* [...] aequivocum est; quia aequale est quod habet unam quantitatem, non est autem eadem ratio unius quantitatis in omnibus.”

<sup>50</sup> *In Physic. 7, l. 7, n. 10* (cf. ARISTOTLE, *Physica* H.4, 248b21–22): “si una natura recipiatur in diversis secundum unum primum subiectum, erunt illa ad invicem comparabilia.”

<sup>51</sup> *In Physic. 7, l. 7, n. 10* (cf. ARISTOTLE, *Physica* H.4, 248b22–24): “sicut equus et canis comparari possunt secundum albedinem, ut dicatur quod eorum sit albius, quia non solum est eadem natura albedinis in utroque, sed etiam est unum primum subiectum in quo recipitur albedo, scilicet superficies. Et similiter magnitudo est comparabilis in utroque, ut dicatur quod eorum sit maius; quia idem est subiectum magnitudinis in utroque, scilicet substantia corporis mixti.”

<sup>52</sup> *In Physic. 7, l. 7, n. 10* (cf. ARISTOTLE, *Physica* H.4, 248b24–25): “Sed aqua et vox non sunt comparabilia secundum magnitudinem, ut dicatur quod vox est maior quam aqua, aut e converso; quia licet magnitudo secundum se sit eadem, non tamen est idem receptivum: quia secundum quod dicitur

is the same according to itself (*secundum se*), what is receptive (of the *ratio* of *magnitude*) is not the same: insofar as (magnitude) is said of water, its subject is *substance*; but insofar as it is said of voice, its subject is *sound*, which is a *quality*.

3. There must be no difference on the part of that which is received in the first subject.<sup>53</sup> For example, color is divided into diverse species of color. Whence, it is not comparable insofar as it (i.e., color commonly taken) is predicated of them (i.e., of diverse species). Even though it is not said equivocally, and although it has one first subject, which is *surface*, which is the first subject of the genus, (it is) not, however, (the first subject) of some species of color. Hence, we cannot say which is more colored, whether white or black; for this comparison is not according to some determinate species of color, but according to common color itself. Instead, according to white, which is not divided into diverse species, a comparison can be made of all white things in order to tell which one is whiter.

Those that are of one genus (e.g., *magnitude*) are not comparable because a genus is not something simply one, while a species (e.g., *line*) is something simply one (► 16.6).<sup>54</sup> On the other hand, those that are of one species (e.g., white or black, which are species of color) are comparable, since those that are of the same nature are comparable. Whence, it is evident that the genus is not one nature, while the species is one nature.

The species is one nature because it is taken from the last form (► 16.6), which is simply one in the nature of things.<sup>55</sup> On the other hand, the genus is not one nature because it is

---

de aqua, subiectum eius est substantia; secundum autem quod dicitur de voce, subiectum eius est sonus, qui est qualitas.”

<sup>53</sup> *In Physic. 7*, l. 7, n. 12 (cf. ARISTOTLE, *Physica* H.4, 249a3–8): “requiritur tertium ad hoc quod aliqua sint comparabilia. Et dicit quod oportet ea quae sunt comparabilia, non solum non esse aequivoca, quod erat primum; sed etiam non habere differentiam, neque ex parte subiecti primi in quo aliquid recipitur, quod erat secundum; neque ex parte eius quod recipitur, quod est forma vel natura; et hoc est tertium. Et exemplificat de hoc tertio. Quia color dividitur in diversas species coloris: unde non est comparabile secundum quod de eis praedicatur; licet non dicatur aequivoce, et licet etiam habeat unum primum subiectum, quod est superficies, quod est primum subiectum generis, non autem alicuius speciei coloris. Non enim possumus dicere quid sit magis coloratum, utrum album vel nigrum: haec enim comparatio non esset secundum aliquam determinatam speciem coloris, sed secundum ipsum colorem communem. Secundum vero album, quod non dividitur in diversas species, potest fieri comparatio omnium alborum, ut dicatur quid sit albius.”

<sup>54</sup> *In Physic. 7*, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a21–25): “genus non est aliquid unum simpliciter, species autem est aliquid unum simpliciter. [...] ea quae sunt unius generis, non sunt comparabilia; quae vero sunt unius speciei, comparabilia sunt; cum [...] eadem natura comparabilium est: ex quo videtur quod genus non sit una natura, sed species sit una natura.”

<sup>55</sup> *In Physic. 7*, l. 8, n. 8: “[...] videtur quod genus non sit una natura, sed species sit una natura. Et huius ratio est, quia species sumitur a forma ultima, quae simpliciter una est in rerum natura: genus autem non sumitur a forma aliqua quae sit una in rerum natura, sed secundum rationem tantum; non est enim aliqua forma ex qua homo sit animal, praeter illam ex qua homo est homo. Omnes igitur homines, qui sunt unius speciei, conveniunt in forma quae constituit speciem, quia quilibet habet animam rationalem: sed non est in homine, equo aut asino aliqua anima communis, quae constituat animal, praeter illam animam quae constituit hominem vel equum aut asinum (quod si esset, tunc genus esset unum et comparabile, sicut

not taken from some form that is one in the nature of things, but (is one) only according to *ratio*. Thus, there is no form from which a man is an animal other than that (form) from which a man is a man (►15.13). Therefore, all men, who are of one species, agree (*conveniunt*) in the form that constitutes the species, because any (of them) has a rational soul. On the other hand, there is no common soul in man, horse or ass, which would constitute an animal, other than that soul which constitutes a man, a horse, or an ass; otherwise, the genus would be comparable, as is the species. Rather, the form of a genus is taken in consideration alone by abstraction of the intellect from the differences.

Therefore, the species is something one from one form existing in the nature of things; the genus, on the other hand, is not one because diverse species of a genus receive predication according to the diverse forms existing in the nature of things.<sup>56</sup> And thus, a (predicable) genus is one logically—but not physically. (Note that the same happens with the genus of body and of substance; ►21.10; 21.11).

#### **21.10. Equivocation Due to Likeness or to Proximity to a Genus**

As ARISTOTLE says, since the (predicable) genus is one in some mode, but not (one) simply, close to the genus there are many latent: that is, due to proximity and likeness to the unity of a genus, the equivocation of many is latent.<sup>57</sup>

There are some very distant equivocal (things) in which only the community of the name is considered: for example, if *dog (canis)* is said of a celestial constellation (i.e., *Canis*) and of an animal capable of barking.<sup>58</sup>

There are others that have some likeness: for example, if the name *man* is said of a true man and of a depicted man insofar as it has some likeness to a true man.<sup>59</sup>

Other equivocations are proximate (to a predicable genus) either:<sup>60</sup>

---

et species); sed in sola consideratione accipitur forma generis, per abstractionem intellectus a differentiis.”

<sup>56</sup> *In Physic.* 7, l. 8, n. 8: “Sic igitur species est unum quid a forma una in rerum natura existente: genus autem non est unum; quia secundum diversas formas in rerum natura existentes, diversae species generis praedicationem suscipiunt. Et sic genus est unum logice, sed non physice.”

<sup>57</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a21–23): “Quia ergo genus quodammodo est unum, et non simpliciter, iuxta genera latent multa: idest, per similitudinem et propinquitatem ad unitatem generis, multorum aequivocatio latet.”

<sup>58</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a23–24): “Sunt autem quaedam aequivocationum multum distantes, in quibus sola communitas nominum attenditur; sicut si canis dicatur caeleste sidus, et animal latrabile.”

<sup>59</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a24): “Quaedam vero sunt quae habent quandam similitudinem; sicut si hoc nomen homo dicatur de vero homine et de homine picto, in quantum habet similitudinem quandam veri hominis.”

<sup>60</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a24): “Quaedam vero aequivocationes sunt proximae.”

1. Because they agree in (a predicable) genus.<sup>61</sup>

For example, when *body* is said of a celestial body (e.g., the sun or the moon, considered to be incorruptible by ancient scientists)<sup>62</sup> and of a corruptible body, it is said equivocally, speaking naturally, because they do not have one matter.<sup>63</sup>

Indeed, as ARISTOTLE proves, the corruptible and the incorruptible (body) are diverse in genus (►41.11).<sup>64</sup> And this is so because, just as form and act pertain to the species, so matter and potency pertain to the genus. Whence, just as the contrariety that is according to forms and acts produces a difference according to species, so the contrariety that is according to potency produces diversity of genus.

Nevertheless, (the corruptible and the incorruptible) agree in the logical genus (of *body*).<sup>65</sup> And because of this agreement of genus, they seem to be altogether non-equivocal.

2. Because they are proximate according to some likeness (< ἀναλογία).<sup>66</sup>

For example, one who teaches in a school, and likewise one who precedes in a house, is equivocally said (to be a) *master* (*magister*). Nonetheless, (each is said to be a master) in

---

<sup>61</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a24): “aut propter convenientiam in genere.”

<sup>62</sup> As St. Thomas explains, there are some universals that contain under themselves only one singular, as *sun* and *moon* (i.e., according to ancient science). Whence, ARISTOTLE says that universal is *that which is naturally apt to be in many*, and not “what is in many.” However, it is not as though the nature itself of the species, of itself (*quantum est de se*), would not be naturally apt to be in many; rather, there is something else that prevents (it from being in many): for example, that the whole matter of the species is comprehended in one individual, and that it is not necessary for a species that can be perpetual in one individual to be multiplied according to number. See *In Metaph.* 7, l. 13, §1574: “Sciendum autem quod ideo dicitur quod universale est quod natum est pluribus inesse, non autem quod pluribus inest; quia quaedam universalia sunt quae non continent sub se nisi unum singulare, sicut sol et luna. Sed hoc non est quin ipsa natura speciei quantum est de se sit nata esse in pluribus; sed est aliquid aliud prohibens, sicut quod tota materia speciei comprehendatur in uno individuo, et quod non est necessarium multiplicari secundum numerum speciem, quae in uno individuo potest esse perpetua.”

<sup>63</sup> *In Physic.* 7, l. 8, n. 8: “sicut si corpus dicatur de corpore caelesti et de corpore corruptibili, aequivoce dicitur, naturaliter loquendo, quia eorum non est materia una.”

<sup>64</sup> *In Metaph.* 10, l. 12, §2137 (cf. ARISTOTLE, *Metaphysica* I.10, 1058b26–29): “corruptibile et incorruptibile sunt contraria. Quod [Philosophus] probat ex hoc, quod impotentia opposita determinatae potentiae est quaedam privatio, ut in nono habitum est. Privatio autem est principium contrarietatis. Unde sequitur, quod impotentia sit contrarium potentiae. Corruptibile autem et incorruptibile opponuntur secundum potentiam et impotentiam. Sed diversimode. Nam si accipiatur potentia communiter, secundum quod se habet ad posse agere vel pati quodcumque, sic corruptibile secundum potentiam dicitur, incorruptibile secundum impotentiam. Si autem dicatur potentia secundum quod non est posse aliquid deterius, sic e converso, incorruptibile dicitur secundum potentiam, corruptibile vero secundum impotentiam. Cum autem ex his videretur concludendum quod corruptibile et incorruptibile differunt specie, concludit quod sunt diversa genere. Et hoc ideo, quia sicut forma et actus pertinent ad speciem, ita materia et potentia pertinent ad genus. Unde sicut contrarietas quae est secundum formas et actus, facit differentiam secundum speciem, ita contrarietas quae est secundum potentiam, facit generis diversitatem.” Cf. AVERROES, *tafsir ma ba’d at-tabī’at*, Comm. 26 on Book X, Tome VII, 1386.3–1387.8.

<sup>65</sup> *In Physic.* 7, l. 8, n. 8: “Conveniunt tamen [corpus caeleste et corpus corruptibile] in genere logico: et propter hanc generis convenientiam videntur omnino non aequivoca esse.”

<sup>66</sup> *In Physic.* 7, l. 8, n. 8 (cf. ARISTOTLE, *Physica* H.4, 249a24–25): “aut etiam sunt propinquae secundum aliquam similitudinem.”

proximate equivocation due to a likeness (i.e., an analogy of proportionality); for each is a leader (*rector*): the former, of a school; the latter, of a house.<sup>67</sup>

◀ Whence, due to this proximity either of genus (§1) or of likeness (§2), there seem to be no equivocations—when nonetheless there are.<sup>68</sup>

### 21.11. Logical vs. Philosophical Genus

Since the material whence the genus is taken has in itself (both) matter and form, the logician considers the genus only from its formal part; whence, also, his definitions are said (to be) *formal*.<sup>69</sup> The natural (scientist), on the other hand, considers the genus from the part of one and of the other (i.e., from the formal and the material part; ▶13.10). Hence, sometimes it happens that something communicates in a genus according to the logician which does not communicate according to the natural (scientist).

Thus, sometimes it happens that a thing attains some likeness (▶21.10, §2) of the first act in such matter; another attains (it) without matter; and another (attains it) in another, altogether diverse matter.<sup>70</sup> For example, a stone (attains some likeness of the first act) in a matter that is according to a potency towards being (*secundum potentiam ad esse*), to which pertains this: that it subsists; which also pertains to the sun (i.e., an incorruptible body) according to a matter (that is in potency) towards place (*ad ubi*), and not towards being; and an angel (attains some likeness of the first act) lacking all matter.

Whence, the logician, finding in all these (things) the matter from which he would have taken the genus, posits all (of them) in one genus of *substance*.<sup>71</sup> On the other hand, the natural (scientist) and the metaphysician, who consider all the principles of a thing, not

---

<sup>67</sup> *In Physic.* 7, l. 8, n. 8: “sicut ille qui docet in scholis dicitur magister, et similiter ille qui praeest domui dicitur magister domus, aequivoce, et tamen propinqua aequivocatione propter similitudinem; uterque enim est rector, hic quidem scholarum, ille vero domus.”

<sup>68</sup> *In Physic.* 7, l. 8, n. 8: “Unde propter hanc propinquitatem vel generis vel similitudinis, non videntur esse aequivocationes, cum tamen sint.”

<sup>69</sup> *In De Trin.*, q. 4 a. 2 co., 159–167: “Sciendum tamen quod cum illud materiale unde sumitur genus habeat in se materiam et formam, logicus considerat genus solum ex parte eius quod formale est, unde et eius diffinitiones dicuntur formales; set naturalis considerat genus ex parte utriusque. Et ideo contingit quandoque quod aliquid communicat in genere secundum logicum, quod non communicat secundum naturalem.”

<sup>70</sup> *In De Trin.*, q. 4 a. 2 co., 167–175: “contingit enim quandoque quod illud de similitudine primi actus <quod> consequitur res aliqua in materia tali, aliud consequatur sine materia, et aliud in alia materia omnino diuersa; sicut patet quod lapis in materia que est secundum potentiam ad esse pertingit ad hoc quod subsistat, ad quod idem pertingit sol secundum materiam ad ubi et non ad esse, et angelus omni materia carens.”

<sup>71</sup> *In De Trin.*, q. 4 a. 2 co., 175–183: “Vnde logicus, inueniens in omnibus his illud materie ex quo genus sumebat, ponit omnia in uno genere substantie; naturalis uero et metaphisicus, qui considerant omnia principia rei, non inuenientes conuenientiam in materia, dicunt genere differre, secundum hoc quod dicitur in X Metaphisice, quod corruptibile et incorruptibile differunt genere, et quod illa conueniunt genere quorum materia est una et generatio ad inuicem.”

finding agreement in matter, say that (a corruptible body, an incorruptible body, and a simple, immaterial substance) differ in genus, according to what ARISTOTLE says, that the corruptible and the incorruptible differ in genus, and that those agree in genus of which the matter is one, and (there is) generation towards each other.

### 21.12. Logical vs. Philosophical Analogy

Something is said according to analogy in three (modes):<sup>72</sup>

1. *According to intention only, but not according to being (secundum intentionem tantum, et non secundum esse).*<sup>73</sup> This occurs when one intention, which has (its act of) being (*esse*) in one (thing), is referred to multiple (things) according to prior and posterior (*per prius et posterius*).

For example, the intention of *health* is referred to animal, urine, and diet, according to prior and posterior (*secundum prius et posterius*) diversely, but not according to a diverse (act of) being (*esse*), since the (act of) being of health is only in the animal.<sup>74</sup>

2. *According to being, but not according to intention (secundum esse et non secundum intentionem).*<sup>75</sup> This happens when multiple (things) are equated (*parificantur*) in the intention of something common, but that common (something) does not have (an act of) being (*esse*) of one *ratio* in all (of them).

For example, all bodies are equated in the intention of *corporeity* (►46.10).<sup>76</sup> Whence, the logician, who considers only intentions, says that the name *body* is predicated univocally of all bodies. However, the (act of) being (*esse*) of its nature is not of the same *ratio* in *corruptible* and *incorruptible bodies*. Whence, according to the metaphysician and the natural (scientist), who considers the thing according to its (act of) being, neither the name *body* nor any other (name) is said univocally of *corruptible* and *incorruptible (bodies)*.

---

<sup>72</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: "aliquid dicitur secundum analogiam tripliciter."

<sup>73</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: "vel secundum intentionem tantum, et non secundum esse; et hoc est quando una intentio refertur ad plura per prius et posterius, quae tamen non habet esse nisi in uno."

<sup>74</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: "sicut intentio sanitatis refertur ad animal, urinam et dietam diversimode, secundum prius et posterius; non tamen secundum diversum esse, quia esse sanitatis non est nisi in animali."

<sup>75</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: "Vel secundum esse et non secundum intentionem; et hoc contingit quando plura parificantur in intentione alicujus communis, sed illud commune non habet esse unius rationis in omnibus."

<sup>76</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: "sicut omnia corpora parificantur in intentione corporeitatis. Unde logicus, qui considerat intentiones tantum, dicit, hoc nomen corpus de omnibus corporibus univoce praedicari: sed esse hujus naturae non est ejusdem rationis in corporibus corruptibilibus et incorruptibilibus. Unde quantum ad metaphysicum et naturalem, qui considerant res secundum suum esse, nec hoc nomen corpus, nec aliquid aliud dicitur univoce de corruptibilibus et incorruptibilibus, ut patet 10 Metaphys. ex Philosopho et Commentatore."

Likewise, quantity, and the unity that is the principle of number, cannot be found according to the same *ratio* in *corruptible* and *incorruptible bodies*.<sup>77</sup>

**3. According to intention and according to being (*secundum intentionem et secundum esse*).**<sup>78</sup> This happens when (multiple things) are equated neither in a common intention nor in being. And concerning such (things), the common nature must have some (act of) being in each of those of which (the name) is said; but it differs according the *ratio* of *greater or lesser perfection*.

For example, *being* (*ens*) is said of substance and of accident (but the act of being differs in them according to perfection; for substance exists in itself, while accident exists in dependence of substance; and therefore, *substance* is posited in the *ratio* of *accident*).<sup>79</sup>

### **21.13. Intentions Not Founded in a Thing-Outside-The-Mind**

Sometimes, that which is signified by a name does not have a foundation—whether proximate or remote—in the thing outside the mind.<sup>80</sup>

For example, the conception of *chimera* (fire-breathing monster with a lion's head, a goat's body, and a serpent's tail) does not have a foundation in a thing outside the mind because it is not the likeness of something that exists outside the mind (►21.5).<sup>81</sup> Nor does it follow upon our mode of understanding something found in nature (►21.8). Whence, this conception is false (i.e., it is not naturally apt to be truly predicated). And something similar can be said of dreams and of imagination.

### **21.14. Priority vs. Causality in Genera, Species, and Individuals**

That which is prior need not be a cause of all those that agree (*conveniunt*) in the nature of a genus or of a species.<sup>82</sup> Indeed, in the order of nature, one (individual) cannot be prior

---

<sup>77</sup> *In Physic.* 7, l. 7, n. 9: “quantitatem et unitatem, quae est principium numeri, non secundum eandem rationem contingit invenire in corporibus caelestibus et in igne et in aere et aqua.”

<sup>78</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: “Vel secundum intentionem et secundum esse; et hoc est quando neque parificatur in intentione communi, neque in esse. [...] et de talibus oportet quod natura communis habeat aliquod esse in unoquoque eorum de quibus dicitur, sed differens secundum rationem majoris vel minoris perfectionis.”

<sup>79</sup> *In Sent.* 1, d. 19 q. 5 a. 2 ad 1: “sicut ens dicitur de substantia et accidente.”

<sup>80</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “Aliquando vero id quod significatur per nomen, non habet fundamentum in re, neque proximum neque remotum.”

<sup>81</sup> *In Sent.* 1, d. 2 q. 1 a. 3 co.: “sicut conceptio Chimerae: quia neque est similitudo alicujus rei extra animam, neque consequitur ex modo intelligendi rem aliquam naturae: et ideo ista conceptio est falsa.” *In Sent.* 1, d. 30 q. 1 a. 3 co.: “Quandoque vero [intellectus] apprehendit aliquid quod nullo modo in re est, ut quando quis imaginatur Chimaeram, vel aliquid hujusmodi.” *In Sent.* 1, d. 19 q. 5 a. 1 co.: “Quaedam autem [eorum quae significantur nominibus] sunt quae nihil habent extra animam, sicut somnia et imaginatio Chimerae.”

<sup>82</sup> *Quodlibet* 3, q. 3 a. 1 ad arg.: “Non autem oportet quod omnium quae conveniunt in natura generis vel speciei, id quod est prius, sit causa omnium aliorum. Et quidem in eadem specie non potest unum esse prius altero, proprie loquendo, ordine naturae: quia species praedicatur aequaliter de omnibus individuis,

to another in the same species, properly speaking; for a species is **equally predicated** of all individuals. But in genera this is not so; for among the species of one genus, one is naturally prior and **more perfect** than the other.

Among individuals of one species, however, one is prior to another in (the order of) time.<sup>83</sup> And although some individual that is prior in time is the cause of some other that is posterior, as the father is the cause of the son, however, this is not universally true, for not all the more ancient are the cause of all the younger.

Among the species of the same genus, that which is prior can be a principle and cause of the others (► 11.3; 27.4; 47.2).<sup>84</sup> For example, local motion (is a principle and cause) of the other motions (i.e., local motion is a cause of alteration, which is motion in the genus of quality; and alteration is a cause of increase or decrease, which is motion in the genus of quantity; ► 48.24); (the number) two (is the principle and cause) of the other numbers; and the triangle (is the principle and cause) of the other rectilinear figures (► 36.8). However, this is not universally true, for man, which is the **most perfect** species of animal, is not the active cause of the other species.

### 21.15. Equality and Priority According to Thing vs. According to *Ratio* in Opposites

Among those that are divided from an opposite (► 42), some can be found to be:<sup>85</sup>

1. Naturally **simultaneous both according to thing** (*secundum rem*) and **according to ratio** (*secundum rationem*), as two species of animals or two species of colors.<sup>86</sup>

When a univocal genus is divided into its species (► 27.2), the parts of the division are **had equally** (*ex aequo se habent*; ► 6.11, ¶6) according to the ratio of the genus, although according to the nature of the thing, one species is **more principal** and **more perfect** than the other, as man (is more principal and more perfect) than the other animals.<sup>87</sup>

---

ut dicitur in III Metaphysicorum. In generibus autem non est sic. Nam inter species unius generis una est naturaliter prior et perfectior altera.”

<sup>83</sup> *Quodlibet* 3, q. 3 a. 1 ad arg.: “Est autem in individuis unius speciei unum altero tempore prius; et quamvis aliquod individuum, quod est prius tempore, sit causa cuidam alii quod est posterius, ut pater est causa filii, sicut in obiciendo tangebatur; non tamen hoc est universaliter verum; non enim omnes antiquiores sunt causa omnium iuniorum.”

<sup>84</sup> *Quodlibet* 3, q. 3 a. 1 ad arg.: “Similiter etiam contingit id quod est prius inter species eiusdem generis, esse aliorum principium et causam, sicut motus localis aliorum motuum, et binarius aliorum numerorum, et triangulus aliarum figurarum rectilinearum; non tamen hoc est universaliter verum. Non enim homo, qui est perfectissima species animalis, est causa activa aliarum specierum.”

<sup>85</sup> *STh* I-II, q. 29 a. 2 ad 1: “in his quae ex opposito dividuntur, quaedam inveniuntur quae sunt [...]”

<sup>86</sup> *STh* I-II, q. 29 a. 2 ad 1: “quaedam inveniuntur quae sunt naturaliter simul et secundum rem, et secundum rationem, sicut duae species animalis, vel duae species coloris.”

<sup>87</sup> *STh* I-II, q. 61 a. 1 ad 1: “quando genus univocum dividitur in suas species, tunc partes divisionis ex aequo se habent secundum rationem generis; licet secundum naturam rei, una species sit principalior et perfectior alia, sicut homo aliis animalibus.”

2. **Simultaneous according to *ratio***, but one is really (*realiter*, i.e., as to the thing) prior to the other and is its cause, as is evident in the species of numbers, figures, and motions.<sup>88</sup>

The species that divide a genus **equally** (*ex aequo*) are simultaneous in nature.<sup>89</sup> Hence, according to the division of a genus into (its) species, the (species) co-divided from each other are simultaneous in nature.<sup>90</sup> But among the principles and parts that are required for the completion (*ad completionem*; i.e., for the perfection) of a composite thing, there can be something (that is) prior (and something that is posterior).

Those that divide something common univocal are simultaneous in respect of the intention of the genus (*quantum ad intentionem generis*; ►27.2, ¶1), even if one could be a cause of another in respect of being (*quantum ad esse*), as local motion is a cause of the other motions against which it is divided (►48.24).<sup>91</sup>

In all univocal (predications), the *ratio* of the name is common to any of those (subjects) of which the name is univocally predicated.<sup>92</sup> Hence, they are **equal** in something with respect to the univocal *ratio* of the name, even though one can be prior or posterior according to being (*secundum esse*).

Thus, the species of some genera—such as numbers and figures—are related according to prior and posterior in respect of being (*quantum ad esse*), even if they are said to be simultaneous insofar as they receive the predication of a common genus.<sup>93</sup> For example, all numbers are **equal** in the *ratio* of *number* (i.e., any number is *as much* a number as any other), even though one (number) is prior to another according to the nature of the

---

<sup>88</sup> *STh* I-II, q. 29 a. 2 ad 1: “Quaedam vero sunt simul secundum rationem, sed unum realiter est prius altero et causa eius, sicut patet in speciebus numerorum, figurarum et motuum.”

<sup>89</sup> *In Peri.* 1, l. 1, n. 10: “quia sunt species ex aequo dividentes genus, sunt simul natura.” Here, St. Thomas is referring to affirmation and negation, which are species of the genus of enunciation.

<sup>90</sup> *STh* I-II, q. 113 a. 6 ad 3: “Ad tertium [sc., *ea quae connumerantur quasi ad invicem condivisa, sunt simul natura*] dicendum quod ista [sc., numeratio eorum quae requiruntur ad iustificationem impii] non est connumeratio secundum divisionem generis in species, in qua oportet quod connumerata sint simul, sed secundum differentiam eorum quae requiruntur ad completionem alicuius. In qua quidem enumeratione aliquid potest esse prius, et aliquid posterius, quia principiorum et partium rei compositae potest esse aliquid alio prius.”

<sup>91</sup> *In Sent.* 3, d. 33 q. 2 a. 1 qc. 1 ad 2: “ea quae dividunt aliquod commune univocum, sunt simul quantum ad intentionem generis, quamvis unum possit esse causa alterius quantum ad esse, sicut motus localis est causa aliorum motuum contra quos dividitur.”

<sup>92</sup> *De veritate*, q. 2 a. 11 co.: “In omnibus enim univocis communis est ratio nominis utriusque eorum de quibus nomen univoce praedicatur; et sic quantum ad illius nominis rationem univoca in aliquo aequalia sunt, quamvis secundum esse unum altero possit esse prius vel posterius.”

<sup>93</sup> *STh* I, q. 77 a. 4 ad 1: “Ad primum [sc., *in his quae cadunt sub una divisione, non est prius et posterius, sed sunt naturaliter simul*] ergo dicendum quod alicuius generis species se habent secundum prius et posterius, sicut numeri et figurae, quantum ad esse; licet simul esse dicantur in quantum suscipiunt communis generis praedicationem.”

thing (*secundum naturam rei*; i.e., according to thing, two is naturally prior to three because there cannot be three without there being two; ►47.2).<sup>94</sup>

**3. Not simultaneous**, both according to thing and according to *ratio*, as substance and accident; for substance is really a cause of accident (i.e., substance is prior to accident *secundum esse*); and *being (ens)*, according to *ratio*, is attributed to substance prior than to accident, for (*being*) is only attributed to accident insofar as it is *in a substance*.<sup>95</sup>

When there is a division of some analog that is said of many according to prior and posterior (*secundum prius et posterius*; ►27.2, ¶2), then nothing prevents one from being **more principal** than another even according to the common *ratio*—i.e., (one can) be related according to prior and posterior also in respect of the intention of the common (analog) that is divided—as substance is more principally said (to be a) *being* than accident.<sup>96</sup>

In those (predicates) that are said of many according to prior and posterior (*per prius et per posterius*), it is not the prior that must receive the predication of the common (nature), which is as the cause of the others; rather, (what must receive the predication of the common predicate is) that in which the complete *ratio* of the common (nature) is (found) first.<sup>97</sup> For example, *healthy* is said priorly of animal, in which the perfect *ratio* of *health* is found, even though (the art of) medicine is said to be *healthy* as effecting health.

### 21.16. Equal and Unequal

*Equal* and *unequal* are said according to quantity (►22.1); for (whatever is) *one in quantity* is said (to be) **equal**, as (whatever is *one*) *in quality* (is said to be) **alike**, and (whatever is *one*) *in substance* (is said to be the) **same**.<sup>98</sup>

---

<sup>94</sup> *De veritate*, q. 2 a. 11 co.: “sicut in ratione numeri omnes numeri sunt aequales, quamvis secundum naturam rei unus altero naturaliter prior sit.”

<sup>95</sup> *STh* I-II, q. 29 a. 2 ad 1: “Quaedam vero non sunt simul nec secundum rem, nec secundum rationem, sicut substantia et accidens, nam substantia realiter est causa accidentis; et ens secundum rationem prius attribuitur substantiae quam accidenti, quia accidenti non attribuitur nisi in quantum est in substantia.”

<sup>96</sup> *STh* I-II, q. 61 a. 1 ad 1: “quando est divisio alicuius analogi, quod dicitur de pluribus secundum prius et posterius; tunc nihil prohibet unum esse principalius altero, etiam secundum communem rationem; sicut substantia principalius dicitur ens quam accidens.” *In Sent.* 3, d. 33 q. 2 a. 1 qc. 1 ad 2: “ea quae dividunt aliquod commune analogum se habent secundum prius et posterius etiam quantum ad intentionem communis quod dividitur, sicut patet de substantia et accidente.”

<sup>97</sup> *De veritate*, q. 1 a. 2 co.: “non oportet in illis quae dicuntur per prius et per posterius de multis, quod illud prius recipiat praedicationem communis, quod est ut causa aliorum, sed illud in quo est primo ratio illius communis completa; sicut sanum per prius dicitur de animali, in quo primo perfecta ratio sanitatis invenitur, quamvis medicina dicatur sana ut effectiva sanitatis.”

<sup>98</sup> *De virtutibus*, q. 5 a. 3 co.: “aequale et inaequale dicuntur secundum quantitatem; unum enim in quantitate aequale dicitur, sicut in qualitate simile, et in substantia idem, ut patet in V Metaph.”

## 22. Virtual Quantity

*We have determined that things can be of unequal perfection, and that inequality pertains to quantity. We seek to clarify here what this quantity of perfection is.*

### 22.1. Dimensive vs. Virtual Quantity

Quantity is twofold, each (mode) of which is diversified by many (*per multa diversificatur*):<sup>1</sup>

**1. Dimensive quantity** (*quantitas dimensiva*) or quantity **of bulk** (*quantitas molis*; ► 35), which is considered **according to extension**, and exists only in corporeal things.<sup>2</sup>

Dimensive quantity is diversified by many because *longitude*, *latitude*, and *profundity*—and, in potency, *number*—are contained under it (► 34).<sup>3</sup>

**2. Virtual quantity** (*quantitas virtualis*) or quantity **of virtue** (*quantitas virtutis*), which is considered **according to intension**: that is, **according to the perfection of some form or nature**; for the virtue of a thing is its perfection (► 22.2; 23); and, therefore, the virtual quantity of any one form is considered according to the mode of its perfection (► 22.3).<sup>4</sup> This quantity is designated (e.g.) when something is said to be *more*—or *less*—hot insofar as it is *more*—or *less*—perfect in heat.

Virtual quantity (is also diversified by many because it) is distinguished in as many natures or forms as there are, of which the mode of perfection produces a whole measure of quantity (*quarum perfectionis modus totam mensuram quantitatis facit*).<sup>5</sup>

A quantity of virtue is considered in two modes:<sup>6</sup> **(a)** in respect of the **number of objects**, which is by the mode of discrete quantity; or **(b)** in respect of the **intension of the act over the same object**, and this is like continuous quantity (i.e., magnitude).

---

<sup>1</sup> *STh I*, q. 42 a. 1 ad 1: “duplex est quantitas.” *De veritate*, q. 29 a. 3 co., 140: “Est autem duplex quantitas.” *Ibid.*, 148–149: “Utraque autem quantitas per multa diversificatur.”

<sup>2</sup> *STh I*, q. 42 a. 1 ad 1: “Una scilicet quae dicitur quantitas *molis*, vel quantitas dimensiva, quae in solis rebus corporalibus est.” *De veritate*, q. 29 a. 3 co., 140–141: “scilicet dimensiva, quae secundum extensionem consideratur.”

<sup>3</sup> *De veritate*, q. 29 a. 3 co., 148–151: “Utraque autem quantitas per multa diversificatur; nam sub quantitate dimensiva continetur longitudo, latitudo et profundum, et numerus in potentia.”

<sup>4</sup> *STh I*, q. 42 a. 1 ad 1: “alia est quantitas *virtutis*, quae attenditur secundum perfectionem alicuius naturae vel formae, quae quidem quantitas designatur secundum quod dicitur aliquid magis vel minus calidum, in quantum est perfectius vel minus perfectum in caliditate.” *De veritate*, q. 29 a. 3 co., 141–148: “et virtualis, quae attenditur secundum intensionem; virtus enim rei est ipsius perfectio secundum illud Philosophi in VII Physicorum «Unumquodque perfectum est quando attingit propriae virtuti»; et sic quantitas virtualis uniuscuiusque formae attenditur secundum modum suae perfectionis.”

<sup>5</sup> *De veritate*, q. 29 a. 3 co., 151–154: “quantitas autem virtualis in tot distinguitur quot sunt naturae vel formae, quarum perfectionis modus totam mensuram quantitatis facit.”

<sup>6</sup> *In Sent.* 1, d. 17 q. 2 a. 1 ad 2: “quantitas virtutis attenditur dupliciter: vel quantum ad numerum objectorum, et hoc est per modum quantitatis discretarum; vel quantum ad intensionem actus super idem objectum; et hoc est sicut quantitas continua.” *STh II-II*, q. 24 a. 4 ad 1: “quantitas virtualis [...] non solum

## 22.2. Virtue as *Maximum Potency*

We call **potency** (*potentia* = δύναμις, i.e., power) *the intrinsic principle by which an agent acts or a patient is affected (principium intrinsecum quo agens agit vel patiens patitur).*<sup>7</sup>

Thus, a potency (►31.3) is nothing other than the principle of operation of something, whether (such an operation) is an action or an affection (►33.5).<sup>8</sup> However, this principle is not the subject that acts or that is affected (*subiectum agens aut patiens*), but that whereby the agent acts or the patient is affected (i.e., acted upon).<sup>9</sup>

For example, the art of building (*ars aedificativa*) is a potency in the builder, who builds through it (*per eam aedificat*). Likewise, heat (is a potency) in fire, which heats by heat (*calore calefacit*).<sup>10</sup> And dry(ness) is a (passive) potency in wood, because (wood) is combustible in respect of it.

However, *potency* does not signify the relation itself of principle—otherwise it would be in the genus of *relation*.<sup>11</sup> Instead, it signifies *that which is the principle*.

A potency receives the name and the *ratio* of **virtue** (*virtus* = ἀρετή, i.e., excellence), as ARISTOTLE says, *insofar as it is referred—i.e., by comparison, in order—to the last in that of which something is capable (secundum quod refertur ad ultimum in quod aliquid potest, per comparisonem ad ultimum in quod potentia potest < πρὸς τὸ πλεῖστον; in ordine ad hoc in quod ultimo potest, per respectum ad plurimum in quod potest).*<sup>12</sup>

(In other words, an active—or passive—potency or power is called *virtue* insofar as it is referred to the maximum it can act—or be acted upon.)

---

attenditur secundum numerum obiectorum, ut scilicet plura vel pauciora diligantur, sed etiam secundum intensionem actus, ut magis vel minus aliquid diligatur.”

<sup>7</sup> *De op. occ.*, 104–105: “hoc enim dicimus potentiam principium intrinsecum quo agens agit uel patiens patitur.”

<sup>8</sup> *Q. d. de anima*, a. 12 co.: “potentia nihil aliud est quam principium operationis alicuius, sive sit actio sive passio.”

<sup>9</sup> *Q. d. de anima*, a. 12 co.: “Non quidem principium quod est subiectum agens aut patiens, sed id quo agens agit aut patiens patitur.” *STh* I, q. 41 a. 5 ad 1: “potentia [...] significat id quod est principium; non quidem sicut agens dicitur principium, sed sicut id quo agens agit.”

<sup>10</sup> *Q. d. de anima*, a. 12 co.: “sicut ars aedificativa est potentia in aedificatore qui per eam aedificat, et calor in igne qui calore calefacit, et siccum est potentia in lignis, quia secundum hoc sunt combustibilia.”

<sup>11</sup> *STh* I, q. 41 a. 5 ad 1: “potentia non significat ipsam relationem principii, alioquin esset in genere relationis, sed significat id quod est principium.”

<sup>12</sup> *De op. occ.*, 105–108: “Hec quidem potentia, secundum quod refertur ad ultimum in quod aliquid potest, accipit nomen et rationem uirtutis.” *STh* II-II, q. 134 a. 1 co.: “sicut dicitur in I *de Caelo*, *virtus dicitur per comparisonem ad ultimum in quod potentia potest.*” *Quodlibet* 4, q. 2 a. 1 ad arg.: “Et hoc modo Philosophus definit uirtutem, cum dicit, quod uirtus est ultimum potentiae: quia scilicet uirtus rei attenditur in ordine ad hoc in quod ultimo potest.” *In Post. an.* 1, l. 37, 51–56: “dicitur enim uirtus uniuscuiusque in quod ultimum potest [...], ut dicitur in I *De celo.*” *In Ethic.* 2, l. 6, 23–27: “uirtus alicuius rei attenditur secundum ultimum id quod potest [...], ut dicitur in I *De caelo.*” Cf. ARISTOTLE, *De caelo* A.1, 281a7–15.

For example, the virtue of one who can carry 100 pounds would not consist in that he can carry ten, but in that he can carry the last in that which he is ultimately capable of—namely, (in that he can carry) 100 (pounds).<sup>13</sup>

Evidently, one who can excel in some things (*qui potest in ea quae excellunt*), necessarily can also (attain) those that are inferior (*possit etiam in ea quae sunt infra*).<sup>14</sup>

However, the virtue of a thing is only attributed to the excellent.<sup>15</sup> That is, the virtue of a thing is considered (*attenditur; pensatur*, i.e., is pondered) in respect of that which is the most excellent—i.e., the whole—of all those in which it can: not indeed (by comparison to) the last *from the part of defect* but *from the part of excess*, whose *ratio* consists in a magnitude; for the magnitude of whatever thing, too, is denominated by that which is the maximum, as when notifying a quantity of three-cubits we do not say that it is two-cubits.

*Virtue* thus taken—i.e., in common, as that which can be a principle of some operation or motion—is not a habit (i.e., a perfection added to a potency).<sup>16</sup>

Nonetheless, this, too, has a place in the (scientific, moral, and artistic) virtues of the soul (e.g., the intellectual virtues, including the mathematical sciences; ► 51);<sup>17</sup> for (that) is said (to be a) human virtue whereby man is capable (of doing) in that which is most excellent

---

<sup>13</sup> *In De caelo* 1, l. 25, n. 4: “dicit [Philosophus] quod, si contingat aliquam rem posse in aliquid magnum, puta quod aliquis homo ambulet per centum stadia, aut possit levare aliquod magnum pondus, semper determinamus sive denominamus eius potentiam per respectum ad plurimum in quod potest.” *Quodlibet* 4, q. 2 a. 1 ad arg.: “sicut virtus eius qui potest ferre centum libras, ut ipse ibidem dicit, non consistit in hoc ut ferat decem, sed in hoc quod ferat illud ultimum in quod ultimo potest, scilicet centum.” *In Post. an.* 1, l. 37, 51–56: “dicitur enim uirtus uniuscuiusque in quod ultimum potest, sicut hominis qui potest ferre centum libras, uirtus non est quod ferat decem, sed quod ferat centum, quod est ultimum sue potencie, ut dicitur in *I De celo*.” *In Ethic.* 2, l. 6, 24–27: “puta in eo quod potest ferre centum libras, virtus eius determinatur non ex hoc quod fert quinquaginta, sed ex hoc quod fert centum.”

<sup>14</sup> *In De caelo* 1, l. 25, n. 4: “Sic igitur patet quod ille qui potest in ea quae excellunt, necesse est quod possit etiam in ea quae sunt infra; puta si aliquis potest portare centum talenta, poterit etiam portare duo, et si potest ire per centum stadia, potest ire per duo.”

<sup>15</sup> *In De caelo* 1, l. 25, n. 4: “sed tamen virtus rei non attribuitur nisi excellentiae, idest, secundum id attenditur virtus rei, quod est excellentissimum omnium eorum in quae potest. — Et hoc est quod dicitur in alia translatione, *virtus est ultimum potentiae*, quia scilicet virtus rei determinatur secundum ultimum in quod potest.” *De veritate*, q. 10 a. 7 ad 4: “quamvis potentiae se extendant ad omnia sua obiecta, tamen earum virtus pensatur ex ultimo in quod possunt, ut patet in *I Caeli et mundi*.” *STh* II-II, q. 134 a. 1 co.: “non quidem ad ultimum ex parte defectus; sed ex parte excessus, cuius ratio consistit in magnitudine.” *Quodlibet* 4, q. 2 a. 1 ad arg.: “Sic ergo virtus cuiuslibet rei non attenditur in uno eorum quae potest, sed respectu totius quod potest.” *In De caelo* 1, l. 25, n. 4 (cf. ARISTOTLE, *De caelo* A.1, 281a9–10): “Nec tamen denominatur ab illis partibus, puta quod determinetur eius potentia quia potest ferre quinquaginta talenta, aut ire quinquaginta stadia; sed per id quod est maximum: ita scilicet ut potentia uniuscuiusque denominetur per respectum *ad finem*, idest per ultimum et per maximum ad quod potest, et per virtutem suae excellentiae; sicut etiam et magnitudo cuiuslibet rei determinatur per id quod est maximum, sicut quantitatem tricubiti notificantes, non dicimus quod sit bicubitum.”

<sup>16</sup> *In Sent.* 3, d. 27 q. 1 a. 1 ad 1: “virtus hic non sumitur pro habitu, sicut in 2 *Ethic.* sed communiter pro omni eo quod potest esse principium alicujus operationis vel motus.”

<sup>17</sup> *In De caelo* 1, l. 25, n. 4: “Et hoc etiam habet locum in virtutibus animae: dicitur enim virtus humana, per quam homo potest in id quod est excellentissimum in operibus humanis, scilicet in opere quod est secundum rationem.”

in human deeds: that is, in a deed that is according to reason. Thus, to execute a *great* work—from which (sc., *magnum*) the name *magnificence* is taken—properly pertains to the *ratio* of *virtue*.<sup>18</sup> Whence, ARISTOTLE calls *magnificence* a *virtue*.

Likewise, (in the logical order) we assign the *ratio* of *man* by *rational*, and not by *sensible*, because—always—that which is last and maximum is completive (i.e., perfective), and gives species to the thing (thus, the rational order follows upon the real order).<sup>19</sup>

Also, ARISTOTLE proves that (in the order of natural philosophy) the demonstration by which we maximally know is more powerful (*potior*), because the virtue of a demonstration is to (scientifically) know (►53.2); and this is the maximum that a demonstration can do: to make (us) know (scientifically).<sup>20</sup> Whence, this is the virtue of demonstration; for it is evident that a demonstration is more powerful the more it makes (us) know (scientifically).

This is true not only in natural but also in mathematical things, since their form is taken for their nature.<sup>21</sup> Thus, as ARISTOTLE says, a circle *maximally* is a—perfect—circle when it maximally is according to (its) nature—that is, when it has the perfection of its form.

### 22.3. Consideration of Virtual Quantity

Virtual quantity (*quantitas virtualis*) is considered:<sup>22</sup>

#### 1. First, in (its) root: that is, in the perfection itself of the form or nature.<sup>23</sup>

In this mode, (a virtual quantity) is said (to be a) *spiritual magnitude*: e.g., heat is said (to be) *great* because of its intensity and perfection.<sup>24</sup> Whence, AUGUSTINE says that, *in those things which are not great in bulk, to be greater is to be better*; for that which is more perfect is said (to be) *better*.

---

<sup>18</sup> *STh* II-II, q. 134 a. 1 co.: “operari aliquid magnum, ex quo sumitur nomen *magnificentiae*, proprie pertinet ad rationem virtutis. Unde magnificentia nominat virtutem.”

<sup>19</sup> *In De caelo* 1, l. 25, n. 4: “Et similiter rationem hominis assignamus per *rationale*, et non per *sensibile*: quia semper id quod est ultimum et maximum, est completivum et dans speciem rei.”

<sup>20</sup> *In Post. an.* 1, l. 37, 49–51; 56–58; 61–62 (cf. ARISTOTLE, *Analytica Posteriora* A.24, 85a21–22): “Illa demonstratio est *potior* per quam maxime scimus (et hoc sic probat [Philosophus], quia *virtus demonstrationis* est scire [...]; hoc autem est maximum quod potest facere demonstratio, quod faciat scire, unde hec est *virtus demonstrationis*; [...]; unde manifeste patet hec propositio, quod tanto est demonstratio *potior*, quanto magis facit scire).”

<sup>21</sup> *In Physic.* 7, l. 6, n. 2: “Quod non solum in rebus naturalibus verum est, sed etiam in mathematicis, ut eorum forma accipiatur pro eorum natura: tunc enim *maxime circulus est*, idest perfectus circulus, *quando maxime est secundum naturam*, idest quando habet perfectionem suae formae.” Cf. ARISTOTLE, *Physica* H.3, 246b29–30: “καθάπερ ὁ κύκλος τότε μάλιστα κατὰ φύσιν ἐστίν, ὅταν μάλιστα κύκλος ᾖ.”

<sup>22</sup> *STh* I, q. 42 a. 1 ad 1: “Huiusmodi autem *quantitas virtualis* attenditur [...].”

<sup>23</sup> *STh* I, q. 42 a. 1 ad 1: “Huiusmodi autem *quantitas virtualis* attenditur primo quidem in radice, idest in ipsa perfectione formae vel naturae.”

<sup>24</sup> *STh* I, q. 42 a. 1 ad 1: “sic dicitur *magnitudo spiritualis*, sicut dicitur *magnus calor* propter suam intensionem et perfectionem. Et ideo dicit Augustinus, VI *de Trin.*, quod *in his quae non mole magna sunt, hoc est maius esse, quod est melius esse*: nam melius dicitur quod perfectius est.”

2. Secondly, **in the effects of the form.**<sup>25</sup> Wherefrom, virtual quantity is considered both:

**(a) According to being** (*secundum esse*); for the first effect of a form is the (act of) being; and everything has (its act of) being according to its form (*secundum suam formam*).<sup>26</sup>

Virtual quantity is considered according to the (act of) being (e.g.) insofar as those (things) that are more perfect in nature are of greater duration.<sup>27</sup>

**(b) According to operation** (*secundum operationem*); for the second effect (of a form) is (its) operation, since every agent operates through its form (*omne agens agit per suam formam*).<sup>28</sup>

Virtual quantity is considered according to operation (e.g.) insofar as those (things) that are more perfect in nature are greater in potency (i.e., more powerful) to act (*sunt magis potentia ad agendum*).<sup>29</sup>

#### 22.4. The Form and the Subject of Virtue

Those that are one in subject but not (one) in *ratio* do not have the same potency or virtue, as is evident in the white and in the musical.<sup>30</sup>

A virtue that is a principle of action or affection is manifestly shown to be derived from the specific form of a thing; for every accident that is proper to some species is derived from the essential principles of that species (► 15.16; 15.17; 15.19).<sup>31</sup>

This is why, in order to demonstrate the proper affections of their subjects, we take as a cause the definition that designates the essential principles of a thing (► 55.12); and the principle of an essence and quiddity is a form that exists *in a determinate matter* (► 56).<sup>32</sup>

---

<sup>25</sup> *STh I*, q. 42 a. 1 ad 1: "Secundo autem attenditur quantitas virtualis in effectibus formae. [...] Attenditur igitur quantitas virtualis et secundum esse, et secundum operationem."

<sup>26</sup> *STh I*, q. 42 a. 1 ad 1: "Primus autem effectus formae est esse, nam omnis res habet esse secundum suam formam."

<sup>27</sup> *STh I*, q. 42 a. 1 ad 1: "Attenditur igitur quantitas virtualis [...] secundum esse quidem, in quantum ea quae sunt perfectioris naturae, sunt maioris durationis."

<sup>28</sup> *STh I*, q. 42 a. 1 ad 1: "Secundus autem effectus est operatio, nam omne agens agit per suam formam."

<sup>29</sup> *STh I*, q. 42 a. 1 ad 1: "Attenditur igitur quantitas virtualis [...] secundum operationem vero, in quantum ea quae sunt perfectioris naturae, sunt magis potentia ad agendum."

<sup>30</sup> *In Physic.* 1, l. 15, n. 2: "ea vero quae sunt subiecto unum sed non ratione, non habent eandem potentiam seu virtutem, ut patet in albo et musico."

<sup>31</sup> *De op. occ.*, 108–113: "Huiusmodi autem uirtus que est talium actionum uel passionum principium, manifeste ostenditur ex forma rei specifica deriuari; omne enim accidens quod est proprium alicuius speciei deriuatur ex principiis essentialibus illius speciei."

<sup>32</sup> *De op. occ.*, 113–120: "et inde est quod ad demonstrandum proprias passiones de suis subiectis, accipimus pro causa diffinitionem designantem essentialia principia rei. Est autem essentie et quidditatis principium forma in determinata materia existens; oportet igitur huiusmodi uirtutes procedere a formis talium rerum secundum quod in propriis materiis existunt."

Therefore, virtues of this mode must proceed from the forms of such things according as they exist in (their) proper matters.

### 22.5. Magnitude of a Form: by Itself vs. by Accident

Every active potency is according to some form.<sup>33</sup> Hence, *magnitude*—and consequently, *finite* and *infinite*—befits (*convenit*) a potency as it befits (its) form. Yet, *magnitude* belongs to a form both *by itself* and *by accident*.

1. **By itself**, according to the perfection of the form itself.<sup>34</sup> For example, *great whiteness* is said, according to the perfection of its proper *ratio*, even of little snow.

This (intensive) magnitude maximally belongs to a potency that is not in an (extensive) magnitude, because immaterial potencies are more perfect and universal the less they are contracted by application to matter.<sup>35</sup>

2. **By accident**, (e.g.) according as some form has extension in a subject.<sup>36</sup> For example, *great whiteness* is said because of the magnitude of a surface.

This (intensive) magnitude cannot belong to a potency that is not in an (extensive) magnitude.<sup>37</sup>

### 22.6. Equality and Inequality in Non-Subsistent Forms

Since the (act of) being of whatever non-subsistent form consists in being in a subject or in matter, its quantity or perfection can be considered in two modes:<sup>38</sup>

(a) According to the ratio of the proper species (*secundum rationem propriae speciei*).<sup>39</sup>

(b) According to the (act of) being that (the form) has in a subject or in matter (*secundum esse quod habet in materia seu subiecto*; ► 22.8).<sup>40</sup>

---

<sup>33</sup> *In Physic.* 8, l. 21, n. 9: “cum omnis potentia activa sit secundum aliquam formam, eo modo convenit magnitudo potentiae, et per consequens finitum et infinitum, sicut convenit formae. Formae autem convenit magnitudo et per se, et per accidens.”

<sup>34</sup> *In Physic.* 8, l. 21, n. 9: “per se quidem, secundum perfectionem ipsius formae, sicut dicitur magna albedo etiam parvae nivis, secundum perfectionem propriae rationis.”

<sup>35</sup> *In Physic.* 8, l. 21, n. 9: “prima magnitudo [sc., secundum perfectionem ipsius formae] maxime ei [sc., potentiae quae non est in magnitudine] competit, quia potentiae immateriales, quanto sunt minus contractae per applicationem ad materiam, tanto sunt perfectiores et universaliares.”

<sup>36</sup> *In Physic.* 8, l. 21, n. 9: “per accidens autem secundum quod aliqua forma habet extensionem in subiecto, sicut dicitur magna albedo propter magnitudinem superficiei.”

<sup>37</sup> *In Physic.* 8, l. 21, n. 9: “Haec autem secunda magnitudo non potest competere potentiae quae non est in magnitudine.”

<sup>38</sup> *De virtutibus*, q. 5 a. 3 co.: “Cum autem cuiuslibet formae non subsistentis esse consistat in eo quod subiecto vel materiae inest, dupliciter potest eius quantitas seu perfectio considerari.”

<sup>39</sup> *De virtutibus*, q. 5 a. 3 co.: “uno modo, secundum rationem propriae speciei.”

<sup>40</sup> *De virtutibus*, q. 5 a. 3 co.: “alio modo, secundum esse quod habet in materia seu subiecto.”

Whence, it is evident that something can be related to diverse forms concerning equality and inequality in (the same) two modes:<sup>41</sup>

1. Some forms **do not receive inequality**: neither **(a)** according to themselves, such that one of them would be greater than another of the same species; nor **(b)** according to (their act of) being, such that they would be more (perfect) in a subject.<sup>42</sup>

Of this mode are all substantial forms.<sup>43</sup>

2. Some forms **do not receive inequality (a) according to themselves, but (b)** insofar as they are **in a subject**, such as whiteness and blackness.<sup>44</sup>

Thus, a whiteness (that is received in a subject) is said (to be) *greater* in two modes:<sup>45</sup> from the intention of its own quantity, and from the quantity of the surface (in which it is received). Whence, although a greater potency can be in a lesser magnitude, any such greater potency can be still greater if the magnitude is greater.

3. Some forms **receive inequality (a) according to themselves, but not (b)** insofar as they are **in a subject**, as a triangle is said (to be) *greater than* (another) triangle because the lines of one triangle are greater than those of the other, even if they are ordered to something one that specifies (them); for *one surface is not more triangular than another*.<sup>46</sup>

4. There are some forms that **receive inequality both (a) according to themselves and (b)** insofar as they are **in a subject**: for example, health, science, and motion.<sup>47</sup>

---

<sup>41</sup> *De virtutibus*, q. 5 a. 3 co.: “Ex his igitur patet, quod dupliciter potest aliquid se ad diversas formas habere circa aequalitatem et inaequalitatem.”

<sup>42</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam enim formae sunt quae in eadem specie inaequalitatem non recipiunt neque secundum se, ut una earum sit maior quam alia eiusdem speciei, neque secundum esse, ut scilicet magis insit subiecto; et huiusmodi sunt omnes formae substantiales.”

<sup>43</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam enim formae sunt quae in eadem specie inaequalitatem non recipiunt neque secundum se, ut una earum sit maior quam alia eiusdem speciei, neque secundum esse, ut scilicet magis insit subiecto; et huiusmodi sunt omnes formae substantiales.”

<sup>44</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam vero inaequalitatem non recipiunt secundum se, sed solum secundum quod insunt subiecto, sicut albedo et nigredo.”

<sup>45</sup> *In Sent.* 4, d. 40 q. 1 a. 2 ad 5: “albedo dicitur maior dupliciter, uno modo ex intensione ipsius qualitatis, alio modo ex quantitate superficiei.” *In Physic.* 8, l. 21, n. 17 (cf. ARISTOTLE, *Physica* Θ.10, 266b7–8): “videmus enim quod aliqua minor magnitudo habet maiorem virtutem quam maior magnitudo, sicut parvus ignis habet maiorem virtutem activam quam multus aer. Sed per hoc non potest haberi quod quantum infinitum habeat potentiam finitam: quia si accipiatur aliqua adhuc magis excedens magnitudo, habebit maiorem virtutem; sicut si aer maior secundum aliquam quantitatem habet minus de virtute quam parvus ignis, si multum augeatur aeris quantitas, habebit maiorem virtutem quam parvus ignis.”

<sup>46</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam vero inaequalitatem recipiunt secundum se, non tamen secundum quod insunt subiecto, sicut triangulus dicitur maior triangulo, eo quod lineae unius trianguli sunt maiores quam alterius, quamvis ordinentur ad aliquid unum specificans; non tamen una superficies est magis triangula quam alia.”

<sup>47</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam vero sunt quae recipiunt inaequalitatem et secundum se, et secundum quod insunt subiecto; sicut sanitas, et scientia, et motus.”

Thus, health can be unequal either because of the degree of commensuration in one is closer to the due and perfect equality than (it is) in another; or because, regarding the same degree of commensuration, one has (health) more firmly and better than another.<sup>48</sup>

Likewise, the science of one (scientist) is greater than that of another either because he knows more conclusions or because he scientifically knows the same things better.<sup>49</sup>

Likewise, a motion is unequal either because it transits a greater space or because the mobile is moved with greater velocity.<sup>50</sup>

### 22.7. Inequality According to the *Ratio* of the Proper Species

The forms of things are ordered; and one adds above another in perfection.<sup>51</sup> This is evident from what ARISTOTLE says in his *Metaphysics*, that the definition and species of things are like numbers, in which the species are multiplied by the addition of a unit (► 16.7); and it is evident also by induction; for the species of things are multiplied according to the perfect and the imperfect (e.g., a stone has fewer perfections than a dog).

That which constitutes the species is a difference (► 41.28; 16.6).<sup>52</sup> Each thing is constituted in a species insofar as it is determined into some special degree (of perfection) in (i.e., among) beings, because—again—the species of things are like numbers, which differ by addition and subtraction of a unit.

The forms of diverse things (e.g., the forms of essentially composite things that are not the same in species) are unequal according to the *ratio* of (their) proper species.<sup>53</sup> But (of) the forms of one species, some can be equal, while others cannot; for the specific principle must be taken in something indivisible; and the difference of such a principle varies the

---

<sup>48</sup> *De virtutibus*, q. 5 a. 3 co.: “potest esse sanitas inaequaliter, vel quia gradus commensurationis in uno est propinquior debitae et perfectae aequalitati quam in alio, vel quia circa eundem gradum commensurationis unus firmius se habet quam alius, et melius.”

<sup>49</sup> *De virtutibus*, q. 5 a. 3 co.: “scientia est maior unius quam alterius, vel quia conclusiones plures novit, vel quia easdem res melius scit.”

<sup>50</sup> *De virtutibus*, q. 5 a. 3 co.: “Est enim motus inaequalis, vel quia maius spatium pertransit, vel quia mobile velocius movetur.”

<sup>51</sup> *De spirit. creat.*, a. 1 ad 9: “formae rerum sunt ordinatae, et una addit super alteram in perfectione. Et hoc patet per Philosophum in VIII Metaph., qui dicit quod definitiones et species rerum sunt sicut numeri, in quibus species multiplicantur per additionem unitatis; tum etiam hoc per inductionem apparet gradatim species rerum multiplicari secundum perfectum et imperfectum.”

<sup>52</sup> *Sth* I, q. 13 a. 5 co.: “differentia est quae constituit speciem. Unumquodque autem constituitur in specie, secundum quod determinatur ad aliquem specialem gradum in entibus, quia species rerum sunt sicut numeri, qui differunt per additionem et subtractionem unitatis, ut dicitur in VIII Metaphys.”

<sup>53</sup> *De virtutibus*, q. 5 a. 3 co.: “Secundum quidem rationem propriae speciei, formae diversarum specierum sunt inaequales; sed formae unius speciei quaedam quidem possunt esse aequales, quaedam autem non. Oportet enim principium specificum accipi in aliquo indivisibili. Differentia enim huiusmodi principii speciem variat, et ideo, si hoc principio esset additio vel subtractio, ex necessitate species variaretur. Unde et Philosophus dicit in VIII Metaph., quod species rerum sunt sicut numeri, in quibus unitas addita vel subtracta variat speciem.”

species. Hence, if in this principle there should be addition or subtraction, the species would necessarily vary; whence, again, ARISTOTLE says that the species of things are like numbers, in which a unit added or subtracted varies the species (►16.7).

1. There are some forms that receive (*sortiuntur*) the species by something of their essence, as all absolute forms, whether they are substantial or accidental.<sup>54</sup> And in such (forms) it is impossible that, in the same species according to this mode, there were found one form greater than another. Thus, no one whiteness—considered according to itself (i.e., not considered insofar as it is in a subject)—is more whiteness than another (►21.9).

2. There are, however, some forms that receive the species from something extrinsic to which they are ordered.<sup>55</sup> For example, motion receives (its) species from (its) terminus (►14.9; 48.21). Whence, one motion is greater than another according to proximity or distance to a terminus (►48.22, ¶2).

3. There are some qualities that are dispositions in an order to something, as health is some commensuration in an order to the nature of the animal that is said to be healthy.<sup>56</sup> Hence, some degree of commensuration is health in a lion but illness in a man. Therefore, since health does not receive the species according to the degree of commensuration but according to the nature of the animal to which it is ordered, one health can be greater than another in the same animal, as ARISTOTLE says: namely, insofar as there can be diverse degrees of commensuration in which agreement with human nature is preserved.

And this is had in the same mode in science, which receives (its) unity from the unity of the subject (►58.6). Whence, geometry can be in one (geometer) greater than in another insofar as (the former) knows more conclusions (i.e., a greater *number of objects*) ordered to the cognition of the subject of geometry, which is magnitude (►60.1).<sup>57</sup>

---

<sup>54</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam vero formae sunt quae sortiuntur speciem per aliquid suae essentiae, sicut omnes formae absolutae, sive sint substantiales sive accidentales; et in talibus impossibile est quod in eadem specie secundum hunc modum una forma maior alia inveniatur, non enim est una albedo secundum se considerata, magis albedo quam alia.”

<sup>55</sup> *De virtutibus*, q. 5 a. 3 co.: “Quaedam vero formae sunt quae sortiuntur speciem ex aliquo extrinseco ad quod ordinantur, sicut motus sortitur speciem ex termino. Unde unus motus est maior alio, secundum propinquitatem vel distantiam a termino.”

<sup>56</sup> *De virtutibus*, q. 5 a. 3 co.: “Et similiter inveniuntur quaedam qualitates quae sunt dispositiones in ordine ad aliquid; sicut sanitas est quaedam commensuratio humorum in ordine ad naturam animalis, quod dicitur sanum: et ideo aliquis gradus commensurationis humorum in leone est sanitas, qui in homine esset infirmitas. Quia ergo secundum gradum commensurationis sanitas non recipit speciem, sed secundum naturam animalis ad quam ordinatur, contingit etiam quod in eodem animali una sanitas est maior quam alia, ut dicitur X Ethicorum: in quantum, scilicet, diversi gradus commensurationis humorum possunt esse, in quibus salvatur convenientia humanae naturae.”

<sup>57</sup> *De virtutibus*, q. 5 a. 3 co.: “Et eodem modo se habet in scientia, quae recipit unitatem ex unitate subiecti; unde in uno potest esse geometria maior quam in alio, in quantum novit plures conclusiones ordinatas ad cognitionem subiecti geometriae, quod est magnitudo.”

## 22.8. Inequality According to the Act of Being in a Subject or in Matter

1. Some forms of one species can be unequal insofar as they are more or less (perfectly) in (a subject or matter).<sup>58</sup> However, some (forms) cannot be more or less (perfectly) in (a subject or matter); for not any form that gives species to a subject in which it is can be in (it) more or less (perfectly) because the specific principle must consist in (something) indivisible—wherefrom, no substantial form (of one species) receives (in individual matter) more or less (perfection; e.g., no human being is more human than another).

2. Likewise, also, if a form should receive (its) species according to something that is indivisible according to its *ratio*, it would not be said according to more or less.<sup>59</sup> Whence, *two*—and whatever other species of number, which is specified according to an added unit—does not receive more or less. The same reason is (considered): in figures that are specified according to number, as *triangle* and *square* (i.e., if the number of a figure's boundaries changes, its species changes; ► 4.4); in determinate quantities, as *two-cubits* and *three-cubits*; and in numerical relations, as *double* and *triple*.

3. On the other hand, forms that neither give species to the subject nor receive the species from something that is indivisible according to its *ratio* can be in (a subject) according to more or less: e.g., whiteness and blackness, and other such.<sup>60</sup>

That which befits accidents from the part of the subject but not from the *ratio* itself of *accident*, is not attributed to an accident in abstract, but in concrete.<sup>61</sup> And such is intension and remission in some accidents: whence, not *whiteness*, but *the white* is said (to be) *more* or *less*. And the same can be said of habits and other qualities, except that some habits increase or diminish through some addition.

---

<sup>58</sup> *De virtutibus*, q. 5 a. 3 co.: “Similiter etiam secundum quantitatem perfectionis quam habent huiusmodi formae secundum quod insunt materiae vel subiecto, quaedam formae unius speciei inaequales esse possunt, in quantum insunt secundum magis et minus; quaedam vero magis et minus inesse non possunt. Non enim quaecumque forma dat speciem subiecto cui inest, potest inesse magis et minus: quia [...] principium specificum oportet in indivisibili consistere; quod inde est, quia nulla forma substantialis recipit magis et minus.”

<sup>59</sup> *De virtutibus*, q. 5 a. 3 co.: “Similiter etiam si qua forma speciem sortiatur secundum aliquid quod secundum suam rationem est indivisibile, non dicitur secundum magis et minus. Et inde est quod binarius, et quaelibet alia species numeri quae specificatur secundum unitatem additam, non recipit magis et minus; et eadem ratio est in figuris quae secundum numerum specificantur, ut triangulus et quadratum; et in quantitibus determinatis, ut bicubitum et tricubitum; et in relationibus numeralibus, sicut duplum et triplum.”

<sup>60</sup> *De virtutibus*, q. 5 a. 3 co.: “Formae vero quae neque dant speciem subiecto, neque sortiuntur speciem ex aliquo quod secundum rationem suam sit indivisibile, possunt inesse secundum magis et minus, ut albedo et nigredo, et alia huiusmodi.”

<sup>61</sup> *STh I-II*, q. 53 a. 2 ad 3: “id quod convenit accidentibus ex parte subiecti, non autem ex ipsa ratione accidentis, non attribuitur accidenti in abstracto, sed in concreto. Et huiusmodi est intensio et remissio in quibusdam accidentibus, unde albedo non dicitur magis et minus, sed album. Et eadem ratio est in habitibus et aliis qualitibus, nisi quod quidam habitus augentur vel diminuuntur per quandam additionem.”

## 22.9. Virtue as That Which Makes—a Subject and its Operation—Good

The last to which the potency of something extends is a good work (*bonum opus*).<sup>62</sup> Hence, it pertains to the virtue of any one thing to render a good work; and, since a perfect operation (*perfecta operatio*) proceeds only from a perfect agent, it follows that any one thing should be good and should operate well according to its proper virtue.

If this is true in all other (things), as is evident from the (above) examples, it follows that man's virtue will be some habit from which man comes to be good formally speaking—just as whiteness makes something white—, and by which someone operates well.

Thus, as ARISTOTLE says, every virtue makes the subject of which it is (properly a virtue) to be good and renders its work good (*omnis virtus subiectum cuius est facit bene se habere et opus eius reddit bene se habens* < οὐ ἄν ἡ ἀρετή, αὐτό τε εὖ ἔχον ἀποτελεῖ καὶ τὸ ἔργον αὐτοῦ εὖ ἀποδίδωσιν).<sup>63</sup>

For example, the virtue of the eye is both (that) whereby the eye is good, and (that) whereby we see well, which (i.e., the act of seeing) is the proper act of the eye.<sup>64</sup>

Likewise, the virtue of a horse is that which makes the horse good, and (that) whereby the horse operates its work well, which is to run swiftly, to agreeably carry the rider, and to courageously drive away the warring (enemies in battle).<sup>65</sup>

*Virtue conveys (importat) the perfection of a potency. Whence, the virtue of whatever thing is determined (in relation) to the last in that which the thing can, as ARISTOTLE says.<sup>66</sup> And the last in which any one potency is capable of must be good; for every bad conveys a defect. Whence, (Pseudo-)DIONYSIUS says that every bad (thing) is weak (infirmitas).*

---

<sup>62</sup> *In Ethic.* 2, l. 6, 27–38: “ultimum autem ad quod potentia alicuius rei se extendit est bonum opus, et ideo ad virtutem cuiuslibet rei pertinet quod reddat bonum opus; et quia perfecta operatio non procedit nisi a perfecto agente, consequens est quod secundum virtutem propriam unaquaeque res et bona sit et bene operetur. Et si hoc est verum in omnibus aliis, ut per exempla iam patuit, sequitur quod virtus hominis erit habitus quidam, ut supra habitum est, ex quo homo fit bonus formaliter loquendo sicut albedine fit aliquid album, et per quem aliquis bene operatur.”

<sup>63</sup> *In Ethic.* 2, l. 6, 14–22 (cf. ARISTOTLE, *Ethica Nicomachea* B.5, 1106a15–17): “Dicit ergo [Philosophus] primo quod omnis virtus subiectum cuius est facit bene se habere et opus eius reddit bene se habens.”

<sup>64</sup> *In Ethic.* 2, l. 6, 14–22 (cf. ARISTOTLE, *Ethica Nicomachea* B.5, 1106a17–19): “sicut virtus oculi est per quam et oculus est bonus et per quam bene videmus, quod est proprium opus oculi.”

<sup>65</sup> *In Ethic.* 2, l. 6, 14–22 (cf. ARISTOTLE, *Ethica Nicomachea* B.5, 1106a19–21): “similiter etiam virtus equi est quae facit equum bonum et per quam equus bene operatur opus suum, quod est velociter currere et suaviter ferre ascensorem et audacter expectare bellatores.”

<sup>66</sup> *STh* I-II, q. 55 a. 3 co.: “virtus importat perfectionem potentiae, unde virtus cuiuslibet rei determinatur ad ultimum in quod res potest, ut dicitur in I *de Caelo*. Ultimum autem in quod unaquaeque potentia potest, oportet quod sit bonum, nam omne malum defectum quendam importat; unde Dionysius dicit, in IV cap. *de Div. Nom.*, quod omne malum est *infirmitas*. Et propter hoc oportet quod virtus cuiuslibet rei dicatur in ordine ad bonum. Unde virtus humana, quae est habitus operativus, est bonus habitus, et boni operativus.”

Wherefrom, the virtue of whatever thing must be said in order to (something) good. Whence, human virtue, which is an operative power, is a good habit, and operative of good (i.e., able to produce that which is good).

Likewise, AUGUSTIN says that virtues are the greatest goods—not simply (of course), but in a genus.<sup>67</sup>

In every composite, the good is not of *this* or *that* part, but of the whole.<sup>68</sup> And we say *good* according to the goodness that is proper of the whole and its perfection; for parts are imperfect in respect of the whole: just as the parts of a man are not a man, also the parts of the number six do not have the perfection of six; and, likewise, the parts of a line do not attain the perfection of measure (i.e., of magnitude) that is found in the whole line.

### 22.10. Order of Potencies and Virtues to Their Acts

A virtue is said (to be) *the last of a potency* in the same genus (as the potency), which is the genus of the principle in respect of that of which it is said (to be a) *potency* or *virtue*.<sup>69</sup> On the other hand, the act (of a virtue) is a last, but outside of that genus. Hence, an act cannot be a virtue.

Again, *virtue*, properly speaking, includes a respect to something of which it would be a principle, such as *running* or *being*.<sup>70</sup> And, since the act as such is a last—i.e., it is not ordered to something as an effect—, hence, the act cannot be said (to be a) *virtue*—except in that mode of speaking whereby a habit is denominated by (its) act as a cause (is denominated) by (its) effect.

However, a potency, according to what it is, involves some relation to an act; for (a potency) is a principle of acting or of being acted upon.<sup>71</sup> Whence, an act must be posited

---

<sup>67</sup> *De virtutibus*, q. 1 a. 1 ad 3: “Augustinus dicit, virtutes esse maxima bona, non simpliciter, sed in genere; sicut et ignis dicitur subtilissimum corporum. Unde non sequitur quod nihil sit in nobis ipsis virtutibus melius; sed quod sint de numero eorum quae sunt maxima bona secundum genus suum.”

<sup>68</sup> ScG 1, 18 n. 6: “In omni composito bonum non est huius vel illius partis, sed totius, - et dico bonum secundum illam bonitatem quae est propria totius et perfectio eius: nam partes sunt imperfectae respectu totius: sicut partes hominis non sunt homo, partes etiam numeri senarii non habent perfectionem senarii, et similiter partes lineae non perveniunt ad perfectionem mensurae quae in tota linea invenitur.”

<sup>69</sup> *In Sent.* 3, d. 23 q. 1 a. 3 qc. 3 ad 2: “virtus dicitur ultimum potentiae in eodem genere, quod est genus principii respectu ejus cujus dicitur potentia vel virtus; sed actus est ultimum extra genus illud: et ideo non oportet quod actus sit virtus.”

<sup>70</sup> *In Sent.* 3, d. 23 q. 1 a. 3 qc. 3 co.: “virtus proprie loquendo includit respectum ad aliquid cujus principium sit, sicut currendi, vel essendi. Et quia actus, in quantum hujusmodi, cum sit ultimum, non ordinatur ad aliquid sicut effectus; ideo actus virtus dici non potest, nisi eo modo loquendi, quo habitus per actus nominantur, sicut causae per effectus.”

<sup>71</sup> *In De anima* 2, c. 6, 124–130 (cf. ARISTOTLE, *De anima* B.4, 415a18–21): “Potencia enim secundum hoc ipsum quod est importat habitudinem quandam ad actum: est enim principium agendi uel paciendi; unde oportet quod actus ponantur in diffinitionibus potenciarum. Et, si ita se habet circa ordinem actus et potencie, et actibus adhuc sunt priora opposita, id est obiecta.”

in the definition of potencies. And if acts and potencies are so related in respect of order (i.e., if acts are prior to potencies), so are objects prior to acts.

### 22.11. Specification of Operations of Active vs. Passive Potencies

The species of acts and operations are taken according to an order to objects (► 14.9); for every operation is an act either of an active or of a passive potency:<sup>72</sup>

**1. The objects of passive potencies** are compared to (their) operations as **active** because they reduce the potencies into act, as the visible (object reduces the potency of sight (i.e., activates it), and (as) every sensible (object reduces) sense (into act).<sup>73</sup>

**2. The objects of active potencies** are compared to their operations as **ends**; for the objects of active potencies are the (things) operated by them (*sunt operata ipsarum*).<sup>74</sup> It is manifest that in any (of them), there are—other than the operations—(the things) operated, which are the ends of the operations, as the house that is constructed is the end of (the act of) constructing.

It is evident, therefore, that every object is compared to an operation either as active (*ut activum*, i.e., as that which activates the potency to operate) or as an end (*ut finis*, i.e., as that towards which the potency is inclined to operate); and (that) the operation is specified by one or the other.<sup>75</sup>

Indeed, it is evident that active (objects that are) diverse in species have operations (that are) different in species, as heating (i.e., an operation) is from heat (i.e., an object that activates a passive potency) and cooling (i.e., an operation different to heating in species) is from cold (i.e., an object that is diverse from heat in species).<sup>76</sup>

Likewise, an operation is also specified from the terminus and end, as (the operations of) healing and sickening differ in species according to the difference of health and illness.<sup>77</sup>

---

<sup>72</sup> *In De anima* 2, c. 6, 131–134: “Species enim actuum et operationum sumuntur secundum ordinem ad obiecta. Omnis enim [...] operatio uel est actus potencie actiue uel passiuæ.”

<sup>73</sup> *In De anima* 2, c. 6, 134–137: “Obiecta quidem potenciarum passiuarum comparantur ad operationes earum ut actiua, quia reducunt potencias in actum, sicut uisibile uisum et omne sensibile sensum.”

<sup>74</sup> *In De anima* 2, c. 6, 137–144: “Obiecta uero potenciarum actiuarum comparantur ad operationes ipsarum ut fines; obiecta enim potenciarum actiuarum sunt operata ipsarum, manifestum est autem quod, in quibuscunque preter operationes sunt aliqua operata, quod operata sunt fines operationum, ut dicitur in I Ethicorum, sicut domus que edificatur est finis edificationis.”

<sup>75</sup> *In De anima* 2, c. 6, 144–147: “Manifestum est igitur quod omne obiectum comparatur ad operationem [...] uel ut actiuum uel ut finis. Ex utroque autem specificatur operatio.”

<sup>76</sup> *In De anima* 2, c. 6, 147–151: “manifestum est enim quod diuersa actiua secundum speciem habent operationes specie differentes, sicut calefactio est a calore et infrigidatio a frigore.”

<sup>77</sup> *In De anima* 2, c. 6, 151–154: “similiter etiam ex termino et fine specificatur operatio, sicut sanatio et egrotatio differunt specie secundum differentiam sanitatis et egritudinis.”

Therefore, objects are prior to operations in the way of definition.<sup>78</sup> And potencies are distinguished according to the *ratio* of (their) objects.<sup>79</sup>

### 22.12. The Proper Principles of Operations

Wherever there are proper operations, there must be proper principles of those operations.<sup>80</sup> Hence, not whatever diversity of acts indicates a diversity of potencies.<sup>81</sup> Sometimes, it indicates only a diversity of habits, as to geometrize and to syllogize (i.e., these two operations do not indicate that man has one potency for exerting the science of geometry and another, diverse potency for exerting the art of logic; rather, this diversity of acts indicates a diversity of habits that perfect a single intellectual potency, making it capable of exerting diverse acts). Sometimes, (a diversity of acts indicates) neither (a diversity of potencies nor a diversity of habits).

This is evident because the substance (i.e., essence) of any which potency is according as it is naturally apt to operate about (its) proper object (*secundum quod est nata operari circa proprium objectum*).<sup>82</sup> Hence, actions that differ according to diverse objects indicate a diversity of potencies, but in such a way that *difference of objects* is taken according to *that which pertains to the proper ratio of the object*.

For example, man and stone differ in genus, but agree in color insofar as they are the object of sight; hence, seeing man or stone pertains to one potency.<sup>83</sup> Yet, to sense sound and colors pertains to diverse potencies, since sound and color—according to the proper *ratios* whereby they are distinguished—are (diverse) proper objects of sense.

Sometimes, however, the diversity of acts is caused from a diversity of media or of principles from which one reaches the same genus of object.<sup>84</sup> And such a diversity (of

---

<sup>78</sup> *In De anima* 2, c. 6, 154–155: “Sic igitur obiecta sunt priora operationibus [...] in uia diffiniendi.”

<sup>79</sup> *In De anima* 3, c. 8, 124–125: “potencie distinguuntur secundum rationes obiectorum.”

<sup>80</sup> *In Sent.* 4, d. 4 q. 1 a. 1 co.: “Ubi quomodo sunt operationes propriae, oportet quod sint principia propria illarum operationum.”

<sup>81</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “non quaelibet diversitas actus ostendit diversitatem potentiae; sed quandoque etiam ostendit tantum diversitatem habitus, sicut geometrizare, et syllogizare; quandoque autem neutrum.”

<sup>82</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “Ista autem sic patet: quia enim substantia uniuscujusque potentiae est, secundum quod est nata operari circa proprium objectum, ut de sensu dicit Philosophus in 2 De anima, ideo actiones quae differunt secundum diversa objecta, ostendunt diversitatem potentiarum: ut tamen accipiatur differentia obiectorum secundum id quod ad propriam rationem objecti pertinet.”

<sup>83</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “homo enim et lapis differunt genere, sed conveniunt secundum quod sunt objectum visus in colore: et ideo visio hominis et lapidis pertinent ad unam potentiam; sed sentire sonum et colores pertinent ad diversas potentias: quia sonus et color, secundum proprias rationes, quibus ad invicem distinguuntur, sunt propria objecta sensus.”

<sup>84</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “Quandoque autem diversitas actuum causatur ex diversitate medii, vel principii, ex quo pervenitur ad idem genus objecti: et talis diversitas actuum ostendit diversitatem habituum: diversae enim scientiae ex diversis principiis procedunt, etiam si easdem condiciones demonstrant.” *In Sent.* 4, d. 14 q. 1 a. 3 qc. 2 co.: “habitus medius est inter potentiam et actum.”

acts) indicates a diversity of habits; for a habit is a mean between the potency and the act. Thus, diverse sciences proceed from diverse principles (and use diverse definitions, which are means to the end of demonstration), even if they demonstrate the same conditions.

For example, the astronomer and the natural (scientist) demonstrate the roundness of the Earth through diverse means.<sup>85</sup> Likewise, moral virtues are distinguished from diverse ends, which (ends) are in operable (objects) as principles (are) in speculative (objects).

Sometimes, on the other hand, the diversity of acts is caused from that which is an accident of the action; and such a diversity of actions requires neither diverse potencies nor diverse habits; for that which is by accident does not cause a difference in species.<sup>86</sup>

### **22.13. Accidental Diversity of Acts**

(A diversity of acts is caused by an accident in the action):

#### **1. From the part of the agent, according as it is more powerful or weaker in acting.<sup>87</sup>**

Indeed, something acts only insofar as it is in act.<sup>88</sup> And since an active potency follows upon (its) act, the quantity of potency follows upon the quantity of the act; for the more any one thing is in act the more it abounds in (its) virtue of acting (*abundat in virtute agendi*).

For example, bluntness or subtlety of disposition, which differ according to the swiftness and tardiness to learn, (are accidents in the agent).<sup>89</sup>

#### **2. From the part of the mean.<sup>90</sup>**

For example, to believe and to opine, which differ according to the efficacy or weakness of the mean, (are accidents in a cognitive habit).<sup>91</sup>

---

<sup>85</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “sicut astrologus et naturalis diversis mediis rotunditatem terrae ostendit, ut dicitur in 2 Phys. Similiter etiam virtutes morales distinguuntur ex diversis finibus, qui sunt in operativis sicut principia in speculativis.”

<sup>86</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “Quandoque vero diversitas actuum causatur ex eo quod est accidens actionis [...]: et talis diversitas actionum neque potentiam diversam neque diversum habitum requirit: quia illud quod est per accidens, non causat differentiam in specie.”

<sup>87</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “vel ex parte agentis, secundum quod est potentius vel infirmius in agendo.”

<sup>88</sup> *In De anima* 3, c. 1, 296–297: “nichil agit nisi secundum quod est actu.” *De potentia*, q. 1 a. 2 co.: “cum potentia activa sequatur actum, quantitas potentiae sequitur quantitatem actus; unumquodque enim tantum abundat in virtute agendi quantum est in actu.”

<sup>89</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “sicut hebetudo vel subtilitas ingenii, quae differunt secundum velocitatem et tarditatem addiscendi.”

<sup>90</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “vel ex parte medii.”

<sup>91</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “ut credere et opinari, quae differunt secundum efficaciam et debilitatem medii.”

### 3. From the part of the object.<sup>92</sup>

For example, to see a man or a stone (is an accident in the object of sight); for to be man or stone happens (*accidit*) to the colored thing.<sup>93</sup> Thus, for example, a twofold quantity can be considered about the act and the intention of an end (in the potency of will):<sup>94</sup> from the part of the object, because one wants or does a greater good; and from the intension of the act, because one intensely wants or does, which is greater from the part of the agent.

#### 22.14. Subjective vs. Objective Quantity

The aforesaid *ratio* of *magnitude*—i.e., the perfection of those (that are) in a subject—is common to all qualities and to all forms.<sup>95</sup> However, some qualities have—apart from this magnitude or quantity that pertains to them by themselves—another magnitude or quantity that pertains to them by accident. And this (can happen) in two modes:

##### 1. By reason of the subject.<sup>96</sup>

For example, whiteness is said (to be a) *quantum* by accident because its subject is a quantum.<sup>97</sup> Whence, if the subject is increased, the whiteness is increased by accident. However, something is not said (to be) *whiter* (*magis album*) according to this increase: rather, (we say there is a) *greater whiteness* (*maior albedo*), as also something is said (to be a) *whiter* (*maius album*) because those that pertain to this increase are not predicated in another way of whiteness and of the subject by reason of which whiteness is said to increase by accident.

This mode of quantity and of increase does not pertain (e.g.) to the qualities of the soul—i.e., to the sciences and to the (moral) virtues.<sup>98</sup>

---

<sup>92</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “vel ex parte objecti.”

<sup>93</sup> *In Sent.* 2, d. 24 q. 2 a. 2 ad 5: “sicut videre hominem et lapidem; accidit enim colorato esse hominem aut lapidem.”

<sup>94</sup> *STh* I-II, q. 19 a. 8 co.: “circa actum et intentionem finis, duplex quantitas potest considerari, una ex parte obiecti, quia vult maius bonum, vel agit; alia ex intensione actus, quia intense vult vel agit, quod est maius ex parte agentis.”

<sup>95</sup> *De virtutibus*, q. 1 a. 11 ad 10: “omnibus qualitibus et formis est communis ratio magnitudinis quae dicta est, scilicet perfectio earum in subiecto. Aliquae tamen qualitates, praeter istam magnitudinem seu quantitatem quae competit eis per se, habent aliam magnitudinem vel quantitatem quae competit eis per accidens; et hoc dupliciter.”

<sup>96</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Uno modo ratione subiecti.”

<sup>97</sup> *De virtutibus*, q. 1 a. 11 ad 10: “sicut albedo dicitur quanta per accidens, quia subiectum eius est quantum; unde augmentato subiecto, augmentatur albedo per accidens. Sed secundum hoc augmentum, non dicitur aliquid magis album, sed maior albedo, sicut et dicitur aliquid maius album: non enim aliter praedicantur ea quae pertinent ad hoc augmentum, de albedine, et de subiecto ratione cuius albedo per accidens augeri dicitur.”

<sup>98</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Sed hic modus quantitatis et augmenti non competit qualitibus animae, scilicet scientiis et virtutibus.”

**2. From the part of the object, in that which acts,** quantity and increase can be attributed to some quality by accident; and this is said (to be a) *quantity of virtue*, which is said (to be) *more* on account of the quantity or containment (*continentia*) of the object (► 14.9).<sup>99</sup>

For example, one is said (to be) *of great virtue* who can carry a great weight, or can do whatever great thing, whether in dimensive magnitude, in magnitude of perfection, or according to discrete quantity—as one is said (to be) *of great virtue* who can produce many (things).<sup>100</sup>

In this mode, quantity can be attributed by accident (e.g.) to the qualities of the soul—namely to the sciences and to the (moral) virtues.<sup>101</sup>

However, there is this (difference) between science and (moral) virtue:<sup>102</sup> that it does not belong to the *ratio* of *science* to extend in act in respect of all objects; for it is not necessary for the scientist to know all that can be known (scientifically); on the other hand, it belongs to the *ratio* of (*moral*) *virtue* to act virtuously in all deeds. Whence, science can increase either according to the number of objects or according to its intension in the subject, while virtue (can increase) only in one mode (i.e., in intensity).

### **22.15. Virtue as Perfection**

As ARISTOTLE says, virtue is some perfection (*perfectio quaedam* = τελείωσις τις).<sup>103</sup> Which he proves thus: each thing is perfect (► 23) when it can attain its proper virtue.<sup>104</sup> For example, a natural body is perfect when it can produce something like itself, which is the virtue of nature. Which he also proves, thus: something is maximally in accordance to

---

<sup>99</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Alio modo quantitas et augmentum attribuitur alicui qualitati per accidens, ex parte obiecti in quod agit: et haec dicitur quantitas virtutis; quae magis dicitur propter quantitatem obiecti vel continentiam.”

<sup>100</sup> *De virtutibus*, q. 1 a. 11 ad 10: “sicut dicitur magnae virtutis qui magnum pondus potest ferre, vel qualitercumque potest magnam rem facere, sive magnitudine dimensiva, sive magnitudine perfectionis, vel secundum quantitatem discretam; sicut dicitur aliquis magnae virtutis qui potest multa facere.”

<sup>101</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Et hoc modo quantitas per accidens potest attribui qualitibus animae, scilicet scientiis et virtutibus.”

<sup>102</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Sed tamen hoc interest inter scientiam et virtutem: quia de ratione scientiae non est quod se extendat in actum respectu omnium obiectorum: non enim est necesse quod sciens omnia scibilia cognoscat. Sed de ratione virtutis est quod in omnibus virtuose se agat. Unde scientia potest augeri vel secundum numerum obiectorum, vel secundum intensionem eius in subiecto; virtus autem uno modo tantum.”

<sup>103</sup> *In Physic.* 7, l. 6, n. 2 (cf. ARISTOTLE, *Physica* H.3, 246b27–28): “assumit [Philosophus] quandam propositionem, scilicet quod virtus sit perfectio quaedam.”

<sup>104</sup> *In Physic.* 7, l. 6, n. 2 (cf. ARISTOTLE, *Physica* H.3, 246b28–29): “Quod quidem sic probat: quia unumquodque tunc est perfectum, quando pertingere potest ad propriam virtutem; sicut naturale corpus tunc perfectum est, quando potest aliud sibi simile facere, quod est virtus naturae. Quod etiam probat per hoc, quia tunc est aliquid maxime secundum naturam, quando naturae virtutem habet; virtus enim naturae est signum completionis naturae: cum autem aliquid habet complete suam naturam, tunc dicitur esse perfectum.”

(its) nature when it has the virtue of (its) nature; for the virtue of a nature is a sign of the completion (i.e., perfection) of a nature; and when something completely has its nature, then is it said to be perfect (e.g., as when a horse can beget a horse).

Therefore, it is evident that, since the virtue of each thing follows upon the perfection of its form, something is perfect when it has its virtue.<sup>105</sup> And thus, it follows that virtue is some perfection.

A magnitude of perfection can be said (to be a) *magnitude of virtue* because some quality should be capable in something great—and it itself would be great for the same reason.<sup>106</sup> The more each thing is closer to its perfection, the more virtuous and the more intense it is.<sup>107</sup> Any one (thing) is more perfect the more it attains its proper virtue.<sup>108</sup> The order of things is such that, the more something is superior, the more it has a united virtue; and (the more) it extends itself to many (things).<sup>109</sup>

---

<sup>105</sup> *In Physic.* 7, l. 6, n. 2: “Sic ergo patet, quod cum ad perfectionem formae cuiuslibet rei consequatur virtus eius, quod tunc unumquodque perfectum est, quando habet suam virtutem. Et ita sequitur quod virtus sit perfectio quaedam.”

<sup>106</sup> *De virtutibus*, q. 1 a. 11 ad 10: “Sed considerandum est, quod eiusdem rationis est quod aliqua qualitas in aliquid magnum possit, et quod ipsa sit magna, sicut ex supradictis patet; unde etiam magnitudo perfectionis potest dici magnitudo virtutis.”

<sup>107</sup> *In Physic.* 5, l. 10, n. 7: “unumquodque autem quanto est propinquius suae perfectioni, tanto est virtuosius et intensius.”

<sup>108</sup> *In Post. an.* 1, l. 37, 58–60: “unumquodque autem tanto perfectius est quanto magis attingit ad propriam uirtutem, ut patet in VII Phisicorum.”

<sup>109</sup> *STh* I, q. 57 a. 2 co.: “Hoc enim rerum ordo habet, quod quanto aliquid est superius, tanto habeat virtutem magis unitam et ad plura se extendentem.” This is immediately applied to common (as opposed to proper) sense in man, but St. Thomas adds, “Et simile etiam est in aliis considerare.”

## 23. Perfection

*Since virtue is a perfection, and quantity of virtue (virtual quantity) is quantity of perfection, we need to determine what it is for something to be perfect.*

### 23.1. Perfect as *That of Which Nothing is Outside*

*Perfect*—together with *whole*, *false*, *accident* (and others)—is one of the names that signifies something that is related to being (*ens*) according to the mode of an affection (*per modum passionis*; i.e., just like *odd* and *even* signify proper qualitative properties of number insofar as it is number, *perfect* signifies a property of being as such).<sup>1</sup>

As ARISTOTLE says, *perfect* and *whole* either are the same or signify almost the same (< ὅλον δὲ καὶ τέλειον ἢ τὸ αὐτὸ πᾶμπαν ἢ σύνεγγυς τὴν φύσιν); for the definition of **whole** and of **perfect** (*perfectum* = τέλειον) is *that of which nothing is outside* (*id cuius nihil est extra est definitio perfecti et totius* < οὐ δὲ μηδὲν ἔξω, τοῦτ' ἔστι τέλειον καὶ ὅλον).<sup>2</sup>

(Moreover), *all* (*omne*, or *every* < τὰ πάντα), *the whole* (*totum* < τὸ πᾶν), and *perfect* (*perfectum* < τὸ τέλειον) do not differ one from the other according to (their) formal *ratio* (*secundum speciem* = κατὰ τὴν ἰδέαν, *idest secundum formalem rationem*), because all (of them) convey some integrity (*important integritatem quandam*).<sup>3</sup> (Therefore), if they differ in something, they (must) differ in matter (*in materia* = ἐν τῇ ὕλῃ) or in subject (*subiecto*), insofar as they are said of diverse (*inquantum de diversis dicuntur* < ἐφ' ὧν λέγονται).

Thus, we use **all** in discrete (things), as (when) we say, “all men” (*omnem hominem*, or *every man*).<sup>4</sup> We use it also in continua that are proximate to division (i.e., continua that

<sup>1</sup> *In Metaph.* 5, l. 18, §1033: “Postquam Philosophus distinxit nomina, quae significant causas, et subiectum, et partes subiectorum huius scientiae; hic incipit distinguere nomina quae significant ea quae se habent per modum passionis; et dividitur in duas partes. In prima distinguit nomina ea quae pertinent ad perfectionem entis. In secunda distinguit nomina quae pertinent ad entis defectum [...]. Circa primum duo facit. Primo distinguit nomina significantia ea quae pertinent ad perfectionem entis. Secundo pertinentia ad totalitatem.” *In Metaph.* 5, l. 22, §1128: “distinguit [Philosophus] nomina, quae significant defectum entis, vel ens incompletum. Et primo hoc nomen falsum. Secundo hoc nomen accidens.”

<sup>2</sup> *In Metaph.* 5, l. 18, §1033: “Perfectum enim et totum, aut sunt idem, aut fere idem significant, ut dicitur in tertio Physicorum.” *In Physic.* 3, l. 11, n. 4: “*Id cuius nihil est extra est definitio perfecti et totius.* [...] Sic igitur manifestum est quod haec est definitio totius: *totum est cuius nihil est extra.*” Cf. ARISTOTLE, *Physica* Γ.6, 207a8–10: “οὐ δὲ μηδὲν ἔξω, τοῦτ' ἔστι τέλειον καὶ ὅλον· οὕτω γὰρ ὀριζόμεθα τὸ ὅλον, οὐ μηδὲν ἄπεισιν”; 13–15: “ὅλον δὲ καὶ τέλειον ἢ τὸ αὐτὸ πᾶμπαν ἢ σύνεγγυς τὴν φύσιν. τέλειον δ' οὐδὲν μὴ ἔχον τέλος· τὸ δὲ τέλος πέρας.” Cf. *De caelo* B.4, 286b18–19. Cf. *Quodlibet* 3, q. 6 a. 3 co.: “totum et perfectum est idem, ut dicitur in III Physic.” *De perf.*, c. 5, 17–18: “Cum enim totum et perfectum sit cui nihil deest [...].” *In Sent.* 1, d. 8 q. 5 a. 3 ad 1: “totum enim et perfectum est idem, ut dicit Philosophus.”

<sup>3</sup> *In De caelo* 1, l. 2 n. 8 (cf. ARISTOTLE, *De caelo* A.1, 268a20–22): “dicit [Philosophus] quod haec tria, *omne* et *totum* et *perfectum*, non differunt ab invicem *secundum speciem*, idest secundum formalem rationem, quia omnia important integritatem quandam: sed si in aliquo differant, differunt in materia et subiecto, inquantum de diversis dicuntur.”

<sup>4</sup> *In De caelo* 1, l. 2 n. 8: “Nam hoc quod dicitur *omne*, utimur in discretis, sicut dicimus *omnem hominem*: utimur etiam eo in continuis quae sunt propinqua divisioni, sicut dicimus *omnem aquam* et *omnem aerem.*”

are easily divided), as (when) we say, “all [the] water” (*omnem aquam*, or *every water*), and “all [the] air” (*omnem aerem*, or *every air*).

In turn, **whole** is said in all of the above, and in continua; for we say, “[the] whole people” (*totum populum*, i.e., in discrete things) or “[the] whole wood” (i.e., in continua).<sup>5</sup>

However, *whole* is not found among simple (things), which do not have parts, and for which we use the name *perfect*.<sup>6</sup>

Thus, we say **perfect** in all of the above, and in forms (in themselves, simple); for we say, “perfect whiteness” (*perfectam albedinem*), and “perfect virtue” (*perfectam virtutem*).<sup>7</sup>

### 23.2. Perfect as Terminated

**Perfect** is *that of which nothing is outside* (as just defined); but nothing that lacks (its) end is perfect (*nullum carens fine est perfectum* = τέλειον οὐδὲν μὴ ἔχον τέλος); for the end is the perfection of each thing; and the **end** is *the terminus of that of which the end is* (< τὸ τέλος πέρας).<sup>8</sup>

Whence, the (thing’s) terminus (► 8.8) is one of the conditions of the perfect; for the perfect is terminated and absolute; does not depend on another, i.e., is by itself (► 17.6); and possesses—i.e., is not deprived of (► 42.7)—those that befit it according to its genus.<sup>9</sup>

Therefore, nothing (that is materially) infinite and indeterminate (*interminatum*) is perfect—and the definition of *perfect*—i.e., *that of which nothing is outside*—does not befit the (material) infinite (► 24.8, ¶1).<sup>10</sup>

---

<sup>5</sup> *In De caelo* 1, l. 2 n. 8: “*Totum* autem dicitur et in his et in continuis: dicimus enim *totum* populum et *totum* lignum.”

<sup>6</sup> *In Physic.* 3, l. 11, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 207a8–15): “Sed *totum* et *perfectum* vel sunt penitus idem, vel sunt propinqua secundum naturam. Et hoc ideo dicit, quia *totum* non invenitur in simplicibus, quae non habent partes: in quibus tamen utimur nomine *perfecti*.”

<sup>7</sup> *In De caelo* 1, l. 2 n. 8: “*Perfectum* autem dicimus et in his et in formis: dicimus enim *perfectam albedinem* et *perfectam virtutem*.”

<sup>8</sup> *In Physic.* 3, l. 11, n. 4: “Per hoc igitur manifestum est quod *perfectum est cuius nihil est extra ipsum*. Sed nullum carens fine est perfectum; quia finis est perfectio uniuscuiusque. Finis autem est terminus eius cuius est finis: nullum igitur infinitum et interminatum est perfectum. Non ergo competit infinito definitio perfecti, cuius scilicet nihil est extra.”

<sup>9</sup> *In Metaph.* 5, l. 19, §1044 (cf. ARISTOTLE, *Metaphysica* Δ.17, 1022a4–14): “Hic prosequitur *de nominibus, quae significant conditiones perfecti*. Perfectum autem, ut ex praemissis patet, est terminatum et absolutum, non dependens ab alio, et non privatum, sed habens ea, quae sibi secundum suum genus competunt. Et ideo primo ponit hoc nomen *Terminus*. Secundo hoc quod dicitur per se [...]. Tertio hoc nomen *Habitus*.” *In Metaph.* 5, l. 18, §1033: “distinguit [Philosophus] quaedam nomina, quae significant quasdam perfectiones perfecti, ibi, «Terminus dicitur».”

<sup>10</sup> *In Physic.* 3, l. 11, n. 4: “Per hoc igitur manifestum est quod *perfectum est cuius nihil est extra ipsum*. Sed nullum carens fine est perfectum; quia finis est perfectio uniuscuiusque. Finis autem est terminus eius cuius est finis: nullum igitur infinitum et interminatum est perfectum. Non ergo competit infinito definitio perfecti, cuius scilicet nihil est extra.”

### 23.3. Perfect as *Totally Terminated*

Everything that comes to be (*omne quod fit*) is drawn from potency into act (*de potentia in actum deductum est*) and from non-being into being (*de non esse in esse*) when it is produced (*quando factum est*).<sup>11</sup>

Whence, according to the origin of the name, something is rightly said to be **perfect** as *totally produced* (*quasi totaliter factum*) when potency is totally reduced to act, such that it retains nothing of non-being, but has a complete being (*esse completum*; ►46.29, ¶1).<sup>12</sup>

### 23.4. Perfect as *in Act*

By some extension of the name, not only that which—in coming about (*fiendo*)—attains a complete act is said (to be) **perfect**, but also *that which is in complete act* without any production (*id quod est in actu completo absque omni factione*; ►24.8, ¶2).<sup>13</sup>

Whence, that is said to be **perfect** which *does not lack* (*its act of*) *being in act* (*non deest esse in actu*), whether it has this through the mode of production (*per modum factionis* or not (►46.29).<sup>14</sup> And since (that) is said (to be) *perfect* which lacks nothing according to the mode of its perfection, something is said to be **perfect** *insofar as it is in act*.

### 23.5. Modes in Which *Perfect* is Said by Itself

ARISTOTLE posits three modes in which something is said (to be) **perfect** by itself, of which the first two modes of perfection are considered according to interior (perfection; ►23.6), while the third one is considered in respect to external (perfection; ►23.8).<sup>15</sup>

### 23.6. Intrinsic Modes in Which *Perfect* is Said by Itself

Something is said (to be) **perfect** by itself, considered according to interior (perfection), in two modes:<sup>16</sup>

---

<sup>11</sup> ScG 1, 28 n. 9: “omne quod fit, de potentia in actum deductum est et de non esse in esse quando factum est.”

<sup>12</sup> ScG 1, 28 n. 9: “si nominis significatio quantum ad sui originem attendatur [...], tunc recte perfectum esse dicitur, quasi totaliter factum, quando potentia totaliter est ad actum reducta, ut nihil de non esse retineat, sed habeat esse completum.”

<sup>13</sup> ScG 1, 28 n. 9: “Per quamdam igitur nominis extensionem perfectum dicitur non solum quod fiendo pervenit ad actum completum, sed id etiam quod est in actu completo absque omni factione.”

<sup>14</sup> *STh* I, q. 4 a. 1 ad 1: “quia in his quae fiunt, tunc dicitur esse aliquid perfectum, cum de potentia educitur in actum; transumitur hoc nomen perfectum ad significandum omne illud cui non deest esse in actu, sive hoc habeat per modum factionis, sive non.” *STh* I, q. 4 a. 1 co.: “Secundum hoc enim dicitur aliquid esse perfectum, secundum quod est actu, nam perfectum dicitur, cui nihil deest secundum modum suae perfectionis.”

<sup>15</sup> *In Metaph.* 5, l. 18, §1033: “ponit [Philosophus] tres modos quibus aliquid secundum se dicitur perfectum.” *Ibid.*, §1038: “Uterque autem [sc., primus et secundus] modus perfectionis attenditur interiorem.” *Ibid.*, §1039: “Tertium modum ponit per respectum ad exterius.”

<sup>16</sup> *In Metaph.* 5, l. 18, §1038 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b12–1022a1): “Uterque autem [sc., primus et secundus] modus perfectionis attenditur interiorem.”

1. Insofar as nothing is lacking in the naturally determined **dimensional quantity** of a thing: *that outside of which no part of it can be taken (extra quod non est accipere aliquam eius particulam < οὐ μὴ ἔστιν ἔξω τι λαβεῖν μηδὲ ἐν μόριον).*<sup>17</sup>

For example, a man is said (to be) *perfect* when he lacks none of its parts.<sup>18</sup> Likewise, time is said (to be) *perfect* when it is impossible to take something outside that is the time's part: for example, a day (is said to be) perfect when no part of the day is lacking.

2. Insofar as nothing lacks in the **virtual quantity** owed to a thing according to nature: *that which has neither excess (superexcellētia vel superabundantia = ὑπερβολή)<sup>19</sup> nor defect (defectum < ἐλλείπωσις) according to (its) virtue (secundum virtutem = κατ' ἀρετήν)* so that it produces (something) well according to its genus (< πρὸς τὸ γένος); for we say that something is well had which has neither more nor less of that which it must have.

For example, a physician or a piper is said (to be) *perfect* when he does not lack something that pertains to the species of (his) proper virtue, according to which the former is a good physician, and the latter, a good piper; for the virtue of anything is what makes the possessor (of the virtue) good and renders its work good (► 22.9).<sup>20</sup>

According to this second mode, we also use—by transfer—the name *perfect* for bad (things).<sup>21</sup> For example, we say (that someone is) a *perfect slanderer*, or a *perfect robber*, when he lacks nothing of that which befits them insofar as they are such.

It is not astonishing that we should use the name *perfection* in these (bad things), which rather sound of defect; for even when they are bad, we use for them—because of some

---

<sup>17</sup> In *Metaph.* 5, l. 18, §1034 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b12–13): “Dicit ergo [Philosophus] primo, quod perfectum *uno modo* dicitur, extra quod non est accipere aliquam eius particulam.” Ibid.: “sicut homo dicitur perfectus, quando nulla deest ei pars.” Ibid., §1038: “primus modus perfecti accipiebatur ex hoc quod nihil rei deerat de quantitate dimensioniva sibi naturaliter determinata.”

<sup>18</sup> In *Metaph.* 5, l. 18, §1034: “sicut homo dicitur perfectus, quando nulla deest ei pars.” Ibid. (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b13–14): “Et dicitur tempus perfectum, quando non est accipere extra aliquid quod sit temporis pars.” Ibid.: “sicut dicitur dies perfectus, quando nulla pars diei deest.”

<sup>19</sup> In *Metaph.* 5, l. 18, §1035 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b14–15): “*Alio modo* dicitur aliquid perfectum secundum virtutem; et sic dicitur aliquid perfectum, quod non habet «hyperbolem,» idest superexcellētia vel superabundantiam ad hoc quod aliquid bene fiat secundum genus illud, et similiter nec defectum. Hoc enim dicimus bene se habere, ut dicitur in secundo Ethicorum, quod nihil habet nec plus nec minus quam debet habere.” Ibid., §1038: “hic secundus modus accipitur ex hoc quod nihil deest alicui de quantitate virtutis sibi debitae secundum naturam.”

<sup>20</sup> In *Metaph.* 5, l. 18, §1035 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b16–17): “Et sic dicitur perfectus medicus et perfectus fistulator, quando non deficit ei aliquid, quod pertineat ad speciem propriae virtutis, secundum quam dicitur, quod hic est bonus medicus, et ille bonus fistulator. Virtus enim cuiuslibet est quae bonum facit habentem, et opus eius bonum reddit.”

<sup>21</sup> In *Metaph.* 5, l. 18, §1036 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b17–18): “Secundum autem hunc modum utimur translative nomine perfecti etiam in malis.” Ibid. (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b18–19): “Dicimus enim perfectum «sycophantam,» idest calumniatorem, et perfectum latronem, quando in nullo deficit ab eo quod competit eis in quantum sunt tales.”

likeness—the name *goodness*.<sup>22</sup> Thus, we say (that someone is) a *good slanderer*, or a *good robber*, because they are had in their operations—even if (they *are*) bad—as the good (agents) are (had) in (their) good (operations).

### 23.7. Virtual and Dimensive Quantities Analogically Compared

That something should be said (to be) *perfect* by comparison to (its) proper virtue, comes from virtue being some perfection of the thing (►22.3); for each one (thing) is perfect when no part of its natural magnitude—which befits it according to the species of (its) proper virtue—is lacking in it.<sup>23</sup> And just as any natural thing has a determinate natural measure of magnitude according to continuous quantity, so too any (one) thing has the determinate quantity of its natural virtue.

For example, a horse has a determinate dimensive quantity according to nature—with some latitude; for there is some quantity beyond which no horse extends in magnitude.<sup>24</sup> And, likewise, there is some (dimensive) quantity that it does not surpass in smallness.

So, too, the virtual quantity of the horse is determined from one and from the other part of some termini; for there is some virtue of the horse that is not found greater in any horse.<sup>25</sup> And, likewise, there is some (virtual quantity) so small, that none is lesser.

### 23.8. Extrinsic Mode in Which *Perfect* is Said by Itself

The third mode (in which something is said—by itself—to be perfect) that ARISTOTLE posits (is) in respect of (something) external (*per respectum ad exterius*): *those are said (to be) perfect which have already attained their end (quibus inest finis = οἷς ὑπάρχει τὸ τέλος, idest quae iam consecuta sunt suum finem)*, if the end is good (*studiosus = σπουδαῖον, idest bonus*).<sup>26</sup>

---

<sup>22</sup> *In Metaph.* 5, l. 18, §1036 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b19–20): “Nec est mirum si in istis quae magis sonant defectum, utimur nomine perfectionis; quia etiam cum sint mala, utimur in eis nomine bonitatis per quamdam similitudinem. Dicimus enim bonum furem et bonum calumniatorem, quia sic se habent in suis operationibus, licet malis, sicut boni in bonis.”

<sup>23</sup> *In Metaph.* 5, l. 18, §1037 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b20–23): “Et quod aliquid dicatur perfectum per comparationem ad virtutem propriam, provenit quia virtus est quaedam perfectio rei. Unumquodque enim tunc est perfectum quando nulla pars magnitudinis naturalis, quae competit ei secundum speciem propriae virtutis, deficit ei. Sicut autem quaelibet res naturalis, habet determinatam mensuram naturalis magnitudinis secundum quantitatem continuam, ut dicitur in secundo de Anima, ita etiam quaelibet res habet determinatam quantitatem suae virtutis naturalis.”

<sup>24</sup> *In Metaph.* 5, l. 18, §1037: “Equus enim habet quantitatem dimensivam determinatam secundum naturam cum aliqua latitudine. Est enim aliqua quantitas, ultra quam nullus equus protenditur in magnitudine. Et similiter est aliqua quantitas, quam non transcendit in parvitate.”

<sup>25</sup> *In Metaph.* 5, l. 18, §1037: “Ita etiam ex utraque parte determinatur aliquibus terminis quantitas virtutis equi. Nam aliqua est virtus equi, qua maior in nullo equo invenitur: et similiter est aliqua tam parva, qua nulla est minor.”

<sup>26</sup> *In Metaph.* 5, l. 18, §1039 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b23–25): “*Tertium modum* ponit [Philosophus] per respectum ad exterius; dicens, quod illa dicuntur tertio modo perfecta «quibus inest finis,» idest quae iam consecuta sunt suum finem; si tamen ille finis fuerit «studiosus,» idest bonus.”

For example, man (is perfect) when it has already attained happiness.<sup>27</sup> On the other hand, one who attains its end in bad (things), is said (to be) *deficient* rather than *perfect*; for **bad** (*malum*) is *the privation of a due perfection (privatio perfectionis debitae)*. Whence, it is evident that the bad are not happier when they attain their will, but more miserable.

Since every end is some last (thing), we transfer the name *perfect* to those that reach the end, even if it is bad.<sup>28</sup> For example, something is said to be perfectly lost, or perfectly corrupted, when nothing of the corruption or loss is lacking. And from this metaphor, death is said (to be) an end, because it is last. However, the end not only has its being last, but also that it should be the cause for the sake of which something is done (*cuius causa fit aliquid* = τὸ οὐ ἔνεκα ἔσχατον; ►9.8), which does not happen in death or in corruption.

### 23.9. Perfect Simply vs. Perfect According to Something

*Perfect* (in respect of an end) is said in multiple modes:<sup>29</sup>

1. **Perfect simply** (*simpliciter*) is that which attains the end that befits it according to its proper *ratio*.<sup>30</sup> For example, an animal is said to be simply perfect when it is brought through to an end such that nothing is lacking in it of those (things) that constitute the integrity of the animal's life: e.g., when nothing is lacking in it from the number and disposition of the limbs, the owed quantity of body, and the virtues by whose operations the lives of animals are perfected.

2. That can be said (to be) **perfect according to something** (*secundum quid*) which attains the end of any of the concomitants of the proper *ratio*.<sup>31</sup> For example, an animal can be said (to be) *perfect* according to something if it is perfect in a concomitant: e.g., if it is perfect in whiteness, in smell, or in something of this mode.

---

<sup>27</sup> *In Metaph.* 5, l. 18, §1039: "sicut homo, quando iam consequitur beatitudinem. Qui autem consequitur finem suum in malis, magis dicitur deficiens quam perfectus; quia malum est privatio perfectionis debitae. In quo patet, quod mali, quando suam perficiunt voluntatem, non sunt feliciores, sed miserores."

<sup>28</sup> *In Metaph.* 5, l. 18, §1039 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b25–30): "Quia vero omnis finis est quoddam ultimum, ideo per quamdam similitudinem transferimus nomen perfectum ad ea, quae perveniunt ad ultimum, licet illud sit malum. Sicut dicitur aliquid perfecte perdi, vel corrumpi, quando nihil deest de corruptione vel perditione rei. Et per hanc metaphoram, mors dicitur finis, quia est ultimum. Sed finis non solum habet quod sit ultimum, sed etiam quod sit cuius causa fit aliquid. Quod non contingit morti vel corruptioni."

<sup>29</sup> *De perf.*, c. 1, 4–21: "perfectum multipliciter dicitur."

<sup>30</sup> *De perf.*, c. 1, 4–5; 6–8: "Est enim aliquid simpliciter perfectum. [...] Simpliciter quidem perfectum est quod attingit ad finem eius quod ei competit secundum propriam rationem." Ibid., 11–18: "sicut animal simpliciter dicitur esse perfectum, quando ad hunc finem perducitur ut nihil ei desit ex his quae integritatem animalis vitae constituunt: puta cum nihil ei deficit ex numero et dispositione membrorum, et debita corporis quantitate, et virtutibus quibus operationes animalis vitae perficiuntur."

<sup>31</sup> *De perf.*, c. 1, 5–6; 8–11: "aliquid vero dicitur perfectum secundum quid. [...] secundum quid autem perfectum dici potest quod attingit ad finem alicuius eorum quae concomitantur propriam rationem." Ibid., 18–21: "secundum quid autem perfectum animal potest dici si sit perfectum in aliquo concomitanti, puta si sit perfectum in albedine, aut in odore, aut in aliquo huiusmodi."

### 23.10. Universally Perfect vs. Perfect in a Genus

ARISTOTLE shows how, in relation to the (above three) modes of perfection (► 23.5), some things are said (to be) *perfect* by themselves in two modes:<sup>32</sup>

**1. Universally perfect;** for they lack absolutely nothing at all; nor do they have any excess; for they are not exceeded inwardly in goodness by anything; nor do they receive something external; for they are not wanting in external goodness.<sup>33</sup>

**2. Perfect in some genus;** for they have neither excess nor defect in respect of that which pertains to that genus and is owed to it; nor is there something pertaining to that genus outside of them, as lacking in them.<sup>34</sup>

For example, man is said to be perfect when he has already obtained happiness.<sup>35</sup>

And just as this distinction is made in reference to the second mode of perfection posited above (i.e., virtual; ► 23.6), so can it be made in respect of the first (i.e., dimensive).<sup>36</sup>

For example, the world is said (to be) perfect *universally* because there is nothing at all outside of it, while any particular body is a perfect quantity *in its genus* because it has three dimensions, of which there are no more.<sup>37</sup>

### 23.11. Perfect in Respect of Another

ARISTOTLE posits the following modes in which things are said (to be) **perfect** in respect of others *by comparison to those that are perfect according to themselves*:<sup>38</sup>

---

<sup>32</sup> *In Metaph.* 5, l. 18, §1033 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b30–1022a1): “ostendit [Philosophus] quomodo secundum hos modos aliqua diversimode perfecta dicuntur.” Ibid., §1040: “Ostendit [Philosophus] quomodo aliqua diversimode se habeant ad praedictos modos perfectionis; et dicit, quod quaedam dicuntur secundum se perfecta: et hoc dupliciter.”

<sup>33</sup> *In Metaph.* 5, l. 18, §1040 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b31–32): “Alia quidem universaliter perfecta, quia nihil omnino deficit eis absolute, nec aliquam habent «hyperbolem,» idest excedentiam, quia a nullo videlicet penitus in bonitate exceduntur, nec aliquid extra accipiunt, quia nec indigent exteriori bonitate.” As St. Thomas immediately explains, this is the condition of the first principle (simply): namely, God, in which there is perfect goodness, which lacks nothing of all the perfections found in each of the genera: “Et haec est conditio primi principii, scilicet Dei, in quo est perfectissima bonitas, cui nihil deest de omnibus perfectionibus in singulis generibus inventis.”

<sup>34</sup> *In Metaph.* 5, l. 18, §1041 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1021b32–1022a1): “Alia dicuntur perfecta in aliquo genere, ex eo quod quantum ad illud genus pertinet, nec «habent hyperbolem,» idest excedentiam, quasi aliquid eis deficiat eorum, quae illi generi debentur; nec aliquid eorum, quae ad perfectionem illius generis pertinent, est extra ea, quasi eo careant.”

<sup>35</sup> *In Metaph.* 5, l. 18, §1041: “sicut homo dicitur perfectus, quando iam adeptus est beatitudinem.”

<sup>36</sup> *In Metaph.* 5, l. 18, §1042: “Et sicut fit haec distinctio quantum ad secundum modum perfectionis supra positum, ita potest fieri quantum ad primum, ut tangitur in principio Caeli et mundi.”

<sup>37</sup> *In Metaph.* 5, l. 18, §1042: “Nam quodlibet corpus particulare est quantitas perfecta secundum suum genus, quia habet tres dimensiones, quibus non sunt plures. Sed mundus dicitur perfectus universaliter, quia omnino nihil extra ipsum est.”

<sup>38</sup> *In Metaph.* 5, l. 18, §1033 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1022a1–3): “[ponit Philosophus] modos, quibus aliqua dicuntur perfecta per respectum ad alia.” Ibid., §1043: “Ponit [Philosophus] *modum*,

1. Because they produce (*faciunt* = ποιεῖν) something perfect in some of the above (three) modes.<sup>39</sup> For example, an (art of) medicine that produces perfect health is perfect.
2. Because they have (*habent* = ἔχειν; ► 42.13) something perfect.<sup>40</sup> For example, a man that has a perfect science is said (to be) *perfect*.
3. By representing (*repraesentando* < *congruendo* = ἀρμόττειν, i.e., to adapt, to fit well) such a perfect (thing).<sup>41</sup> For example, an image (► 9.6) that perfectly represents a man is said (to be) *perfect*.
4. By referring in any other mode to those that are said to be perfect by themselves in the first modes.<sup>42</sup>

### 23.12. Virtual Existence of an Effect in its Effective Cause

Whatever perfections are in an effect must be found in the effective cause, whether according to the same *ratio*—if the agent is univocal, as man begets man—or in a more eminent mode—if it is an equivocal agent, as there is in the sun a likeness of those that are generated by the virtue of the sun (► 46.19). For it is manifest that the effect preexists virtually (*virtute*) in the agent cause; and to preexist in the virtue of the agent cause is not to preexist in a more imperfect mode, but in a more perfect (mode).<sup>43</sup> Although to preexist in the potency of a material cause is to preexist in a more imperfect mode—because matter as such (*huiusmodi*) is imperfect—, the agent, on the other hand, is—as such—perfect.

Therefore, actions are comprehended under habits as that-which-is-from-a-principle (*principiatum*) is contained in its principle.<sup>44</sup>

---

*secundum quem aliqua dicuntur perfecta per respectum ad aliud: et dicit, quod alia dicuntur perfecta «secundum ipsa,» idest per comparisonem ad perfecta, quae sunt secundum se perfecta.»*

<sup>39</sup> *In Metaph.* 5, l. 18, §1043 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1022a1–2): “Vel ex eo, quod faciunt aliquid perfectum aliquo priorum modorum; sicut medicina est perfecta, quia facit sanitatem perfectam.”

<sup>40</sup> *In Metaph.* 5, l. 18, §1043 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1022a2): “Aut ex eo, quod habent aliquid perfectum; sicut homo dicitur perfectus, qui habet perfectam scientiam.”

<sup>41</sup> *In Metaph.* 5, l. 18, §1043 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1022a2): “Aut repraesentando tale perfectum; sicut illa, quae habent similitudinem ad perfecta; ut imago dicitur perfecta, quae repraesentat hominem perfecte.”

<sup>42</sup> *In Metaph.* 5, l. 18, §1043 (cf. ARISTOTLE, *Metaphysica* Δ.16, 1022a2–3): “Aut qualitercumque aliter referantur ad ea, quae dicuntur per se perfecta primis modis.”

<sup>43</sup> *STh* I, q. 4 a. 2 co.: “per hoc quod quidquid perfectionis est in effectu, oportet inveniri in causa effectiva, vel secundum eandem rationem, si sit agens univocum, ut homo generat hominem; vel eminentiori modo, si sit, agens aequivocum, sicut in sole est similitudo eorum quae generantur per virtutem solis. Manifestum est enim quod effectus praeexistit virtute in causa agente, praeexistere autem in virtute causae agentis, non est praeexistere imperfectiori modo, sed perfectiori; licet praeexistere in potentia causae materialis, sit praeexistere imperfectiori modo, eo quod materia, in quantum huiusmodi, est imperfecta; agens vero, in quantum huiusmodi, est perfectum.”

<sup>44</sup> *De veritate*, q. 22 a. 13 ad 13: “actiones comprehenduntur sub habitibus, sicut principiatum continetur in suo principio.”

### 23.13. Perfection in Substantial Forms

Some (thinkers) would posit that, according to the order of genera, of which one is ordered under another, there is an order of diverse forms in matter: i.e., as if we were to say that matter would have its being-a-substance-in-act according to one form; and, according to another (form, it would have its) being-a-body; and again, according to another (form, it would have its) being-an-animated-body, and so on.<sup>45</sup>

However, if this position were to be taken, only the first form, which would make a substance in act, would be substantial, while all the others (would be) accidental, since the substantial form is what causes *this something* (*facit hoc aliquid*; ► 15.13).<sup>46</sup>

Hence, we ought to say that it is the same form in number whereby a thing has its being a substance; its being in the last, most special species (*in ultima specie specialissima*); and (its being) in all the intermediate genera (► 15.13).<sup>47</sup>

Therefore, since the forms of natural things are like numbers (► 16.7), in which there is a diversity of species if a unit is added or subtracted, as ARISTOTLE says, we ought to understand the diversity of natural forms, according to which matter is constituted in diverse species, from this: that *one adds a perfection above the other*, such that, for example, one form constitutes in corporeal being only—which must be the lowest degree of animal forms, since matter is in potency only to corporeal forms (► 46.11); for those (beings) that are incorporeal are immaterial—, while another, more perfect form constitutes matter in corporeal being; an ulterior (form) gives to it a vital (act of) being; and an ultimate (form) gives to it corporeal being and vital being, and adds to it, over the latter, a sensitive being; and so on in other (corporeal substances, until we reach the form of man, which adds rational being).<sup>48</sup>

---

<sup>45</sup> Q. d. de anima, a. 9 co.: “inter formam substantialem et materiam non potest cadere aliqua forma substantialis media, sicut quidam voluerunt, ponentes quod secundum ordinem generum, quorum unum sub altero ordinatur, est ordo diversarum formarum in materia; utpote si dicamus, quod materia secundum unam formam habet quod sit substantia in actu, et secundum aliam quod sit corpus, et iterum secundum aliam quod sit animatum corpus, et sic deinceps.”

<sup>46</sup> Q. d. de anima, a. 9 co.: “Sed hac positione facta, sola prima forma, quae faceret esse substantiam actu, esset substantialis, aliae vero omnes accidentales; quia forma substantialis est quae facit hoc aliquid.”

<sup>47</sup> Q. d. de anima, a. 9 co.: “Oportet igitur dicere, quod eadem numero forma sit per quam res habet quod sit substantia, et quod sit in ultima specie specialissima, et in omnibus intermediis generibus.”

<sup>48</sup> Q. d. de anima, a. 9 co.: “Relinquitur ergo dicendum quod cum formae rerum naturalium sint sicut numeri, in quibus est diversitas speciei addita vel subtracta unitate, ut dicitur in VIII Metaphys.; oportet intelligere diversitatem formarum naturalium, secundum quas constituitur materia in diversis speciebus, ex hoc quod una addit perfectionem super aliam, ut puta quod una forma constituit in esse corporali tantum (hunc enim oportet esse infimum gradum formarum animalium, eo quod materia non est in potentia nisi ad formas corporales. Quae enim incorporea sunt, immaterialia sunt, ut in praecedentibus ostensum est). Alia autem perfectior forma constituit materiam in esse corporali, et ulterius dat ei esse vitale. Et ulterius alia forma dat ei et esse corporale et esse vitale, et super hoc addit ei esse sensitivum; et sic est in aliis.”

Therefore, we ought to understand that a form that is more perfect insofar as—together with matter—it constitutes a composite in the perfection of a lower degree, is understood as material in respect of an ulterior perfection; and so on, proceeding (with) ulterior (forms).<sup>49</sup>

For example, first matter—insofar as it is already constituted in corporeal being—is matter in respect of an ulterior perfection, which is life.<sup>50</sup> Wherefrom, *body (corpus)* is the genus of *living body (corporis viventis)*; and *animated or living (animatum, sive vivens)* is the difference; for the genus is taken from matter (with an indeterminate form; ► 14.12), while the difference (is taken determinately) from the form.

### 23.14. Perfection in Proper Accidental Forms

In some mode, one and the same form, insofar as it constitutes a matter in an act of an inferior degree, is a mean between (that) matter and itself insofar as it constitutes it in an act of a higher degree.<sup>51</sup> And matter, insofar as it is understood (to be) constituted in a substantial being according to a perfection of a lower degree, can be consequently understood as subjected to accidents; for, according to that lower degree of perfection, it is necessary for substance to have some proper accidents that must be in it of necessity.

For example, since matter is constituted in corporeal being by forms, it immediately follows that there are in it dimensions whereby matter is understood (to be) divisible by diverse parts, so that, in this way, according to its diverse parts, it can be susceptible of diverse forms (► 35.19).<sup>52</sup> And ultimately, since matter is understood (to be) constituted into some substantial being, it can be understood as (being) susceptible of accidents whereby it is disposed to an ulterior perfection, according to which matter comes to be (the) proper (matter in relation) to the reception of an ulterior perfection.

---

<sup>49</sup> *Q. d. de anima*, a. 9 co.: “Oportet ergo intelligere quod forma perfectior secundum quod simul cum materia compositum constituit in perfectione inferioris gradus, intelligatur ut materiale respectu ulterioris perfectionis, et sic ulterius procedendo.”

<sup>50</sup> *Q. d. de anima*, a. 9 co.: “Utpote materia prima, secundum quod iam constituta est in esse corporeo, est materia respectu ulterioris perfectionis, quae est vita; et exinde est quod corpus est genus corporis viventis; et animatum, sive vivens, est differentia. Nam genus sumitur a materia et differentia a forma.”

<sup>51</sup> *Q. d. de anima*, a. 9 co.: “et sic quodammodo una et eadem forma, secundum quod constituit materiam in actu inferioris gradus, est media inter materiam et seipsam, secundum quod constituit eam in actu superioris gradus. Materia autem prout intelligitur constituta in esse substantiali secundum perfectionem inferioris gradus, per consequens intelligi potest ut accidentibus subiecta. Nam substantia secundum illum inferiorem gradum perfectionis necesse est quod habeat quaedam accidentia propria quae necesse est ei inesse.”

<sup>52</sup> *Q. d. de anima*, a. 9 co.: “Sicut ex hoc quod materia constituitur in esse corporeo per formas, statim consequitur ut sint in ea dimensiones, per quas intelligitur materia divisibilis per diversas partes, ut sic secundum diversas sui partes possit esse susceptiva diversarum formarum. Et ulterius ex quo materia intelligitur constituta in esse quodam substantiali, intelligi potest ut susceptiva accidentium quibus disponitur ad ulteriorem perfectionem, secundum quam materia fit propria ad ulteriorem perfectionem suscipiendam.”

Such dispositions are understood before form as induced by an agent into matter, even if they are some (sort of) accidents improper to the form that are caused in matter only from the form itself (► 15.16).<sup>53</sup> Whence, forms are not understood (to be) in matter before as dispositions: rather, the form is understood before them as a cause (is prior) to (its) effects.

For example, since the soul is a substantial form—for it constitutes a man in a determinate species of substance—, there is no other mean substantial form whatever between the soul and first (i.e., prime) matter.<sup>54</sup> Rather, man is perfected by the rational soul itself according to diverse degrees of perfection: i.e., such that it is a body, an animated body, and a rational animal.

On the other hand, matter, insofar as it is understood as receiving from the rational soul itself the perfections of a lower degree—for example, that it is a body, an animated body, and an animal—must be understood, together with (its) befitting dispositions, to be the proper matter (in relation) to a rational soul insofar as (the rational soul) gives (to it) the last perfection (i.e., being rational).<sup>55</sup> Therefore, the soul, insofar as it is a form that gives being, does not have some other mean between itself and first (i.e., prime) matter.

### 23.15. Perfection in Operations

Since any one (thing) acts insofar as it is in act (*unumquodque agit secundum quod est actu*), it is necessary for any form to be also the principle of operations.<sup>56</sup> Hence, the same form that gives (the act of) being to matter is also the principle of operation (which is the second effect of form, after giving the act of being to matter; ► 22.3, ¶2b).

However, we ought to consider that, according to the degree of forms in the perfection of being, there is also a degree of them in the virtue of operating, since operation is proper to that which exists in act.<sup>57</sup> Hence, the more a form is of greater perfection in giving being,

---

<sup>53</sup> Q. d. de anima, a. 9 co.: “Huiusmodi autem dispositiones praeintelliguntur formae ut inductae ab agente in materiam, licet sint quaedam accidentia impropria formae, quae non nisi ex ipsa forma causentur in materia. Unde non praeintelliguntur in materia formae quasi dispositiones, sed magis forma praeintelligitur eis, sicut causa effectibus.”

<sup>54</sup> Q. d. de anima, a. 9 co.: “Sic igitur cum anima sit forma substantialis, quia constituit hominem in determinata specie substantiae, non est aliqua alia forma substantialis media inter animam et materiam primam; sed homo ab ipsa anima rationali perficitur secundum diversos gradus perfectionum, ut sit scilicet corpus, et animatum corpus, et animal rationale.”

<sup>55</sup> Q. d. de anima, a. 9 co.: “Sed oportet quod materia secundum quod intelligitur ut recipiens ab ipsa anima rationali perfectiones inferioris gradus, puta quod sit corpus et animatum corpus et animal, intelligatur, simul cum dispositionibus convenientibus, quod sit materia propria ad animam rationalem, secundum quod dat ultimam perfectionem. Sic igitur anima, secundum quod est forma dans esse, non habet aliquid aliud medium inter se et materiam primam.”

<sup>56</sup> Q. d. de anima, a. 9 co.: “Sed quia eadem forma quae dat esse materiae est etiam operationis principium, eo quod unumquodque agit secundum quod est actu; necesse est quod anima, sicut et quaelibet alia forma, sit etiam operationis principium.”

<sup>57</sup> Q. d. de anima, a. 9 co.: “Sed considerandum est quod secundum gradum formarum in perfectione essendi est etiam gradus earum in virtute operandi, cum operatio sit existentis in actu. Et ideo quanto

the greater it is in virtue in operating. Whence, more perfect forms have multiple and more diverse operations than less perfect forms.

Wherefrom, a diversity of accidents suffices for the diversity of operations in less perfect things, while an ulterior diversity of parts is required in more perfect things—and the more a form is perfect, the more (a diversity of parts is required).<sup>58</sup>

For example, we see that diverse operations befit (*conveniunt*) fire according to diverse operations: e.g., to bear up according to (its) lightness; to heat, according to heat; and so on.<sup>59</sup> However, any one of these operations befits fire according to any of its parts. On the other hand, in animated bodies that have nobler forms, diverse operations are ascribed (*deputantur*) to diverse parts. For example, in plants, the operation of the root is other than (the operation) of the branch or (the operation) of the trunk.

The more the animated bodies are perfect, the more it is necessary to find greater diversity in parts on account of greater perfection.<sup>60</sup> Whence, since the rational soul is the most perfect natural form, the greatest distinction of parts is found in man on account of diverse operations. And the soul of each of them (i.e., the soul of each of the most perfect animated bodies) gives a substantial (act of) being (►22.3, ¶2a) according to the mode that befits their operations (►22.3, ¶2b). A sign of this is that, if the soul is removed, neither flesh nor eye remains—except equivocally.

### 23.16. A Perfect Whole Requires Unequal Parts

Whoever intends to constitute a whole, considers for this purpose that the whole should be perfect.<sup>61</sup> And according to this, he brings together diverse and unequal parts into its composition; for, if all (parts) were equal, the whole would not be perfect.

---

aliqua forma est maioris perfectionis in dando esse, tanto etiam est maioris virtutis in operando. Unde formae perfectiores habent plures operationes et magis diversas quam formae minus perfectae.”

<sup>58</sup> Q. d. *de anima*, a. 9 co.: “Et inde est quod ad diversitatem operationum in rebus minus perfectis sufficit diversitas accidentium. In rebus autem magis perfectis requiritur ulterius diversitas partium; et tanto magis, quanto forma fuerit perfectior.”

<sup>59</sup> Q. d. *de anima*, a. 9 co.: “Videmus enim quod igni conveniunt diversae operationes secundum diversa accidentia; sicut ferri sursum secundum levitatem, calefacere secundum calorem, et sic de aliis. Sed tamen quaelibet harum operationum competit igni secundum quamlibet partem eius. In corporibus vero animatis quae habent nobiliores formas, diversis operationibus deputantur diversae partes; sicut in plantis alia est operatio radices, alia rami et stipitis.”

<sup>60</sup> Q. d. *de anima*, a. 9 co.: “Et quanto corpora animata fuerint perfectiora, tanto propter maiorem perfectionem necesse est inveniri maiorem diversitatem in partibus. Unde cum anima rationalis sit perfectissima formarum naturalium, in homine invenitur maxima distinctio partium propter diversas operationes; et anima singulis earum dat esse substantiale, secundum illum modum qui competit operationi ipsorum. Cuius signum est, quod remota anima, non remanet neque caro neque oculus nisi aequivoce.”

<sup>61</sup> *De sub. sep.*, c. 12, 135–139: “Qui enim aliquod totum constituere intendit, ad hoc respicit quod totum perfectum sit et secundum hoc diversas partes et inaequales ad eius compositionem conducit. Si enim omnes essent aequales, iam non esset totum perfectum.”

This is as evident in a natural whole as in a civic whole; for the body of a human would not be perfect if it did not have diverse limbs of unequal dignity; nor would a body politic be perfect unless there existed unequal conditions and diverse offices in it.<sup>62</sup>

Indeed, nature proceeds in its operation from the simple to the composite, such that, among those (things) that come to be through an operation of nature, that which is maximally composite is a whole and (is) the end of the others, as is apparent in all wholes in respect of their parts.<sup>63</sup> Whence, also the operative human reason proceeds from the simple towards the composite as from the imperfect towards the perfect.

Thus, those (parts) from which some perfect one thing must come to be differ in species.<sup>64</sup> Whence, every perfect whole in natural things is found to be constituted from parts (that are) diverse according to species, as man (is constituted) from flesh, bones, and nerves.

On the other hand, a whole that is composed from parts of the same species is imperfect in the genus of nature, as the elements, and other inanimate bodies.<sup>65</sup> Whence, it is manifest that, since the body politic is some perfect whole, it must consist from unlike parts according to species.

### **23.17. Priority of the Perfect vs. the Imperfect**

The perfect is prior to the imperfect in (the order of) nature (► 46.29); but in (the order of) time, the imperfect is prior to the perfect in one and the same (thing).<sup>66</sup>

---

<sup>62</sup> *De sub. sep.*, c. 12, 140–144: “quod patet tam in toto naturali, quam in toto civili. Non enim esset corpus hominis perfectum nisi membra diversa et inaequalis dignitatis haberet; neque esset civitas perfecta nisi inaequales conditiones et officia diversa in civitate existerent.”

<sup>63</sup> *In Polit.*, pr.: “Procedit autem natura in sua operatione ex simplicibus ad composita; ita quod in eis quae per operationem naturae fiunt, quod est maxime compositum est perfectum et totum et finis aliorum, sicut apparet in omnibus totis respectu suarum partium. Unde et ratio hominis operativa ex simplicibus ad composita procedit tamquam ex imperfectis ad perfecta.”

<sup>64</sup> *In Polit.* 2, l. 1 n. 12: “ea ex quibus oportet unum aliquid perfectum fieri, differunt specie: unde omne totum perfectum in rebus naturalibus invenitur esse constitutum ex partibus diversis secundum speciem; ut homo ex carnibus, ossibus et nervis.”

<sup>65</sup> *In Polit.* 2, l. 1 n. 12: “Totum vero quod componitur ex partibus eiusdem speciei est imperfectum in genere naturae, sicut aer et aqua et alia inanimata corpora. Unde manifestum est quod, cum civitas sit quoddam totum perfectum, oportet quod consistat ex partibus dissimilibus secundum speciem.”

<sup>66</sup> *STh* III, q. 1 a. 5 ad 3: “perfectum est prius imperfecto, in diversis quidem, tempore et natura, oportet enim quod perfectum sit quod alia ad perfectionem adducit, sed in uno et eodem imperfectum est prius tempore, etsi sit posterius natura.”

## 24. The Infinite

*Having distinguished between dimensive and virtual quantity, we seek now to clarify what is meant by infinite quantity; whether such a quantity exists or can be known—and how. The next chapter provides more detail on the infinite in dimensive quantity in particular.*

### 24.1. Infinite

As ARISTOTLE says, **infinite** (*infinitum* = τὸ ἄπειρον) must be defined as *that of which there is always something outside* (*cuius est semper aliquid extra* = οὗ ἄεί τι ἔξω ἐστί), contrary to how some others before him defined it as *that of which there is nothing outside*.<sup>1</sup>

(The predecessors of ARISTOTLE posited the latter definition because) they reckoned that *infinite* is conjoined to *whole*.<sup>2</sup> Thus, about the infinite, they took it as a thing knowable by itself that it would contain all, and that it would have all in itself, because it has some likeness with a whole, just as that which is in potency has a likeness with (that which is) in act; for the infinite, insofar as it is in potency, is as matter in respect of the perfection of a magnitude; and it is as a whole in potency (► 24.5), but not in act (► 24.3).

This is evident because *infinite* is said according as it is possible for something to be divided into a lesser and insofar as addition can come to be from the opposite of division (i.e., the parts that are infinitely subtracted from one magnitude through division can be added infinitely to any magnitude).<sup>3</sup> Therefore, the infinite, according to its proper *ratio*, is a whole in potency; and it is imperfect, just as matter does not have perfection.

However, (the infinite) is not whole and finite according to the proper *ratio* whereby it is infinite, but according to the end and to the whole in respect of which it is in potency; for division, which is possible (to proceed) infinitely (*in infinitum*), is said to be perfect insofar as it terminates at something; but insofar as it goes towards the infinite, it is imperfect.<sup>4</sup>

---

<sup>1</sup> *In Physic.* 3, l. 11, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206b33–207a2): “Dicit ergo [Philosophus] primo quod contrario modo definiendum est infinitum quam sicut quidam definirunt. Dixerunt enim quidam quod infinitum est *extra quod nihil est*: sed e contra dicendum est quod infinitum est *cuius est semper aliquid extra*.”

<sup>2</sup> *In Physic.* 3, l. 11, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 207a18–22): “excludit [Philosophus] quandam falsam opinionem ex praedicta definitione falsa exortam. Et primo communiter quantum ad omnes. [...] Dicit ergo primo quod quia aestimaverunt infinitum coniungi toti, hinc acceperunt quasi *dignitatem*, idest rem per se notam, de infinito, quod omnia contineret et omnia in se haberet; propter hoc quod habet quandam similitudinem cum toto, sicut id quod est in potentia habet similitudinem cum actu. Infinitum enim in quantum est in potentia, est sicut materia respectu perfectionis magnitudinis: et est sicut totum in potentia, non autem in actu.”

<sup>3</sup> *In Physic.* 3, l. 11, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 207a22–23): “Quod patet ex hoc, quod infinitum dicitur secundum quod possibile est aliquid dividi in minus, et secundum quod ex opposito divisioni potest fieri appositio, ut supra dictum est. Sic igitur infinitum secundum se, idest secundum propriam rationem, est in potentia totum: et est imperfectum, sicut materia non habens perfectionem.”

<sup>4</sup> *In Physic.* 3, l. 11, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 207a23–24): “Non autem est totum et finitum secundum se, idest secundum propriam rationem qua est infinitum; sed secundum aliud, idest secundum

Moreover, it is manifest that, since it is proper of a whole to contain and of matter to be contained, the infinite as such (*infinitem in quantum huiusmodi < ἢ ἄπειρον*) does not contain, but is contained (*non continet, sed continetur* = οὐ περιέχει ἀλλὰ περιέχεται): i.e., insofar as that which is in act of the infinite is always contained by something greater according as it is possible to take something outside.<sup>5</sup>

Whence, speaking of the infinite according to the whole that is in potency in it, to which addition cannot be made—as opposed to the infinite according to that which is in act of it, to which addition can always be made—, ARISTOTLE (elsewhere) defines **infinite** (in some way, ὠριστάί πως ὁ ἄπειρος), as *that of which there is not more* (*cuius non est plus < οὐ οὐκ ἔστι πλείων*): that is, *than which a greater cannot be taken* (*quo non potest maius accipi*), which is (equivalent to) the definition of the perfect and whole.<sup>6</sup>

## 24.2. Division of the Infinite

ARISTOTLE posits two divisions of the infinite:<sup>7</sup>

### 1. The infinite in act (► 24.3).

This division is insofar as *infinite* is the same as *non-traversable* (*infinitem idem est quod intransibile*); for something is said (to be) *infinite* because it does not have an end (*non est finitem*).<sup>8</sup> However, this division is common to the infinite and to everything that is said privatively. Thus, (for example), *invisible* is said in three (modes):

**(a)** *What is not naturally apt to be seen*, as a voice, which is not of the genus of *visible*.

**(b)** *What is badly seen*, as that which is seen in darkness or remotely.

**(c)** *What is naturally apt to be seen and is not seen*, as that which is totally in darkness.

---

finem et totum, ad quod est in potentia. Divisio enim quae est possibilis in infinitum, secundum quod ad aliquid terminatur, dicitur esse perfecta: et secundum quod vadit in infinitum, est imperfecta.”

<sup>5</sup> *In Physic.* 3, l. 11, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 207a24–25): “Et manifestum est quod, cum totius sit continere, materiae autem contineri, quod infinitum in quantum huiusmodi non continet, sed continetur: in quantum scilicet id quod de infinito est in actu, semper continetur ab aliquo maiori, secundum quod possibile est aliquid extra accipere.”

<sup>6</sup> *In De caelo* 1, l. 29, n. 3 (cf. ARISTOTLE, *De caelo* A.12, 283a9–10): “infinitem est *cuius non est plus*, id est quo non potest maius accipi. Nec obstat quod Aristoteles in III *Physic.* improbat hanc definitionem infiniti, dicens eam magis esse definitionem perfecti et totius, cum tamen infinitum sit imperfectum et in modum partis se habens: quia Philosophus ibi loquitur de infinito secundum id quod de eo est in actu, cui semper potest additio fieri; hic autem loquitur de infinito secundum totum quod est de eo in potentia, cui non potest additio fieri.”

<sup>7</sup> *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a2–7): “ponit [Philosophus] duas divisiones infiniti.”

<sup>8</sup> *In Physic.* 3, l. 7, n. 9: “Quarum prima est communis infinito et omnibus privative dictis. Nam invisibile dicitur tripliciter, vel quod non est aptum natum videri, ut vox, quae non est de genere visibilium; vel quod male videtur, sicut quod videtur in obscuro aut a remotis; vel quod natum est videri et non videtur, sicut quod est omnino in tenebris. Sic igitur et [...] dicitur infinitum, [...] (nam infinitum idem est quod intransibile).” *STh* I, q. 7 a. 1 co.: “infinitem dicitur aliquid ex eo quod non est finitem.”

## 2. The infinite in potency (► 24.5).

This division is proper of the infinite, and is insofar as *infinite* is said:<sup>9</sup> **(a)** according to **addition** (*per appositionem, secundum appositionem* = κατὰ πρόσθεσιν), as in numbers; **(b)** according to **division** (*secundum divisionem* = κατὰ διαίρεσιν), as in magnitudes; or **(c)** according to **both**, as in time.

### 24.3. Infinite in Act

Every finite is traversable by division.<sup>10</sup> Whence, **infinite** is properly *that which cannot be traversed in measuring* (*quod mensurando pertransiri non potest*). Thus, *infinite* is said in as many modes as *non-traversable* (*intransibile*) is said.

ARISTOTLE distinguishes four modes in which *infinite* is said in act:<sup>11</sup>

1. That which cannot be traversed (*quod non potest transiri* = τὸ ἀδύνατον διελθεῖν) in measuring (*mensurando*) insofar as it is not naturally apt (*eo quod non est natum* = τῷ μὴ πεφυκέναι), according to its genus (*secundum suum genus*), to be traversed (*pertransiri* = διιέναι).<sup>12</sup>

For example, an indivisible, such as a point and a form (is infinite; for it is not in the genus of *traversable*).<sup>13</sup> Thus, we say that the point, the unit, or anything that is not a quantum and measurable, is infinite or non-traversable. Likewise, in this (negative) mode a voice (*vox* = φωνή) is also said (to be) *invisible* (*invisibilis* = ἀόρατος) because it is not of the genus of *visible*.

2. That which, considered in itself (*quantum est de se*), can be traversed (*transiri potest* < τὸ διεξοδόν), but is not yet traversed, even if it has begun to be traversed (*nondum est*

---

<sup>9</sup> *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a6–7): “Aliam divisionem propriam infiniti ponit [Philosophus...] dicens quod infinitum dicitur vel per appositionem, sicut in numeris; aut secundum divisionem, sicut in magnitudinibus; aut utroque modo, sicut in tempore.”

<sup>10</sup> *In Metaph.* 11, l. 10, §2314: “Circa primum [sc., *quot modis dicitur infinitum in actu*] considerandum est, quod omne finitum dividendo pertransitur. Unde infinitum proprie est, quod mensurando pertransiri non potest. Tot ergo modis dicitur infinitum, quot modis dicitur intransibile.”

<sup>11</sup> *In Metaph.* 11, l. 10, §2314 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a35–b1): “ostendit [Philosophus] *quot modis dicitur infinitum in actu*.” Ibid., §2315: “Utrumque autem [sc., infinitum et intransibile] dicitur [in actu] quatuor modis.” Note that, in a parallel place in his *Physics*, St. Thomas counts only three modes, the second of which (*quod est esse male transibile*) he subdivides into two.

<sup>12</sup> *In Metaph.* 11, l. 10, §2315 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a35–36): “quorum primus est secundum quod infinitum sive intransibile dicitur quod non potest transiri mensurando, eo quod non est natum secundum suum genus pertransiri.” *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a3–4): “Sic igitur et uno modo dicitur infinitum, quod non est natum transiri (nam infinitum idem est quod intransibile): et hoc est quia est de genere intransibilium.”

<sup>13</sup> *In Metaph.* 11, l. 10, §2315 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a36): “sicut dicimus punctum, aut unitatem, aut aliquid quod non est quantum et mensurabile, esse infinitum seu intransibile; per quem modum vox dicitur invisibilis, quia non est de genere visibilium.” *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a4): “sicut indivisibilia ut punctus et forma; per quem etiam modum dicitur vox invisibilis.”

*pertransitum, licet inceptum sit pertransiri*), since its traversal cannot be completed by us (*eius transitus non potest perfici a nobis*), for, as ARISTOTLE says, it has imperfect traversal (*habens transitionem imperfectam* < ἔχον ἀτελεύτητον, i.e., is impracticable).<sup>14</sup>

For example, if we were to say that the depth of the sea, the height of the sky, or some long, immeasurable or non-traversable road (is) *infinite* because it exceeds the virtue of the measurer (*excedit vires mensurantis*), although it would be traversable in itself.<sup>15</sup>

3. That which, of itself, can be traversed; for (the traversal) can be completed (*potest perfici*), but with difficulty (*cum difficultate*); for it is scarcely (*vix* = μόλις) traversable.<sup>16</sup>

For example, a journey to India can be said to be infinite.<sup>17</sup>

This mode (§3) and the preceding one (§2) pertain to *that which is badly traversable (quod est esse male transibile; ► 24.2, §1b)*.<sup>18</sup>

4. That which is naturally apt of being traversed or terminated according to its genus, but is not (*quod natum est habere transitionem aut terminum <secundum suum genus, sed> non habet* = ὁ πεφυκὸς ἔχει μὴ ἔχει διέξοδον ἢ πέρασ): i.e., as existing in the genus of the traversable (*quasi de genere transibiliū existens*), which, however, is not traversable to an end (*non habet transitum ad finem*).<sup>19</sup> And **this is truly and properly the infinite**.<sup>20</sup>

For example, if there should be some line or any other quantity that does not have a terminus.<sup>21</sup>

---

<sup>14</sup> *In Metaph.* 11, l. 10, §2316 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a36–37): “Secundo modo dicitur infinitum vel intransibile quod nondum est pertransitum, licet inceptum sit pertransiri: hoc enim est quod dicit «habens transitionem imperfectam.»” *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a4–5): “Alio modo dicitur infinitum, quod quantum est de se, transiri potest, sed eius transitus non potest perfici a nobis.”

<sup>15</sup> *In Metaph.* 11, l. 10, §2317: “Ut si dicamus profunditatem maris infinitam, vel altitudinem caeli, vel aliquam viam longam immensurabilem seu intransibilem seu infinitam: quia excedit vires mensurantis, licet in se sit transibilis.” *In Physic.* 3, l. 7, n. 9: “sicut si dicatur profunditas maris esse infinita.”

<sup>16</sup> *In Metaph.* 11, l. 10, §2317 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a37): “Tertius modus est secundum quod dicitur infinitum vel intransibile quod vix transitur.” *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a5): “Alio modo dicitur infinitum, quod quantum est de se, transiri potest, sed eius transitus [...] potest perfici, tamen vix et cum difficultate, sicut si dicamus quod iter usque in Indiam est infinitum. Et utrumque istorum pertinet ad hoc quod est esse male transibile.”

<sup>17</sup> *In Physic.* 3, l. 7, n. 9: “sicut si dicamus quod iter usque in Indiam est infinitum.”

<sup>18</sup> *In Physic.* 3, l. 7, n. 9: “Et utrumque istorum pertinet ad hoc quod est esse male transibile.”

<sup>19</sup> *In Metaph.* 11, l. 10, §2318 (cf. ARISTOTLE, *Metaphysica* K.10, 1066a37–b1): “Quartus modus est secundum quod dicitur infinitum illud quod natum est habere transitionem aut terminum secundum suum genus, sed non habet.” *In Physic.* 3, l. 7, n. 9 (cf. ARISTOTLE, *Physica* Γ.4, 204a5–6): “Tertio modo dicitur infinitum, quod est natum transiri quasi de genere transibiliū existens, quod tamen non habet transitum ad finem.”

<sup>20</sup> *In Metaph.* 11, l. 10, §2318: “Et hoc est vere et proprie infinitum.” *In Physic.* 3, l. 7, n. 9: “et sic proprie dicitur infinitum.”

<sup>21</sup> *In Metaph.* 11, l. 10, §2318: “Putat si sit linea aliqua interminata.” *In Physic.* 3, l. 7, n. 9: “ut si esset aliqua linea non habens terminum, vel quaecumque alia quantitas.”

#### 24.4. The Infinite is Found Only in Quantities

(From the above division), *infinite* is said in two modes:<sup>22</sup>

1. **Negatively** (► 42.2, ¶1): *that which does not have an end (quod non habet finem*; this corresponds to the first mode, since it is a negation outside of a genus).
2. **Privatively** (► 42.2, ¶2; 42.8): *that which is naturally apt to have an end and does not have it (quod natum est habere finem et non habet)*; and this infinite **is found only in quantities**.

(As discussed above; ► 8.8) *end* or *terminus* is said of the terminus of a quantity, as the point (is said to be the end or terminus) of the line.<sup>23</sup> In this mode, *finite* and *infinite* are said from position (*a positione*) and from privation (*a privatione*) of such an end, insofar as it is an affection (*passio*) of quantity, which is found only in corporeal things.

*Privation* belongs to the *ratio* of *infinite* because *being in potency (ens in potentia)* has the *ratio* of *infinite* only insofar as it is under the *ratio* of *privation* (► 42.7).<sup>24</sup> (Indeed, *that which is badly traversable—infinite in act* of modes 2 and 3, above—is intrinsically finite; it is infinite only in respect of something extrinsic.)

Speaking by itself, *infinite*—as well as *finite*—is only in quantity, as ARISTOTLE says.<sup>25</sup>

The infinite is a universal affection (*passio... universalis*) of any quantum, including motion (i.e., including quanta *secundum posterius*, such as motion).<sup>26</sup>

#### 24.5. Infinite in Potency

ARISTOTLE distinguishes (three) modes in which *infinite* is said in potency:<sup>27</sup>

1. **By addition** (*appositione* = προσθέσει).<sup>28</sup>

<sup>22</sup> *De potentia*, q. 1 a. 2 co.: “infinitem dicitur dupliciter. Uno modo privative; et sic dicitur infinitum quod natum est habere finem et non habet: tale autem infinitum non invenitur nisi in quantitativibus. Alio modo dicitur infinitum negative, id est quod non habet finem.”

<sup>23</sup> *In Sent.* 1, d. 43 q. 1 a. 1 co.: “Uno modo [finis vel terminus dicitur] terminus quantitatis, sicut punctus lineae; et hoc modo dicitur a positione et a privatione talis finis, finitum et infinitum, secundum quod est passio quantitatis; et sic non sunt in incorporeis.”

<sup>24</sup> *In Metaph.* 2, l. 4, §329: “privatio est de ratione infiniti. Non enim ens in potentia habet rationem infiniti, nisi secundum quod est sub ratione privationis.”

<sup>25</sup> *In Physic.* 1, l. 4, n. 3: “infinitem per se loquendo non est nisi in quantitate.” Cf. ARISTOTLE, *Physica* A.2, 185b2–3: “ὁ γὰρ τοῦ ἀπείρου λόγος τῷ ποσῷ προσχρῆται.” *De veritate*, q. 29 a. 3 co., 137–139: “finitum et infinitum circa quantitatem intelliguntur, ut patet per Philosophum in I Physicorum.”

<sup>26</sup> *In Metaph.* 11, l. 10, §2314: “Philosophus [...] determinat *de infinito*, quod est passio motus et cuiuslibet quanti universalis.”

<sup>27</sup> *In Metaph.* 11, l. 10, §2314 (cf. ARISTOTLE, *Metaphysica* K.10, 1066b1): “ostendit [Philosophus...] quot modus dicitur infinitum in potentia.” Ibid., §2319: “Ostendit *quot modis dicitur infinitum in potentia*.”

<sup>28</sup> *In Metaph.* 11, l. 10, §2319 (cf. ARISTOTLE, *Metaphysica* K.10, 1066b1): “dicit [Philosophus] quod dicitur infinitum uno modo appositione.”

For example, number (is said to be infinite) because a unit can always be added to any given number; and in this way, number is infinitely increasable (*augmentabilis in infinitum*).<sup>29</sup>

**2. By removal** (*ablatione* = ἀφαίρεσις) and **division** (*divisione*).<sup>30</sup>

In this mode, magnitude is said (to be) *infinitely divisible* (*divisibilis in infinitum*).<sup>31</sup>

**3. By one and the other** (*utrinque* = ἄμφω: i.e., by addition and removal/division).<sup>32</sup>

For example, time is said (to be) *infinite* both by division, because it is a continuum, and by addition, because it is a number (i.e., the number of a motion according to prior and posterior).<sup>33</sup> Likewise, motion is infinite in this mode.

#### 24.6. Is There Something Infinite?

As ARISTOTLE says, it is manifest that, if there simply (*simpliciter* = ἀπλῶς) is no infinite, many impossible (consequences would) happen:<sup>34</sup>

1. Against those who posit the eternity of the world, time would have principle and end.<sup>35</sup>
2. It would follow that a magnitude is not always divisible into magnitudes—but every magnitude *is* divisible.<sup>36</sup> Therefore, through the division of magnitude, sometimes we would arrive at some (parts) that are not magnitudes.
3. It would also follow that a number cannot be increased infinitely.<sup>37</sup>

Therefore, it is necessary to say in what mode there is or there is not (an infinite).<sup>38</sup>

---

<sup>29</sup> *In Metaph.* 11, l. 10, §2319: “sicut numerus. Semper enim cuilibet numero dato est apponere unitatem, et sic numerus est augmentabilis in infinitum.”

<sup>30</sup> *In Metaph.* 11, l. 10, §2320 (cf. ARISTOTLE, *Metaphysica* K.10, 1066b1): “Alius modus secundum quod infinitum dicitur ablatione et divisione.”

<sup>31</sup> *In Metaph.* 11, l. 10, §2320: “secundum quod magnitudo dicitur divisibilis in infinitum.”

<sup>32</sup> *In Metaph.* 11, l. 10, §2321 (cf. ARISTOTLE, *Metaphysica* K.10, 1066b1): “Tertius modus contingit utrinque.”

<sup>33</sup> *In Metaph.* 11, l. 10, §2321: “sicut tempus dicitur infinitum et divisione, quia continuum est, et appositione, quia numerus est. Et similiter etiam in motu infinitum est.”

<sup>34</sup> *In Physic.* 3, l. 10, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206a9–10): “manifestum est quod si infinitum simpliciter non sit, quod multa impossibilia accidunt.”

<sup>35</sup> *In Physic.* 3, l. 10, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206a10–11): “Quorum unum est quod tempus habebit principium et finem: quod reputatur inconueniens secundum ponentes aeternitatem mundi.”

<sup>36</sup> *In Physic.* 3, l. 10, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206a11): “sequetur quod magnitudo non semper sit divisibilis in magnitudines, sed quandoque deveniatur per divisionem magnitudinum ad quaedam quae non sunt magnitudines: sed omnis magnitudo est divisibilis.”

<sup>37</sup> *In Physic.* 3, l. 10, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206a1–12): “Item sequetur quod numerus non augeatur in infinitum.”

<sup>38</sup> *In Physic.* 3, l. 10, n. 2 (cf. ARISTOTLE, *Physica* Γ.6, 206a12–14): “igitur [...] necesse est dicere quod quodammodo est, quodammodo non est.”

## 24.7. Infinite Simply vs. Infinite According to Something

That which is infinite in all modes can only be one.<sup>39</sup> Whence, ARISTOTLE says that, since a body has dimensions towards every part (*est ad omnem partem dimensionatum*), it is impossible for there to be multiple infinite bodies.

Indeed, when something is said to be infinite, *infinite* must be taken according to its (own, proper) *ratio*.<sup>40</sup> Thus, if we say that a line is infinite, we understand it to be infinite according to longitude; and if we say that a surface is infinite, we understand that it is infinite according to longitude and latitude.

A body, in turn, extends towards all parts because it has all dimensions.<sup>41</sup> And in this mode, if a body should be said to be infinite, it would have to be infinite towards every part. Hence, from no part will there be something outside of it. Therefore, it is not possible that there should be more than one infinite body.

However, if something were infinite in one mode only, nothing would prevent there being multiple such infinite (things): for example, if we were to understand multiple lines infinite according to longitude drawn in some surface finite according to latitude.<sup>42</sup>

Therefore, since the infinite is not some substance but happens to (i.e., is a proper affection of) things that are said (to be) *infinite*, just as the infinite is multiplied according to diverse subjects, so is it necessary that a property of the infinite be multiplied in such a way that it would befit (*conveniat*) any one of them according to that subject.<sup>43</sup>

Now, there is some property of the infinite: that there is not something greater than the infinite.<sup>44</sup> Hence, if we take one infinite line, there is nothing in it greater than the infinite.

---

<sup>39</sup> *STh* III, q. 10 a. 3 ad 3: “id quod est infinitum omnibus modis, non potest esse nisi unum, unde et Philosophus dicit, in I *de Caelo et Mundo*, quod quia corpus est ad omnem partem dimensionatum, impossibile est plura esse corpora infinita.” Cf. ARISTOTLE, *De caelo* A.7, 274b19–22.

<sup>40</sup> *In De caelo* 1, l. 13, n. 11: “Cum enim aliquid dicitur esse infinitum, oportet quod infinitum accipiatur secundum propriam eius rationem: puta, si dicamus lineam esse infinitam, intelligimus eam esse infinitam secundum longitudinem; si vero dicamus superficiem esse infinitam, intelligimus quod sit infinita secundum longitudinem et latitudinem.”

<sup>41</sup> *In De caelo* 1, l. 13, n. 11 (cf. ARISTOTLE, *De caelo* A.7, 274b19–22): “Corpus autem distenditur ad omnem partem, quia habet omnes dimensiones, ut supra dictum est: et sic, si corpus dicatur infinitum, oportet quod sit infinitum ad omnem partem; et ita ex nulla parte erit aliquid extra ipsum. Non ergo est possibile quod in corpore infinito sint plura dissimilia, quorum unumquodque sit infinitum: quia non est possibile esse plura infinita, secundum praedicta.”

<sup>42</sup> *STh* III, q. 10 a. 3 ad 3: “Si tamen aliquid esset infinitum uno modo tantum, nihil prohiberet esse plura talia infinita, sicut si intelligeremus plures lineas infinitas secundum longitudinem protractas in aliqua superficie finita secundum latitudinem.”

<sup>43</sup> *STh* III, q. 10 a. 3 ad 3: “Quia igitur infinitum non est substantia quaedam, sed accidit rebus quae dicuntur infinitae [...]; sicut infinitum multiplicatur secundum diversa subiecta, ita necesse est quod proprietas infiniti multiplicetur, ita quod conveniat unicuique eorum secundum illud subiectum.”

<sup>44</sup> *STh* III, q. 10 a. 3 ad 3: “Est autem quaedam proprietas infiniti quod infinito non sit aliquid maius. Sic igitur, si accipiamus unam lineam infinitam, in illa non est aliquid maius infinito. Et similiter, si accipiamus

Likewise, if we take any of other infinite lines, it is manifest that any one of them has infinite parts. Therefore, there must not be in *this* line something greater than all these infinite (parts), although in *another* line—and in a *third* one—there will be multiple—also infinite—parts other than these.

We see that this happens also in numbers; for the species of even numbers are infinite; and likewise, the species of odd numbers.<sup>45</sup> However, there are more even and odd numbers than even (i.e., according to determination, not according to one-to-one relation).

Therefore, nothing is greater than that which is simply infinite in respect of all (*simpliciter quoad omnia*).<sup>46</sup> On the other hand, there is nothing greater than that which is infinite according to something (*secundum aliquid*) in that order—but something greater can be taken outside of that order.

#### 24.8. *Infinite* Attributed to Matter vs. to Form

(As already discussed, matter is ended by form and form is ended by matter; ► 10.7.)

**1. Matter is perfected by the form** by which it is ended.<sup>47</sup> Hence, *infinite*, insofar as it is attributed to matter, has the *ratio of imperfect*; for it is as matter not having a form.

Thus, the infinite that befits (dimensional) quantity is the infinite that is had from the part of matter; for the terminus of (such) quantity is as its form.<sup>48</sup> A sign of this is that *figure*, which consists in the termination of (continuous) quantity (► 4), is some *form around quantity*.

If we speak of *infinite* insofar as it pertains to matter, it is evident that every existent in act has some form; and, in this way, its matter is terminated by a form.<sup>49</sup> Matter, insofar as it

---

quamcumque aliarum linearum infinitarum, manifestum est quod uniuscuiusque earum partes sunt infinitae. Oportet igitur quod omnibus illis infinitis non sit aliquid maius in illa linea, tamen in alia linea et in tertia erunt plures partes, etiam infinitae, praeter istas.”

<sup>45</sup> *STh* III, q. 10 a. 3 ad 3: “Et hoc etiam videmus in numeris accidere, nam species numerorum parium sunt infinitae, et similiter species numerorum imparium; et tamen numeri et pares et impares sunt plures quam pares.”

<sup>46</sup> *STh* III, q. 10 a. 3 ad 3: “Sic igitur dicendum quod infinito simpliciter quoad omnia, nihil est maius, infinito autem secundum aliquid determinatum, non est aliquid maius in illo ordine, potest tamen accipi aliquid maius extra illum ordinem.”

<sup>47</sup> *STh* I, q. 7 a. 1 co.: “Materia autem perficitur per formam per quam finitur, et ideo infinitum secundum quod attribuitur materiae, habet rationem imperfecti; est enim quasi materia non habens formam.”

<sup>48</sup> *STh* I, q. 7 a. 1 ad 2: “terminus quantitatis est sicut forma ipsius, cuius signum est, quod figura, quae consistit in terminatione quantitatis, est quaedam forma circa quantitatem. Unde infinitum quod competit quantitanti, est infinitum quod se tenet ex parte materiae.”

<sup>49</sup> *STh* I, q. 7 a. 2 co.: “Si enim loquamur de infinito secundum quod competit materiae, manifestum est quod omne existens in actu, habet aliquam formam, et sic materia eius est terminata per formam. Sed quia materia, secundum quod est sub una forma substantiali, remanet in potentia ad multas formas accidentales; quod est finitum simpliciter, potest esse infinitum secundum quid, utpote lignum est finitum secundum suam formam, sed tamen est infinitum secundum quid, in quantum est in potentia ad figuras infinitas.” Cf. *Quodlibet* 3, q. 2 a. 1 co.; *In Sent.* 4, d. 49 q. 2 a. 1 ad 12.

is under one substantial form, remains in potency to many accidental forms. Therefore, what is simply (*simpliciter*) finite—e.g., wood is finite according to its form—can be infinite according to something (*secundum quid*) insofar as it is in potency to infinite figures.

Thus, first (i.e., prime) matter, even in respect of potency, is not simply (*simpliciter*) infinite, but (infinite) according to something (*secundum quid*), because its potency extends only to natural forms.<sup>50</sup>

**2. Form is not perfected by matter;** instead, its amplitude (*amplitudo*) is contracted (*contrahitur*) by it.<sup>51</sup> Whence, *infinite* has the *ratio* of *perfect* insofar as it is had from the part of a form not determined by matter.

If we speak of *infinite* insofar as it pertains to form, it is manifest that in this mode, those (things) whose forms are in matter are simply finite, and in no mode (are they) infinite.<sup>52</sup> Indeed, material creatures have (imperfect) infinity from the part of matter, but finitude from the part of the form, which is limited by the matter in which it is received; for a form is only limited because it is received in another—to which matter it is commensurate.

For example, if whiteness existed separated—i.e., subsistent, not in a subject—, it would be infinite in respect of the *ratio* of *whiteness*, since it would not be contracted into some subject.<sup>53</sup> Such whiteness would differ from any whiteness existing in a subject: it would be distinguished from them because it would not be *in another*; nor would it be *limited*.

## 24.9. Infinite According to Virtual Quantity

What is finite according to one quantity may be infinite according to another.<sup>54</sup> This is evident (as just discussed; ► 24.7) if each quantity taken is dimensive; for some surface can be understood (to be) finite according to latitude, and infinite according to longitude.

---

<sup>50</sup> *STh* I, q. 7 a. 2 ad 3: “materia prima, etiam secundum potentiam, non est infinita simpliciter, sed secundum quid, quia eius potentia non se extendit nisi ad formas naturales.”

<sup>51</sup> *STh* I, q. 7 a. 1 co.: “Forma autem non perficitur per materiam, sed magis per eam eius amplitudo contrahitur, unde infinitum secundum quod se tenet ex parte formae non determinatae per materiam, habet rationem perfecti.”

<sup>52</sup> *STh* I, q. 7 a. 2 co.: “Si autem loquamur de infinito secundum quod convenit formae, sic manifestum est quod illa quorum formae sunt in materia, sunt simpliciter finita, et nullo modo infinita.” *Quodlibet* 7, q. 1 a. 1 ad 1: “forma non limitatur nisi ex hoc quod in alio recipitur, cui materia commensuratur.” *STh* I, q. 50 a. 2 ad 4: “Creaturae autem materiales habent infinitatem ex parte materiae, sed finitatem ex parte formae, quae limitatur per materiam in qua recipitur.”

<sup>53</sup> *STh* I, q. 50 a. 2 ad 4: “Sicut si diceremus albedinem separatam existentem esse infinitam quantum ad rationem albedinis, quia non contrahitur ad aliquod subiectum.” *Quodlibet* 7, q. 1 a. 1 ad 1: “si esset aliqua albedo existens non in subiecto, ex hoc ipso distingueretur a qualibet albedine in subiecto existente; [...] in ratione albedinis non esset recepta, et sic nec limitata.” *STh* I, q. 7 a. 1 ad 3: “si esset albedo subsistens, ex hoc ipso quod non esset in alio, differret ab omni albedine existente in subiecto.”

<sup>54</sup> *De veritate*, q. 29 a. 3 co., 155–160: “Contingit autem id quod est secundum unam quantitatem finitum, esse secundum aliam infinitum. Et hoc patet, si utraque quantitas accipiatur dimensiva; potest enim intelligi aliqua superficies finita secundum latitudinem et infinita secundum longitudinem.”

It is also evident if we take one dimensive quantity and the other virtual; for if an infinite white body were understood, whiteness would not be intensely infinite on account of this, but only extensively, by accident; for it would be possible to find something whiter.<sup>55</sup>

The same is evident notwithstanding if one and the other quantity should be virtual; for, in one and the same (subject), a diverse virtual quantity can be considered according to the diverse *ratios* of those that are predicated of the same (subject).<sup>56</sup>

For example, insofar as (the subject) is said (to be) *sensible* (*sensibilis*), (a virtual quantity can be considered in it) from the perfection of sensing (*ex perfectione sentiendi*).<sup>57</sup> And likewise of other (*ratios*).

Therefrom, insofar as (a subject) is said (to be a) *being* (*ens*), a virtual quantity can be considered in it in respect of the perfection of (the act of) being (*quantum ad perfectionem essendi*).<sup>58</sup>

#### 24.10. Limitation in Quantity of Being

Nothing prevents some creature from being infinite according to something (*secundum quid*; ►24.7).<sup>59</sup> However, every creature is simply finite (*finita simpliciter*) insofar as its (act of) being (*esse*) is not an absolute subsistent, but is limited to some nature that befalls it (*cui advenit*).

Thus, if whiteness should exist separated—i.e., subsistent, not in a subject—, it would be infinite in respect of the *ratio* of *whiteness*, since it would not be contracted into some subject (as just discussed; ►24.8).<sup>60</sup> However, its (act of) being (*esse*) would be finite, since it would be determined to some special nature (i.e., limited to the special nature of whiteness, which is a color, which is a quality; none of which is separated being).

---

<sup>55</sup> *De veritate*, q. 29 a. 3 co., 160–165: “Patet etiam si accipiatur una quantitas dimensiva et alia virtualis; si enim intelligatur corpus album infinitum, non propter hoc albedo intensive infinita erit, sed solum extensive per accidens, poterit enim aliquid albius inveniri.”

<sup>56</sup> *De veritate*, q. 29 a. 3 co., 165–169: “Patet nihilominus idem si utraque quantitas sit virtualis, nam in uno et eodem diversa quantitas virtualis attendi potest secundum diversas rationes eorum quae de ipso praedicantur.”

<sup>57</sup> *De veritate*, q. 29 a. 3 co., 169; 171–173: “sicut [...] ex hoc quod dicitur sensibilis [consideratur in eo quantitas virtualis] ex perfectione sentiendi, et sic de aliis.”

<sup>58</sup> *De veritate*, q. 29 a. 3 co., 169–171: “sicut ex hoc quod dicitur ens, consideratur in eo quantitas virtualis quantum ad perfectionem essendi.”

<sup>59</sup> *STh I*, q. 50 a. 2 ad 4: “omnis creatura est finita simpliciter, inquantum esse eius non est absolutum subsistens, sed limitatur ad naturam aliquam cui advenit. Sed nihil prohibet aliquam creaturam esse secundum quid infinitam.”

<sup>60</sup> *STh I*, q. 50 a. 2 ad 4: “Sicut si diceremus albedinem separatam existentem esse infinitam quantum ad rationem albedinis, quia non contrahitur ad aliquod subiectum; esse tamen eius esset finitum, quia determinatur ad aliquam naturam specialem.” *Quodlibet 7*, q. 1 a. 1 ad 1: “si esset aliqua albedo existens non in subiecto [...]” *STh I*, q. 7 a. 1 ad 3: “si esset albedo subsistens [...]”

Likewise, if there should be some created forms non-received in matter, but subsistent by themselves, as some have opined concerning angels, they will indeed be infinite according to something: insofar as such forms are neither terminated nor contracted by some matter.<sup>61</sup> However, since a created form subsisting in this way has (an act of) being (*esse*) and (the form itself) is not its (own act of) being, it is necessary for its being to be received and contracted to a determinate nature. Whence, it cannot be simply infinite.

Thus, immaterial substances (i.e., subsistent forms) are finite according to their (act of) being (*secundum suum esse*), but infinite insofar as their forms are not received in another.<sup>62</sup> Whence, it is said in the *Book of Causes*<sup>63</sup> that (an immaterial substance) is “finite (from) above” (*superius*): i.e., insofar as it receives (its act of) being from its superior; but “infinite (from) below” (*inferius*), insofar as it is not received in some matter.

#### 24.11. Formal vs. Quantitative Division

Division causes multitude (►40.2).<sup>64</sup> However, division is twofold (►40.4):

**1. Formal division**, which is *by opposites*. This division causes a multitude that is of transcendentals, according to which *being* is divided by *one* and *many*.<sup>65</sup> The multitude that follows upon the formal division of things cannot be infinitely multiplied; for there are determinate species of things, as (there is) also a determinate quantity of universe.

**2. Division according to quantity**. The division of continuous quantity causes number, which is a species of quantity insofar as it has the *ratio* of *measure*.<sup>66</sup> And this number is infinitely multipliable, just as magnitude is infinitely divisible. Whence, ARISTOTLE says that this number that is infinitely multiplied is not separated from the division of the continuum.

---

<sup>61</sup> *STh* I, q. 7 a. 2 co.: “Si autem sint aliquae formae creatae non receptae in materia, sed per se subsistentes, ut quidam de Angelis opinantur, erunt quidem infinitae secundum quid, in quantum huiusmodi formae non terminantur neque contrahuntur per aliquam materiam, sed quia forma creata sic subsistens habet esse, et non est suum esse, necesse est quod ipsum eius esse sit receptum et contractum ad determinatam naturam. Unde non potest esse infinitum simpliciter.”

<sup>62</sup> *STh* I, q. 50 a. 2 ad 4: “Substantiae autem immateriales creatae sunt finitae secundum suum esse, sed infinitae secundum quod eorum formae non sunt receptae in alio. [...] Et propter hoc dicitur in libro *de Causis*, quod intelligentia est *finita superius*, in quantum scilicet recipit esse a suo superiori; sed est *infinita inferius*, in quantum non recipitur in aliqua materia.”

<sup>63</sup> A work once attributed to ARISTOTLE, but which St. Thomas rightly identified as having been taken mostly from the *Elements of Theology*, by PROCLUS.

<sup>64</sup> *In Physic.* 3, l. 12, n. 5: “divisio [...] multitudinem causat. Est autem duplex divisio: una formalis, quae est per opposita; et alia secundum quantitatem.”

<sup>65</sup> *In Physic.* 3, l. 12, n. 5: “Prima autem divisio causat multitudinem, quae est de transcendentibus, secundum quod ens dividitur per unum et multa [...]: sed multitudo quae sequitur divisionem formalem rerum, non multiplicatur in infinitum; sunt enim determinatae species rerum, sicut et determinata quantitas universi.”

<sup>66</sup> *In Physic.* 3, l. 12, n. 5: “divisio continuae quantitatis causat numerum, qui est species quantitatis, in quantum habet rationem mensurae. Et hic numerus multiplicabilis est in infinitum, sicut et magnitudo divisibilis est in infinitum.” Ibid. (cf. ARISTOTLE, *Physica* Γ.7, 207b13–14): “Et ideo dicit [Philosophus] quod hic numerus, qui multiplicatur in infinitum, non separatur a divisione continui.”

Nor is this number infinite in such a way that (it would be) something permanent, but as something that always exists in coming-to-be, insofar as (something) is successively added over whatever given number; as is (the case) also of time, and of the number of time; for the number of time grows successively by addition of day to day, but not (in such a way) that all days should be simultaneous.<sup>67</sup>

#### 24.12. The Infinite Virtue of Reason

Our intellect receives cognition of things through abstract species, which are likenesses (►21.4) of forms and not of matters or of the material dispositions that are the principles of individuation.<sup>68</sup> Whence, our intellect can only know universals, and not singulars.

Therefore, our intellect cannot consider many (things) simultaneously in act.<sup>69</sup> And thus, if it should know infinite things (by) considering them, it would have to enumerate infinite (things) one after one, which is against the *ratio* of *infinite* (*in act*). However, our intellect can know infinite (things) virtually and in potency—for example, all the species of numbers or of proportions—insofar as it has a sufficient principle to know all (things). Hence, our intellect knows *in potency and in virtue* the infinite (things) *of which it has the principle of cognition*.<sup>70</sup>

Reason is in some mode of infinite virtue insofar as it can consider something infinitely, as is apparent in the addition of numbers and of lines.<sup>71</sup> Whence, the infinite—taken in some mode—is proportionate to reason; for also the universal that reason apprehends is in some mode infinite, insofar as it contains infinite singulars in potency.

It is impossible for there to be an infinite virtue in a body.<sup>72</sup> However, the possible intellect is of infinite virtue in some mode; for through it we judge infinite things according to number

---

<sup>67</sup> *In Physic.* 3, l. 12, n. 5 (cf. ARISTOTLE, *Physica* Γ.7, 207b14–15): “Neque tamen hic numerus sic est infinitus, sicut aliquid permanens, sed sicut semper in fieri existens, in quantum successive additur supra quemlibet numerum datum; sicuti etiam est de tempore et de numero temporis. Numerus enim temporis crescit successive per additionem diei ad diem, non quod omnes dies sint simul.”

<sup>68</sup> *Comp. th.* 1, c. 133, 12–18: “intellectus noster cognitionem de rebus accipit per species abstractas, que sunt similitudines formarum et non materie, nec materialium dispositionum que sunt individuationis principia: unde intellectus noster singularia cognoscere non potest, sed solum uniuersalia.”

<sup>69</sup> *Comp. th.* 1, c. 133, 25–33: “Intellectus enim noster non potest simul actu plura considerare, et sic si infinita cognosceret considerando ea, oporteret quod numeraret infinita unum post unum, quod est contra rationem infiniti; sed uirtute et in potentia intellectus noster infinita cognoscere potest, utpote omnes species numerorum uel proportionum, in quantum habet sufficiens principium ad omnia cognoscenda.”

<sup>70</sup> *Comp. th.* 1, c. 133, 38–40: “intellectus noster potentia et uirtute cognoscit infinita quorum cognitionis principium habet.”

<sup>71</sup> *STh* I-II, q. 30 a. 4 ad 2: “ratio quodammodo est virtutis infinitae in quantum potest in infinitum aliquid considerare, ut apparet in additione numerorum et linearum. Unde infinitum aliquo modo sumptum, est proportionatum rationi. Nam et uniuersale, quod ratio apprehendit, est quodammodo infinitum, in quantum in potentia continet infinita singularia.”

<sup>72</sup> *ScG* 2, 59 n. 6: “Impossibile est in corpore esse virtutem infinitam: ut probatur ab Aristotele in VIII Physicor. Intellectus autem possibilis est quodammodo virtutis infinitae: iudicamus enim per ipsum res

insofar as by it we know universals, under which are comprehended infinite particulars in potency. Therefore, the possible intellect is not a virtue in a body.

### 24.13. Cognition of the Infinite

Cognition extends to many or few according to the virtue of the mean of knowing.<sup>73</sup> For example, the likeness that is received in sight is determined according to the particular conditions of the thing; whence, it is conducive to the cognition of only one thing.

On the other hand, the likeness of the thing received in the intellect is detached (*absoluta*) from particular conditions.<sup>74</sup> Whence, since it is thus loftier (*elevation*), it is conducive into many. And since one universal form is naturally apt to be participated by infinite singulars, it is therefrom that the intellect knows infinite (things) in some mode.

However, since the likeness that is in the intellect does not lead to the cognition of the singular in respect of those (conditions) whereby singulars are distinguished one from another, but only in respect of (their) common nature, it is therefrom that our intellect, through the species that it has in itself, is cognitive of infinite (things) only in potency.<sup>75</sup>

(Again), nothing prevents one thing from being infinite in one mode and finite in another mode: for example, (again) if a body should be infinite in longitude but finite in latitude.<sup>76</sup> And (this) can (happen) likewise in forms: for example, if we posit some infinite body to be white, the extensive quantity of whiteness—according to which (whiteness) is said to be a quantum by accident—will be infinite, while its quantity by itself—that is, (its) intensive (quantity)—would nonetheless be finite. And the same is (true) of any other form of an infinite body, since every form received in some matter is ended (*finitur*) according to the mode of the recipient and does not have—in this mode—an infinite intension.

---

infinitas secundum numerum, in quantum per ipsum cognoscimus universalia, sub quibus comprehenduntur particularia infinita in potentia. Non est igitur intellectus possibilis virtus in corpore.”

<sup>73</sup> *De veritate*, q. 2 a. 9 co.: “secundum virtutem medii cognoscendi, cognitio ad multa vel ad pauca se extendit; sicut similitudo quae recipitur in visu, est determinata secundum particulares condiciones rei, unde non est ductiva in cognitionem nisi unius rei.”

<sup>74</sup> *De veritate*, q. 2 a. 9 co.: “sed similitudo rei recepta in intellectu, est absoluta a particularibus conditionibus, unde cum sic elevatior, est ductiva in plura. Et quia una forma universalis nata est ab infinitis singularibus participari, inde est quod intellectus quodammodo infinita cognoscit.”

<sup>75</sup> *De veritate*, q. 2 a. 9 co.: “Sed quia illa similitudo quae est in intellectu, non ducit in cognitionem singularis quantum ad ea quibus singularia ad invicem distinguuntur, sed solum quantum ad naturam communem; inde est quod intellectus noster per speciem quam habet apud se non est cognoscitivus infinitorum nisi in potentia.”

<sup>76</sup> *De veritate*, q. 2 a. 9 co.: “Nihil prohibet aliquid esse infinitum uno modo, et alio modo finitum: ut si aliquod corpus esset quidem longitudine infinitum, sed latitudine finitum; et similiter potest esse in formis: ut si aliquod corpus infinitum ponamus esse album, quantitas albedinis extensiva, secundum quam dicitur quanta per accidens, erit infinita; quantitas autem eius per se, scilicet intensiva, nihilominus esset finita; et similiter est de quacumque alia forma corporis infiniti: quia omnis forma recepta in aliqua materia finitur ad modum recipientis, et ita non habet intensionem infinitam.”

Now the infinite, just as it is incompatible with (*repugnat*) cognition, so too is it incompatible with traversal; for the infinite can neither be known nor can it be traversed.<sup>77</sup> Nonetheless, if something were to be set in motion over an infinite (magnitude), but not through the way of its infinity, it could be traversed. For example, what is infinite in longitude and finite in latitude can be traversed through (its) latitude, but not (through its) longitude.

In the same mode, too, if some infinite were to be known through the way in which it is infinite, it would in no mode be perfectly knowable.<sup>78</sup> On the other hand, if it were known not by the infinite way, it could be perfectly known in this way; for the *ratio* of *infinite* befits (*congruit*) quantity; and every quantity has, from its *ratio*, an *order of parts*. It follows that the infinite is known through the way of the infinite when it is apprehended *part after part*.

Whence, if our intellect had to know an infinite white body, it could in no mode know it perfectly—nor (could it perfectly know) its whiteness.<sup>79</sup> However, if it were to know the nature itself of whiteness or of corporeity that is found in an infinite body, it would in this way know an infinite perfectly in respect of all its parts, but not through the way of the infinite.

In this mode (i.e., through the way of the species, which is a likeness of the thing; ►24.12, 21.4), it is possible for our intellect to perfectly know—in some mode—an infinite continuum.<sup>80</sup> However, in no mode (can our intellect know) infinite (things) discretely (i.e., singularly), because it cannot know many (things singularly) through one species. Wherefrom, if (our intellect) is to consider many (things), it must know one after another; and in this way, it knows a discrete quantity through the way of the infinite. Whence, if it were to know an infinite multitude in act, it would follow that it would know an infinite through the way of the infinite, which is impossible.

---

<sup>77</sup> *De veritate*, q. 2 a. 9 co.: “Infinitem autem, sicut repugnat cognitioni, ita et repugnat transitioni: infinitum enim nec cognosci nec transiri potest: nihilominus tamen, si aliquid moveatur super infinitum non per viam infinitatis suae, transiri poterit; sicut quod est infinitum longitudine, et latitudine finitum, potest pertransiri latitudine, sed non longitudine.”

<sup>78</sup> *De veritate*, q. 2 a. 9 co.: “ita etiam si aliquod infinitum cognoscatur per viam per quam est infinitum, nullo modo perfecte cognosci potest; si autem cognoscatur non per viam infiniti, sic perfecte cognosci poterit: quia enim infiniti ratio congruit quantitati, secundum Philosophum in I Phys., omnis autem quantitas de sui ratione habet ordinem partium; sequitur quod tunc infinitum per viam infiniti cognoscatur, quando apprehenditur pars post partem.”

<sup>79</sup> *De veritate*, q. 2 a. 9 co.: “Unde si sic debeat intellectus noster cognoscere corpus album infinitum, nullo modo cognoscere poterit perfecte ipsum, neque albedinem eius; si autem cognoscat ipsam naturam albedinis vel corporeitatis, quae invenitur in corpore infinito, sic cognoscat infinitum perfecte quantum ad omnes partes eius, non tamen per viam infiniti.”

<sup>80</sup> *De veritate*, q. 2 a. 9 co.: “et sic possibile est ut intellectus noster quodammodo infinitum continuum perfecte cognoscat; sed infinita discrete nullo modo, eo quod non potest per unam speciem multa cognoscere; et inde est quod si multa debet considerare, oportet quod unum post alterum cognoscat, et ita quantitatem discretam per viam infiniti cognoscit. Unde si cognosceret infinitam multitudinem in actu, sequeretur quod cognosceret infinitum per viam infiniti; quod est impossibile.”

## 25. The Infinite in Dimensive Quantity

*In this chapter we provide greater detail about the way in which there is—and the way in which there is not—an infinite in dimensive quantity and in mathematics.*

### 25.1. No Actual Infinite in Magnitude

To be infinite according to one's essence and according to magnitude is not the same.<sup>1</sup> Given that there should be some infinite body according to magnitude—for example, some element—, it would not however be infinite according to essence, because its essence would be terminated at some species by a form; and at some individual, by matter.

Since no creature is infinite according to essence (► 24.10), it remains to inquire whether some creature is infinite *according to magnitude*.<sup>2</sup>

**Body**, which is a complete (i.e., perfect) magnitude, is taken in two (modes; ► 46.10):<sup>3</sup>

1. **Naturally**, insofar as matter and form is considered in it (i.e., in the body).

Concerning the natural body, it is manifest that it cannot be infinite; for every natural body has some determinate substantial form.<sup>4</sup> Hence, since accidents follow upon a substantial

---

<sup>1</sup> *STh I*, q. 7 a. 3 co.: “aliud est esse infinitum secundum suam essentiam, et secundum magnitudinem. Dato enim quod esset aliquod corpus infinitum secundum magnitudinem, utpote ignis vel aer, non tamen esset infinitum secundum essentiam, quia essentia sua esset terminata ad aliquam speciem per formam, et ad aliquod individuum per materiam.”

<sup>2</sup> *STh I*, q. 7 a. 3 co.: “Et ideo, habito ex praemissis quod nulla creatura est infinita secundum essentiam, adhuc restat inquirere utrum aliquid creatum sit infinitum secundum magnitudinem.”

<sup>3</sup> *STh I*, q. 7 a. 3 co.: “Sciendum est igitur quod corpus, quod est magnitudo completa, dupliciter sumitur, scilicet mathematice, secundum quod consideratur in eo sola quantitas; et naturaliter, secundum quod consideratur in eo materia et forma.”

<sup>4</sup> *STh I*, q. 7 a. 3 co.: “Et de corpore quidem naturali, quod non possit esse infinitum in actu, manifestum est. Nam omne corpus naturale aliquam formam substantialem habet determinatam, cum igitur ad formam substantialem consequantur accidentia, necesse est quod ad determinatam formam consequantur determinata accidentia; inter quae est quantitas. Unde omne corpus naturale habet determinatam quantitatem et in maius et in minus. Unde impossibile est aliquod corpus naturale infinitum esse.” St. Thomas adds other, physical arguments through which the same conclusion is reached, saying that this is evident also from motion, for every natural body has some natural motion, and an infinite body could not have some natural motion: neither straight, because something is moved naturally in straight motion only when it is outside of its place, which cannot happen to an infinite body, for it would occupy all places and, in this way, any place would be its place indifferently; nor, likewise, according to circular motion, for in circular motion one part of the body must be transferred to the place in which another part was; which in a circular body, if it is posited (to be) infinite, cannot be, for two lines drawn from the center, the longer they are protracted from the center, the more they will be distant from each other; therefore, if the body is infinite, the lines would be infinitely distant from each other, and in this mode one could never arrive to the place of another. *STh I*, q. 7 a. 3 co.: “Hoc etiam ex motu patet. Quia omne corpus naturale habet aliquem motum naturalem. Corpus autem infinitum non posset habere aliquem motum naturalem, nec rectum, quia nihil movetur naturaliter motu recto, nisi cum est extra suum locum, quod corpori infinito accidere non posset; occuparet enim omnia loca, et sic indifferenter quilibet locus esset locus eius. Et similiter etiam neque secundum motum circularem. Quia in motu circulari oportet quod una pars corporis transferatur ad locum in quo fuit alia pars; quod in corpore circulari, si ponatur infinitum, esse non posset, quia duae lineae protractae a centro, quanto longius protrahuntur a centro, tanto longius distant ab invicem; si ergo corpus esset infinitum, in infinitum lineae distarent ab invicem, et sic una nunquam posset pervenire ad locum alterius.” These and other reasons (physical and logical) are in ARISTOTLE'S

form, it is necessary that determinate accidents follow upon a determinate form—among which (accidents) is quantity. Whence, a natural body has a determinate quantity, both in the greater and in the lesser. Therefore, it is impossible for some natural body to be infinite.

**2. Mathematically**, insofar as only quantity is considered in it (i.e., in the body).

The same reason is (true) also concerning a mathematical body; for if we were to imagine a mathematical body existing in act, we would have to imagine it under some form, since something is in act only through its form.<sup>5</sup> Whence, since **figure** is *the form of the quantum as such*, it would have to have some figure. And in this way, it will be finite; for it is a figure, which is comprehended within a terminus or within termini (► 4.3; 36.5).

Although the infinite is not against the *ratio of magnitude* in common, it is however against the *ratio* of whichever of its species: e.g., against the *ratio* of *a magnitude of two cubits* or *of three cubits*—whether circular, triangular, or something like this.<sup>6</sup> And it is impossible for that which is not in a species to be in a genus. Whence, it is not possible for there to be some infinite magnitude, since no species of magnitude is infinite.

The infinite that befits quantity is had from the part of matter (► 24.8).<sup>7</sup> And matter is reached by the division of the whole; for parts are related in the *ratio* of *matter* (► 13.1); on the other hand, the whole, which is had in the *ratio* of *form*, is reached by addition. Hence, no infinite is found in the addition of magnitude: rather, only in division (is found).

Motion and time are not in act according to the whole, but successively; whence, they have potency mixed with act; but magnitude is whole in act.<sup>8</sup> Hence, the infinite that befits quantity and is had from the part of matter is incompatible with (*repugnat*) the totality of magnitude, but not with the totality of time or of motion; for being in potency befits matter.

---

works. See *Metaphysica* K.10, 1066a35–1067a37; *Physica* Γ.4–8, 202b30–208a23; *De caelo* A.5–7, 271b1–276a17; and the corresponding commentaries by St. Thomas.

<sup>5</sup> *STh* I, q. 7 a. 3 co.: “De corpore etiam mathematico eadem ratio est. Quia si imaginemur corpus mathematicum existens actu, oportet quod imaginemur ipsum sub aliqua forma, quia nihil est actu nisi per suam formam. Unde, cum forma quanti, in quantum huiusmodi, sit figura, oportebit quod habeat aliquam figuram. Et sic erit finitum, est enim figura, quae termino vel terminis comprehenditur.”

<sup>6</sup> *STh* I, q. 7 a. 3 ad 2: “licet infinitum non sit contra rationem magnitudinis in communi, est tamen contra rationem cuiuslibet speciei eius, scilicet contra rationem magnitudinis bicubitae vel tricubitae, sive circularis vel triangularis, et similibus. Non autem est possibile in genere esse quod in nulla specie est. Unde non est possibile esse aliquam magnitudinem infinitam, cum nulla species magnitudinis sit infinita.”

<sup>7</sup> *STh* I, q. 7 a. 3 ad 3: “infinitum quod convenit quantitati, ut dictum est, se tenet ex parte materiae. Per divisionem autem totius acceditur ad materiam, nam partes se habent in ratione materiae, per additionem autem acceditur ad totum, quod se habet in ratione formae. Et ideo non invenitur infinitum in additione magnitudinis, sed in divisione tantum.”

<sup>8</sup> *STh* I, q. 7 a. 3 ad 4: “motus et tempus non sunt secundum totum in actu, sed successive, unde habent potentiam permixtam actui. Sed magnitudo est tota in actu. Et ideo infinitum quod convenit quantitati, et se tenet ex parte materiae, repugnat totalitati magnitudinis, non autem totalitati temporis vel motus, esse enim in potentia convenit materiae.”

## 25.2. Infinite Multitude: By Itself vs. by Accident

A multitude is said (to be) *infinite*:<sup>9</sup>

1. **By itself**, when it is required for something that the multitude be infinite (*quando requiritur ad aliquid ut multitudo infinita sit*).<sup>10</sup>

It is impossible for this to be, because something would then have to depend on infinities; whence, its generation would never be completed, since infinities cannot be traversed.<sup>11</sup>

2. **By accident**, when it is not required for something that the multitude be infinite, but it happens to be so (*sed accidit ita esse*).<sup>12</sup>

This (mode) can be manifested in the operation of an artificer, for which some multitude is required by itself: to wit, that there be an art in the soul, a hand that moves, and a hammer.<sup>13</sup> And if this multitude were to be infinitely multiplied, the artwork would never be completed, because it would depend on infinite causes.

On the other hand, a multitude of hammers that occurs because one breaks and another is taken, is a multitude by accident; for it happens that (the artwork) would be operated by multiple hammers; and it makes no difference whether it would be operated by one, two, many, or infinite (hammers), if it would be operated in infinite time.<sup>14</sup>

## 25.3. No Actual Infinite in Multitude

Some, like AVICENNA and ALGAZEL, have said that it is impossible for there to be an infinite multitude in act by itself, but that it is not impossible for an infinite multitude to be in act by accident in the mode just described.<sup>15</sup> However, this is impossible because every multitude has to be in some species of multitude, and the species of multitude are

---

<sup>9</sup> *STh I*, q. 7 a. 4 co.: “Dicitur enim multitudo esse infinita per se [...]. Per accidens autem dicitur multitudo infinita [...].”

<sup>10</sup> *STh I*, q. 7 a. 4 co.: “Dicitur enim multitudo esse infinita per se, quando requiritur ad aliquid ut multitudo infinita sit.”

<sup>11</sup> *STh I*, q. 7 a. 4 co.: “Et hoc est impossibile esse, quia sic oporteret quod aliquid dependeret ex infinitis; unde eius generatio nunquam completeretur, cum non sit infinita pertransire.”

<sup>12</sup> *STh I*, q. 7 a. 4 co.: “Per accidens autem dicitur multitudo infinita, quando non requiritur ad aliquid infinitas multitudinis, sed accidit ita esse.”

<sup>13</sup> *STh I*, q. 7 a. 4 co.: “Et hoc sic manifestari potest in operatione fabri, ad quam quaedam multitudo requiritur per se, scilicet quod sit ars in anima, et manus movens, et martellus. Et si haec in infinitum multiplicarentur, nunquam opus fabrile completeretur, quia dependeret ex infinitis causis.”

<sup>14</sup> *STh I*, q. 7 a. 4 co.: “Sed multitudo martellorum quae accidit ex hoc quod unum frangitur et accipitur aliud, est multitudo per accidens, accidit enim quod multis martellis operetur; et nihil differt utrum uno vel duobus vel pluribus operetur, vel infinitis, si infinito tempore operaretur.”

<sup>15</sup> *STh I*, q. 7 a. 4 co.: “Quidam enim, sicut Avicenna et Algazel, dixerunt quod impossibile est esse multitudinem actu infinitam per se, sed infinitam per accidens multitudinem esse, non est impossibile. Et hoc sic manifestari potest in operatione fabri [...]. Per hunc igitur modum, posuerunt quod possibile est esse actu multitudinem infinitam per accidens.”

according to the species of numbers; but no species of number is infinite, since any number is a multitude *measured* by one (►2.1).<sup>16</sup> Whence, it is impossible for there to be an infinite multitude in act, whether by itself or by accident.

(In other words, the argument used to prove that there are no infinite magnitudes is true also for multitudes. Since any number is *a whole composed from units*, the multitude of unit-parts is as its matter; and since it is *a whole measured by one*, the measure itself is as its form-whole; ►13.1. Now if this form should be infinite, it would be indeterminate; and an indeterminate form constitutes a genus; ►14.12. But there is no genus without species; ►14.14. Therefore, an infinite multitude is opposed to whatever species of multitude in the same way that a genus is opposed to its species: to wit, according to the opposition of the unsigned to the signed; for the designation of the species in respect of the genus is by a constitutive difference, which is taken from the form of the thing; ►14.15. Thus, a multitude cannot be simultaneously differentiated and undetermined).<sup>17</sup>

On the other hand, an infinite multitude in potency is possible because the increase of multitude follows upon the division of magnitude: the more something is divided, the greater the resultant plurality is according to number.<sup>18</sup> Whence, just as an infinite is found in potency in the division of a continuum, since (division) proceeds towards matter, for the same reason also an infinite is found in potency in the addition of multitude.

#### 25.4. How the Infinite is in Potency

ARISTOTLE shows how the infinite would be in potency; for something is found (to be) in potency in two modes:<sup>19</sup>

---

<sup>16</sup> *STh* I, q. 7 a. 4 co.: “Sed hoc est impossibile. Quia omnem multitudinem oportet esse in aliqua specie multitudinis. Species autem multitudinis sunt secundum species numerorum. Nulla autem species numeri est infinita, quia quilibet numerus est multitudo mensurata per unum. Unde impossibile est esse multitudinem infinitam actu, sive per se, sive per accidens.” St. Thomas adds another argument from creation, in *ibid.*: “Item, multitudo in rerum natura existens est creata, et omne creatum sub aliqua certa intentione creantis comprehenditur, non enim in vanum agens aliquod operatur. Unde necesse est quod sub certo numero omnia creata comprehendantur. Impossibile est ergo esse multitudinem infinitam in actu, etiam per accidens.”

<sup>17</sup> Cf. *STh* I, q. 7 a. 4 ad 3: “Ad tertium [sc., *ea quae non opponuntur ad invicem, non impediunt se invicem. Sed, posita aliqua multitudine rerum, adhuc possunt fieri alia multa quae eis non opponuntur, ergo non est impossibile aliqua iterum simul esse cum eis, et sic in infinitum. Ergo possibile est esse infinita in actu*] dicendum quod, licet, quibusdam positis, alia poni non sit eis oppositum; tamen infinita poni opponitur cuilibet speciei multitudinis. Unde non est possibile esse aliquam multitudinem actu infinitam.”

<sup>18</sup> *STh* I, q. 7 a. 4 co.: “Sed esse multitudinem infinitam in potentia, possibile est. Quia augmentum multitudinis consequitur divisionem magnitudinis, quanto enim aliquid plus dividitur, tanto plura secundum numerum resultant. Unde, sicut infinitum invenitur in potentia in divisione continui, quia proceditur ad materiam, ut supra ostensum est; eadem ratione etiam infinitum invenitur in potentia in additione multitudinis.”

<sup>19</sup> *In Physic.* 3, l. 10, n. 4: “ostendit [Philosophus] quomodo infinitum sit in potentia. Dupliciter enim invenitur aliquid in potentia.”

1. Such that the whole can be reduced into act.<sup>20</sup>

For example, it is possible for this bronze to be a statue, which will at some time will be a statue.<sup>21</sup> However, the infinite is not said to be in potency in this mode, such that it would thereafter be in act.<sup>22</sup>

2. Such that **it comes to be** a being in act not simultaneously but **successively**.<sup>23</sup>

In this mode, the infinite is said to be simultaneously in potency and in act; for all are thus simultaneously in potency in respect of one part; and in act, in respect of another.<sup>24</sup>

Indeed, something is said *to be* (*esse*) in multiple (modes):<sup>25</sup> either because the whole is simultaneous, as a man or a house; or because one part of it always comes to be after another—by which mode are said to be a day and a (recurrent) game (lit., *ludus agonalis*).

Thus, since one (thing) whatsoever that is in potency is reduced into act according to the mode of its being (*secundum modum sui esse*), a day is not reduced into act as though it were a whole simultaneously, but successively.<sup>26</sup> For example, the Olympic Games are said to be and to last for as long as there can come to be contests and (for as long as they) come to be in act, for—as long as this festivity lasted—some part of the games was coming to be, and some (part) was to come to be in the future.

Likewise, a multitude is not reduced into act as if it were a whole simultaneously, but successively; for after any multitude whatever, another multitude can be taken infinitely.<sup>27</sup>

---

<sup>20</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a18–19): “Uno modo sic quod totum potest reduci in actum.”

<sup>21</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a19–20): “sicut possibile est hoc aes esse statuam, quod aliquando erit statua.”

<sup>22</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a20–21): “non autem sic dicitur esse infinitum in potentia, quod postea totum sit in actu.”

<sup>23</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a22): “Alio modo aliquid dicitur in potentia esse, quod postea fit actu ens, non quidem totum simul, sed successive.”

<sup>24</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a23–24): “Et hoc modo dicitur infinitum esse simul et in potentia et in actu: omnia enim huiusmodi simul sunt in potentia quantum ad unam partem, et in actu quantum ad aliam.”

<sup>25</sup> *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a21–22): “Multipliciter enim dicitur aliquid esse: vel quia totum est simul, ut homo et domus; vel quia semper una pars eius fit post aliam, per quem modum dicitur esse dies et ludus agonalis.”

<sup>26</sup> *STh* I, q. 7 a. 4 ad 1: “unumquodque quod est in potentia, reducitur in actum secundum modum sui esse, dies enim non reducitur in actum ut sit tota simul, sed successive. Et similiter infinitum multitudinis non reducitur in actum ut sit totum simul, sed successive, quia post quamlibet multitudinem, potest sumi alia multitudo in infinitum.” *In Physic.* 3, l. 10, n. 4 (cf. ARISTOTLE, *Physica* Γ.6, 206a24–25): “Olympia enim, idest festa agonalia quae celebrabantur in monte Olympo, dicuntur esse et durare secundum agones posse fieri et fieri in actu: quia quamdiu durabant ista festa, aliqua pars illorum ludorum erat in fieri, et aliqua erat ut in futurum fienda.”

<sup>27</sup> *STh* I, q. 7 a. 4 ad 1: “Et similiter infinitum multitudinis non reducitur in actum ut sit totum simul, sed successive, quia post quamlibet multitudinem, potest sumi alia multitudo in infinitum.”

Thereafter, the species of figures have infinity from the infinity of number; for three-sided (*trilaterum*), four-sided (*quadrilaterum*), and so on, are species of figures (►4.4).<sup>28</sup> Whence, just as an infinite numerable multitude is not reduced into act (such) that it would be simultaneously whole, likewise, nor (is) a multitude of figures (reduced simultaneously into act, but successively).

### 25.5. Succession Is Found in All Infinities in Potency

ARISTOTLE shows what is common to all infinities.<sup>29</sup> He says that this is found altogether and universally in all (material) infinities: that the infinite is (i.e., consists in) *always taking another and another (part of a whole) according to some succession*, but in such a way that *whatever of the infinite is taken in act, the whole is finite*.

Whence, the infinite cannot be taken to be some whole existing in act as *this designated something*, as we take a (singular) man, or a house, but as are successive (things), such as days and (recurrent) games, whose being is not such that something of them would be like some perfect substance existing whole in act.<sup>30</sup>

On the other hand, in generation and corruption, even if it were to proceed infinitely, that which is taken in act is always finite; for in the whole course of (human) generation, even if it were to proceed infinitely, both: (a) all the men that are taken in act are finite according to number; and (b) such a finite (number) must be taken another and another (*alterum et alterum* = ἕτερον καὶ ἕτερον), according as some men succeed some (other).<sup>31</sup>

### 25.6. Assimilation of the Infinite to Matter

For something to be infinite, it is required that there always be some part outside of any other taken part, such that the same part that was priorly taken is never taken again.<sup>32</sup>

---

<sup>28</sup> *STh* I, q. 7 a. 4 ad 2: “species figurarum habent infinitatem ex infinitate numeri, sunt enim species figurarum, trilaterum, quadrilaterum, et sic inde. Unde, sicut multitudo infinita numerabilis non reducitur in actum quod sit tota simul, ita nec multitudo figurarum.”

<sup>29</sup> *In Physic.* 3, l. 10, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 206a27–29): “ostendit [Philosophus] quid sit commune omnibus infinitis. Et dicit quod hoc omnino et universaliter in omnibus infinitis invenitur, quod infinitum est in semper aliud et aliud accipiendo secundum quandam successionem, ita tamen quod quidquid accipitur in actu de infinito, totum sit finitum.”

<sup>30</sup> *In Physic.* 3, l. 10, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 206a29–32): “Unde non oportet accipere quod infinitum sit aliquid totum simul existens, sicut *hoc aliquid* demonstratum, sicut accipimus hominem vel domum; sed sicut sunt successiva, ut dies et ludus agonalis, quorum esse non est hoc modo quod aliquid eorum sit sicut quaedam substantia perfecta tota actu existens.”

<sup>31</sup> *In Physic.* 3, l. 10, n. 6 (cf. ARISTOTLE, *Physica* Γ.6, 206a32–33): “In generatione autem et corruptione, etsi in infinitum procedatur, semper illud quod accipitur in actu, est finitum. In toto enim decursu generationis, etiam si procedatur in infinitum, et omnes homines qui simul actu accipiuntur, sunt finiti secundum numerum, et huiusmodi finitum oportet accipere alterum et alterum, secundum quod quidam homines succedunt quibusdam.”

<sup>32</sup> *In Physic.* 3, l. 11, n. 3 (cf. ARISTOTLE, *Physica* Γ.6, 207a4–6): “ad hoc quod aliquid sit infinitum, requiritur *hoc*, scilicet quod extra quamlibet partem acceptam sit quaedam alia; ita tamen quod nunquam resumatur illa quae prius fuit accepta.”

Thus, an infinite quantity cannot be comprehended; and if one should want to take it, he would take it—*part after part*—infinitely (*in infinitum*).<sup>33</sup>

Since *infinite* in addition or division is said insofar as something *can be* added to or divided, the infinite is as a being in potency; for *to be* (*esse* = τὸ εἶναι) is said of that which is in act (*in actu* = ἐντελεχεία, ἐνεργεία, κατ' ἐνέργειαν) and of that which is in potency (*in potentia* = δυνάμει).<sup>34</sup>

Since the infinite is always in potency, it is assimilated to matter (►9.3), which is always in potency; and does not exist by itself whole in act, as the finite is in act.<sup>35</sup> And just as the *infinite according to division* is simultaneously in potency with act, likewise, we ought to say of the *infinite according to addition* that it is in some mode the same with the *infinite according to division*. Whence, it is manifest that the infinite by addition is in potency, since something else can always be taken by adding.

Thus, as ARISTOTLE says, the infinite according to addition is in some mode the same as the infinite according to division, since the infinite according to addition comes to be conversely with the infinite according to division.<sup>36</sup> For according as something is divided infinitely, according to this it can seemingly be added to some determinate quantity.

### 25.7. Infinite as a Principle

ARISTOTLE shows in what mode the infinite is a principle.<sup>37</sup> He says that, since there are four genera of causes, it is evident from the aforesaid that the infinite is a cause as matter (*sicut materia* = ὡς ὕλη); for the infinite has an (act of) being in potency, which is proper

---

<sup>33</sup> *In Physic.* 3, l. 11, n. 3: “Non enim potest comprehendi quantitas infiniti; sed si quis velit eam accipere, accipiet partem post partem in infinitum.”

<sup>34</sup> *In Physic.* 3, l. 10, n. 3 (cf. ARISTOTLE, *Physica* Γ.6, 206a14–16): “ostendit [Philosophus] quod infinitum est sicut potentia ens. Et dicit quod aliquid dicitur esse in actu, et aliquid dicitur esse in potentia. Infinitum autem dicitur esse per appositionem, sicut in numeris, vel per ablationem, sicut in magnitudinibus.”

<sup>35</sup> *In Physic.* 3, l. 10, n. 9 (cf. ARISTOTLE, *Physica* Γ.6, 206b12–18): “cum infinitum sit semper in potentia, assimilatur materiae, quae est semper in potentia; et non est per se existens in actu totum, sicut finitum est in actu. Et sicut infinitum secundum divisionem est in potentia cum actu simul, similiter dicendum est de infinito secundum appositionem, quod quodammodo est idem cum infinito secundum divisionem, ut dictum est. Inde autem manifestum est quod infinitum per appositionem est in potentia, quia semper contingit aliquid aliud accipere apponendo.”

<sup>36</sup> *In Physic.* 3, l. 10, n. 8 (cf. ARISTOTLE, *Physica* Γ.6, 206b3–6): “Dicit ergo primo [Philosophus] quod quodammodo infinitum secundum appositionem est idem cum infinito secundum divisionem; quia infinitum secundum appositionem fit e converso cum infinito secundum divisionem. Secundum enim quod aliquid dividitur in infinitum, secundum hoc in infinitum videtur posse apponi ad aliquam determinatam quantitatem.”

<sup>37</sup> *In Physic.* 3, l. 12, n. 10 (cf. ARISTOTLE, *Physica* Γ.7, 207b34–208a1): “ostendit [Philosophus] quomodo infinitum sit principium. Et dicit quod cum sint quatuor genera causarum, ut supra dictum est, patet ex praemissis quod infinitum est causa sicut materia: infinitum enim habet esse in potentia, quod est proprium materiae. Sed materia quidem quandoque est sub forma, quandoque autem sub privatione. Infinito autem non competit ratio materiae secundum quod est sub forma, sed secundum quod est sub privatione: quia scilicet infinitum dicitur per remotionem perfectionis et termini. Et propter hoc subiungit quod ipsi infinito esse est privatio, idest ratio infiniti in privatione consistit.”

of matter. However, matter is sometimes under a form and sometimes under privation, and the *ratio* of *matter* does not befit the infinite insofar as it is under a form but insofar as it is under privation—namely, because *infinite* is said by removal of a perfection and of a terminus. For this (reason), he adds that the *ratio* of *infinite* consists in privation (*ipsi infinito esse est privatio* < τὸ... εἶναι αὐτῷ [sc., τῷ ἀπείρῳ] στέρησις, *idest ratio infiniti in privatione consistit*).

### 25.8. Infinite Division in Magnitude

ARISTOTLE shows how there would be an infinite in the division of magnitude.<sup>38</sup> He says that if someone, having taken some determinate part of a finite magnitude by division, should then continue to take other parts by division, always maintaining the same *ratio*, i.e., proportion (*eandem rationem* < τῷ αὐτῷ λόγῳ, *idest proportionem*), but not according to the same quantity (*non secundum eandem quantitatem* < μὴ τὸ αὐτό τι τοῦ ὅλου μέγεθος), he will not traverse the finite by dividing in the same proportion.

For example, if from a line of one cubit he would take a half, and again (he would take) from the remainder a half, he could proceed in this way infinitely; for he would preserve the same proportion in subtracting, but not the same quantity of that which is subtracted, since, according to quantity, a half of a half (of any given whole) is less than a half of the whole.<sup>39</sup>

On the other hand, should he always take the same quantity, the proportion would always be increased more and more necessarily.<sup>40</sup>

For example, if one cubit is subtracted from a quantity of ten cubits, what is subtracted is related to the whole in a ratio of 1 : 10 (*in subdecupla proportione*).<sup>41</sup> And, should one cubit be subtracted again from the remainder, that which is subtracted would be related (to the remaining nine cubits) in a greater proportion (i.e., 1 : 9 > 1 : 10); for one cubit is exceeded by nine (cubits) less than (it is exceeded) by ten (i.e., 9 – 1 < 10 – 1).

<sup>38</sup> *In Physic.* 3, l. 10, n. 9 (cf. ARISTOTLE, *Physica* Γ.6, 206b7–9): “Manifestat igitur [Philosophus] quomodo sit infinitum divisione in magnitudine. Et dicit quod si aliquis in aliqua magnitudine finita, accepta aliqua parte determinata per divisionem, semper accipiat dividendo alias partes secundum eandem *rationem*, idest proportionem, sed non secundum eandem quantitatem in eadem proportione, non pertransibit dividendo illud finitum.”

<sup>39</sup> *In Physic.* 3, l. 10, n. 9: “puta si a linea cubitali accipiat medietatem, et iterum a residuo medietatem; et sic in infinitum procedere potest. Servabitur enim in subtrahendo eadem proportio, sed non eadem quantitas subtracti; minus est enim secundum quantitatem dimidium dimidii quam dimidium totius.”

<sup>40</sup> *In Physic.* 3, l. 10, n. 9 (cf. ARISTOTLE, *Physica* Γ.6, 206b9–11): “Sed si semper sumeret eandem quantitatem, oporteret quod semper magis ac magis augetur proportio.”

<sup>41</sup> *In Physic.* 3, l. 10, n. 9: “Put a si a quantitate decem cubitorum subtrahatur unus cubitus, subtractum se habet ad totum in subdecupla proportione: si autem iterum a residuo subtrahatur unus cubitus, subtractum se habebit in maiori proportione; minus enim unus cubitus exceditur a novem quam a decem.”

Thus, just as the quantity is decreased whenever the same proportion is preserved, so the proportion is increased whenever the same quantity is taken.<sup>42</sup>

Therefore, if someone—thus subtracting from some finite magnitude—should always increase the proportion by taking the same quantity, he would traverse the finite magnitude by dividing:<sup>43</sup> for example, if he should always subtract one cubit from a line of one hundred cubits. And this is so because every finite (quantity) is consumed if whatsoever finite (quantity) is always taken.

It is not unfitting if in some infinite (quantity) there are infinite unequal (parts) if the *ratio* of *quantity* is considered (*si attendatur ratio quantitatis*).<sup>44</sup> For if a continuum is divided according the same proportion, it will be (possible) to proceed infinitely: for example, if we were to take one third of the whole, and one third of the third, and so on. But the parts taken will not be equal according to quantity. On the other hand, if the division is made according to unequal parts, it will not be (possible) to proceed indefinitely even if the *ratio* of *quantity* were to be considered only in a mathematical body.

It has been shown that magnitude is not infinite in act.<sup>45</sup> Thus, the infinite is not found in magnitudes by addition but by division. Hence, it is not difficult to destroy the opinion of those who posit that there are indivisible lines—and to show that such lines are divisible. However, *infinite* is said, in addition or in division, insofar as it can be added or divided. It remains, therefore, that the infinite is as a being in potency.

### 25.9. Infinite Addition vs. Division in Magnitude

ARISTOTLE shows the difference between the infinite according to addition and the infinite according to division.<sup>46</sup> He says that the infinite by addition does not exceed in the greater

---

<sup>42</sup> *In Physic.* 3, l. 10, n. 9: “Sicut igitur servando eandem proportionem diminuitur quantitas, ita sumendo eandem quantitatem augetur proportio.”

<sup>43</sup> *In Physic.* 3, l. 10, n. 9 (cf. ARISTOTLE, *Physica* Γ.6, 206b9–11): “Si ergo aliquis sic subtrahendo ab aliqua magnitudine finita, semper augeat proportionem sumendo eandem quantitatem, transibit dividendo magnitudinem finitam.” Ibid.: “puta si a linea centum cubitorum semper subtrahat unum cubitum.” Ibid. (cf. ARISTOTLE, *Physica* Γ.6, 206b11–12): “Et hoc ideo est, quia omne finitum consumitur quocumque finito semper accepto.”

<sup>44</sup> *In Physic.* 1, l. 9, n. 12: “Non enim est inconveniens quod in aliquo finito sint infinita inaequalia, si attendatur ratio quantitatis: quia si dividatur continuum secundum eandem proportionem, erit procedere in infinitum, ut puta si accipiatur tertium totius et tertium tertii et sic deinceps; sed tamen partes acceptae non erunt aequales secundum quantitatem. Sed si fiat divisio per partes aequales, non erit procedere in infinitum, etiam si sola ratio quantitatis in corpore mathematico consideretur.”

<sup>45</sup> *In Physic.* 3, l. 10, n. 3 (cf. ARISTOTLE, *Physica* Γ.6, 206a16–18): “Ostensum est enim quod magnitudo non est actu infinita; et sic in magnitudinibus per appositionem infinitum non invenitur, sed per divisionem in eis invenitur infinitum. Non enim est difficile destruere opinionem ponentium indivisibiles esse lineas. Vel, secundum aliam litteram: non est difficile *partiri atomos lineas*, idest ostendere lineas, quas quidam ponunt indivisibiles, esse partibiles. Dicitur autem infinitum in appositione vel divisione, secundum quod potest apponi vel dividi. Relinquitur igitur quod infinitum sit tanquam in potentia ens.”

<sup>46</sup> *In Physic.* 3, l. 10, n. 10 (cf. ARISTOTLE, *Physica* Γ.6, 206b18–20): “ostendit [Philosophus] differentiam inter infinitum secundum appositionem et infinitum secundum divisionem. Et dicit quod infinitum per

every given finite magnitude (*non excedit in maius omnem magnitudinem finitam datam < οὐ ὑπερβαλεῖ παντὸς μεγέθους*), while the infinite according to division exceeds every determinate smallness in the lesser (*excedit omnem determinatam parvitatem in minus < ὑπερβάλλει παντὸς ὠρισμένου καὶ ἀεὶ ἔσται ἔλαττον*).

For example, let us take some determinate smallness—say, one inch.<sup>47</sup> If a line of 100 cubits should be divided infinitely, taking always a half, we would arrive at something less than one inch. But by adding infinitely, from the contrary of division, there will be some given finite quantity that will never be passed through. Thus, let two magnitudes be given, each of ten cubits, and a third one that is of 20. Now if that which is subtracted infinitely, taking always a half from one magnitude of ten cubits, were to be added to the other that is also of ten cubits, one would never arrive, by infinitely adding, at the measure of quantity that is twenty cubits; for however much there remains in the magnitude from which is being subtracted, that much would be lacking from the given measure in the quantity to which is being added.

#### **25.10. Infinite Division Transcends Infinite Addition in Magnitude**

As ARISTOTLE says, infinite addition does not bring about the transcendence of every determinate quantity.<sup>48</sup> Wherefrom, it is not possible—not even in potency—for every determinate quantity to be exceeded through addition.

If there existed in nature the potency towards an addition that transcends every quantity, it would follow that there would be an infinite in act, such that the infinite would be an accident of some nature.<sup>49</sup> Hence, if it is not possible for there to be a sensible body infinite in act, it follows that there is no potency in nature towards an addition that transcends every quantity, but only towards an infinite addition through the contrary of division.

---

appositionem non excedit in maius omnem magnitudinem finitam datam; sed infinitum secundum divisionem excedit omnem determinatam parvitatem in minus.” Cf. *In De caelo* 2, l. 9, n. 7.

<sup>47</sup> *In Physic.* 3, l. 10, n. 10: “Accipiamus enim aliquam determinatam parvitatem, puta unius digiti: si lineam centum cubitorum dividam in infinitum, accipiendo semper dimidium, venietur ad aliquid minus uno digito. Sed apponendo in infinitum, e contrario divisioni, erit dare aliquam quantitatem finitam quae nunquam pertransibitur. Dentur enim duae magnitudines, quarum utraque sit decem cubitorum, et tertia quae sit viginti. Si igitur id quod subtrahitur in infinitum, accipiendo semper dimidium ab una magnitudine decem cubitorum, addatur alteri quae etiam est decem cubitorum, nunquam pervenietur in infinitum apponendo ad mensuram quantitatis quae est viginti cubitorum: quia quantum remanebit in magnitudine cui subtrahitur, tantum deficiet a data mensura in quantitate cui addetur.”

<sup>48</sup> *In Physic.* 3, l. 10, n. 11 (cf. ARISTOTLE, *Physica* Γ.6, 206b20–22): “Dicit ergo [Philosophus] primo quod ex quo appositio in infinitum non facit transcendere omnem determinatam quantitatem, non est possibile esse, nec etiam in potentia, quod excellatur omnis determinata quantitas per appositionem.”

<sup>49</sup> *In Physic.* 3, l. 10, n. 11 (cf. ARISTOTLE, *Physica* Γ.6, 206b23–27): “Quia si esset in natura potentia ad appositionem transcendentem omnem quantitatem, sequeretur quod esset actu infinitum; sic quod infinitum esset accidens alicui naturae [...]. Si ergo non est possibile esse corpus sensibile actu infinitum [...], sequitur quod non sit potentia in natura ad appositionem transcendentem omnem magnitudinem; sed solum ad appositionem infinitam per contrarium divisioni.”

ARISTOTLE makes this manifest through the dictum of PLATO.<sup>50</sup> Since the infinite in the addition of magnitudes is through the opposite of division, PLATO posits two infinities:

1. *The great*, which pertains to addition.
2. *The small*, which pertains to division.

This is so because, to wit, the infinite seems to exceed both through addition into increase; and through division into decrease, or by *tending into nothing* (*tendendo in nihil*).<sup>51</sup>

However, even though PLATO posits two infinities, he does not use them.<sup>52</sup> Indeed, he posits number to be the substance of all things, and in numbers the infinite through division is not found, since in them there is a minimum unit. Nor (is the infinite found) by addition, also according to him, since he says that the species of numbers vary only up to ten, and after (ten) there is a return to the unit, reckoning *eleven*, *twelve*, etc. (i.e., 10 + 1, etc.).

### 25.11. Why Division Transcends Addition in Magnitude

As shown above, infinite addition (*appositio in infinitum*) is found in magnitudes in such a way that any determinate magnitude is not exceeded by this (addition).<sup>53</sup> On the other hand, infinite division (*divisio in infinitum*) is found in magnitudes such that, in dividing, any quantity whatever is traversable in the less (*transitur quaecumque quantitas in minus*).

ARISTOTLE says that this happens according to *ratio* (*secundum rationem* = κατὰ λόγον) because, since *infinite* has the *ratio* of *matter*, it is contained within as matter (*cum infinitum habeat rationem materiae, continetur intus sicut materia* < περιέχεται ἡ ὕλη ἐντὸς καὶ τὸ ἄπειρον); for that which contains is a species and a form (*quod continet, est species et forma* < περιέχει τὸ εἶδος); and it is manifest from what has been said (► 13.1; 13.11) that *whole* has the *ratio* of *form*, while *parts* (have) the *ratio* of *matter*.<sup>54</sup>

---

<sup>50</sup> *In Physic.* 3, l. 10, n. 12 (cf. ARISTOTLE, *Physica* Γ.6, 206b27–28): “manifestat [Philosophus...] quod dixerat per dictum Platonis. Et dicit quod quia infinitum in appositione magnitudinum est per oppositum divisioni, propter hoc Plato duo fecit infinita, scilicet magnum, quod pertinet ad additionem, et parvum quod pertinet ad divisionem.”

<sup>51</sup> *In Physic.* 3, l. 10, n. 12 (cf. ARISTOTLE, *Physica* Γ.6, 206b28–29): “quia scilicet infinitum videtur excellere et per additionem in augmentum, et per divisionem in decrementum, vel tendendo in nihil.”

<sup>52</sup> *In Physic.* 3, l. 10, n. 12 (cf. ARISTOTLE, *Physica* Γ.6, 206b30–33): “Sed cum ipse Plato faciat duo infinita, non tamen utitur eis: quia cum numerum poneret substantiam esse omnium rerum, in numeris non invenitur infinitum per divisionem, quia in eis est minimum unitas; neque etiam per additionem secundum ipsum, quia dicebat quod species numerorum non variantur nisi usque ad decem, et postea reditur ad unitatem, computando undecim et duodecim et cetera.”

<sup>53</sup> *In Physic.* 3, l. 12, n. 2 (cf. ARISTOTLE, *Physica* Γ.7, 207a33–35): “Dictum est autem supra quod appositio in infinitum sic invenitur in magnitudinibus, quod tamen non exceditur per hoc quaecumque determinata magnitudo. Sed divisio in infinitum sic invenitur in magnitudinibus, quod dividendo transitur quaecumque quantitas in minus, ut supra expositum est.”

<sup>54</sup> *In Physic.* 3, l. 12, n. 2 (cf. ARISTOTLE, *Physica* Γ.7, 207a33; 35–b1): “Hoc autem secundum rationem dicit [Philosophus] accidere: quia cum infinitum habeat rationem materiae, continetur intus sicut materia:

Therefore, since in magnitudes one goes from whole to parts by division, it is reasonable that no terminus should be found there that is not transcended by infinite division.<sup>55</sup> On the other hand, in addition one goes from parts to whole, which has the *ratio* of *containing* and *terminating form*. Whence, it is reasonable (εὐλόγως) that there should be some determinate quantity that infinite addition does not transcend.

### 25.12. Finite Division vs. Infinite Addition in Number

In (the genus of) number: (1) there is found some terminus in the lesser that cannot be transcended by division, but (2) some terminus is not found in the greater; for (given) any number, another greater can be found by addition; while (3) the opposite occurs in magnitudes, as has been said.<sup>56</sup> ARISTOTLE assigns the reason for this:

1. *Why in numbers there is found some terminus in the lesser that is not transcended by dividing.*<sup>57</sup> The reason for this is that every one as such (*omne unum, in quantum unum*), is indivisible, as an indivisible man is one man, and not many. And any number must be resolved into one, which is evident from the ratio itself of number; for number signifies this: that some [things] should be more than one (*plura uno* = ἕνα πλείω); for any multitudes that exceed—more or less—one, are determinate species of numbers. Whence, since one belongs to the ratio of number, and indivisibility belongs to the ratio of one, it follows that the division of number rests at an indivisible term.

ARISTOTLE manifests that it belongs to the *ratio* of *number* that it should be *more than one* by (its) species, since *two*, *three*, and whatever other number is denominated from *one*.<sup>58</sup> Whence, he says that the substance (i.e., essence) of *six* is in this: that it should be *one*

---

illud autem quod continet, est species et forma. Manifestum est autem ex iis quae dicta sunt in secundo, quod totum habet rationem formae, partes autem rationem materiae.”

<sup>55</sup> *In Physic.* 3, l. 12, n. 2: “Cum ergo in magnitudinibus a toto itur ad partes per divisionem, rationabile est quod ibi nullus terminus inveniatur, qui non transcendatur per infinitam divisionem. Sed in additione itur a partibus ad totum, quod habet rationem formae continentis et terminantis: unde rationabile est quod sit aliqua determinata quantitas, quam infinita appositio non transcendat.”

<sup>56</sup> *In Physic.* 3, l. 12, n. 3 (cf. ARISTOTLE, *Physica* Γ.7, 207b1–5): “in numero invenitur aliquis terminus in minus, quem non est dividendo transcendere: sed non invenitur aliquis terminus in plus; quia quolibet numero est invenire alium maiorem per additionem. In magnitudinibus autem est e converso, ut dictum est. Et huius rationem assignat [Philosophus]”

<sup>57</sup> *In Physic.* 3, l. 12, n. 3 (cf. ARISTOTLE, *Physica* Γ.7, 207b5–8): “et primo quidem quare in numeris aliquis terminus invenitur, qui in minus non transcenditur dividendo. Huius autem ratio est, quia omne unum, in quantum unum, est indivisibile, sicut homo indivisibilis est unus homo et non multi. Quemlibet autem numerum oportet resolvere in unum: quod patet ex ipsa ratione numeri. Numerus enim hoc significat, quod sint aliqua plura uno: quaelibet autem plura excedentia unum plus vel minus, sunt determinatae species numerorum. Unde cum unum sit de ratione numeri, et de ratione unius sit indivisibilitas, sequitur quod divisio numeri stet in termino indivisibili.”

<sup>58</sup> *In Physic.* 3, l. 12, n. 3 (cf. ARISTOTLE, *Physica* Γ.7, 207b8–10): “Quod autem dixerat, quod de ratione numeri sit quod sint plura uno, manifestat per species; quia duo et tria et quilibet alius numerus denominatur ab uno. Unde dicitur in V Metaphys. quod substantia senarii est in hoc quod sit sexies unum, non autem in hoc quod sit bis tria vel ter duo: quia sequeretur quod unius rei essent plures definitiones et plures substantiae; quia ex diversis partibus diversimode consurgit unus numerus.”

*six-times*; and not in this: that it should be *twice three* or *thrice two*; for it would then follow that there would be multiple definitions of one thing, and multiple substances (i.e., essences), since one number emerges diversely from diverse parts.

**2. Why addition in numbers exceeds every determinate multitude.**<sup>59</sup> As ARISTOTLE says, given any number, we can always understand another, greater (number) because magnitude is infinitely divisible; for it is manifest that division causes multitude. Whence, the more a magnitude is divided, the greater a multitude arises. Hence, the infinite addition of numbers follows upon the infinite division of magnitudes.

Thus, just as the infinite division of magnitude is not in act but in potency and exceeds every determinate (magnitude) in the lesser, as has been said, so the infinite addition of numbers is not in act but in potency and exceeds every determinate multitude.<sup>60</sup> However, this number that is thus infinitely multiplied is not a number separated from the diminishing of magnitude.

**3. Why the opposite occurs in magnitudes.** ARISTOTLE shows that in magnitudes (this occurs) contrarily because the continuum is infinitely divisible, as has been said.<sup>61</sup> But (this division) does not proceed infinitely into the greater, even according to potency, because the more some one thing is in potency, the more it can be in act.

Therefore, if there existed in the potency of nature that some magnitude would grow infinitely, it would follow that there would be some infinite sensible magnitude, which is false.<sup>62</sup> It remains, therefore, that there is no addition of magnitudes infinite in potency such that every determinate quantity would be exceeded; for it would follow that there would be a greater universe.

---

<sup>59</sup> *In Physic.* 3, l. 12, n. 4 (cf. ARISTOTLE, *Physica* Γ.7, 207b10–11): “assignat [Philosophus] causam quare in numeris additio excedit omnem determinatam multitudinem. Et dicit quod possumus semper intelligere quolibet numero dato alium maiorem, per hoc quod magnitudo dividitur in infinitum. Manifestum est enim quod divisio causat multitudinem: unde quanto plus dividitur magnitudo, tanto maior multitudo consurgit; et ideo ad infinitam divisionem magnitudinum sequitur infinita additio numerorum.”

<sup>60</sup> *In Physic.* 3, l. 12, n. 4 (cf. ARISTOTLE, *Physica* Γ.7, 207b11–14): “Et ideo sicut infinita divisio magnitudinis non est in actu sed in potentia, et excedit omne determinatum in minus, ut dictum est; ita additio numerorum infinita non est in actu sed in potentia, et excedit omnem determinatam multitudinem. Sed hic numerus, qui sic in infinitum multiplicatur, non est numerus *separatus a decisione* magnitudinum.”

<sup>61</sup> *In Physic.* 3, l. 12, n. 6 (cf. ARISTOTLE, *Physica* Γ.7, 207b15–18): “ostendit [Philosophus] quod e contrario est in magnitudinibus. Dividitur enim continuum in infinitum, ut dictum est. Sed in maius non procedit in infinitum etiam secundum potentiam, quia quantum unumquodque est in potentia, tantum potest esse in actu.”

<sup>62</sup> *In Physic.* 3, l. 12, n. 6 (cf. ARISTOTLE, *Physica* Γ.7, 207b19–21): “Si igitur esset in potentia naturae quod cresceret aliqua magnitudo in infinitum, sequeretur quod esset aliqua magnitudo sensibilis infinita; quod est falsum, ut supra dictum est. Relinquitur igitur quod non est in potentia additio magnitudinum in infinitum sic quod excedatur omnis determinata quantitas: quia sequeretur quod esset aliquid maius caelo.”

From this, it is evidently false what some say, that in first matter there is potency to all quantity; for in first matter there is potency only to a determinate quantity.<sup>63</sup>

Also, it is evident from the preceding reason why it is not necessary for a number to be in act as much as it is in potency, as here is said of magnitude, because the addition of a number follows upon the division of a continuum, whereby one goes from the whole to that which is in potency (in relation) to number.<sup>64</sup> Whence, it is not necessary to arrive at some act that ends the potency. On the other hand, the addition of magnitude leads into act, as has been said.

### 25.13. The Infinite in Mathematics

As ARISTOTLE shows, even if there is no infinite magnitude in act, this does not take away the consideration of mathematicians, who use the infinite: for example, when a geometrician says, “let there be such an infinite line.”<sup>65</sup>

Thus, (geometricians) do not need for their demonstration an infinite (line) in act, nor do they use it: rather, they only need for there to be some finite line, as much (i.e., as long) as they need it, such that they can subtract from it what they want. And for this it suffices that there be some greatest magnitude, since it befits (*competit*) some greatest magnitude to be divisible according to whatever proportion in respect of another given magnitude—and this line, they call *infinite*.<sup>66</sup>

---

<sup>63</sup> *In Physic.* 3, l. 12, n. 7: “Ex quo patet falsum esse, quod quidam dicunt, quod in materia prima est potentia ad omnem quantitatem: non enim est in materia prima potentia nisi ad determinatam quantitatem.”

<sup>64</sup> *In Physic.* 3, l. 12, n. 7: “Patet etiam ex praemissis ratio quare non oportet numerum tantum esse in actu, quantum est in potentia, sicuti hic dicitur de magnitudine: quia additio numeri sequitur divisionem continui, per quam a toto itur ad id quod est in potentia ad numerum. Unde non oportet devenire ad aliquem actum finientem potentiam. Sed additio magnitudinis ducit in actum, ut dictum est.” As St. Thomas explains, AVERROES, however, assigns another reason: because the potency to the addition of magnitude is one and the same in magnitude; but the potency to the addition of number is in diverse numbers, insofar as something can be added to any number. But this reason is not enough, because just as by addition there is another and another species of number, so (is there) another and another species of measure, insofar as two-cubits and three-cubits are said (to be) species of quantity. Moreover, whatever is added to a greater number can be added to a lower (number); and according to this, in one and the same number—namely, two or three—there is potency to infinite addition. *Ibid.*: “Commentator autem assignat aliam rationem: quia potentia ad additionem magnitudinis est in una et eadem magnitudine; sed potentia ad additionem numerorum est in diversis numeris, in quantum cuilibet numero potest aliquid addi. Sed haec ratio parum valet, quia sicut per additionem est alia et alia species numeri, ita alia et alia species mensurae, secundum quod bicubitum et tricubitum dicuntur species quantitatis. Et etiam quidquid additur superiori numero, additur inferiori; et secundum hoc in uno et eodem numero, scilicet binario vel ternario, est potentia ad infinitam additionem.”

<sup>65</sup> *In Physic.* 3, l. 12, n. 9 (cf. ARISTOTLE, *Physica* Γ.7, 207b27–28): “ostendit [Philosophus] quomodo mathematici utuntur infinito. Et dicit quod ratio praedicta, qua ponimus non esse magnitudinem infinitam in actu, non removet considerationem mathematicorum, qui utuntur infinito; puta cum geometra dicit, *sit talis linea infinita*.”

<sup>66</sup> *In Physic.* 3, l. 12, n. 9 (cf. ARISTOTLE, *Physica* Γ.7, 207b28–32): “Non enim indigent ad suam demonstrationem infinito in actu, neque eo utuntur: sed solum indigent quod sit aliqua linea finita tanta quanta est eis necessaria, ut ex ea possint subtrahere quod volunt. Et ad hoc sufficit quod aliqua maxima

Whence, in order to demonstrate, it makes no difference whether there is an infinite (quantity) or a greatest, finite quantity.<sup>67</sup> But it very much makes a difference in respect of the being of the thing (*quantum ad esse rei*) whether there is or there is not (an infinite).

#### 25.14. The *Ratio of Infinite* is in Things According to Prior and Posterior

ARISTOTLE shows in what mode the infinite in potency is found diversely in diverse (things).<sup>68</sup> He says that the infinite is not in motion, in magnitude, and in time, according to the same *ratio*, as though it were one nature univocally predicated of them, but according to prior and posterior (*per prius et posterius*). And always that which is in them posterior is said (to be) *infinite* insofar as that which is prior is infinite (< τὸ ὕστερον λέγεται κατὰ τὸ πρότερον). Thus, it is said of the posterior of them according to the prior, as of motion (2nd) on account of the magnitude (1st) in which (there) is motion, whether local, increase, or alteration; and of time (3rd), (*infinite* is said) on account of motion (2nd).

This is (so) because the infinite pertains to (*competit*) quantity (1st), while motion (2nd) is a quantum according to magnitude (1st); and time (3rd), on account of motion (2nd).<sup>69</sup>

Thus, motion (is said to be infinite) according to the magnitude in which something (a) is moved locally; (b) is altered; or (c) is increased.<sup>70</sup> For *infinite* is attributed by division to the continuum, which (i.e., *continuum*) is first attributed to magnitude (1st), from which motion (2nd) has continuity.<sup>71</sup> This is evident in local motion (a), since the parts in local motion are taken according to the parts of a magnitude.<sup>72</sup>

---

magnitudo sit; quia alicui maximae magnitudini competit, quod possit dividi secundum quantamcumque proportionem respectu alterius magnitudinis datae.” *STh* I, q. 7 a. 3 ad 1: “geometer non indiget sumere aliquam lineam esse infinitam actu, sed indiget accipere aliquam lineam finitam actu, a qua possit subtrahi quantum necesse est, et hanc nominat lineam infinitam.”

<sup>67</sup> *In Physic.* 3, l. 12, n. 9 (cf. ARISTOTLE, *Physica* Γ.7, 207b33–34): “Unde ad demonstrandum non differt utrum sit hoc modo vel illo, scilicet vel infinita vel finita maxima quantitas. Sed quantum ad esse rei multum differt, utrum sit vel non sit.”

<sup>68</sup> *In Physic.* 3, l. 12, n. 8 (cf. ARISTOTLE, *Physica* Γ.7, 207b21–25): “ostendit [Philosophus] quomodo infinitum inveniatur diversimode in diversis. Et dicit quod infinitum non est secundum eandem rationem in motu et in magnitudine et tempore, ac si esset una natura univoce praedicata de eis: sed dicitur de posteriori eorum secundum prius, sicut de motu propter magnitudinem, in qua est motus, vel localis vel alterationis vel augmenti; de tempore autem propter motum.” *In Metaph.* 11, l. 10, §2354 (cf. ARISTOTLE, *Metaphysica* K.10, 1067a33–35): “Ostendit [Philosophus] quomodo infinitum in potentia in diversis inveniatur; et dicit quod invenitur in magnitudine et motu et tempore; et non univoce praedicatur de eis, sed per prius et posterius. Et semper quod est in eis posterius, dicitur infinitum, secundum quod id quod est prius est infinitum.”

<sup>69</sup> *In Physic.* 3, l. 12, n. 8: “Et hoc ideo quia infinitum competit quantitati, motus autem est quantus secundum magnitudinem, et tempus propter motum.”

<sup>70</sup> *In Metaph.* 11, l. 10, §2354 (cf. ARISTOTLE, *Metaphysica* K.10, 1067a35–36): “motus [dicitur infinitum] secundum magnitudinem, in quam aliquid movetur localiter, aut augetur, aut alteratur.”

<sup>71</sup> *In Metaph.* 11, l. 10, §2354: “quod sic intelligendum est. Infinitum enim divisione, attribuitur continuo, quod primo attribuitur magnitudini, ex qua motus habet continuitatem.”

<sup>72</sup> *In Metaph.* 11, l. 10, §2354: “Quod manifestum est in motu locali; quia partes in motu locali accipiuntur secundum partes magnitudinis.”

Likewise, this is evident in the motion of increase (c), since increase is considered (attenditur) according to the addition of magnitude.<sup>73</sup>

In alteration (b), on the other hand, it is not so manifest.<sup>74</sup> However, also there it is somehow true, since the quality whereby alteration comes to be is divisible by accident (following) upon the division of magnitude. Moreover, the intension and remission of quality is considered insofar as the subject that exists in a magnitude participates (in) the quality in some—either more (perfect) or less perfect—mode.

Likewise, time (3rd) is said to be infinite according to motion (2nd).<sup>75</sup>

Time is continuous (following) upon the continuity of motion; for time, according to itself, since it is a number, does not have continuity: rather, (it has continuity) in the subject, just as ten measures of cloth are continuous because the cloth is some continuum.<sup>76</sup>

Therefore, *infinite* must be said of these three in the same order as *continuous* (is said of them: i.e., 1st of magnitude; 2nd of motion; and 3rd of time).<sup>77</sup>

### 25.15. The First Subject by Itself of the Infinite

Lest someone should understand that the infinite is matter as first matter, ARISTOTLE adds that the subject by itself (< τὸ καθ' αὐτὸ ὑποκείμενον) of the privation in which the *ratio* of *infinite* consists is the sensible continuum (< τὸ συνεχὲς καὶ αἰσθητόν).<sup>78</sup>

This is apparent because the infinite that is in numbers is caused from an infinite division of magnitude.<sup>79</sup> Likewise, the infinite in time and motion is caused from magnitude (i.e., motion follows upon magnitude, and time follows upon motion). And what is first in any

---

<sup>73</sup> *In Metaph.* 11, l. 10, §2354: “Et similiter manifestum est in motu augmenti; quia secundum additionem magnitudinis, augmentum attenditur.”

<sup>74</sup> *In Metaph.* 11, l. 10, §2354: “Sed in alteratione non est ita manifestum. Sed tamen etiam ibi aliquantulum verum est; quia qualitas secundum quam fit alteratio, per accidens dividitur ad divisionem magnitudinis. Et iterum intensio et remissio qualitatis attenditur secundum quod subiectum in magnitudine existens, aliquo modo vel perfectiori vel minus perfecto participat qualitatem.”

<sup>75</sup> *In Metaph.* 11, l. 10, §2354 (cf. ARISTOTLE, *Metaphysica* K.10, 1067a36–37): “Et tempus dicitur infinitum secundum motum.”

<sup>76</sup> *In Metaph.* 11, l. 10, §2354: “Ad continuitatem autem motus, est et tempus continuum. Nam tempus secundum se, cum sit numerus, non habet continuitatem, sed solum in subiecto. Sicut decem mensurae panni continuae sunt, eo quod pannus quoddam continuum est.”

<sup>77</sup> *In Metaph.* 11, l. 10, §2354: “Eodem igitur ordine oportet quod infinitum de istis tribus dicatur sicut et continuum.”

<sup>78</sup> *In Physic.* 3, l. 12, n. 10 (cf. ARISTOTLE, *Physica* Γ.7, 208a1–2): “Et ne aliquis intelligat quod infinitum est materia sicut materia prima, subiungit [Philosophus] quod per se subiectum privationis, quae constituit rationem infiniti, est continuum sensibile”

<sup>79</sup> *In Physic.* 3, l. 12, n. 10: “Et hoc apparet, quia infinitum quod est in numeris causatur ex infinita divisione magnitudinis; et similiter infinitum in tempore et motu causatur ex magnitudine: unde relinquatur quod primum subiectum infiniti sit continuum.”

genus is the cause of all others in the same genus (►27); therefore, every infinite follows upon magnitude). Whence, it remains that the first subject of the infinite is the continuum.

And since magnitude, according to being (*secundum esse*, i.e., as opposed to *secundum rationem*), is not separated from sensible (things), it follows that the (first) subject of the infinite is sensible.<sup>80</sup>

All the ancients that use the infinite as a material principle agree in this.<sup>81</sup> Whence, it was unfitting that they should attribute to the infinite (the property of) containing, since it does not belong to matter to contain (*continere* < περιέχον) but to be contained (*contineri* < περιεχόμενον).

### 25.16. Infinite: Unknown and Part

Because the infinite is as a being in potency, it follows not only that it is contained and that it does not contain, but also two other conclusions.<sup>82</sup>

1. The infinite as such is unknown (*ignotum* = ἄγνωστον) because it is as matter not having a form (<est sicut> *materia non habens speciem* < εἶδος οὐκ ἔχει ἢ ὕλη, *idest formam*), and matter is known only through form.<sup>83</sup>

2. The infinite has the *ratio* of *part* rather than (the *ratio*) of *whole* (*magis habet rationem partis quam totius* = μᾶλλον ἐν μορίου λόγῳ τὸ ἄπειρον ἢ ἐν ὅλου), because matter is compared to the whole as a part.<sup>84</sup> And the infinite is rightly related as a part insofar as it belongs to it to take only some part in act.

---

<sup>80</sup> *In Physic.* 3, l. 12, n. 10: “Et quia magnitudo secundum esse non est separata a sensibilibus, sequitur quod subiectum infiniti sit sensibile.”

<sup>81</sup> *In Physic.* 3, l. 12, n. 10 (cf. ARISTOTLE, *Physica* Γ.7, 208a2–4): “Et in hoc etiam concordant omnes antiqui, qui utuntur infinito sicut principio materiali. Unde inconueniens fuit quod attribuerunt infinito continere, cum materiae non sit continere, sed magis contineri.”

<sup>82</sup> *In Physic.* 3, l. 11, n. 7 (cf. ARISTOTLE, *Physica* Γ.6, 207a25–28): “Ex hoc autem quod est sicut ens in potentia, non solum hoc sequitur, quod infinitum contineatur et non contineat: sed etiam sequuntur duae aliae conclusiones.”

<sup>83</sup> *In Physic.* 3, l. 11, n. 7 (cf. ARISTOTLE, *Physica* Γ.6, 207a25–26): “Quarum una est, quod infinitum in quantum huiusmodi est ignotum, quia est sicut materia non habens speciem, idest formam, ut dictum est; materia autem non cognoscitur nisi per formam.”

<sup>84</sup> *In Physic.* 3, l. 11, n. 7 (cf. ARISTOTLE, *Physica* Γ.6, 207a26–28): “Alia conclusio est, quae ex eodem sequitur, quod infinitum magis habet rationem partis quam totius, quia materia comparatur ad totum ut pars. Et recte infinitum se habet ut pars, in quantum non est de ipso accipere nisi aliquam partem in actu.”

## 26. Participation

We have determined that infinite has the ratio of perfect only insofar as it is had from the part of a form that is not determined by matter (► 24.8); and the reason for this is that form is not perfected by matter: rather, the amplitude of the perfection of a form is contracted by the matter in which it is received. In this chapter we seek to clarify the way in which any received perfection is contracted by that in which it is received.

### 26.1. Participation

**To participate** (*participare*) is—as it were—to receive (lit., *to take, to acquire*) a part (*quasi partem capere*).<sup>1</sup> Therefrom, when something receives particularly (*particulariter recipit*) that which universally pertains to another, it is said *to participate (in) it*.

### 26.2. Modes of Participation

#### 1. **Species** participate (in a) **genus**.<sup>2</sup>

For example, (the species) *man* is said to participate (in the genus) *animal* because (*man*) does not have the *ratio* of *animal* according to its whole community.<sup>3</sup>

#### 2. **Individuals** participate (in a) **species**.<sup>4</sup>

Sortes (i.e., some individual man) participates (in the species of) *man* for the same reason (i.e., because he does not have the *ratio* of *man* according to its whole community).<sup>5</sup>

#### 3. **Matter** participates (in a) **form**.

A subject participates (in) an accident, and matter (participates in) a form; for a substantial or accidental form, which is common in its *ratio*, is determined to *this* or *that* subject.<sup>6</sup>

Thus, it is evident that if something hot does not have the whole perfection of the hot, this is because heat is not participated according to (its) perfect *ratio*.<sup>7</sup> On the other hand, if heat should be subsistent by itself, it could not lack something of the virtue of heat.

---

<sup>1</sup> *In De ebdo.*, l. 2, 70–73: “Est autem participare quasi partem capere. Et ideo quando aliquid particulariter recipit id quod ad alterum pertinet uniuersaliter, dicitur participare illud.”

<sup>2</sup> *ScG* 1, 32 n. 6: “species participare dicitur genus.”

<sup>3</sup> *In De ebdo.*, l. 2, 71–76: “homo dicitur participare animal quia non habet rationem animalis secundum totam communitatem.”

<sup>4</sup> *ScG* 1, 32 n. 6: “participare dicitur [...] individuum speciem.”

<sup>5</sup> *In De ebdo.*, l. 2, 76–77: “et eadem ratione Sortes participat hominem.”

<sup>6</sup> *In De ebdo.*, l. 2, 77–80: “Similiter etiam subiectum participat accidens et materia formam, quia forma substantialis uel accidentalis, que de sui ratione communis est, determinatur ad hoc uel illud subiectum.”

<sup>7</sup> *STh* I, q. 4 a. 2 co.: “Manifestum est enim quod, si aliquod calidum non habeat totam perfectionem calidi, hoc ideo est, quia calor non participatur secundum perfectam rationem, sed si calor esset per se subsistens, non posset ei aliquid deesse de virtute caloris.”

#### 4. Effects participate (in their) cause.

An effect is said to participate (in) its cause (► 11.3; 11.5), above all, when it does not attain the virtue of its cause by equaling it (*non adequat*).<sup>8</sup> For example, when we say that air participates (in) the light of the sun because it does not receive it in the (whole) brightness that (light) is in the sun.

#### 26.3. Reception is According to the Mode of the Receiver

Every recipient receives something according to its own mode.<sup>9</sup> Hence, each (perfection) is received in something according to the mode of the recipient, such that what is received is limited according to the receiver. And everything that is in potency to something, and apt to receive it, is devoid of that to which it is in potency and of which it is receptive.

Every form (that is) received in something is limited and is terminated, ended according to the mode and capacity of the recipient.<sup>10</sup> Whence, it does not have infinite intension. For example, *this white body* does not have *the whole whiteness* according to *the whole possible whiteness*. On the other hand, if whiteness should be separate, it would lack nothing of that which pertains to the virtue of whiteness.

Everything that is imperfect is derived from something perfect; for perfect (things) are naturally prior to the imperfect, as act (is prior) to potency.<sup>11</sup> Forms existing in particular things are imperfect, since (they are derived) partially and not according to the community of their *ratio*. Hence, they must be derived from some perfect—and not particular—forms.

---

<sup>8</sup> *In De ebdo.*, l. 2, 80–85: “Et similiter etiam effectus dicitur participare suam causam, et precipue quando non adequat uirtutem sue cause, puta si dicamus quod aer participat lucem solis quia non recipit eam in claritate qua est in sole.”

<sup>9</sup> *In De anima* 2, c. 27, 218–219: “omne enim recipiens recipit aliquid secundum modum suum.” *De veritate*, q. 21 a. 6 ad 5: “ubicumque est aliquid receptum, oportet ibi esse modum, cum receptum limitetur secundum recipiens.” *In Sent.* 2, d. 3 q. 3 a. 1 co.: “unumquodque recipitur in aliquo per modum recipientis.” Cf. 1, d. 22 q. 1 a. 2 co.; 2, d. 15 q. 1 a. 2 ad 3; d. 19 q. 1 a. 3 ad 1; d. 30 q. 1 a. 2 ad 5; d. 32 q. 2 a. 3 co.; 3, d. 14 q. 1 a. 1 qc. 3 co.; 4, d. 36 q. 1 a. 4 co.; d. 44 q. 2 a. 1 qc. 3 ad 2; a. 4 qc. 1 co.; d. 49 q. 2 a. 1 co.; a. 2 co.; *ScG* 1, 43 n. 5; 2, 50 n. 6; 55 n. 9; 73 n. 31; 74 n. 8; 79 n. 7; 3, 79 n. 4; 85 n. 14; 86 n. 1; *STh* I, q. 79 a. 6 co.; q. 84 a. 1 co.; q. 85 a. 5 ad 3.; q. 89 a. 4 co.; I-II, q. 67 a. 2 co.; III, q. 54 a. 2 ad 1; q. 79 a. 6 ad 1. *In De anima* 3, c. 1, 131–150: “omne enim quod est in potencia ad aliquid et receptium eius caret eo ad quod est in potencia et cuius est receptiuus.”

<sup>10</sup> *In De div. nom.*, c. 5, l. 1: “omnis forma, recepta in aliquo, limitatur et finitur secundum capacitatem recipientis; unde, hoc corpus album non habet totam albedinem secundum totum posse albedinis. Sed si esset albedo separata, nihil deesset ei quod ad virtutem albedinis pertineret.” *De veritate*, q. 2 a. 2 ad 5: “omnis forma in aliquo recepta terminatur secundum modum recipientis”; q. 2 a. 3 co.; q. 2 a. 9 co.: “omnis forma recepta in aliqua materia finitur ad modum recipientis, et ita non habet intensionem infinitam”; q. 19 a. 1 co.; q. 20 a. 4 ad 1; q. 21 a. 6 co.; q. 22 a. 11 co.; q. 28 a. 3 ad 5; *De potentia*, q. 7 a. 10 ad 10; *Q. d. de anima*, a. 19 ad 10; a. 20 co.; *De malo*, q. 3 a. 13 ad 6; *De virtutibus*, q. 1 a. 1 ad 12; *Quodlibet* 7, q. 1 a. 1 co.; 9, q. 4 a. 1 co.; 3, q. 9 a. 1 co.; 12, q. 9 a. 1 co.; *In De causis*, l. 10; l. 24.

<sup>11</sup> *ScG* 1, 44 n. 8: “Omne quod est imperfectum, derivatur ab aliquo perfecto: nam perfecta naturaliter sunt priora imperfectis, sicut actus potentia. Sed formae in rebus particularibus existentes sunt imperfectae: quia partialiter, et non secundum communitatem suae rationis. Oportet igitur quod deriventur ab aliquibus formis perfectis et non particulatis.”

## 26.4. Consideration of That Which is Received

Of that which is received in something, we can consider both the (act of) *being* (*esse*) and the *ratio*.<sup>12</sup>

**1. According to its (act of) being,** (that which is received) is in that in which it is received by the mode of the recipient.<sup>13</sup>

The received form follows upon the mode of the recipient insofar as it has (its act of) being (*esse*) in the subject, for it is received in it materially or immaterially, uniformly or in multiple modes (i.e., depending on whether the subject is material or immaterial, etc.).<sup>14</sup>

For example, heat received in water has (its act of) being in water according to the mode of water: namely, insofar as it is in water as an accident (is) in a subject.<sup>15</sup>

**2. (According to its *ratio*,** that which is received) *draws* (*trahit*) the recipient itself to its *ratio*.<sup>16</sup>

Insofar as the nobilities that belong to the *ratio of form* are communicated to the receiving subject, the received form draws (*trahit*) the receiving subject to its mode.<sup>17</sup> And in this way, the subject is perfected and made nobler by the form.

For example, heat draws water from its natural disposition to this: that it should come to be hot (*quod fiat calida*), and that it should produce the act of heat (*faciat actum caloris*).<sup>18</sup> Likewise, light (draws) air (from its natural disposition, causing it to be lit, and causing it to produce the act of light), although not against the nature of air (► 15.24).

## 26.5. Community of Analogy and Participation

A community of analogy can be of two modes, either.<sup>19</sup>

---

<sup>12</sup> *De veritate*, q. 24 a. 8 ad 6, 171–173: “eius quod recipitur in aliquo, potest considerari et esse et ratio.”

<sup>13</sup> *De veritate*, q. 24 a. 8 ad 6, 173–174: “Secundum quidem esse suum est in eo in quo recipitur, per modum recipientis.”

<sup>14</sup> *De veritate*, q. 12 a. 6 ad 4, 289–294: “forma recepta sequitur modum recipientis quantum ad aliquid, prout habet esse in subiecto: est enim in eo materialiter vel immaterialiter, uniformiter vel multipliciter, secundum exigentiam subiecti recipientis.”;

<sup>15</sup> *De veritate*, q. 24 a. 8 ad 6, 175–178: “sicut calor receptus in aqua habet esse in aqua per modum aquae, in quantum scilicet inest aquae ut accidens subiecto.”

<sup>16</sup> *De veritate*, q. 24 a. 8 ad 6, 175: “[quod recipitur] ipsum recipiens trahit ad suam rationem.”

<sup>17</sup> *De veritate*, q. 12 a. 6 ad 4, 294–299: “quantum ad aliquid forma recepta trahit subiectum recipiens ad modum suum, prout scilicet nobilitates quae sunt de ratione formae communicantur subiecto recipienti: sic enim subiectum per formam perficitur et nobilitatur.”;

<sup>18</sup> *De veritate*, q. 24 a. 8 ad 6, q. 24 a. 8 ad 6, 178–181: “[calor receptus in aqua] aquam trahit a naturali sua dispositione ad hoc quod fiat calida, et faciat actum caloris; et similiter lux aerem, licet non contra naturam aeris.”

<sup>19</sup> *In Sent.* 1, q. 1 a. 2 ad 2: “analogiae [...] communitas potest esse dupliciter.”

1. Because some (i.e., multiple things) participate (in) something one according to prior and posterior.<sup>20</sup>

For example, *potency* and *act* (participate in) the *ratio of being (ens)*; and likewise, *substance* and *accident*.<sup>21</sup>

2. Because one receives its (act of) being (*esse*) and (its) *ratio* from another.<sup>22</sup>

An un-participated principle is a cause of both the participations and the participants.<sup>23</sup>

## 26.6. Naming of a Participated Perfection

A twofold name is imposed on a participated perfection, either:<sup>24</sup>

1. According to the **common *ratio*** of *perfection*.<sup>25</sup>

(In this mode), the name is common by analogy to both the communicating principle itself and to all participants. For example, *goodness*, *beingness*, and such.<sup>26</sup>

2. According to the **proper mode** in which it is received.<sup>27</sup>

For example, the name *sense* is imposed to signify *cognition* according to some determinate mode in that which has it. Whence, the name (*sense*) is not common to all (modes of cognition).<sup>28</sup> And because of this, it is not a common name.

## 26.7. Predication by Essence and Predication by Participation

Something is said of something in two modes:<sup>29</sup> (1) **substantially** (*substantialiter*), i.e., **by essence** (*per essentiam*); (2) **by participation** (*per participationem*).

According to the modes in which *a subject is said to participate (in) an accident*, and *matter is said to participate (in) a form* (► 26.2, ¶3), it is true that *to be by essence (esse per*

---

<sup>20</sup> *In Sent.* 1, q. 1 a. 2 ad 2: "Aut ex eo quod aliqua participant aliquid unum secundum prius et posterius."

<sup>21</sup> *In Sent.* 1, q. 1 a. 2 ad 2: "sicut potentia et actus [participant] rationem entis, et similiter substantia et accidens."

<sup>22</sup> *In Sent.* 1, q. 1 a. 2 ad 2: "aut ex eo quod unum esse et rationem ab altero recipit."

<sup>23</sup> *In De div. nom.*, c. 11, l. 4: "principium imparticipatum, causa est et participationum et participantium."

<sup>24</sup> *In Sent.* 1, d. 19 q. 2 a. 1 ad 3: "Perfectioni autem participatae duplex nomen imponitur."

<sup>25</sup> *In Sent.* 1, d. 19 q. 2 a. 1 ad 3: "Vel secundum rationem communem perfectionis illius."

<sup>26</sup> *In Sent.* 1, d. 19 q. 2 a. 1 ad 3: "et tunc nomen est commune et ipsi principio communicanti et omnibus participantibus, secundum analogiam, sicut bonitas, entitas et hujusmodi."

<sup>27</sup> *In Sent.* 1, d. 19 q. 2 a. 1 ad 3: "Vel secundum proprium modum quo recipitur vel est in aliqua creatura."

<sup>28</sup> *In Sent.* 1, d. 19 q. 2 a. 1 ad 3: "ut patet quod [...] hoc nomen sensus imponitur ad significandum cognitionem secundum aliquem modum determinatum habendi ipsam, et propter hoc non est commune omnibus."

<sup>29</sup> *In De ebd.*, l. 3, 42–44: "Dupliciter autem aliquid de aliquo dicitur, uno modo substantialiter, alio modo per participationem."

*essentiam*) and *to be by participation* (*esse per participationem*) are opposites, for an accident is other than (*praeter*) the nature of the subject, and form (is) other than (*praeter*) the substance itself (i.e., the essence itself) of matter.<sup>30</sup>

In the mode of participation whereby *a species participates (in) a genus* (► 26.2, mode 1), according to the opinion of PLATO, who posited that the Idea of *biped* and *animal* is other than (the Idea) of *man*, it is true that *to be by essence* (*esse per essentiam*) and *to be by participation* (*esse per participationem*) are opposites.<sup>31</sup>

On the other hand, according to the determination of ARISTOTLE, who posited that *man* truly is that which *animal* is, such that (*quasi*) the essence of *animal* does not exist without (*praeter*) the difference of *man* (► 14.14) **nothing prevents that which is said by participation from being said substantially** (true also of individuals; ► 26.2, ¶2).<sup>32</sup>

Indeed, whenever something is predicated of another by participation, there must be something other than (*praeter*) that which is participated (namely, the participant, which cannot be the same according to the same, since nothing participates in itself).<sup>33</sup>

However, something is participated in two modes:<sup>34</sup>

1. As that which exists pertaining to the essence of the participant (*quasi existens de substantia participantis*).<sup>35</sup>

For example, a genus is participated by a species (as that which pertains to its essence), for that belongs to the substance of the thing which falls in its definition (► 13.16).<sup>36</sup>

Therefore, whatever is predicated univocally of many (i.e., according to the same *ratio* or definition; ► 20.1) befits (*convenit*) any of those of which it is predicated by participation

---

<sup>30</sup> *In De ebdo.*, l. 3, 47–55: “considerandum est, quod in ista questione presupponitur quod aliquid esse per essentiam et per participationem sint opposita. Et in uno quidem supradictorum participationis modorum manifeste hoc uerum est, scilicet secundum illum modum quo subiectum dicitur participare accidens uel materia formam. Est enim accidens praeter substantiam subiecti et forma praeter ipsam substantiam materie.”

<sup>31</sup> *In De ebdo.*, l. 3, 55–63: “Set in alio participationis modo, quo scilicet species participat genus, hoc etiam uerum est secundum sententiam Platonis qui posuit aliam esse ydeam animalis et bipedis et hominis.”

<sup>32</sup> *In De ebdo.*, l. 3, 55–63: “set secundum sententiam Aristotilis sententiam qui posuit quod homo uere est id quod est animal, quasi essentia animalis non existente praeter differentiam hominis, nihil prohibet id quod per participationem dicitur etiam substantialiter predicari.”

<sup>33</sup> *Quodlibet 2*, q. 2 a. 1 co.: “Quandocumque autem aliquid praedicatur de altero per participationem, oportet ibi aliquid esse praeter id quod participatur.”

<sup>34</sup> *Quodlibet 2*, q. 2 a. 1 co.: “Sed sciendum est, quod aliquid participatur dupliciter.”

<sup>35</sup> *Quodlibet 2*, q. 2 a. 1 co.: “Uno modo quasi existens de substantia participantis.”

<sup>36</sup> *Quodlibet 2*, q. 2 a. 1 co.: “sicut genus participatur a specie. [...] Id enim est de substantia rei quod cadit in eius definitione.”

(*secundum participationem*), as a species is said to participate in a genus, and an individual (is said to participate) in a species.<sup>37</sup>

Nonetheless, a name that is predicated by participation is said in respect to that which is predicated by itself (► 17); which (predication) is not pure equivocation, but a multiplicity of analogy (i.e., according to prior and posterior; ► 20).<sup>38</sup>

2. As that which exists not pertaining to the essence of the thing (*sicut aliquid non existens de essentia rei*).<sup>39</sup>

Everything that is other than the essence of the thing is said (to be an) *accident*.<sup>40</sup>

### 26.8. Accidental Participation of Differences in a Genus

No difference participates (in) a genus in such a way that (the) *genus* would be in the *ratio* of (the) *difference*, for then (the) *genus* would be posited twice in the definition of (the) *species* (e.g., *man* is a *rational-animal animal* if *rational*, too, is an *animal*).<sup>41</sup> Rather, (the) *difference* must be other than (*praeter*) that which is understood in the *ratio* of (a) *genus*.

Indeed, every genus is divided by some differences.<sup>42</sup> And differences participate (in) a genus only by accident insofar as the species (that are) constituted by the differences participate (essentially) in the genus.

### 26.9. Participation of the Mean in the Extremes

The mean participates in some mode (in) either extreme.<sup>43</sup> And insofar as it participates (in) one of them it is contrary (*contrariatur*) to the other.

For example, the equal, which is a mean between the greater and the less, is less in comparison to the greater, and greater in comparison to the less.<sup>44</sup> Whence, *equal* is

---

<sup>37</sup> ScG 1, 32 n. 6: “Omne quod de pluribus praedicatur univoce, secundum participationem cuilibet eorum convenit de quo praedicatur: nam species participare dicitur genus, et individuum speciem.”

<sup>38</sup> *In Metaph.* 1, l. 14, §224: “nomen quod per participationem praedicatur, dicitur per respectum ad illud quod praedicatur per se, quod non est pura aequivocatio, sed multiplicitas analogiae.”

<sup>39</sup> *Quodlibet* 2, q. 2 a. 1 co.: “[Alio modo] participatur sicut aliquid non existens de essentia rei.”

<sup>40</sup> *Quodlibet* 2, q. 2 a. 1 co.: “cum omne quod est praeter essentiam rei, dicatur accidens [...]”

<sup>41</sup> ScG 1, 25 n. 6: “Nulla autem differentia participat genus, ita scilicet quod genus sit in ratione differentiae, quia sic genus poneretur bis in definitione speciei: sed oportet differentiam esse praeter id quod intelligitur in ratione generis.”

<sup>42</sup> *Comp. th.* 1, c. 13, 7–11: “omne genus differentiis aliquibus diuiditur; [...] differentie enim non participant genus nisi per accidens, in quantum species constitute per differentias genus participant.”

<sup>43</sup> *In Ethic.* 2, l. 10, 36–38 (cf. ARISTOTLE, *Ethica Nicomachea* B.8, 1108b15–19): “cum medium participet aequaliter utrumque extremum, in quantum participat unum eorum contrariatur alteri.”

<sup>44</sup> *In Ethic.* 2, l. 10, 38–43: “sicut aequale, quod est medium inter magnum et parvum, est quidem in comparatione ad magnum parvum et in comparatione ad parvum est magnum, et ideo aequale et magno opponitur secundum rationem parvi et parvo secundum rationem magni.”

opposed both to *great* according to the *ratio* of *less*, and to *less* according to the *ratio* of *great*.

This is why there is motion (not only) from a contrary into a mean, but also (from a mean) into a contrary.<sup>45</sup>

### 26.10. Equal vs. Unequal Participation

In those (things) that **differ materially**, nothing prevents many (things) from being found (to be) related *equally* (*ex aequo se habere*; cf. EUCLID's ratio *ex aequo* = δι' ἴσου λόγος; ► 6.11),<sup>46</sup> for in substances, the individuals of one species equally (*aequaliter*) participate (in) the *ratio* of (the) *species*; and in accidents, too, it is possible for diverse subjects to equally (*aequaliter*) participate (e.g., in the *ratio* of) *whiteness*.<sup>47</sup>

However, in those things that **differ formally**, *some order is always found*.<sup>48</sup> If one should consider it diligently, in every species of one genus he would always find one thing that is

---

<sup>45</sup> *In Ethic.* 2, l. 10, 43–45: “et propter hoc est motus a contrario in medium sicut et in contrarium, ut dicitur in V Physicorum.” Cf. *In Physic.* 5, l. 1, n. 10 (cf. ARISTOTLE, *Physica* E.1, 224b28–30): “mutatio quae non est secundum accidens, non est in omnibus; sed est tantum *in contrariis et mediis*, quantum ad motum qui est in quantitate, qualitate et ubi; *et in contradictione*, quantum ad generationem et corruptionem, quorum termini sunt esse et non esse: et hoc patet per inductionem. Sub arte autem non cadunt nisi ea quae sunt determinata; nam infinitorum non est ars.” Ibid., n. 11 (cf. ARISTOTLE, *Physica* E.1, 224b30–35): “manifestat [Philosophus] quoddam quod dixerat, scilicet quod motus sit in mediis. Et dicit quod contingit mutari ex medio ad utrumque extremorum et e converso, in quantum scilicet possumus uti medio ut contrario respectu utriusque extremi. Medium enim in quantum habet convenientiam cum utroque extremorum, est quodammodo utrumque eorum; et ideo potest dici hoc ad illud, et illud ad hoc: sicut si dicam quod media vox inter gravem et acutam *est gravis ad ultimam*, idest per comparisonem ad acutam, et *subtilis*, idest acuta, per comparisonem *ad extremam*, idest ad gravem; et fuscum est album per comparisonem ad nigrum, et e converso.” Ibid., l. 8, n. 12 (cf. ARISTOTLE, *Physica* E.5, 229b14–22): “determinat [Philosophus] de contrarietate motus ex parte medii. Et dicit quod in quibuscumque contrariis invenitur medium, motus qui terminantur ad medium, hoc modo ponendi sunt esse contrarii, sicut illi qui terminantur ad contraria: quia motus utitur medio sicut contrario, ita quod ex medio contingit mutari in utrumque contrariorum. Sicut ex fusco, quod est medium inter album et nigrum, hoc modo mutatur in album, ac si mutaretur ex nigro in album; et e converso ex albo sic mutatur aliquid in fuscum, ac si mutaretur in nigrum; et ex nigro sic mutatur in fuscum, ac si mutaretur in album: quia fuscum, cum sit medium ad utrumque extremorum, dicitur utrumque; quia in comparatione albi est nigrum, et in comparatione nigri est album, ut supra dictum est. Ultimo autem concludit quod principaliter intendit, scilicet quod motus sit contrarius motui secundum contrarietatem utrorumque extremorum.”

<sup>46</sup> See EUCLID, *Opera Omnia*, vol. 2, 6.7–13: “Δι' ἴσου λόγος ἐστὶ πλειόνων ὄντων μεγεθῶν καὶ ἄλλων αὐτοῖς ἴσων τὸ πλῆθος σύνδυο λαμβανομένων καὶ ἐν τῷ αὐτῷ λόγῳ, ὅταν ἦ ὡς ἐν τοῖς πρώτοις μεγέθεσι τὸ πρῶτον πρὸς τὸ ἔσχατον, οὕτως ἐν τοῖς δευτέροις μεγέθεσι τὸ πρῶτον πρὸς τὸ ἔσχατον· ἢ ἄλλως· Λήψις τῶν ἄκρων καθ' ὑπεξαίρεσιν τῶν μέσων.” HEIBERG's version (ibid., 7): “Datis compluribus magnitudinibus et aliis iis numero aequalibus, ita ut bini coniuncti in eadem ratione sint, ex aequo ratio est, ubi erit, ut in prioribus magnitudinibus prima ad extremam, ita in alteris magnitudinibus prima ad extremam. uel aliter: ubi termini exteriores sumuntur omissis mediis.” HEIBERG adds in note 1 its algebraic representation, “Si  $a : b : c = \alpha : \beta : \gamma$ , ratio ex aequo erit  $a : c = \alpha : \gamma$ .”

<sup>47</sup> *In De causis*, l. 4: “In his autem quae materialiter differunt nihil prohibet inveniri multa ex aequo se habere, nam in substantiis individua unius speciei aequaliter speciei rationem participant; in accidentibus etiam possibile est diversa subiecta aequaliter participare albedinem.”

<sup>48</sup> *In De causis*, l. 4: “Sed in his quae formaliter differunt, semper quidam ordo invenitur. Si quis enim diligenter consideret, in omnibus speciebus unius generis semper inveniet unam alia perfectiorem, sicut in coloribus albedinem et in animalibus hominem. Et hoc ideo quia quae formaliter differunt, secundum aliquam contrarietatem differunt; est enim contrarietas differentia secundum formam, ut Philosophus dicit in X Metaphysicae.”

more perfect than the others, as whiteness in colors, and man in animals. And because they differ formally, they differ according to some contrariety, for *contrariety is a difference according to form*.

In contraries, there is always a nobler one and a viler one, because the first contrariety is privation and habit (► 43.9).<sup>49</sup> Wherefrom, as ARISTOTLE says, the species of things are like numbers, which are diversified in species following the addition of one over the another (► 16.7).

It is manifest that the more something is perfect, the more it is closer to a most perfect one (► 27).<sup>50</sup> For (that which is) good by essence is prior to (that which is) good by participation.<sup>51</sup>

### 26.11. What Is by Essence Is the Cause of That Which Is by Participation

In all those things that are said (analogically) according to prior and posterior, the first can be a cause of those that are (posterior to it); and that which is said by itself is the cause of that which is said by participation.<sup>52</sup>

Hence, in whatever genus of things, that which is by essence (*per essentiam*) is the proper cause of—and is prior, superior (*potius*), more perfect (*perfectius*), than—those (things) that are (in the same genus) by participation (*per participationem*).<sup>53</sup>

For example, the nature of fire (*natura ignis*; i.e., *igneitas*, *fireness*) is found (to be) more perfect in fire itself than in things (that are) afire.<sup>54</sup> And fire is the cause of all things afire

---

<sup>49</sup> *In De causis*, l. 4: “In contrariis autem semper est unum nobilius et aliud vilius, ut dicitur in I Physicorum, et hoc ideo quia prima contrarietas est privatio et habitus, ut dicitur in X Metaphysicae. Et propter hoc in VIII Metaphysicae Philosophus dicit quod species rerum sunt sicut numeri, qui specie diversificantur secundum additionem unius super alterum.”

<sup>50</sup> *In De causis*, l. 4: “Manifestum est autem quod quanto aliquid est perfectius, tanto propinquius est uni perfectissimo.”

<sup>51</sup> *STh* I, q. 3 a. 2 co.: “bonum per essentiam, prius est bono per participationem.”

<sup>52</sup> *In Sent.* 2, d. 37 q. 1 a. 2 co.: “In omnibus autem quae secundum prius et posterius dicuntur, primum eorum quae sunt, potest esse causa; et per se dictum, est causa ejus quod per participationem dicitur.” *ScG* 2, 15 n. 5: “Quod per essentiam dicitur, est causa omnium quae per participationem dicuntur.”

<sup>53</sup> *Super Io.* 5, l. 5: “In quolibet autem genere rerum, quod est per essentiam, est causa eorum quae sunt per participationem.” As an example, St. Thomas notes that fire is the cause of all things afire: “sicut ignis est causa omnium ignitorum.” *In Sent.* 3, d. 33 q. 1 a. 1 qc. 2 ad 1: “prius est quod est per essentiam quam quod est per participationem.” *In Sent.* 4, d. 8 q. 2 a. 4 qc. 3 expos.: “quod est per essentiam, prius est quam id quod est per participationem.” *ScG* 1, 102 n. 4: “Quod per essentiam est, potius est eo quod per participationem dicitur.” That St. Thomas considers *potius* to be the equivalent of *perfectius* is evident from the example that he provides immediately: “sicut natura ignis perfectius invenitur in ipso igne quam in rebus ignitis.” *ScG* 3, 66 n. 7: “Quod est per essentiam tale, est propria causa eius quod est per participationem tale.” *STh* I, q. 87 a. 2 ad 3: “Omne autem quod est per participationem causatur ab eo quod est per essentiam.” *STh* III, q. 65 a. 3 co.: “Semper autem quod est per essentiam, potius est eo quod est per participationem.”

<sup>54</sup> *ScG* 1, 102 n. 4: “sicut natura ignis perfectius invenitur in ipso igne quam in rebus ignitis.” *ScG* 2, 15 n. 5: “sicut ignis est causa omnium ignitorum in quantum huiusmodi.” *ScG* 3, 66 n. 7: “sicut ignis est causa

as such (*est causa omnium ignitorum inquantum huiusmodi*), for all those things that are afire by participation are reduced to fire, which is such by its essence. Thus, that which is afire participates in fireness from that which is fire by its essence, and all things that are afire have in fire the cause of their being-afire (*ignitio*) in some mode.

Indeed, a thing is in act by some substantial or accidental form, since form is an act.<sup>55</sup> Thus, fire is fire in act by fireness (i.e., by its substantial nature), and (fire is) hot (in act) by heat (i.e., by an accidental nature that results from the substantial form of fire). Whence, an (action or an) operation befits (*convenit*) something only through some substantial or accidental form existing in it, for something acts or operates only insofar as it is in act (e.g., fire heats other things insofar as it is hot in act; and it is hot in act on account of its substantial form).

However, an exemplar form (►9.6) need not be of one species with the (thing) caused, for participants do not always participate by the mode of that which is participated.<sup>56</sup>

Thus, everything that is *x* (*illud*) by participation (*secundum participationem*) is reduced to that which is *x* (*illud*) by its essence as to a first and highest (*summum*) principle and cause.<sup>57</sup> For everything that befits (*convenit*) something by participation, is substantially (i.e., essentially) in another priorly.<sup>58</sup> And everything that is by participation is brought under (*subditur*) that which is by essence and universally.<sup>59</sup> Thus, everything that befits (*convenit*) something by participation, is found (to be) more perfect in that which is by essence, wherefrom it is derived into others (*a quo in alia derivatur*).<sup>60</sup>

---

omnium ignitorum.” *STh* I, q. 87 a. 2 ad 3: “sicut omne ignitum causatur ab igne.” *Super Io.* 5, l. 5: “sicut omnia ignita per participationem reducuntur ad ignem, qui est per essentiam suam talis.” *Comp. th.* 1, c. 68, 20–22: “sicut ferrum ignitum participat igneitate ab eo quod est ignis per essentiam suam.” *Comp. th.* 1, c. 123, 29–30: “omnia enim ignita suae ignitionis ignem causam habent aliquo modo.”

<sup>55</sup> *De spirit. creat.*, a. 2 co.: “Nulla autem operatio convenit alicui nisi per aliquam formam in ipso existentem, vel substantialem vel accidentalem; quia nihil agit aut operatur nisi secundum quod est actu. Est autem unumquodque actu per formam aliquam vel substantialem vel accidentalem, cum forma sit actus; sicut ignis est actu ignis per igneitate, actu calidus per calorem.”

<sup>56</sup> *In Sent.* 3, d. 27 q. 2 a. 4 qc. 3 ad 1: “forma exemplaris non oportet quod sit unius speciei cum causatis: quia participantia non semper participant per modum participati.”

<sup>57</sup> *Super Io.* 5, l. 5: “omne illud quod est secundum participationem, reducitur ad aliquid quod sit illud per suam essentiam, sicut ad primum et ad summum.” *Comp. th.* 1, c. 68, 18–20: “omne quod habet aliquid per participationem reducitur in id quod habet illud per essentiam sicut in principium et causam.” *Comp. th.* 1, c. 123, 27–28: “Ea quae sunt per participationem, reducuntur in id quod est per essentiam, sicut in causam.” *ScG* 1, 98 n. 4: “Omne autem quod est per participationem, reducitur ad id quod est per seipsum.”

<sup>58</sup> *De spirit. creat.*, a. 10 co.: “omne quod convenit alicui per participationem, prius est in aliquo substantialiter; sicut si ferrum est ignitum, oportet esse in rebus aliquid quod sit ignis secundum suam substantiam et naturam.”

<sup>59</sup> *STh* I, q. 96 a. 1 co.: “Omne autem quod est per participationem, subditur ei quod est per essentiam et universaliter”

<sup>60</sup> *De sub. sep.*, c. 14, 49–52: “Omne autem quod convenit alicui per participationem, perfectius invenitur in eo quod per essentiam est, a quo in alia derivatur.”

## 26.12. Agreement

An agreement (*convenientia*) can be of one of two (modes):<sup>61</sup>

1. Insofar as two (things) participate in something one.
2. Insofar as (something) one is simply by itself (*unum per se est simpliciter*) and another participates in its likeness as much as it can. For example, if we should posit that heat (by itself) is without matter and that fire agrees with it, since it would participate (in) some (virtual quantity or *ratio*) of heat.

## 26.13. Consideration of Agreement

An agreement (*convenientia*) can be considered in one of two (modes):<sup>62</sup>

1. According to the properties of a nature. In this mode, for example, the soul and the body are very distant (e.g., although they agree in one act of being or living, they disagree in the passive properties of matter, on one hand, and the active properties of form, on the other).
2. According to the proportion of potency to act. In this mode, the soul and the body maximally agree (e.g., not only is matter susceptible of receiving the act of being that the form gives, but a relation of matter to form necessarily follows upon their union; ►46.12).

---

<sup>61</sup> *In Sent.* 2, d. 16 q. 1 a. 1 ad 3: “convenientia potest esse dupliciter: aut duorum participantium aliquod unum [...] aut secundum quod unum per se est simpliciter, et alterum participat de similitudine ejus quantum potest; ut si poneremus calorem esse sine materia, et ignem convenire cum eo, ex hoc quod aliquid caloris participaret.” We were unable to find a definition of *convenientia*, but it seems to consist in some degree of community. See, for example, *In Sent.* 1, d. 10 q. 1 a. 4 ad 1: “Et rationem convenientiae assignat Augustinus in littera. Quia enim est communitas [...], decet ut communi nomine nominetur.” *STh* I, q. 36 a. 1 co.: “Et huius quidem convenientiae ratio sumi potest [...] ex ipsa communitate [...]” The order of community or dependence is the mode to which all other orders are reduced, as we will show.

<sup>62</sup> *In Sent.* 2, d. 1 q. 2 a. 4 ad 3: “Sciendum ergo, quod convenientia potest attendi dupliciter: aut secundum proprietates naturae; et sic anima et corpus multum distant: aut secundum proportionem potentiae ad actum; et sic anima et corpus maxime conveniunt.”

## 27. The Principle in Any Genus

As determined above, (1) there is a principle in every order (►8.2; 8.5); (2) a cause is a principle in some genus (►9); (3) in the same genus, there are prior and posterior causes (►11.3); (4) one ought always to reduce any question to a first cause (►11.6); and the first and maximum in each genus is the cause of those things that are posterior (►8.3). Here, we aim to determine the nature of this principle in a genus.

### 27.1. Genus: Properly vs. in Common

(The name) **genus** can be taken in two modes:<sup>1</sup>

#### 1. Properly (*proprie*), insofar as *in it*, an essence is predicated of many (►14).<sup>2</sup>

In this way, neither *good* nor *bad* are genera, since they are among the transcendentals, for *good* and *being* are convertible (*bonum et ens convertuntur*; ►30.10).<sup>3</sup>

2. **In common** (*communiter*), such that *everything that embraces and contains many (things) in its commonality* would be said (to be a) *genus* (e.g., we speak of the *medical genus*, but not such that one medical essence would be predicated of diverse things).<sup>4</sup>

In this way, *good* and *bad* are said (to be the) *genera of all contraries*, for all contraries are related in such a way that one of them is more noble and the other more vile.<sup>5</sup> And the more vile includes in itself privation, as black in respect of white, and cold in respect of hot. Wherefrom, ARISTOTLE says that coldness is the privation of heat.

In this mode, one of the contraries always pertains to the *good*, and the others to the *bad*.<sup>6</sup>

### 27.2. Division of the Common

The mode of dividing the common into those that are under it is twofold, just as the mode of community is twofold:<sup>7</sup>

---

<sup>1</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "genus dupliciter potest accipi."

<sup>2</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "Uno modo proprie, prout praedicatur de pluribus in eo quod quid est."

<sup>3</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "et sic neque bonum neque malum sunt genera; quia sunt de transcendentibus, quia bonum et ens convertuntur."

<sup>4</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "Alio modo communiter, ut genus dicatur omne id quod sua communitate multa ambit et continet."

<sup>5</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "et sic bonum et malum dicuntur genera omnium contrariorum: quia, ut in 1 *Physic.* dicitur, omnia contraria hoc modo se habent quod alterum est nobilius, et alterum vilius; ita quod vilius privationem in se includit, sicut nigrum in respectu ad album, et frigidum in respectu ad calidum: propter quod in 1 *De generat.* dicitur, quod frigus est privatio caloris."

<sup>6</sup> *In Sent. 2*, d. 34 q. 1 a. 2 ad 1: "et per hunc modum semper alterum contrarium pertinet ad bonum, et reliquum ad malum."

<sup>7</sup> *In Sent. 2*, d. 42 q. 1 a. 3 co.: "est duplex modus dividendi commune in ea quae sub ipso sunt, sicut est duplex communitatis modus." *De malo*, q. 7 a. 1 ad 1: "duplex est divisio."

1. *The division by differences of the univocal into species.* In this division, the nature of the genus is participated equally in the species.<sup>8</sup>

For example, *animal* is divided into *man*, *horse*, and such (each of which participates equally in the nature of *animal*).<sup>9</sup>

When some (i.e., multiple) things are co-divided (*condividuntur*) equally (*aequaliter*), receiving a common predication, then one is not posited in the definition of the other (e.g., *horse* is not posited in the definition of *man*).<sup>10</sup>

2. *The division of that which is common by analogy*, which is predicated of one of the (things) that divide (the common) according to a perfect *ratio*, while (it is predicated) of the others imperfectly and according to something (*secundum quid*).<sup>11</sup> This division is as a mean between the equivocal and the univocal.

For example, *being* (*ens*) is divided into *substance* and *accident*, and into *being in act* and *being in potency*; yet (these are predicated unequally, for) the minimum (perfection) that can be (pondered) about the nature of being (*de natura entis*) is in *being in potency* and in *being by accident*.<sup>12</sup>

When (something) is predicated of (multiple things) in common according to prior and posterior (*per prius et posterius*), then the first is posited in the definition of the others.<sup>13</sup> Thus, *substance* (is posited) in the definition of accidents, for that which is by essence is prior to that which is by participation (*prius est quod est per essentiam quam quod est per participationem*; ► 26.11).

---

<sup>8</sup> *In Sent.* 2, d. 42 q. 1 a. 3 co.: “Est enim quaedam divisio univoci in species per differentias quibus aequaliter natura generis in speciebus participatur.” *De malo*, q. 7 a. 1 ad 1: “una qua dividitur genus univocum in suas species, quae ex aequo participant genus.”

<sup>9</sup> *In Sent.* 2, d. 42 q. 1 a. 3 co.: “sicut animal dividitur in hominem et equum, et hujusmodi.” *De malo*, q. 7 a. 1 ad 1: “sicut animal in bovem et equum.”

<sup>10</sup> *In Sent.* 3, d. 33 q. 1 a. 1 qc. 2 ad 1: “quando aliqua condividuntur aequaliter recipientia communis praedicationem, tunc unum non ponitur in definitione alterius.”

<sup>11</sup> *In Sent.* 2, d. 42 q. 1 a. 3 co.: “alia vero divisio est ejus quod est commune per analogiam, quod quidem secundum perfectam rationem praedicatur de uno dividendum, et de altero imperfecte et secundum quid [...]: et haec divisio est quasi media inter aequivocum et univocum.” *De malo*, q. 7 a. 1 ad 1: “alia est divisio communis analogi in ea de quibus dicitur secundum prius et posterius [...]; et in talibus ratio communis perfecte salvatur in uno; in aliis autem secundum quid et per posterius.”

<sup>12</sup> *In Sent.* 2, d. 42 q. 1 a. 3 co.: “sicut ens dividitur in substantiam et accidens, et in ens actu et in ens potentia: et haec divisio est quasi media inter aequivocum et univocum; [...] minimum quod potest esse de natura entis est in ente in potentia et in ente per accidens.” Cf. *STh* I-II, q. 88 a. 1 ad 1: “divisio peccati venialis et mortalis non est divisio generis in species, quae aequaliter participant rationem generis, sed analogi in ea de quibus praedicatur secundum prius et posterius.” *De malo*, q. 7 a. 1 ad 1: “sicut ens dividitur per substantiam et accidens, et per potentiam et actum.”

<sup>13</sup> *In Sent.* 3, d. 33 q. 1 a. 1 qc. 2 ad 1: “sed quando commune praedicatur de eis per prius et posterius, tunc primum ponitur in definitione aliorum, sicut substantia in definitione accidentium [...]: quia prius est quod est per essentiam quam quod est per participationem.”

### 27.3. Modes of Priority Among the Parts of the Common

Of (the parts) that divide something common, one can be prior to another in two modes:<sup>14</sup>

1. According to the proper ratios or natures of those (parts) that divide (the common whole).<sup>15</sup> This mode (of priority) does not take away the univocity of a genus.

This is evident in numbers, in which *two* (*binarius*) is naturally prior to *three* (*ternario*) according to its proper *ratio*, but they both participate equally in the *ratio* of their genus (►21.15): namely, (the genus of) *number*, for just as *three* is a *multitude measured by one* (which is the *ratio* of *number*), so is *two*.<sup>16</sup>

2. According to the participation of the *ratio* of the common that is divided into them (i.e., according to a greater participation of the *ratio* of the common whole found in one of the parts into which it is divided).<sup>17</sup> This mode (of priority) impedes the univocity of a genus.

This is why *being* (*ens*) cannot be (properly speaking) the (predicable) genus of *substance* and of *accident*: because in the *ratio* itself of *being*, substance, which is *being by itself* (*ens per se*), has priority in respect of accident, which is *being by another and in another* (*ens per aliud et in alio*).<sup>18</sup>

Thus, it is evident that, that which is *being* by itself (*ens per se ipsum*), namely, substance, is naturally prior to all those that have (their act of) being (*esse*) only in comparison to substance.<sup>19</sup>

---

<sup>14</sup> *In Peri.* 1, l. 8, 53–54: “unum diidentium aliquod commune potest esse prius altero dupliciter.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “unum diidentium aliquod commune potest esse prius altero dupliciter.”

<sup>15</sup> *In Peri.* 1, l. 8, 55–56; 58: “uno modo, secundum proprias rationes aut naturas diidentium. [...] primum autem non tollit univocationem generis.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “Uno modo secundum proprias rationes aut naturas diidentium. [...] Primum autem non tollit univocationem generis.”

<sup>16</sup> *In Peri.* 1, l. 8, 59–63: “ut manifestum est in numeris, in quibus binarius secundum propriam rationem naturaliter est prior ternario, set tamen equaliter participant rationem communis, scilicet numeri: ita enim est ternarius multitudo mensurata per unum sicut et binarius.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “ut manifestum est in numeris, in quibus binarius secundum propriam rationem naturaliter est prior ternario; sed tamen aequaliter participant rationem communis, scilicet numeri: nam ita ternarius sicut et binarius est multitudo mensurata per unum.”

<sup>17</sup> *In Peri.* 1, l. 8, 56–57; 64: “alio modo secundum participationem rationis illius communis quod in ea diiditur. [...] set secundum impedit univocationem generis.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “Alio modo secundum majorem participationem rationis illius communis quod in ea dividitur. [...] Secunda autem prioritas impedit univocationem generis.”

<sup>18</sup> *In Peri.* 1, l. 8, 64–68: “et propter hoc ens non potest esse genus substantie et accidentis: quia in ipsa ratione entis prioritatem habet substantia, que est ens per se, respectu accidentis, quod est ens per aliud et in alio.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “et propter hoc, ens non potest esse genus substantie et accidentis, quia in ratione entis prius habet esse substantia, quae est ens per se, quam accidens, quod est ens in alio vel in aliud.”

<sup>19</sup> *In Ethic.* 1, l. 6, 112–115 (cf. ARISTOTLE, *Ethica Nicomachea* A.4, 1096a20–21): “manifestum est autem quod illud quod est ens per se ipsum, scilicet substantia, est naturaliter prior omnibus his quae non habent esse nisi in comparatione ad substantiam.”

For example, **quantity** is a *measure of substance*; **quality** is a *disposition of substance*; and **relation** (*ad aliquid*) is a *habitude (habitus) of substance*.<sup>20</sup> And the same occurs in all the other genera, all of which are assimilated to the progeny of being—that is, (to) substance, which principally is being, from which all other genera are propagated and derived, which also are said (to be) *beings (entia)* insofar as they befall substance (*accidunt substantiae*).<sup>21</sup>

In this mode too, *affirmation*, according to its proper *ratio*, is prior to *negation* because it is simpler, even if they participate equally (in) the *ratio* of *enunciation*.<sup>22</sup>

Platonists would not posit some Idea in those genera in which the prior and the posterior are found.<sup>23</sup> This is evident in numbers, for *two* is naturally prior to *three*, and so on. Hence, they did not say that *common number (numerus communis)* is some separate Idea.

On the other hand, they posited single, separated ideal numbers.<sup>24</sup> For example, *two*, *three*, and such. The reason for this is that those (things) in which the prior and the posterior is found seem not to be of one order, and consequently (seem) not to participate equally (in) one Idea.

---

<sup>20</sup> *In Ethic.* 1, l. 6, 116–118: “sicut est quantitas quae est mensura substantiae et qualitas quae est dispositio substantiae et ad aliquid quod est habitudo substantiae.”

<sup>21</sup> *In Ethic.* 1, l. 6, 118–123 (cf. ARISTOTLE, *Ethica Nicomachea* A.4, 1096a21–23): “et idem est in aliis generibus quae omnia assimilantur propagini entis, id est substantiae quae est principaliter ens, a qua propagantur et derivantur omnia alia genera quae etiam in tantum dicuntur entia in quantum accidunt substantiae.”

<sup>22</sup> *In Peri.* 1, l. 8, 68–72: “Sic ergo affirmatio secundum propriam rationem prior est negatione, tamen equaliter participant rationem enunciationis quam supra posuit [Philosophus], quod enunciatio est oratio in qua est uero uel falsum.” Cf. the anonymous *Summa totius Logicae Aristotelis*, tract. 6 cap. 6: “dividit [Aristoteles] enunciationem ut genus in species; dividit enim eam in affirmationem et negationem, quae sunt species enunciationis: licet enim affirmatio sit prior negatione; non tamen propter hoc enunciatio de eis analogice praedicatur, sicut dictum est quod praedicatur de simpliciter una et conjunctione una. Notandum quod unum dividendum aliquod commune potest esse prius altero dupliciter [...]. Sic in proposito. Licet affirmatio primo modo, scilicet secundum suam naturam, sit prior negatione, non tamen secundo modo; immo aequaliter participant rationem enunciationis; utraque enim est oratio verum vel falsum significans. Est autem secundum suam naturam affirmatio prior negatione: nam affirmatio est enunciatio alicujus de aliquo, ut homo est animal; negatio vero est enunciatio alicujus ab aliquo, ut homo non est lapis. Cum autem enunciatio, ut dictum est, sit vox significativa, non immediate significat rem, sed mediante conceptu intellectus. Unde in omni enunciatione est tria considerare: scilicet ipsam vocem, quae est signum conceptus intellectus; et ipsum conceptum intellectus, qui est ipsa similitudo rei; et ipsam rem. Quantum ad vocem, prior est affirmatio negatione, quia minus habet de compositione quam negatio: plures enim dictiones sunt Socrates non currit quam Socrates currit: et per consequens est magis composita. Ex parte intellectus prior est affirmatio, quae significat compositionem, quam negatio, quae significat divisionem: posterior enim est divisio compositione, sicut non est corruptio nisi generatorum, sic non est divisio nisi compositorum. Ex parte etiam rei affirmatio quae significat esse, prior est negatione quae significat non esse, sicut habitus naturaliter prior est negatione.”

<sup>23</sup> *In Ethic.* 1, l. 6, 98–104 (cf. ARISTOTLE, *Ethica Nicomachea* A.4, 1096a17–19): “Quarum prima [ratio] sumitur ex ipsa positione Platoniorum, qui non faciebant aliquam ideam in illis generibus in quibus invenitur prius et posterius, sicut patet in numeris. Nam binarius naturaliter prior est ternario et sic inde, et ideo non dicebant Platonici, quod numerus communis esset quaedam idea separata.”

<sup>24</sup> *In Ethic.* 1, l. 6, 104–108: “ponebant autem singulos numeros ideales separatos, puta binarium, ternarium et similia. Et huius ratio est, quia ea in quibus invenitur prius et posterius, non videntur esse unius ordinis, et per consequens nec aequaliter unam ideam participare.”

#### 27.4. The Cause of Everything in a Genus

That which befits (*convenit*) something from its nature (*ex sua natura*), not from another cause (*non ex alia causa*), cannot be diminished or deficient, for should something essential be subtracted or added, it would already be another nature, as happens in numbers, in which a unit added or subtracted varies the species.<sup>25</sup> On the other hand, if something were found to be diminished and the nature or quiddity remained integral, it is evident that that (thing) does not depend simply on that nature but on something else, by whose removal it is diminished. Hence, that which befits something less than (it befits) others does not befit it only from its nature but from another cause.

Therefore, *that will be the cause of everything in some genus to which maximally befits the predication of that genus.*<sup>26</sup> Whence, we also see that whatever is maximally hot is the cause of heat in all hot things, and that which is maximally lucid (is) the cause of all the things that are lucid.

If one should consider the order of things, one would always find that that which is first and maximum in any genus is the cause of all the other (things) that are posterior in that genus, for the cause is more powerful (*potior*) than the effect.<sup>27</sup>

---

<sup>25</sup> ScG 2, 15 n. 3: "Quod alicui convenit ex sua natura, non ex alia causa, minoratum in eo et deficiens esse non potest. Si enim naturae aliquid essenziale subtrahitur vel additur, iam altera natura erit: sicut et in numeris accidit, in quibus unitas addita vel subtracta speciem variat. Si autem, natura vel quidditate rei integra manente, aliquid minoratum inveniatur, iam patet quod illud non simpliciter dependet ex illa natura, sed ex aliquo alio, per cuius remotionem minoratur. Quod igitur alicui minus convenit quam aliis, non convenit ei ex sua natura tantum, sed ex alia causa."

<sup>26</sup> ScG 2, 15 n. 3: "Illud igitur erit causa omnium in aliquo genere cui maxime competit illius generis praedicatio: unde et quod maxime calidum est videmus esse causam caloris in omnibus calidis, et quod maxime lucidum causam omnium lucidorum."

<sup>27</sup> For the origin of this doctrine, St. Thomas frequently refers us to ARISTOTLE, *Metaphysica* α.1, 993b24–27: "ἕκαστον δὲ μάλιστα αὐτὸ τῶν ἄλλων καθ' ὃ καὶ τοῖς ἄλλοις ὑπάρχει τὸ συνώνυμον, οἷον τὸ πῦρ θερμώτατον· καὶ γὰρ τοῖς ἄλλοις τὸ αἴτιον τοῦτο τῆς θερμότητος· ὥστε καὶ ἀληθέστατον τὸ τοῖς ὑστέροις αἴτιον τοῦ ἀληθέσιν εἶναι." Whence, the example provided is most often that of fire, then believed to be an element and the cause of heat in compound bodies. St. Thomas contrasts this with the equivocal heat coming from the sun, then considered to be an incorruptible body (and, therefore, made from diverse matter). *In Metaph.* 2, l. 2, §292: "Unumquodque inter alia maxime dicitur, ex quo causatur in aliis aliquid univoce praedicatum de eis; sicut ignis est causa caloris in elementatis. Unde, cum calor univoce dicitur et de igne et de elementatis corporibus, sequitur quod ignis sit calidissimus. Facit autem mentionem de univocatione, quia quandoque contingit quod effectus non pervenit ad similitudinem causae secundum eandem rationem speciei, propter excellentiam ipsius causae. Sicut sol est causa caloris in istis inferioribus: non tamen inferiora corpora possunt recipere impressionem solis aut aliorum caelestium corporum secundum eandem rationem speciei, cum non communicent in materia. Et propter hoc non dicimus solem esse calidissimum sicut ignem, sed dicimus solem esse aliquid amplius quam calidissimum. Nomen autem veritatis non est proprium alicui speciei, sed se habet communiter ad omnia entia. Unde, quia illud quod est causa veritatis, est causa communicans cum effectu in nomine et ratione communi, sequitur quod illud, quod est posterioribus causa ut sint vera, sit verissimum." Notwithstanding the examples taken from ancient science, this principle is clearly true in any order of things. St. Thomas uses it profusely. We have synthesized the above statement from *De sub. sep.*, c. 9, 145–147: "si quis ordinem rerum consideret, semper inveniet id quod est maximum causam esse eorum quae sunt post ipsum." *In Sent.* 1, d. 32 q. 1 a. 3 co.: "cum omne quod est primum in aliquo genere, sit causa eorum quae sunt post [...]." *In Sent.* 2, d. 37 q. 2 a. 2 co.: "Primum enim in quolibet genere est causa eorum quae sunt post, ut in 2 *Metaphys.* dicitur." *In Sent.* 3, d. 36 q. 1 a. 1 co.: "illud quod est maximum in quolibet genere, est causa aliorum." *In Sent.* 4, d. 49 q. 1 a. 3 qc. 4 co.: "illud quod est primum in quolibet

## 27.5. Perfection of the First Principle

The principle in each genus must be perfect.<sup>28</sup> And the maximum in each genus is the same as that which is perfect (*maximum in unoquoque genere est idem quod perfectum est* < τὸ μέγιστον ἐν ἑκάστῳ γένει τέλειον). This is evident because **maximum** is *that which is not exceeded* (*quod non exceditur* < οὐ μὴ ἔστιν ὑπερβολή), and **perfect** is *that outside of which nothing can be taken* (*extra quod non potest aliquid sumi* = οὐ μὴ ἔστιν ἔξω λαβεῖν τι δυνατόν).

That the perfect is *that outside of which nothing can be taken*, is evident, for all (things) are said to be perfect because they come to an end (*deveniunt ad finem*); and there is nothing outside the end, for the **end** is *that which is last in each thing*, and *which contains the thing*; whence, nothing is outside the end.<sup>29</sup> Nor does that which is perfect need something external: rather, *the whole is contained under its perfection* (*totum continetur sub sua perfectione*).

The perfect in any genus is naturally prior because, as BOETHIUS says, the beginning (*initium*) is taken from the perfect.<sup>30</sup> Whenever one is found to be better than another in whatever (order of) things, that which is better is always prior according to nature.<sup>31</sup> Thus, in whatever genus, the perfect is naturally prior to the corrupted.

Even though the first principle in any genus is most perfect, not everything that is prior is necessarily more perfect, since something that is more imperfect may be prior in the order

---

genere et maximum, est causa eorum quae sunt post." ScG 1, 41 n. 4: "Quod est maximum in unoquoque genere est causa aliorum quae sunt in illo genere: causa enim potior est effectus." ScG 3, 17 n. 3: "Quod est maximum in unoquoque genere, est causa omnium illorum quae sunt illius generis." ScG 3, 82 n. 6: "Primum in quolibet genere est causa eorum quae sunt post." ScG 3, 102 n. 7: "primum enim in quolibet genere causa invenitur eorum quae in illo genere consequuntur." In *Physic.* 7, l. 1, n. 6: "quod est primum in quolibet genere, est causa eorum quae sunt post." ScG 4, 27 n. 1: "id quod est in unoquoque genere maximum, causa aliorum esse videatur." *STh* I, q. 77 a. 6 co.: "primum est causa in quolibet genere." *STh* III, q. 56 a. 1 co.: "illud quod est primum in quolibet genere, est causa omnium eorum quae sunt post, ut dicitur in II *Metaphys.*"

<sup>28</sup> In *De caelo* 2, l. 10, n. 10: "In quolibet autem genere id quod est primum est causa eorum quae sunt post in eodem genere." In *Metaph.* 10, l. 5, §2027 (cf. ARISTOTLE, *Metaphysica* I.4, 1055a10–12): "Maximum in unoquoque genere est idem quod perfectum est. Quod patet ex hoc, quod maximum est quod non exceditur; et perfectum est, extra quod non potest aliquid sumi." *Comp. th.* 1, c. 213, 15–16: "Principium enim in unoquoque genere oportet esse perfectum."

<sup>29</sup> In *Metaph.* 10, l. 5, §2028 (cf. ARISTOTLE, *Metaphysica* I.4, 1055a14–16): "Et quod perfectum sit extra quod non potest aliquid sumi, patet; quia omnia dicuntur perfecta, eo quod deveniunt ad finem. Extra finem autem nihil est: quia finis est id quod est ultimum in omni re, et quod continet rem. Unde nihil est extra finem. Nec id quod perfectum est, indiget aliquo exteriori; sed totum continetur sub sua perfectione."

<sup>30</sup> *Contra retr.*, c. 7, 366–368: "perfectum in quolibet genere naturaliter prius est: natura enim, ut Boetius dicit, a perfectis sumit initium." The reference is to BOETHIUS, *De consol.* III, prosa 10: "Neque enim ab diminutis inconsummatisque natura rerum coepit exordium, sed ab integris absolutisque procedens" (PL 63, 76A).

<sup>31</sup> In *Metaph.* 3, l. 8, §439: "in quibuscumque invenitur unum alio melius, semper illud quod est melius, est prius secundum naturam." Cf. ARISTOTLE, *Metaphysica* B.3, 999a13–14: "ὅπου τὸ μὲν βέλτιον τὸ δὲ χεῖρον, αἰεὶ τὸ βέλτιον πρότερον." In *Polit.* 3, l. 1, n. 7: "in quolibet genere perfectum est naturaliter prius corrupto."

of generation (*in via generationis*), as the child (is more imperfect but prior in the order of generation; ►47.7) to the adult; and one who is learning, to one who knows scientifically.<sup>32</sup>

## 27.6. Participation in the Virtue of the First Principle

The more something approaches the principle in any genus, the more it participates in the effect of that principle.<sup>33</sup> *More* and *less* are said of diverse things insofar as they diversely approach something that maximally is, just as that is *hotter* which approaches what is *maximally hot*.<sup>34</sup>

However, there is nothing found that does not participate in the form of the small (according to dimensive quantity), for the small is found in the great, while the great is not found in the small (e.g., *one* is found in every number, but no number is found in *one*; hence, no number can be found that does not participate in the form of *one*, which *one* is most small, for no number is as small as *one*).<sup>35</sup> And the (thing) participated is clearly the cause of the participant (e.g., the *one* that is participated by any number is clearly the cause of that number, for every number is composed from a multitude of *ones*).

Whence, **principles in all genera are small in (dimensive) quantity (*parva quantitate*) but great in virtue (*magna virtute*)**.<sup>36</sup> (For example, *one*, the principle of number, is less than any number but greater in virtue, for all numbers exist virtually in *one*.)

## 27.7. Simplicity of the First Principle

In any genus, that which is first is the cause from which all the things that are of the genus are constituted in that genus—but it is impossible to proceed infinitely in some order of

---

<sup>32</sup> *In Sent.* 3, d. 27 q. 1 a. 4 ad 2: “quamvis primum principium in quolibet genere sit perfectissimum, non tamen oportet quod omne quod est prius, sit perfectius, cum aliquid sit prius in via generationis quod est imperfectius, sicut puer viro, et addiscens sciente.”

<sup>33</sup> *STh* III, q. 27 a. 5 co.: “quanto aliquid magis appropinquat principio in quolibet genere, tanto magis participat effectum illius principii.”

<sup>34</sup> *STh* I, q. 2 a. 3 co.: “magis et minus dicuntur de diversis secundum quod appropinquant diversimode ad aliquid quod maxime est, sicut magis calidum est, quod magis appropinquat maxime calido. Est igitur aliquid quod est verissimum, et optimum, et nobilissimum, et per consequens maxime ens, nam quae sunt maxime vera, sunt maxime entia, ut dicitur II *Metaphys.* Quod autem dicitur maxime tale in aliquo genere, est causa omnium quae sunt illius generis, sicut ignis, qui est maxime calidus, est causa omnium calidorum, ut in eodem libro dicitur.” This constitutes the basis for the *fourth way*, which is taken from the degrees that are found in things (*Quarta via sumitur ex gradibus qui in rebus inveniuntur*).

<sup>35</sup> *In De div. nom.*, c. 9, l. 1: “nihil invenitur quod non participet formam parvi: parvum enim invenitur in magnis, sed magnum non invenitur in parvis; participatum autem videtur esse causa participantis.”

<sup>36</sup> St. Thomas concludes this from his reading of ARISTOTLE, *Metaphysica* Z.17, 1041a18–20: “πλήν εἴ τις λέγοι ὅτι ἀδιαίρετον πρὸς αὐτὸ ἕκαστον, τοῦτο δ’ ἦν τὸ ἐνὶ εἶναι: ἀλλὰ τοῦτο κοινόν γε κατὰ πάντων καὶ σύντομον.” He gives his interpretation *In Metaph.* 7, l. 17, §1654: “unumquodque est indivisibile ad seipsum. «Et est quod breve [σύντομον],» id est se habet ad modum principii, quod est parvum quantitate et maximum virtute.” *In De div. nom.*, c. 9, l. 1: “unde et principia in omnibus generibus sunt parva quantitate, sed magna virtute.” *In Sent.* 2, d. 3 q. 3 a. 2 co.: “principia sunt parva quantitate, et maxima virtute.” This is undoubtedly how we ought to interpret his famous saying in *De ente*, pr., 1–2: “parvus error in principio magnus est in fine secundum Philosophum in I Celi et mundi.” Cf. *In De caelo* 1, l. 9 n. 4: “principium quod est minimum quantitate, facit magnam differentiam in sequentibus.”

things.<sup>37</sup> Therefore, in every genus there must be a first *one* that is **most simple** in that genus, and the **measure** (►28) of all the things that are in that genus. Simpler (things) extend to more (things).<sup>38</sup> Whence, the virtue of the first principle of any genus extends universally to all the effects of that genus.

That in which something is found not mixed with a contrary is the maximum (in virtual quantity) and first in that genus—and is the cause of all other things (in that genus).<sup>39</sup> In all those (causes) that are a mean between two extremes, of which one is last and another first, it is necessary that that which is first be the cause of that which is posterior—i.e., (the first cause is the cause) of the mean and of the last.<sup>40</sup>

In any genus, the more something is prior, the more it is simple and consists in fewer, as (in the genus *body*) first bodies (i.e., elements) are simpler (than composite bodies).<sup>41</sup> And those (principles) that are *first* in any genus are in some mode simpler and consist in *one*. Thus, in every genus, we see that a multitude proceeds from some unity; and in whatever genus, there is found one first (i.e., a principle) that is the measure of all the things that are found in that genus.<sup>42</sup> Therefore, whatever things are found in agreement with something one, must depend on some *one* principle.

### 27.8. The *One* That is the Measure

That is said (to be) *one* in whatever genus which is its measure—i.e., that by which the quantity of the genus is known first.<sup>43</sup> And that which is the measure of whichever genus of quantity is said (to be the) *one* in that genus.

---

<sup>37</sup> *In De causis*, l. 18: “in unoquoque genere est causa illud quod est primum in genere illo, a quo omnia quae sunt illius generis in illo genere constituuntur [...]; non est autem in aliquo rerum ordine in infinitum procedere.” *In Post. an.* 1, l. 36, 232–234: “in quolibet genere oportet esse unum primum quod est simplicissimum in genere illo et mensura omnium quae sunt illius generis.”

<sup>38</sup> *In Sent.* 2, d. 3 q. 3 a. 2 co.: “principia sunt parva quantitate, et maxima virtute, et simplicia ad plurima se extendunt.” *STh* III, q. 7 a. 9 co.: “Virtus autem primi principii alicuius generis universaliter se extendit ad omnes effectus illius generis.”

<sup>39</sup> *In Sent.* 1, d. 5 q. 1 a. 1 ad 1: “Illud autem in quo invenitur aliquid non permixtum contrario, est maximum et primum in genere illo, et causa omnium aliorum.”

<sup>40</sup> *In Metaph.* 2, l. 3, §301: “proponit [Philosophus] quamdam propositionem: scilicet, quod in omnibus his, quae sunt media inter duo extrema, quorum unum est ultimum, et aliud primum, necesse est quod illud quod est primum, sit causa posteriorum, scilicet medii et ultimi.” Cf. ARISTOTLE, *Metaphysica* α.2, 994a11–13: “τῶν γὰρ μέσων, ὧν ἐστὶ τι ἔσχατον καὶ πρότερον, ἀναγκάσιον εἶναι τὸ πρότερον αἴτιον τῶν μετ’ αὐτό.”

<sup>41</sup> *STh* I-II, q. 19 a. 2 co.: “in quolibet genere, quanto aliquid est prius, tanto est simplicius et in paucioribus consistens, sicut prima corpora sunt simplicia. Et ideo invenimus quod ea quae sunt prima in quolibet genere, sunt aliquo modo simplicia, et in uno consistunt.”

<sup>42</sup> *ScG* 1, 42 n. 16: “In unoquoque genere videmus multitudinem ab aliqua unitate procedere: et ideo in quolibet genere invenitur unum primum, quod est mensura omnium quae in illo genere inveniuntur. Quorumcumque igitur invenitur in aliquo uno convenientia, oportet quod ab aliquo uno principio dependant.”

<sup>43</sup> *In Metaph.* 10, l. 2, §1940: “dicitur mensura in aliis quantitibus, id [...] quo primo cognoscitur unumquodque eorum. Et id quod est mensura cuiuslibet generis quantitatis, dicitur unum in illo genere.”

The perfection of each thing—according to which its measuring is considered, and likewise its quantity—is from (its) first principle.<sup>44</sup> And this is what AUGUSTINE says, that *in those things that are great (but) not in bulk, better is the same as greater.*

Thus, in any genus there must be a first that is most simple in that genus, and the measure of all (things) that are of that genus.<sup>45</sup> And since a measure is homogeneous to the (thing) measured, such first indivisible (principles) must be diverse according to the diversity of genera; whence, (the measure) is not the same in all (genera): rather, each genus must have one first measure.

### 27.9. The Principle of a Genus

That which is maximally said in any genus—i.e., that to which the predication of the genus maximally befits—is the principle and cause of the other things in that genus, and the other things are said according to an order to it.<sup>46</sup>

However, *the principle of some genus* can be taken in two modes:<sup>47</sup>

1. The principle that **is in that genus** (► 29), as when we say that the first part of the line is the principle (i.e., since a part of any line is itself a line, and in this way, the first part of the line is its principle).<sup>48</sup>
2. The principle that **does not receive the predication** (of the genus), as the point (which is not said to be a line) is said to be the principle of the line.<sup>49</sup>

---

<sup>44</sup> *De virtutibus*, q. 5 a. 3 co.: “perfectio uniuscuiusque rei secundum quam attenditur mensuratio eius, est a primo principio; similiter quantitas eius; et hoc est quod Augustinus dicit in VIII de Trinit., quod in his quae non mole magna sunt, idem est melius quod maius.”

<sup>45</sup> *In Post. an.* 1, l. 36, 231–238; 246–247 (cf. ARISTOTLE, *Analytica Posteriora* A.23, 84b37–38; *Metaphysica* I.1, 1052b18–1053b8, *ad sensum*): “sicut habetur in X Metaphysice, in quolibet genere oportet esse unum primum quod est simplicissimum in genere illo et mensura omnium que sunt illius generis; et, quia mensura est homogenea mensurato, secundum diuersitatem generum oportet esse huiusmodi prima indiuisibilia diuersa, unde hoc non est idem in omnibus, set [...] in diuersis generibus sunt diuersa prima indiuisibilia.” *ScG* 3, 8 n. 8: “Unius autem generis oportet esse unam mensuram primam.”

<sup>46</sup> *STh* I-II, q. 90 a. 2 co.: “In quolibet autem genere id quod maxime dicitur, est principium aliorum, et alia dicuntur secundum ordinem ad ipsum.” *ScG* 2, 15 n. 3: “Illud igitur erit causa omnium in aliquo genere cui maxime competit illius generis praedicationem.” *De ente*, c. 6, 50–54: “illud quod dicitur maxime et uerissime in quolibet genere est causa eorum que sunt post in illo genere [...] ut in II Methaphysice dicitur.”

<sup>47</sup> *In Sent.* 4, d. 40 q. 1 a. 4 expos.: “Principium autem alicujus generis potest accipi dupliciter.”

<sup>48</sup> *In Sent.* 4, d. 40 q. 1 a. 4 expos.: “Uno modo principium quod est in genere illo; ut si primam partem lineae principium dicamus.”

<sup>49</sup> *In Sent.* 4, d. 40 q. 1 a. 4 expos.: “Alio modo principium, quia non recipit generis praedicationem, sicut principium lineae dicitur punctus.”

## 28. Measure

We have determined that the principle in any genus is something one, and that this one is the measure of everything in the genus. Here, we intend to clarify what a measure is.

### 28.1. Measure

**Measure** (*mensura* = μέτρον) is that by which the quantity of a thing is known (*id quo quantitas <rei> cognoscitur* = ὃ τὸ ποσὸν γινώσκειται).<sup>1</sup>

As ARISTOTLE says, since the *ratio* of one is to be indivisible (► 38), and since that which is in some mode indivisible in whatever genus is the measure, hence, *measure* is most properly said in that to which it belongs to be the first measure in whatever genus.<sup>2</sup> And mensuration is properly due to quantity, for that is properly measured of which the quantity is measured. Hence, *measure* most properly is said in quantity, from whence the *ratio* of *measure* is derived to the other genera. Now *measure* is nothing other than that by which the quantity of a thing is known, and the quantity of a thing is known by one or by number:

1. **By one** (*per unum* = ἐνί), as when we say, “one stadium” or “one foot.”<sup>3</sup>
2. **By number** (*per numerum* = ἀριθμῶ), as when we say, “three stadia” or “three feet.”<sup>4</sup>

Ultimately, however, every number is known by one because, taken several times, one renders whatever number.<sup>5</sup>

It follows, therefore, that every quantity—insofar as it is a quantity—is known by one.<sup>6</sup> ARISTOTLE adds *insofar as it is a quantity* (*in quantum quantitas* = ἢ ποσόν) so that this may refer to the measure of quantity, for properties and other accidents of quantity are known in another mode (► 28.4).

---

<sup>1</sup> *In Metaph.* 10, I. 2, §1938 (cf. ARISTOTLE, *Metaphysica* I.1, 1052b20): “Mensura autem nihil aliud est quam id quo quantitas rei cognoscitur.” *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “dicitur enim mensura illud per quod innotescit quantitas rei.”

<sup>2</sup> *In Metaph.* 10, I. 2, §1938 (cf. ARISTOTLE, *Metaphysica* I.1, 1052b15–21): “Dicit ergo [Philosophus] primo, quod cum ratio unius sit indivisibile esse; id autem quod est aliquo modo indivisibile in quolibet genere sit mensura; maxime dicitur in hoc quod est esse primam mensuram cuiuslibet generis. Et hoc maxime proprie dicitur in quantitate, et inde derivatur ad alia genera ratio mensurae. Mensura autem nihil aliud est quam id quo quantitas rei cognoscitur. Quantitas vero rei cognoscitur per unum aut numerum.” *In Physic.* 4, I. 20, n. 10 (cf. ARISTOTLE, *Physica* Δ.12, 221b16–20): “Mensuratio enim proprie debetur quantitati: cuius ergo quantitas [...] mensuratur, illud proprie [...] mensuratur.” *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “mensura proprie dicitur in quantitatibus.”

<sup>3</sup> *In Metaph.* 10, I. 2, §1938: “Per unum quidem, sicut cum dicimus, unum stadium, vel unum pedem.”

<sup>4</sup> *In Metaph.* 10, I. 2, §1938: “Per numerum autem, sicut dicimus tria stadia, vel tres pedes.”

<sup>5</sup> *In Metaph.* 10, I. 2, §1938 (cf. ARISTOTLE, *Metaphysica* I.1, 1052b21–22): “Ulterius autem omnis numerus cognoscitur per unum, eo quod unitas aliquoties sumpta quemlibet numerum reddit.”

<sup>6</sup> *In Metaph.* 10, I. 2, §1938 (cf. ARISTOTLE, *Metaphysica* I.1, 1052b22): “Unde relinquitur quod omnis quantitas cognoscatur per unum. Addit autem «in quantum quantitas,» ut hoc referatur ad mensuram quantitatis. Nam proprietates et alia accidentia quantitatis alio modo cognoscuntur.”

Thus, as ARISTOTLE says, that by which quantity is first known is *one itself* (*ipsum unum* = αὐτὸ ἓν), that is, the unit (*unitas* = μονάς), which is the principle of number.<sup>7</sup> *One* in other species of quantity is not *one* itself, but something to which *one* befalls (*aliquid cui accidit unum*), as when we say, “one hand” or “one magnitude.” Whence, it follows that *one itself*, which is the first measure, is the principle of number insofar as it is number.

## 28.2. Measure as a Minimum

A thing in any genus is measured by that which is a minimum (in dimensive quantity) and the first principle in its genus.<sup>8</sup>

A measure is a **minimum** in the genus of quantity either:<sup>9</sup>

1. **Simply** (*simpliciter*), as in numbers, which are measured by the unit, which is a minimum simply.<sup>10</sup>
2. **According to our (im)position** (*secundum positionem nostram*), as in continua, in which there is no minimum simply.<sup>11</sup> Whence, we posit the span (*palmum*) in the place of a minimum to measure cloth; and the stadium, to measure a road.

Thus, *quantity* conveys (*importat*) the *ratio* of *measure*, which is found first in discrete quantity—that is, in numbers.<sup>12</sup> Secondarily, (it is found) in magnitudes, and—in some other mode—in all the other genera.

Wherefrom,<sup>13</sup> the name *measure* has been transferred (*transumptum est*) to all (other) genera, so that that which is *first*, *most simple*, and *most perfect* in whatever genus is said

---

<sup>7</sup> *In Metaph.* 10, l. 2, §1939 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b23–24): “id quo primo cognoscitur quantitas est ipsum unum, idest unitas, quae est principium numeri. Nam unum in aliis speciebus quantitatis non est ipsum unum, sed aliquid cui accidit unum; sicut dicimus unam manum, aut unam magnitudinem. Unde sequitur, quod ipsum unum, quod est prima mensura, sit principium numeri secundum quod est numerus.”

<sup>8</sup> *De veritate*, q. 10 a. 1 co.: “Res autem uniuscuiusque generis mensuratur per id quod est minimum, et principium primum in suo genere, ut patet in X Metaphys.”

<sup>9</sup> *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “mensura [...] est minimum in genere quantitatis vel simpliciter [...] secundum positionem nostram.”

<sup>10</sup> *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “vel simpliciter, ut in numeris, quae mensurantur unitate, quae est minimum simpliciter.”

<sup>11</sup> *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “aut minimum secundum positionem nostram, sicut in continuis, in quibus non est minimum simpliciter; unde ponimus palmum loco minimi ad mensurandum pannos, vel stadium ad mensurandum viam.”

<sup>12</sup> *De virtutibus*, q. 5 a. 3 co.: “Quantitas autem importat rationem mensurae, quae primo quidem invenitur in numeris; secundario autem in magnitudinibus; et quodam alio modo in omnibus aliis generibus, ut patet in IX Metaph.” *In Metaph.* 10, l. 2, §1939: “ratio mensurae primo invenitur in discreta quantitate, quae est numerus.”

<sup>13</sup> *In Sent.* 1, d. 8 q. 4 a. 2 ad 3: “Exinde transumptum est nomen mensurae ad omnia genera, ut illud quod est primum in quolibet genere et simplicissimum et perfectissimum dicatur mensura omnium quae sunt in genere illo; eo quod unumquodque cognoscitur habere de veritate generis plus et minus, secundum quod magis accedit ad ipsum vel recedit, ut album in genere colorum.”

(to be the) *measure* of all those that are in that genus, since each (thing) is known to have more or less of the truth of a genus according as it approaches it or recedes from it—as white in the genus of colors.

### 28.3. One as a Measure

It belongs to the *ratio* of *one* to be a measure.<sup>14</sup> And this is maximally proper insofar as it is in quantity; and therefrom, in quality, and in the other genera, for that which is the measure must be indivisible either according to quantity or according to quality. And in this way, it follows that one should be indivisible either simply (*simpliciter*), as the unit that is the principle of number, or according to something (*secundum quid*): that is, insofar as it is one.

The reason that *one* is a measure of all things (*unum est mensura omnium* = πάντων μέτρον τὸ ἓν) is that *one* is *that at which division is terminated*; and those (material principles) from which the substance (i.e., the essence) of any one (thing) is, are known by division or resolution of the whole into (its) components, whether the parts should be according to quantity (*secundum quantitatem* = κατὰ τὸ ποσόον) or the parts should be according to species (*secundum speciem* = κατὰ τὸ εἶδος), as matter and form, and the elements of compound bodies.<sup>15</sup>

Hence, that which is one by itself (*per se unum* < τὸ ἓν) must be indivisible (*indivisible* = ἀδιαίρετον), since it is the measure by which the thing is known, for, in each (*in singulis* < ἐκάστων; i.e., in each whole), that which is first in composition—and last in resolution—is indivisible, and the thing is known by it.<sup>16</sup>

However, the indivisible is not found likewise in all things.<sup>17</sup> Some things are altogether indivisible, as the unit that is the principle of number; others are not altogether indivisible

---

<sup>14</sup> *In Metaph.* 10, l. 2, §1960 (cf. ARISTOTLE, *Metaphysica* I.1, 1053b3–8): “de ratione unius est, quod sit mensura. Et hoc maxime proprium est, prout est in quantitate; deinde in qualitate, et in aliis generibus; quia id quod est mensura, debet esse indivisible, aut secundum quantitatem, aut secundum qualitatem. Et ita sequitur, quod unum sit indivisible, aut simpliciter, sicut unitas, quae est principium numeri, aut secundum quid, id est in quantum est unum.”

<sup>15</sup> *In Metaph.* 10, l. 2, §1952 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a17–20): “Hoc autem dicto, concludit [Philosophus] epilogando quae supra dicta sunt, scilicet quod unum est mensura omnium. Cuius ratio est, quia unum est ad quod terminatur divisio. Ea vero, ex quibus est substantia uniuscuiusque, cognoscuntur per divisionem sive resolutionem totius in componentia; sive sint partes secundum quantitatem, sive sint partes secundum speciem, ut materia et forma, et elementa corporum mixtorum.”

<sup>16</sup> *In Metaph.* 10, l. 2, §1952 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a20–21): “Et ideo oportet id quod est per se unum, esse indivisible, cum sit mensura qua cognoscitur res; quia quod in singulis est primum in compositione et ultimum in resolutione, est indivisible, et per hoc cognoscitur res, ut dictum est.”

<sup>17</sup> *In Metaph.* 10, l. 2, §1953 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a21–24): “non similiter in omnibus invenitur indivisible; sed quaedam sunt omnino indivisibilia, sicut unitas quae est principium numeri. Qaedam vero non sunt omnino indivisibilia, sed indivisibilia secundum sensum, secundum quod voluit auctoritas instituentium tale aliquid pro mensura; sicut mensura pedalis, quae quidem indivisibilis est proportione, sed non natura. Nam omne continuum forsan divisibile est.”

but indivisible according to sense (*indivisibilia secundum sensum* = ἀδιαίρετα πρὸς τὴν αἴσθησιν), insofar as an authority, in instituting, wants such a thing (to be used) as a measure: for example, the foot, which is divisible in (any mathematical) ratio (*proportione*) but not in nature, for every continuum is *perhaps* divisible.

ARISTOTLE says *perhaps* (*forsan* = ἴσως) because of the doubts of some who posited that magnitudes are composed from indivisibles; or because mathematical magnitudes are infinitely divisible, while natural magnitudes are not: for example, some minimal flesh is necessarily found (and some minimal iron, water, etc.).<sup>18</sup>

#### 28.4. Indivisible

**Indivisible** is said in three (modes, i.e.), in as many modes as also **one** is said, the *ratio* of which is (taken) from *non-division* (► 38):<sup>19</sup>

##### 1. Indivisible in continuity (*continuitate*; ► 39).<sup>20</sup>

Whence, something is said to be an indivisible continuum insofar as it is not divided in act, although it is divisible in potency.<sup>21</sup>

##### 2. Indivisible according to species (*secundum speciem*), as that is said to be *one* which has one species, even if it is composed of non-continuous parts (► 38.12).<sup>22</sup>

For example, a man, a house, or even an army.<sup>23</sup>

##### 3. The altogether indivisible (*penitus indivisibile*; ► 38.13).<sup>24</sup>

For example, the unit, and the point.<sup>25</sup>

As ARISTOTLE says, the point, which is some sign (*signum*; cf. σημεῖον = στιγμή) of division between the parts of a line, and likewise everything that is a division between the parts of

---

<sup>18</sup> *In Metaph.* 10, l. 2, §1953: “Dicit autem [Philosophus] «forsan» propter dubitationem quorundam ponentium magnitudinem componi ex indivisibilibus; vel quia magnitudines naturales non dividuntur in infinitum, sed solae mathematicae. Est enim invenire minimam carnem, ut tangitur primo Physicorum.”

<sup>19</sup> *In De anima* 3, c. 5, 97–98: “indivisibile tripliciter dicitur, quot modis dicitur et unum, cuius ratio ex indiuisione est.”

<sup>20</sup> *In De anima* 3, c. 5, 99–100: “Dicitur enim uno modo aliquid unum continuitate.”

<sup>21</sup> *In De anima* 3, c. 5, 100–102 (cf. ARISTOTLE, *De anima* Γ.6, 430b6–7): “unde et id quod est continuum indivisibile dicitur in quantum non est diuisum actu, licet sit diuisibile potencia.”

<sup>22</sup> *In De anima* 3, c. 5, 135–170 (cf. ARISTOTLE, *De anima* Γ.6, 430b14–15): “ponit [Philosophus] alium modum indivisibilis: nam dicitur alio modo unum quod habet speciem unam, etiam si sit compositum ex partibus non continuis [...], et huic respondet indivisibile secundum speciem.”

<sup>23</sup> *In De anima* 3, c. 5, 139–140: “sicut homo aut domus aut etiam exercitus.”

<sup>24</sup> *In De anima* 3, c. 5, 171–173: “prosequitur [Philosophus] de indivisibili tercio modo dicto: dicitur enim unum quod est penitus indivisibile.”

<sup>25</sup> *In De anima* 3, c. 5, 173–174 (cf. ARISTOTLE, *De anima* Γ.6, 430b20–21): “ut punctus et unitas.”

a continuum, as an instant between the parts of time, and likewise other (altogether indivisibles), *are manifested to the intellect as a privation (sicut privatio = ὥσπερ ἡ στέρησις)*: that is, through the privation of the continuous and divisible.<sup>26</sup>

### 28.5. The *Ratio* of Measure Transferred from Number to Other Genera

A measure must be indivisible because *that measure is certain from which nothing can be subtracted or added*, as ARISTOTLE says.<sup>27</sup> And the *one* (itself) is the most certain measure (*mensura certissima = ἀκριβέστατον [μέτρον]*) because the *one* that is the principle of number is altogether indivisible: it does not continue to be *one* if it undergoes any addition of subtraction. But the measures of other genera imitate (*imitantur = μιμοῦνται*) this *one*, which is indivisible, taking something minimal as a measure insofar as it is possible.

Hence, as ARISTOTLE says, the *ratio* of *measure* is found first in numbers, for it belongs first and most properly to the *one* that is the principle of number.<sup>28</sup> Then, (it is found) in continuous quantities. Thereafter, however, it is transferred also to qualities insofar as in them can be found an excess of one quality above another, whether by mode of intension (*per modum intensionis*), as something is said to be whiter than another, or by mode of extension (*per modum extensionis*), as something that is in a greater surface is said to be a greater whiteness.

---

<sup>26</sup> *In De anima* 3, c. 5, 174–182 (cf. ARISTOTLE, *De anima* Γ.6, 430b20–26): “Et de hoc ostendit [Philosophus] nunc quomodo intelligatur, dicens quod *punctum*, quod est quoddam signum diuisionis inter partes lineae, *et omne* quod est diuisio inter partes continui, sicut instans inter partes temporis et sic de aliis, *et omne* quod est *sic indiuisibile* actu et potencia ut punctus, *monstratur*, id est manifestatur intellectui, *sicut priuatio*, id est per priuationem continui et diuisibilis.”

<sup>27</sup> *In Metaph.* 10, l. 2, §1945 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b35–1053a4): “Assignat [Philosophus] autem rationem, quare mensuram oportet esse aliquid indiuisibile; quia scilicet hoc est certa mensura, a qua non potest aliquid auferri vel addi. Et ideo unum est mensura certissima; quia unum quod est principium numeri, est omnino indiuisibile, nullamque additionem aut subtractionem suscipiens manet unum. Sed mensurae aliorum generum quantitatis imitantur hoc unum, quod est indiuisibile, accipiens aliquid minimum pro mensura secundum quod possibile est. Quia si acciperetur aliquid magnum, utpote stadium in longitudinibus, et talentum in ponderibus, lateret, si aliquod modicum subtraheretur vel adderetur; et semper in maiori mensura hoc magis lateret quam in minori.”

<sup>28</sup> *In De sensu* 1, c. 6, 74–83: “sicut Philosophus tradit in X Methaphisice, ratio mensurae primo quidem inuenitur in numeris, secundo in quantitibus continuis, deinde uero transfertur etiam ad qualitates secundum quod in eis potest inueniri excessus unius qualitatis super aliam siue per modum intensionis, prout aliquid dicitur alio albius, siue per modum extensionis, prout dicitur albedo maior que est in maiori superficie.” *In Metaph.* 5, l. 8, §875: “Sed tamen haec ratio mensurae, licet primo conveniat uni quod est principium numeri, tamen per quamdam similitudinem derivatur ad unum in aliis generibus, ut in decimo huius Philosophus ostendet. Et secundum hoc ratio mensurae inuenitur in quolibet genere.” Cf. *In Metaph.* 10, l. 2, §1937: “Postquam ostendit Philosophus quot modis unum dicitur, et quae sit ratio unius, ad quam omnes modi reducuntur, scilicet esse indiuisibile; hic ex hac ratione unius ostendit quamdam eius proprietatem, scilicet esse mensuram: [...] ostendit, quomodo uni competit ratio mensurae, et aliis generibus accidentium. [...] ostendit quomodo unum habens rationem mensurae inueniatur in substantia [...] ostendit in quo genere primo inueniatur unum habens rationem mensurae; et quomodo exinde ad alia derivetur secundum propriam rationem mensurae. [...] ponit quomodo derivetur ad alia secundum quamdam similitudinem [...] ostendit ubi primo sit unum rationem mensurae habens, et quomodo exinde ad alia fiat derivatio [...] ostendit quomodo unum quod est mensura inueniatur in quantitate, et exinde ad alia genera derivetur [...] et] in qua specie quantitatis est primo [...] et] quomodo derivetur in alias species quantitatis.”

Thus, according to some (analogical) likeness (*secundum quamdam similitudinem*), the *ratio* of *measure* is derived from (the one in) *number* into a *one* in quality and in the other genera: *just as the one that is the measure of number is indivisible, so in all other genera of quantity something one, indivisible is the measure and principle.*<sup>29</sup>

For example, in measuring lines, men use as indivisible the measure of one foot.<sup>30</sup>

Everywhere, something indivisible—which is simple either according to quantity or according to quality—is sought as a measure (*pro mensura*):<sup>31</sup>

**1. According to quantity** (*secundum quantitatem* = τῷ ποσῶ), as the unit (is the measure) in number and the foot is a measure in lines.<sup>32</sup>

**2. According to quality** (*secundum qualitatem* = τῷ ποιῶ), as white is in some mode the measure of colors.<sup>33</sup>

In any genus, that which is most simple and most perfect is the measure of all others, for any one thing is the more perfect the more it approaches (*accedit*) the first principle of its genus.<sup>34</sup> Everything that is a measure is first of its genus and most simple.<sup>35</sup> And conversely, everything that is first and most simple is the measure (of its genus).

Hence, all take this (i.e., something indivisible) as a measure, both in liquids (*in humidis*), such as oil and wine, in solids, such as grain and barley, in weights and dimensions, which

---

<sup>29</sup> *In Metaph.* 10, l. 2, §1944 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b31–32): “ostendit [Philosophus] qualiter a numero derivetur ratio mensurae ad alia. [...] Dicit ergo primo, quod hoc modo derivatur ratio mensurae a numero ad alias quantitates, quod sicut unum quod est mensura numeri est indivisibile, ita in omnibus aliis generibus quantitatis aliquod unum indivisibile est mensura et principium.” Cf. §1937.

<sup>30</sup> *In Metaph.* 10, l. 2, §1944 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b32–33): “Sicut in mensuratione linearum utuntur homines quasi indivisibili, «mensura pedali,» idest unius pedis.”

<sup>31</sup> *In Metaph.* 10, l. 2, §1944 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b33–35): “ubique enim quaeritur pro mensura aliquid indivisibile, quod est aliquod simplex, vel secundum qualitatem, vel secundum quantitatem.”

<sup>32</sup> *In Metaph.* 10, l. 2, §1944 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b35): “Secundum quantitatem vero, ut unitas in numero, et mensura pedalis in lineis.”

<sup>33</sup> *In Metaph.* 10, l. 2, §1944 (cf. ARISTOTLE, *Metaphysica* l.1, 1052b35): “Secundum qualitatem quidem, ut album in coloribus, quod quodammodo est mensura colorum, ut dicitur infra.”

<sup>34</sup> St. Thomas uses here the example of white among colors, and of daily motion among motions. The former is valid if we take it to mean that all colors derive from white as from something one. The latter example can be replaced in modern science with the motion of the whole universe. *De virtutibus*, q. 5 a. 3 co.: “In quolibet enim genere id quod est simplicissimum et perfectissimum, est mensura omnium aliorum, ut in coloribus albedo, et in motibus motus diurnus; eo quod unaquaeque res tanto perfectior est, quanto magis accedit ad primum sui generis principium.”

<sup>35</sup> *STh* I, q. 66 a. 4 ad 3: “omnia mensurantur primo sui generis.” *Quodlibet* 5, q. 4 co.: “semper illud quod est simplicissimum, est mensura in quolibet genere, sicut dicitur in X *Metaph.*” *In De div. nom.*, c. 5, l. 1: “principium in quolibet genere et est mensura eorum quae sunt in genere illo.” *In Physic.* 8, l. 20, n. 2 (cf. ARISTOTLE, *Physica* Θ.9, 265b8–11): “omnia enim mensurantur primo sui generis, ut in X *Metaphys.* ostenditur. Et sic ista proposito convertibilis est: omne quod est mensura, est primum sui generis; et omne quod est primum, est mensura.”

are signified (in ARISTOTLE's text) by *heavy* and *magnitude* (< καὶ βάρους καὶ μεγέθους), which (measure) is first found such that some unknown sensible (quantity) cannot be taken away from or added to it.<sup>36</sup> And then they reckon to know the quantity of a thing with certitude (*certitudinaliter*) when they know (it) through such a minimum measure.

For example, in (the genus of) heaviness (*in gravitate* = ἐν βάρει), a weight (*ponderum*) such as the ounce or mina (*uncia, sive mna* = μνᾶ)—that is, something minimum—is taken as one, indivisible by supposition (*per suppositionem*), which is not, however, altogether simple, for whatever weight is divisible into smaller weights.<sup>37</sup>

Likewise, men measure motion by a uniform and quickest motion that has the minimum of time.<sup>38</sup> Hence, they take in astronomy such principle in order to measure.

And since the lowness and highness of sounds occurs from the quickness and slowness of motion, as determined in music (i.e., harmonics), ARISTOTLE supplies the example of measuring concerning sounds, saying that in music, the first measure is the difference of two semitones, for the tone is divided into two unequal semitones.<sup>39</sup> Likewise, in voices, the measure is the element (i.e., the syllable), since also the shortness or longness of voices follow upon the quickness or slowness of motion; and the vocal phoneme is more a one and a first than the consonant.

All these measures are something one: but not in such a way that some measure would be common to all things; rather, because any measure is in itself something one.<sup>40</sup>

---

<sup>36</sup> *In Metaph.* 10, l. 2, §1946 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a5–8): “Et ideo omnes accipiunt hoc pro mensura tam in humidis, ut est oleum et vinum, quam in siccis, ut est granum et hordeum, quam in ponderibus et dimensionibus, quae significantur per grave et magnitudinem; quod primo invenitur tale, ut ab eo non possit aliquid auferri sensibile vel addi quod lateat. Et tunc putant se cognoscere quantitatem rei certitudinaliter, quando cognoscunt per huiusmodi mensuram minimam.”

<sup>37</sup> *In Post. an.* 1, l. 36, 238–243 (cf. ARISTOTLE, *Analytica Posteriora* A.23, 84b38): “in gravitate ponderum accipitur ut unum indivisibile *uncia* siue *mna*, idest quoddam minimum pondus, quod tamen non est simplex omnino, quia quodlibet pondus est diuisibile in minora pondera, set accipitur ut simplex per suppositionem.”

<sup>38</sup> Although St. Thomas refers us to diurnal motion, the same principle is at work in atomic clocks. *In Metaph.* 10, l. 2, §1947 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a8–12): “etiam motum mensurant homines «motu simplici,» idest uniformi et velocissimo quod habet minimum de tempore. Et ideo in astrologia accipiunt tale principium ad mensurandum. Accipiunt enim motum primi caeli, scilicet motum diurnum, qui est regularis et velocissimus, ad quem iudicant et mensurant omnes alios motus.”

<sup>39</sup> *In Metaph.* 10, l. 2, §1948 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a12–13): “Et quia ex velocitate et tarditate motuum contingit gravitas et acuitas in sonis, ut determinatur in musica, subdit exemplum de mensuratione sonorum; dicens, quod in musica prima mensura «diesis est,» idest differentia duorum semitonorum. Tonus enim dividitur in duo semitona inaequalia, ut in musica probatur. Et similiter in voce, mensura est elementum, quia etiam brevitatem et longitudo vocis velocitatem et tarditatem motus consequitur.” *In Metaph.* 5, l. 8, §873 (cf. ARISTOTLE, *Metaphysica* Δ.6, 1016b21–23): “In vocibus autem unum primum et minimum est litera vocalis, aut consonans; et magis vocalis quam consonans.”

<sup>40</sup> *In Metaph.* 10, l. 2, §1949 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a13–14): “Omnes autem istae mensurae sunt aliquid unum: non ita quod aliqua mensura sit communis omnibus; sed quia quaelibet mensura in se est aliquid unum.”

## 28.6. Homogeneity of Measure and Measured

All those (things) that pertain to measure are in some mode conveyed (*importantur*) either through the mode of continuous quantity or (through the mode) of discrete (quantity).<sup>41</sup> Yet, the measure must always be a cognate (*cognatum* = συγγενής): that is, of the same nature or measure with the (thing) measured, just as the measure of magnitudes must be a magnitude.<sup>42</sup>

However, it is not enough for a measure to agree (*conveniat*) in a common nature, as all magnitudes (e.g., lines, surfaces, and bodies) agree (in that each is a *magnitude*): there must be an agreement of the measure to the thing measured in a *special* nature according to each (*secundum unumquodque* = καθ' ἕκαστον, i.e., according to each genus), such that the measure of a longitude would be a longitude; of a latitude, a latitude; a voice, of a voice; a weight, of a weight; and a unit, of units.<sup>43</sup>

It is in this way (i.e., that a *unit is the measure of units*) that we must take (the homogeneity between unit and units) in order that we may speak without fallacy (*absque calumnia*),<sup>44</sup> and not that that a number should be the measure of numbers, for it is not *number* that has the *ratio* of *first measure*, but *unit*. And if a unit is the measure, we ought to say—to signify the agreement between measure and measured—that a unit is the measure of units, and not of numbers.

However, if the truth of the thing is considered, this must also be conceded: that a *number is the measure of numbers* and (that) a *unit (is the measure) of numbers* should be taken likewise too.<sup>45</sup> However, because of the difference that is seen to exist between *unit* and

---

<sup>41</sup> *In Sent.* 4, d. 16 q. 3 a. 1 qc. 2 ad 6: “omnia quae ad mensuram pertinent vel per modum quantitatis continuae vel discretuae, importantur in quomodo.”

<sup>42</sup> *In Metaph.* 10, l. 2, §1954 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a24–25): “«metrum,» idest mensura, semper debet esse cognatum, scilicet eiusdem naturae vel mensurae, cum mensurato: sicut mensura magnitudinum debet esse magnitudo.”

<sup>43</sup> *In Metaph.* 10, l. 2, §1954 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a25–27): “non sufficit quod conveniat in natura communi, sicut omnes magnitudines conveniunt: sed oportet esse convenientiam mensurae ad mensuratum in natura speciali secundum unumquodque, sic quod longitudinis sit longitudo mensura, latitudinis latitudo, vox vocis, et gravitas gravitatis, et unitatum unitas.”

<sup>44</sup> *In Metaph.* 10, l. 2, §1955 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a27–30): “Sic enim oportet accipere ut absque calumnia loquamur; sed non quod numerorum mensura sit numerus. Numerus autem non habet rationem mensurae primae, sed unitas. Et si unitas mensura est, ad significandum convenientiam inter mensuram et mensuratum, oportet dicere, quod unitas sit mensura unitatum, et non numerorum.”

<sup>45</sup> *In Metaph.* 10, l. 2, §1955 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a30): “Et tamen si rei veritas attendatur, oportebit hoc etiam concedere, quod numerus esset mensura numerorum, aut etiam unitas numerorum similiter acciperetur. Sed non similiter dignum videtur dicere unitatem esse mensuram unitatum, et numerum numeri, vel unitatem numeri; propter differentiam, quae videtur esse inter unitatem et numerum. Sed istam differentiam observare, idem est, ac si quis dignum diceret quod unitates essent mensurae unitatum, sed non unitas; quia unitas differt ab unitatibus ut singulariter prolatum ab his quae pluraliter proferuntur. Et similis ratio est de numero ad unitatem; quia numerus nihil aliud est quam pluralitas unitatum. Unde nihil aliud est dicere unitatem esse mensuram numeri, quam unitatem esse mensuram unitatum.”

*number*, it does not seem as worthy to say that *a unit is the measure of units* and (that) *a number (is the measure) of numbers*, or (that) *a unit (is the measure) of number*. However, it is the same to observe this difference even if someone should say that it is worthy that *units*—and not *a unit*—should be the measures of units, for *a unit* differs from *units* as (that which is) singularly proffered (differs) from those that are plurally proffered. And the *ratio* of *number* to *unit* is alike, for **number** is nothing other than *a plurality of units* (*pluralitas unitatum* = πλῆθος μονάδων). Whence, to say that *a unit is the measure of number* is nothing other than (to say that) *a unit is a measure of units*.

(To summarize), principles must be taken from the same genus, for each thing is measured by something of its own genus.<sup>46</sup> And the *ratio* of *measure* must be taken from the (thing) measured.<sup>47</sup>

### 28.7. Intrinsic vs. Extrinsic Measure

Measure is twofold:<sup>48</sup>

**1. Intrinsic**, which is in the thing measured as an accident in a subject; and this is multiplied to multiply the thing measured.<sup>49</sup>

For example, multiple lines measure the length of multiple equal bodies.<sup>50</sup>

**2. Extrinsic**, which does not need to be multiplied to multiply the things measured: instead, it is (something) one as *in a subject (in relation) to which* many are measured.<sup>51</sup>

For example, many cloths are measured (in relation) to the length of one fathom.<sup>52</sup>

### 28.8. Not of One Genus Simply

A measure, insofar as it is the principle of knowing the thing measured, is indeed of one genus with the thing measured—but *not simply (non simpliciter)*.<sup>53</sup> This is evident in that

<sup>46</sup> *STh* III, q. 55 a. 5 co.: “oportet enim principia ex eodem genere assumi, ut dicitur in I Posteriorum.” *In Physic.* 4, l. 20, n. 2 (cf. ARISTOTLE, *Physica* Δ.12, 220b32–221a7): “unumquodque mensuratur per aliquid sui generis, ut dicitur in X Metaphysicae.”

<sup>47</sup> *In Sent.* 2, d. 2 q. 1 a. 1 co.: “oportet enim rationem mensurae ex mensurato accipere.”

<sup>48</sup> *In Sent.* 2, d. 2 q. 1 a. 2 ad 1: “mensura est duplex.”

<sup>49</sup> *In Sent.* 2, d. 2 q. 1 a. 2 ad 1: “Quaedam intrinseca, quae est in mensurato sicut accidens in subjecto; et haec multiplicatur ad multiplicationem mensurati.”

<sup>50</sup> *In Sent.* 2, d. 2 q. 1 a. 2 ad 1: “sicut plures lineae sunt quae mesurant longitudinem plurium corporum aequalium.”

<sup>51</sup> *In Sent.* 2, d. 2 q. 1 a. 2 ad 1: “Est etiam quaedam mensura extrinseca; et hanc non est necesse multiplicari ad multiplicationem mensuratorum, sed est in uno sicut in subjecto ad quod multa mesurantur.”

<sup>52</sup> *In Sent.* 2, d. 2 q. 1 a. 2 ad 1: “sicut multi panni mesurantur ad longitudinem unius ulnae.”

<sup>53</sup> *De veritate*, q. 8 a. 11 ad 11: “mensura, in quantum est principium cognoscendi mensuratum est unius generis cum mensurato, sed non simpliciter; sicut patet quod ulna est mensura panni, et non convenit cum eo nisi in quantitate: sic enim est mensura eius.” *In Physic.* 4, l. 23, n. 12: “Illud enim quod

a fathom is a measure for cloth but agrees with it only in quantity—and it is in this way alone that it is its measure. Thus, when a measure is taken of one genus, that which is measured is not diverse from the measure. Rather, multiple measures make up one whole, as multiple units make up one number—and multiple measures of cloth make up a quantity of cloth.

### 28.9. Not Necessarily One in Number

Although that which is a measure has the *ratio* of *one* insofar as it attains indivisibility, it need not be something one in number.<sup>54</sup> Sometimes, the things that measure are multiple (although they are taken as something indivisible, and therefore *one*).

For example, in (the qualitative genus of) melodies (*in melodiis* = ἐν μέλει) or consonant (sounds), what is taken as *one*, *principle*, *measure* is either: (1) the tone (*tonus*), which consists in the ratio of 8 : 9 (*sesquioctava proportione*, i.e., a ratio containing within itself the whole of eight and one eighth of eight; ► 5.2, the superparticular species of ratio); or (2) the semitone (*diesis* = δίεσις), for the tone is divided into two unequal semitones, and the minimal semitone is called *diesis*, which is the minimum in consonant (sounds).<sup>55</sup> Thus, in melodies, (the things that are used as a measure) are two (unequal) semitones, even if they are not (separately) discernible in hearing due to their smallness, for sense does not perceive very small differences; yet, their difference is perceived in the *ratios* (*in rationibus* = ἐν τοῖς λόγοις): that is, according to diverse *ratios* of proportions, since they are caused from diverse numerical ratios (► 6.4).

Likewise, too, that by which we measure voices is multiple, for the quantity of one meter or of one foot is measured from diverse syllables, of which some are short and others (are) long.<sup>56</sup>

---

mensuratur, non videtur esse aliud quam mensura: sed multae mensurae videntur facere unum totum, sicut multae unitates unum numerum, et multae mensurae panni unam quantitatem panni. Et hoc verum est, quando accipitur mensura unius generis.” Cf. ARISTOTLE, *Physica* Δ.15, 223b33–224a2: “τὸ μέτρον οὐδὲν ἄλλο παρεμφαίνεται τῷ μετρομένῳ, ἀλλ’ ἢ πλείω μέτρα τὸ ὅλον.”

<sup>54</sup> *In Metaph.* 10, l. 2, §1950 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a14–16): “licet id quod est mensura habeat rationem unius, in quantum accedit ad indivisibilitatem, non tamen necessarium est unum numero esse quod mensurat. Sed aliquando plura sunt mensurantia.”

<sup>55</sup> *In Metaph.* 10, l. 2, §1950 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a14–16): “sicut in melodiis sunt duae dieses, id est duo semitona. Sed propter parvitatem non discernitur secundum auditum. Nam sensus non percipit differentiam valde parvorum, sed eorum differentia percipitur in rationibus, id est secundum diversas rationes proportionum, quia ex diversis proportionibus numeralibus causantur.” *In Metaph.* 5, l. 8, §873 (cf. ARISTOTLE, *Metaphysica* Δ.6, 1016b21–23): “In genere enim consonantiarum est unum, quod est diesis, quod est minimum in consonantiis. Diesis enim est semitonium minus. Dividitur enim tonus in duo semitonia inaequalia, quorum unus dicitur diesis.” *In Post. an.* 1, l. 36, 243–246 (cf. ARISTOTLE, *Analytica Posteriora* A.23, 84b38–39): “in melodiis autem accipitur ut unum principium *tonus*, qui consistit in sesquioctava proportione, uel *diesis*, quod <est> differentia toni et semitonii.”

<sup>56</sup> *In Metaph.* 10, l. 2, §1951 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a17): “Similiter etiam voces quibus etiam mensuramus, plures sunt. Quantitas enim unius metri vel unius pedis, mensuratur ex diversis syllabis, quarum aliae sunt breves, et aliae longae.”

Likewise, too, (that by which we measure) the diameter of the circle or of the square is (something multiple).<sup>57</sup>

Indeed, whatever magnitude is measured by two (magnitudes), for an unknown quantity is found only by two known quantities.<sup>58</sup>

### 28.10. Cognition as Measuring

ARISTOTLE shows how measure is transferred to some (other genera) according to likeness (*secundum similitudinem*).<sup>59</sup> He says that, since it has been said that *measure* is *that by which the quantity of a thing is known*, we say that science (*scientia* = ἐπιστήμη) is the measure of things (*mensuram rerum* = μέτρον τῶν πραγμάτων) knowable by science (*scibilium*), and sense knowledge (*sensum* = αἴσθησις, is the measure) of (things) knowable by sense (*sensibilium*), since we know something by them: namely, by sense knowledge (we know) things knowable by sense; and by science (we know) things knowable by science. Not, however, in the same mode as a measure, for by a measure something is known as by a principle of knowing, while by scientific and sense knowledge (something is known) as by a cognitive potency or (by) a cognitive habit (which is a mean between the potency and the act: e.g., the habit of geometry).

Hence, by this likeness, (science and sense) are said (to be) *measures*, for, according to the truth of the thing, rather than measuring, they are measured. Indeed, not because we sense or scientifically know something it is so in the nature of things (i.e., in reality): rather, because it is so in the nature of things, we truly sense or scientifically know something.<sup>60</sup> And thus, it happens to us that, in (the act of) sensing and scientifically knowing, we are measured by the things that are outside of us.

In (the act of) knowing and measuring ourselves, as by something else that measures us, we know how much we are in corporeal quantity through a cubital measure applied to

---

<sup>57</sup> *In Metaph.* 10, l. 2, §1951 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a17–18): “Similiter etiam est diameter circuli vel quadrati, et etiam latus quadrati.”

<sup>58</sup> *In Metaph.* 10, l. 2, §1951 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a17): “et quaelibet magnitudo mensuratur duobus: non enim invenitur quantitas ignota nisi per duas quantitates notas.”

<sup>59</sup> *In Metaph.* 10, l. 2, §1956 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a31–32): “Ostendit [Philosophus] qualiter mensura transfertur ad quaedam secundum similitudinem; dicens, quod cum dictum sit quod mensura est, qua quantitas rei cognoscitur, dicemus scientiam esse mensuram rerum scibilium et sensum rerum sensibilium, quia ipsis aliquid cognoscimus, sensu scilicet sensibilia et scientia scibilia. Non tamen eodem modo sicut mensura. Nam per mensuram cognoscitur aliquid sicut per principium cognoscendi: per sensum autem et scientiam sicut per potentiam cognoscitivam, aut habitum cognoscitivum.”

<sup>60</sup> *In Metaph.* 10, l. 2, §1957 (cf. ARISTOTLE, *Metaphysica* I.1, 1053a32–33): “Sic igitur per hanc similitudinem dicuntur mensurae, quia secundum rei veritatem magis mensurantur quam mensurent. Non enim quia nos aliquid sentimus aut scimus, ideo sic est in rerum natura. Sed quia sic est in rerum natura, ideo vero aliquid scimus, aut sentimus, ut dicitur nono Metaphysicorum. Et sic accidit nobis, quod in sentiendo et sciendo mensuramur per res quae extra nos sunt.”

us.<sup>61</sup> And thus, just as the externally applied cubit is the measure of our corporeal quantity, so things scientifically known or apprehended by sense are the measure through which it can be known whether we truly know something by sensing or by understanding.

On the other hand, if there is a science that is the cause of the thing known, it must be its measure.<sup>62</sup> For example, the science of the artificer is the measure of artifacts, since each of the artifacts is perfect according as it attains a likeness to the art.

On the other hand, PROTAGORAS said that man is the measure of all things insofar as he knows or senses because science and sense are the measure of sensible and knowable substances, for the Protagoreans said that things are such because we so sense them or we so opine about them.<sup>63</sup> Hence, though saying nothing great, they seem however to say something, for they secretly insinuate what they want to say.

### 28.11. Thing and Understanding Compared as Measure

Something (*aliqua res*) is compared to understanding (*ad intellectum*) in two modes:<sup>64</sup>

#### 1. As measure to measured (*sicut mensura ad mensuratum*).<sup>65</sup>

Natural things are compared to the human speculative understanding in this mode.<sup>66</sup> Hence, an understanding is said to be true insofar as it is conformed (*conformatur*) to the thing; and false, insofar as it is inconsistent (*discordat*) with the thing.

A natural thing is not said to be true by comparison to our intellect, as the ancient natural (scientists) posited, estimating the truth of things to be only in seeming (to be).<sup>67</sup> According

---

<sup>61</sup> *In Metaph.* 10, l. 2, §1958 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a33–35): “Nobis autem cognoscentibus et mensurantibus, sicut aliquo alio nos mesurante, cognoscimus quanti sumus in quantitate corporali per mensuram cubitalem applicatam nobis. Et sic sicut cubitus exterius appositus est mensura quantitatis corporalis nostrae, ita res scitae vel per sensum apprehensae, sunt mensurae per quas potest sciri utrum vere cognoscamus aliquid per sensum vel per intellectum.”

<sup>62</sup> *In Metaph.* 10, l. 2, §1959: “Si qua vero scientia est quae est causa rei scitae, oportebit quod sit eius mensura. Ut scientia artificis est mensura artificiorum; quia unumquodque artificiatum secundum hoc perfectum est, quod attingit ad similitudinem artis. Et hoc modo se habet scientia Dei respectu omnium.”

<sup>63</sup> *In Metaph.* 10, l. 2, §1959 (cf. ARISTOTLE, *Metaphysica* l.1, 1053a35–b3): “Sed Protagoras dixit hominem esse mensuram omnium rerum in quantum est sciens aut sentiens, quia scientia et sensus sunt mensura substantiarum, scilicet sensibilium et scibilium. Dicebant enim Protagorici, ut in quarto habitum est, quod res sunt tales, quia sic sentimus eas, vel sic opinamur in eis. Cum igitur nihil superabundans vel magnum dicant, videntur tamen aliquid dicere, quia occulte insinuant quae dicere volunt.”

<sup>64</sup> *In Peri.* 1, l. 3, 114–115: “Considerandum autem quod aliqua res comparatur ad intellectum dupliciter.”

<sup>65</sup> *In Peri.* 1, l. 3, 116: “Vno modo sicut mensura ad mensuratum.”

<sup>66</sup> *In Peri.* 1, l. 3, 116–120: “et sic comparantur res naturales ad intellectum speculativum humanum. Et ideo intellectus dicitur verus secundum quod conformatur rei, falsus autem secundum quod discordat a re.”

<sup>67</sup> *In Peri.* 1, l. 3, 120–127: “Res autem naturalis non dicitur esse vera per comparisonem ad intellectum nostrum, sicut posuerunt quidam antiqui Naturales, estimantes rerum veritatem esse solum in hoc quod est uideri: secundum hoc enim sequeretur quod contradictoria essent simul vera, quia contradictoria cadunt sub diversorum opinionibus.”

to this (opinion), it would follow that contradictories should be simultaneously true, since contradictories fall under the opinions of diverse (thinkers).

Things are said (to be) true or false in comparison to our understanding not essentially or formally but effectively: namely, insofar as they are naturally apt to produce of themselves (*de se*) a true or a false estimation.<sup>68</sup> And according to this, gold is said (to be) *true* or *false*.

## 2. As measured to measure (*sicut mensuratum ad mensuram*).<sup>69</sup>

This is evident in practical understanding, which is a cause of things.<sup>70</sup> Whence, the work of the artificer is said to be true insofar as it attains the *ratio* of the art and false insofar as it falls short of the *ratio* of the art.<sup>71</sup>

### 28.12. Truth as Comparison to a Measure

(Again), that which is the principle of knowing is not the same in all genera: the principles of diverse genera are diverse.<sup>72</sup>

Just as a thing is said (to be) *true* by comparison to its measure, so, too, sensing and understanding (are said to be true by comparison to their measure), whose measure is the thing outside the soul.<sup>73</sup> Whence, sense is said (to be) *true* when, by (its) form, it

---

<sup>68</sup> *In Peri.* 1, l. 3, 127–132: “Dicuntur tamen aliqua res uera uel falsa per comparisonem ad intellectum nostrum, non essentialiter uel formaliter, sed effectiue, in quantum scilicet nata est facere de se ueram uel falsam estimationem; et secundum hoc dicitur aurum uerum uel falsum.”

<sup>69</sup> *In Peri.* 1, l. 3, 133–134: “Alio uero modo res comparantur ad intellectum sicut mensuratum ad mensuram.”

<sup>70</sup> *In Peri.* 1, l. 3, 134–138: “ut patet in intellectu practico, qui est causa rerum. Vnde opus artificis dicitur esse uerum in quantum attingit ad rationem artis, falsum uero in quantum deficit a ratione artis.”

<sup>71</sup> As St. Thomas immediately explains, all—even natural—things are compared to divine understanding as artefacts to art. Consequently, anything is said to be true insofar as it has a proper form whereby divine art is imitated, for false gold is true pyrite. And in this mode, being (*ens*) and true (*verum*) are convertible, since any natural thing conforms to divine art by its form. Whence, ARISTOTLE calls form *something divine*. *In Peri.* 1, l. 3, 138–147: “Et quia omnia, etiam naturalia, comparantur ad intellectum diuinum sicut artificialia ad artem, consequens est ut quelibet res dicatur esse uera secundum quod habet propriam formam secundum quam imitatur artem diuinam: nam falsum aurum est uerum aurum. Et hoc modo ens et uerum conuertuntur, quia quelibet res naturalis per suam formam arti diuine conformatur. Vnde et Philosophus in I Physicorum formam nominat quicquam diuinum.” See *In Physic.* 1, l. 15, n. 7 (cf. ARISTOTLE, *Physica* A.15, 192a13–19): “forma est quoddam diuinum et optimum et appetibile. Diuinum quidem est, quia omnis forma est quaedam participatio similitudinis diuini esse, quod est actus purus: unumquodque enim in tantum est actu in quantum habet formam. Optimum autem est, quia actus est perfectio potentiae et bonum eius: et per consequens sequitur quod sit appetibile, quia unumquodque appetit suam perfectionem.”

<sup>72</sup> *In Metaph.* 5, l. 8, §873 (cf. ARISTOTLE, *Metaphysica* Δ.6, 1016b21–23): “Hoc autem unum, quod est principium cognoscendi, non est idem in omnibus generibus.” *In De anima* 1, c. 12, 69: “diuersorum generum diuersa sunt principia.”

<sup>73</sup> *In Peri.* 1, l. 3, 149–157: “Et, sicut dicitur res uera per comparisonem ad suam mensuram, ita etiam et sensus uel intellectus, cuius mensura est res extra animam: unde sensus dicitur uerus quando per formam <suam> conformatur rei extra animam existentis. Et sic intelligitur quod sensus proprii sensibilis sit uerus. Et hoc etiam modo intellectus apprehendens quod quid est absque compositione et diuisione semper est uerus, ut dicitur in III De anima.” See *In De anima* 3, c. 5, 216–242 (cf. ARISTOTLE, *De anima*

conforms to the thing that exists outside the soul: it is in this way that sensing of the proper sensible (object) is true. And also, in this mode, the intellect that apprehends an essence (*quod quid est*), without composition or division, is always true.

Nonetheless, one ought to consider that, although the sensing of the proper object is true, (sense) does not know this (to be) true, for it cannot know the habitude of its conformity to the thing: rather, it only apprehends the thing.<sup>74</sup> On the other hand, the intellect can know in this mode the habitude of conformity. Hence, only the intellect can know truth. Whence, ARISTOTLE says that truth is only in the mind: namely, as in that which is cognizant of the truth; but to know the aforesaid habitude of conformity is only to judge that the thing is—or is not—so, which is to compose and divide. Hence, the intellect knows truth only (by) composing or dividing through its judgment, which judgment, if it should accord with (*consonet*) things, will be true: for example, when the intellect judges that a thing that is, is; or that a thing that is not, is not; and (it will be) false when it discords (*dissonat*) from the thing: for example, when it judges that what is, is not; or that what is not, is. Whence, it is evident that truth and falsehood, as (existing) in one who knows and says, is only about composition and division.

[Since voices are signs of understandings,<sup>75</sup> that voice will be true which signifies a true understanding; and (that voice will be) false which signifies a false understanding,

---

Γ.6, 430b26–30): “dicit [Philosophus] quod *dictio* qua dicit intellectus *aliquid de aliquo*, sicut contingit in affirmatione, semper est *uera aut falsa*, set *intellectus non* semper est uerus aut falsus, quia est intellectus incomplexorum qui neque est uerus neque falsus quantum ad id quod intelligitur: ueritas enim et falsitas consistit in quadam comparatione unius ad alterum, que quidem est in compositione et diuisione intellectus, non autem in intelligibili incompleto. Set tamen, licet ipsum intelligibile incompleto non sit neque uerum neque falsum, tamen intellectus intelligendo ipsum uerus est in quantum adequatur rei intellecte; et ideo subdit quod intellectus *qui est ipsius quid est secundum hoc quod aliquid erat esse*, id est secundum quod intelligit quid est res, *uerus est semper, et non secundum quod intelligit aliquid de aliquo*. Et huius rationem assignat quia quod quid est est proprium obiectum intellectus, unde, sicut uisus nunquam decipitur in proprio obiecto, ita nec intellectus in cognoscendo quod quid est, unde intellectus nunquam decipitur in cognoscendo quod quid est homo; set, sicut uisus non semper uerus est in iudicando de hiis que sunt adiuncta proprio obiecto, puta *si album est homo uel non*, sic nec intellectus semper est uerus in componendo aliquid alicui.”

<sup>74</sup> *In Peri.* 1, l. 3, 158–180: “Est autem considerandum quod, quamuis sensus proprii obiecti sit uerus, non tamen cognoscit hoc uerum: non enim potest cognoscere habitudinem conformitatis sui ad rem, set solam rem apprehendit; intellectus autem potest huiusmodi habitudinem conformitatis cognoscere, et ideo solus intellectus potest cognoscere ueritatem: unde et Philosophus dicit in VI Metaphisice quod ueritas est solum in mente, scilicet sicut in cognoscente ueritatem. Cognoscere autem predictam conformitatis habitudinem nichil est aliud quam iudicare ita esse in re uel non esse, quod est componere et diuidere, et ideo intellectus non cognoscit ueritatem nisi componendo uel diuidendo per suum iudicium. Quod quidem iudicium, si consonet rebus, erit uerum, puta cum intellectus iudicat rem esse que est, uel non esse que non est, falsum autem quando dissonat a re, puta cum iudicat non esse quod est uel esse quod non est. Vnde patet quod ueritas et falsitas sicut in cognoscente et dicente non est nisi circa compositionem et diuisionem. Et hoc modo hic Philosophus loquitur.” Cf. ARISTOTLE, *Metaphysica* E.4, 1027b25–27: “οὐ γὰρ ἔστι τὸ ψεῦδος καὶ τὸ ἀληθές ἐν τοῖς πράγμασιν, οἷον τὸ μὲν ἀγαθὸν ἀληθές τὸ δὲ κακὸν εὐθὺς ψεῦδος, ἀλλ’ ἐν διανοίᾳ.”

<sup>75</sup> *In Peri.* 1, l. 3, 181–187: “[Et, quia uoces sunt signa intellectuum, erit uox uera que significat uerum intellectum, falsa autem que significat falsum intellectum, quamuis uox, in quantum est res quedam, dicatur uera sicut et alie res; unde hec uox: «Homo est asinus», est uera uox et uerum signum, set, quia

although a voice—as also other things—is said (to be) *true* insofar as it is something (*res quaedam*). Whence, the voice “Homer is an ass” is a true voice and a true sign. However, since it is a sign of a false (understanding), it is said (to be) *false*.]

---

est signum falsi, ideo dicitur falsa.]” We include this text in brackets because the Leonine edition’s critical apparatus notes the following: “*Hi uersus adnotatio quaedam ipsius Thomae esse uidentur, quae cum in margine addita esset, non loco inserta est.*”

## 29. In a Genus

We examine here how something is said to be in a genus.

### 29.1. To Be in Something

ARISTOTLE posits eight modes in which something is said **to be in something** (*aliquid in aliquo dicitur esse* < ἄλλο ἐν ἄλλῳ λέγεται):<sup>1</sup>

1. As a **part in its whole** (*pars in < suo > toto* = τὸ μέρος ἐν τῷ ὅλῳ).<sup>2</sup> For example, as a finger is said to be in a hand.
2. As a **whole in (its) parts** (*totum... in partibus* = τὸ ὅλον ἐν τοῖς μέρεσιν), for a whole is not other than its parts (*praeter partes* = παρὰ τὰ μέρη).<sup>3</sup>
3. As a **species in its genus** (*species in < suo > genere* = εἶδος ἐν γένει).<sup>4</sup> For example, as *man* is said to be in *animal*.
4. As a **genus in its species** (*genus... in speciebus* = τὸ γένος ἐν τῷ εἴδει), for the genus (e.g., *animal*) is part of the definition of the species (e.g., *man*), as is the difference (e.g., *rational*); whence, both genus and difference (e.g., *animal* and *rational*) are somehow said to be in the species (e.g., *man*) as parts in a whole (► 13.16).<sup>5</sup>
5. As a **form in matter** (*forma in materia* = τὸ εἶδος ἐν τῇ ὕλῃ), whether it is an accidental form in (its) subject or a substantial form in (its) matter.<sup>6</sup>
6. As a **thing moved (quod movetur) in the first mover** (*in primo motivo* = ἐν τῷ πρώτῳ κινήτικῳ).<sup>7</sup> For example, as the affairs of the Greeks are said to be in the king of Greece.

---

<sup>1</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a14–23): “Ponit ergo [Philosophus] octo modos quibus aliquid in aliquo dicitur esse.”

<sup>2</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a15–16): “Quorum primus est, sicut digitus dicitur esse in manu, et universaliter quaecumque alia pars in suo toto.”

<sup>3</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a16–17): “Secundus modus est, prout totum dicitur esse in partibus. Et quia iste modus non est adeo consuetus sicut primus, ad eius manifestationem subiungit quod totum non est praeter partes, et sic oportet ut intelligatur esse in partibus.”

<sup>4</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a17–18): “Tertius modus est, sicut homo dicitur esse in animali, vel quaecumque alia species in suo genere.”

<sup>5</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a18–20): “Quartus modus est, sicut genus dicitur esse in speciebus. Et ne iste modus extraneus videatur, rationem innuit quare hoc dicit: nam genus est pars definitionis speciei, et etiam differentia; unde quodammodo et genus et differentia dicuntur esse in specie sicut partes in toto.”

<sup>6</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a20–21): “Quintus modus est, sicut sanitas dicitur esse in calidis et frigidis, quorum contemperantia constituit sanitatem; et universaliter quaecumque alia forma in materia vel subiecto, sive sit accidentalis sive substantialis.”

<sup>7</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a21–22): “Sextus modus, sicut res Graecorum dicuntur esse in rege Graeciae, et universaliter omne quod movetur est in primo motivo. Per hunc etiam modum dicere possum aliquid esse in me, quia est in potestate mea ut faciam illud.”

7. As **something** (*aliquid*) **in the end** (*in fine* = ἐν τῷ τέλει).<sup>8</sup> For example, as the heart is said to be in something it desires and loves.

8. As a **placed** (*locatum*) **in a place** (*in loco* = ἐν τόπῳ).<sup>9</sup> For example, as something is said to be *in a vessel*.

◀ ARISTOTLE seems to omit the mode in which something is said to be in something as **in time**, but this is reduced to the eighth mode (¶8), for just as place is the measure of the mobile, so is time the measure of motion (▶ 33.6; 35.4).<sup>10</sup>

## 29.2. Reduction to *Being in a Place*

Something is said to be *in something* most properly (*maxime proprie* = κυριώτατον) in the eighth mode, as ARISTOTLE says.<sup>11</sup> Whence, all other modes must somehow be reduced to this mode whereby something is said *to be in something* as *in a place*, according to the rule that he consigns in his *Metaphysics* (to wit, such that the other modes are reduced to the principle whence the thing—i.e., *to be in something*—is first known, ὅθεν γνωστὸν τὸ πρᾶγμα πρῶτον, since the other modes are analogically predicated in respect of that one principle, λέγεται πολλαχῶς... ἀλλ' ἅπαν πρὸς μίαν ἀρχήν; ▶ 8.11; 20).<sup>12</sup> This is evident as follows:

1. **(An integral part is in its integral whole.)** The placed (*locatum*) is contained or included (*continetur, sive includitur*) by a place (*a loco*), and it has rest and fixedness in it.<sup>13</sup> Therefore, most proximately to this mode, a part is said to be in an integral whole, in which it is included in act. Whence ARISTOTLE says that the placed is as a separated part (▶ 35.4); and an (integral) part is as some conjoined, placed (thing).<sup>14</sup>

<sup>8</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a22–23): “Septimo modo dicitur aliquid esse in aliquo, sicut in quodam optimo diligibili et desiderabili, et universaliter sicut in fine. Et per hunc modum dicitur esse cor alicuius in aliqua re quam desiderat et amat.”

<sup>9</sup> *In Physic.* 4, l. 4, n. 2 (cf. ARISTOTLE, *Physica* Δ.3, 210a24): “Octavo modo dicitur esse aliquid in aliquo sicut in vase, et universaliter sicut locatum in loco.”

<sup>10</sup> *In Physic.* 4, l. 4, n. 2: “Videtur autem praetermittere modum quo aliquid est in aliquo sicut in tempore: sed hic reducitur ad hunc octavum modum; nam sicut locus est mensura mobilis, ita tempus est mensura motus.”

<sup>11</sup> *In Physic.* 4, l. 4, n. 3 (cf. ARISTOTLE, *Physica* Δ.3, 210a24): “Dicit autem [Philosophus] quod secundum hunc octavum modum maxime proprie dicitur esse aliquid in aliquo. Unde oportet secundum regulam quam tradit in IV et V *Metaphys.* quod omnes alii modi reducantur aliquo modo ad hunc modum quo aliquid est in aliquo sicut in loco. Quod sic patet.”

<sup>12</sup> See *In Metaph.* 5, l. 1, §759 (cf. ARISTOTLE, *Metaphysica* Δ.1, 1013a14–15); *ibid.* 4, l. 1, §535 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b5–6).

<sup>13</sup> *In Physic.* 4, l. 4, n. 3: “Locatum enim continetur, sive includitur a loco, et in eo habet quietem et fixationem. Propinquissime igitur ad hunc modum pars dicitur esse in toto integrali, in quo actu includitur: unde etiam infra dicitur quod locatum est sicut pars separata, et pars est sicut quoddam locatum coniunctum.”

<sup>14</sup> See ARISTOTLE, *Physica* Δ.4, 211b21–23: “ταυτό ποιήσει τὰ μόρια πάντα ἐν τῷ ὄλῳ ὅπερ ἅπαν τὸ ὕδωρ ἐν τῷ ἀγγεῖῳ.” Cf. *In Physic.* 4, l. 6, n. 7: “Omnis autem pars continetur a toto sicut locatum a vase.” *In Physic.* 4, l. 8, n. 5: “corpus locatum se habet ad corpus continens sicut quaedam pars ad totum, divisa

**2. (A part of a *ratio* is in its *ratio*.)** The whole that is according to *ratio* is taken in the likeness (*ad similitudinem*) of this (integral) whole.<sup>15</sup> Whence, consequently, that which is in some *ratio* is said to be in it, as (the species) *animal* (is said to be) in (the genus) *man*.

**3. (A subjective part is in its universal whole.)** Just as the part of an integral whole can be included in the whole according to act, so a part of a universal whole (can be) included in the whole according to potency, for the genus extends—in potency—to more (things) than the species, even if the species has more (differences) in act. Whence, consequently too, a species is said to be in a genus.<sup>16</sup>

**4. (Form is in matter.)** As the species is contained in the potency of the genus, so (is) a form (contained) in the potency of matter.<sup>17</sup> Wherefrom, form is said to be in matter.

**5. (A whole is in its parts.)** Since the whole has the *ratio* of *form* in respect to the parts, consequently, too, a whole is said to be in the parts.<sup>18</sup>

**6. (A moved thing is in its first mover.)** Just as a form is included under the passive potency of matter, so is an effect included under the active potency of the agent.<sup>19</sup> Whence, also, something is said to be in the first mover.

**7. (An affect is in its end.)** Thereafter, it is manifest that the appetite rests in the desired and loved good, and it is fixed in it—as (is) also the placed (*locatum*) in a place.<sup>20</sup> Whence, also the affect of the lover is said to be in the (thing) loved.

◀ And, in this way, it is evident that all the other modes are derived from the last (▶ 29.1, ¶8; i.e., insofar as something is said to be *in a place*), which is maximally proper.<sup>21</sup>

---

tamen. Et hoc manifestius apparet in corporibus quae sunt facilis divisionis, sicut est aer vel aqua: horum enim partes possunt moveri ab aliquo in toto, sicut locatum movetur in loco.” ARISTOTLE, *Physica* Δ.5, 212b34–213a1: “τὸ μέρος τόδε ἐν ὅλῳ τῷ τόπῳ ὡς διαιρετὸν μέρος πρὸς ὅλον ἐστίν, οἷον ὅταν ὕδατος κινήσῃ τις μόριον ἢ ἀέρος.”

<sup>15</sup> *In Physic.* 4, l. 4, n. 3: “Totum autem quod est secundum rationem, ad similitudinem huius totius sumitur: unde consequenter dicitur id quod est in ratione alicuius, esse in eo; ut animal in homine.”

<sup>16</sup> *In Physic.* 4, l. 4, n. 3: “Contingit autem sicut partem totius integralis includi in toto secundum actum, ita partem totius universalis includi in toto secundum potentiam: nam genus ad plura se extendit in potentia quam species, licet species habeat plura in actu: unde consequenter dicitur esse etiam species in genere.”

<sup>17</sup> *In Physic.* 4, l. 4, n. 3: “Et quia sicut species continetur in potentia generis, ita forma in potentia materiae, ulterius dicitur forma esse in materia.”

<sup>18</sup> *In Physic.* 4, l. 4, n. 3: “Et quia totum habet rationem formae respectu partium, ut dictum est in secundo; consequenter etiam totum dicitur esse in partibus.”

<sup>19</sup> *In Physic.* 4, l. 4, n. 3: “Sicut autem forma includitur sub potentia passiva materiae, ita effectus includitur sub potentia activa agentis: unde et dicitur aliquid esse in primo motivo.”

<sup>20</sup> *In Physic.* 4, l. 4, n. 3: “Deinde autem manifestum est quod appetitus quiescit in bono desiderato et amato, et in eo fixatur, sicut et locatum in loco: unde etiam dicitur affectus amantis esse in amato.”

<sup>21</sup> *In Physic.* 4, l. 4, n. 3: “Et sic patet quod omnes alii modi derivantur ab ultimo, qui est maxime proprius.”

### 29.3. Contained in Something in Act vs. Virtually

Something is contained in another in two modes:<sup>22</sup>

1. **In act** (*in actu*), as the placed (is contained) in a place (*sicut locatum in loco*).<sup>23</sup>
2. **Virtually** (*virtute*), as an effect (is contained) in (its) cause (► 23.12); as a complement (is contained) in the incomplete: for example, a genus potentially (*potestate*) contains (its) species; and as a whole tree is contained in a seed.<sup>24</sup>

### 29.4. In a Subject vs. in an Efficient Cause

Something is said to be in something in two modes:<sup>25</sup>

1. **As in a proper subject.** And the proper subject of some accident is coequal (*coaequatur*) with the accident itself.<sup>26</sup> For example, if we want to consider the proper subject of happiness and of virtue, since happiness and virtue are proper to man, the proper subject of one and of the other will be that which is proper to man: namely, the rational part of the soul.

Thus, the form of a house is in stones and wood as in (its) proper subject.<sup>27</sup>

2. **As in (its efficient) cause** (► 23.12). And the (efficient) cause is twofold (► 46.14):<sup>28</sup>

(a) *Principal*.<sup>29</sup> Something is in the principal cause according to the likeness of the form (*secundum similitudinem formae*), either of the same species, if the cause is univocal, e.g., as man begets man, and fire (generates) fire, or according to some more excellent form, if the agent is not univocal, as the sun generates a man (► 46.19).

Thus, the form of a house is in the soul of the artificer as in (its) principal cause.<sup>30</sup>

---

<sup>22</sup> *STh* I-II, q. 107 a. 3 co.: “aliquid continetur in alio dupliciter. Uno modo, in actu [...]. Alio modo, virtute.”

<sup>23</sup> *STh* I-II, q. 107 a. 3 co.: “Uno modo, in actu, sicut locatum in loco.”

<sup>24</sup> *STh* I-II, q. 107 a. 3 co.: “Alio modo, virtute, sicut effectus in causa, vel complementum in incompleto, sicut genus continet species potestate, et sicut tota arbor continetur in semine.”

<sup>25</sup> *De malo*, q. 4 a. 3 co.: “aliquid dupliciter dicitur esse in aliquo: uno modo sicut in proprio subiecto, alio modo sicut in causa.” *STh* I-II, q. 83 a. 1 co.: “aliquid potest esse in aliquo dupliciter, uno modo, sicut in causa, vel principali vel instrumentali; alio modo, sicut in subiecto.”

<sup>26</sup> *De malo*, q. 4 a. 3 co.: “Proprium autem subiectum alicuius accidentis coaequatur ipsi accidenti; puta, si volumus considerare proprium subiectum felicitatis et virtutis, cum felicitas et virtus sint propria hominis, proprium subiectum utriusque erit id quod est proprium hominis, scilicet pars animae rationalis, ut Philosophus probat in I Ethic.”

<sup>27</sup> *De malo*, q. 4 a. 3 co.: “est forma domus in lapidibus et lignis, tamquam in proprio subiecto.”

<sup>28</sup> *De malo*, q. 4 a. 3 co.: “Causa autem est duplex, scilicet instrumentalis et principalis.”

<sup>29</sup> *De malo*, q. 4 a. 3 co.: “In principali quidem causa est aliquid secundum similitudinem formae, vel eiusdem speciei, si sit causa univoca; puta, cum homo generat hominem, vel ignis ignem; vel secundum aliquam excellentiorem formam, si sit agens non univocum; sicut sol generat hominem.”

<sup>30</sup> *De malo*, q. 4 a. 3 co.: “est forma domus [...] in anima artificis, tamquam in causa principali.”

(b) *Instrumental*.<sup>31</sup> Some effect is in an instrumental cause according to the virtue that the instrument receives from the principal cause insofar as it is moved by it.

Thus, the form of a house is in a saw and in an ax as in an instrumental cause.<sup>32</sup>

## 29.5. Being in Itself

As ARISTOTLE says, something can be understood to be in itself (*in seipso* = ἐν ἑαυτῷ) in two modes:<sup>33</sup>

### 1. First and by itself (*primo et per se* < καθ' αὐτό... πρώτως).<sup>34</sup>

ARISTOTLE shows that nothing can be first (*primo*) in itself: neither by itself (*per se*; ► 29.7) nor by accident (*per accidens*; ► 29.8).<sup>35</sup> However, it should be noted that sometimes something is said to be in itself not according to an affirmative understanding, as ARISTOTLE here disapproves, but according to a negative understanding, insofar as *to be in itself* signifies only *not to be in another* (e.g., as substance *is in itself*; ► 33.1).<sup>36</sup>

### 2. According to another (*secundum alterum* = καθ' ἕτερον): that is, according to a part (*secundum partem* < κατὰ τὰ μέρη).<sup>37</sup>

In this mode,<sup>38</sup> something can (truly) be said to be in itself, for two parts of some whole are related in such a way that if one should be (*that*) *in which something is*, and the other should be *what is in it*, it follows that the whole would be said (to be) both *that in which it*

---

<sup>31</sup> *De malo*, q. 4 a. 3 co.: “In causa autem instrumentali est aliquis effectus secundum virtutem quam recipit instrumentum a causa principali, in quantum movetur ab ea.”

<sup>32</sup> *De malo*, q. 4 a. 3 co.: “est forma domus [...] in serra et securi tamquam in causa instrumentali.”

<sup>33</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a26–27): “ostendit [Philosophus] quomodo possit esse aliquid in seipso [...]. Dicit ergo primo quod dupliciter potest intelligi aliquid esse in seipso: uno modo primo et per se; alio modo secundum alterum, idest secundum partem.”

<sup>34</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a27): “uno modo primo et per se.”

<sup>35</sup> *In Physic.* 4, l. 4, n. 7 (cf. ARISTOTLE, *Physica* Δ.3, 210b8–22): “ostendit iam [Philosophus] quod nihil est primo in seipso. Et primo ostendit quod non sit aliquid primo in seipso per se; secundo quod non sit aliquid primo in seipso per accidens.” Ibid., n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210a33–34): “ostendit [Philosophus] quod non contingit aliquid esse primo in seipso. Et primo proponit quod intendit, distinguens utrumque modum quo aliquid est in seipso, et quo non est; secundo probat propositum [...]. Dicit ergo quod non contingit aliquid esse primo in seipso.” Ibid., n. 9 (cf. ARISTOTLE, *Physica* Δ.3, 210b21–22): “Sic igitur patet quod impossibile est aliquid esse primo in seipso.”

<sup>36</sup> *In Physic.* 4, l. 4, n. 9: “Sciendum tamen quod aliquando dicitur aliquid esse in seipso, non secundum intellectum affirmativum, sicut hic reprobatur Philosophus, sed secundum intellectum negativum, prout esse in seipso non significat nisi non esse in alio.”

<sup>37</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a27): “alio modo secundum alterum, idest secundum partem.”

<sup>38</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a27–29): “isto secundo modo potest dici aliquid esse in seipso. Cum enim alicuius totius duae partes ita se habeant quod una sit in quo est aliquid, et alia sit quod est in illa, sequitur quod totum dicatur et *in quo est* ratione unius partis, et *quod est in hoc* ratione alterius: et sic totum dicetur esse in seipso. [...] Per hunc igitur modum contingit aliquid idem esse in seipso.”

is, by reason of one part, and *that which is in this*, by reason of the other. And in this way, the whole would be said to be in itself.

Indeed, we find that something is said of something according to a part.<sup>39</sup> For example, something is said (to be) *white* because its surface is white; and a man is said (to be a) *scientific knower* (*sciens*) because there is science in (his) reasoning part.

Hence, if a flask should be taken (to be) full of wine as some whole whose parts are the flask and the wine, neither of its parts will be in itself—that is, neither the flask nor the wine.<sup>40</sup> However, *this whole*—namely, the flask of wine—will be in itself insofar as one and the other—namely, both the wine that is in the flask, and the flask in which the wine is—is its part.

### 29.6. Being *First* in Something

ARISTOTLE shows the difference between *being first in something* and (*being in something but*) *not first*.<sup>41</sup>

Thus, the (color) white is said to be in a body because the (colored) surface is in the body. Whence, (the color white) is not *first* in the body but in the surface.<sup>42</sup>

Likewise, science (*scientia* = ἐπιστήμη) is said to be first in the soul (*in anima* = ἐν ψυχῇ), and not in man, in which it is through the soul.<sup>43</sup>

Hence, according to the surface and to the soul, there are appellations by which man is named *white* or *scientific knower* (*sciens*), since the surface and the soul are as parts in man: not that a surface would be a part, but that it is related by the mode of a part (*se habet ad modum partis*) insofar as it is something of man, as the terminus of (his) body.<sup>44</sup>

---

<sup>39</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a29–30): “Invenimus enim quod aliquid dicitur de aliquo secundum partem, sicut aliquis dicitur albus quia superficies eius est alba, et homo dicitur sciens quia scientia est in parte ratiocinativa.”

<sup>40</sup> *In Physic.* 4, l. 4, n. 5 (cf. ARISTOTLE, *Physica* Δ.3, 210a29–33): “Si igitur accipiatur amphora plena vino sicut quoddam totum cuius partes sunt amphora et vinum, neutra partium eius erit in seipsa, idest neque amphora neque vinum, sed hoc totum, scilicet amphora vini, erit in seipsa, inquantum utrumque est pars eius, scilicet et vinum quod est in amphora, et amphora in qua est vinum.”

<sup>41</sup> *In Physic.* 4, l. 4, n. 6 (ARISTOTLE, *Physica* Δ.3, 210a33–b8): “manifestat [Philosophus] quid sit aliquid esse primo in seipso, per oppositum.” *Ibid.*, n. 7: “ostensa differentia inter hoc quod est esse primo in aliquo et non primo [...]” St. Thomas is referring here to what he has just commented in *ibid.*, n. 6. Thus, as he says, ARISTOTLE shows what it is for something to be *first* in itself *through the opposite*.

<sup>42</sup> *In Physic.* 4, l. 4, n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210a34–b1): “Album enim dicitur esse in corpore, quia superficies est in corpore: unde non est primo in corpore, sed in superficie.”

<sup>43</sup> *In Physic.* 4, l. 4, n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210b1): “Et similiter scientia primo dicitur esse in anima, non autem in homine, in quo est per animam.”

<sup>44</sup> *In Physic.* 4, l. 4, n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210b1–2): “Et secundum hoc, scilicet secundum animam et superficiem, sunt appellationes quibus nominatur homo albus vel sciens, cum anima et superficies sint sicut partes in homine: non quod superficies sit pars, sed quia se habet ad modum partis, inquantum est aliquid hominis, ut terminus corporis.”

Now if wine and flask are taken separately one from the other (*seorsum ab invicem*), they are not parts.<sup>45</sup> Whence, it befits neither to be in itself. However, when they are (taken) simultaneously (*simul*), as when the flask is full of wine, because both flask and wine are parts, the same will be in itself not *first* but through the parts (*per partes*), as the (color) white is not first in man, but through the body; and in the body, through the surface.

Moreover, *that in which something is first* is not the same as *that which is in it*, just as the (color) white (is not the same) as the surface because the white and the surface are diverse (*altera = ἕτερα*) according to species (*secundum speciem = τῷ εἶδει*), and the nature (*natura = φύσις*) and potency (*potentia = δύναμις*) of one and of the other is diverse (*alia = ἄλλη*).<sup>46</sup>

### 29.7. Something Cannot Be *First and by Itself* in Itself

ARISTOTLE shows that nothing can be first (*primo*) in itself by itself (*per se*) in two ways:<sup>47</sup>

**1. Inductively** (*inductive = ἐπακτικῶς*).<sup>48</sup> Considering by induction, one by one, the afore-determined modes in which something is said to be in something (►29.1), it is evident that nothing is in itself *first and by itself* (*primo et per se*), for nothing is its own whole, (its own) part, or (its own) genus, etc.

ARISTOTLE posits this, concluding from the premises, because, as (this) is evident in the (color) white and in the surface, which are related as form and matter, which are diverse according to species and virtue, so too can the other modes be considered.<sup>49</sup>

**2. Rationally** (*ratione = τῷ λόγῳ*).<sup>50</sup> It is manifest through reasoning (*per rationem*) that it is impossible for something to be first and by itself in itself, for if something should be

<sup>45</sup> *In Physic.* 4, l. 4, n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210b2–5): “Si autem accipiatur vinum et amphora seorsum ab invicem, non sunt partes: unde neutri competit esse in seipso. Sed cum sunt simul, utpote cum amphora est plena vino, propter hoc quod et amphora et vinum sunt partes, idem erit in seipso, ut expositum est, non primo, sed per partes: sicut album non primo est in homine, sed per corpus, et in corpore per superficiem.”

<sup>46</sup> *In Physic.* 4, l. 4, n. 6 (cf. ARISTOTLE, *Physica* Δ.3, 210b5–8): “Nec est idem id in quo est aliquid primo, et quod est in eo, sicut album et superficies: quia altera sunt secundum speciem superficies et album, et alia est natura et potentia utriusque.”

<sup>47</sup> *In Physic.* 4, l. 4, n. 7 (cf. ARISTOTLE, *Physica* Δ.3, 210b8–17): “primo ostendit [Philosophus] quod non sit aliquid primo in seipso per se [...]. Primum ostendit dupliciter, scilicet inductive et ratione.”

<sup>48</sup> *In Physic.* 4, l. 4, n. 7 (cf. ARISTOTLE, *Physica* Δ.3, 210b8–9): “Dicit ergo ergo [Philosophus] primo quod considerando per inductionem in singulis modis supra determinatis quibus dicitur aliquid esse in aliquo, apparet quod nihil est in seipso primo et per se: neque enim aliquid est totum sui ipsius, neque pars neque genus, et sic de aliis.”

<sup>49</sup> *In Physic.* 4, l. 4, n. 7: “Ponit autem hoc concludendo ex praemissis, quia sicut manifestum est in albo et in superficie, quae se habent ut forma et materia, quod sunt aliud secundum speciem et virtutem, ita etiam potest in omnibus aliis modis considerari.”

<sup>50</sup> *In Physic.* 4, l. 4, n. 8 (cf. ARISTOTLE, *Physica* Δ.3, 210b10–11): “probat [Philosophus] idem ratione. Et dicit manifestum esse per rationem quod impossibile est aliquid esse primo et per se in seipso. Si enim aliquid primo et per se sit in seipso, oportet quod eidem et secundum idem conveniat ratio eius in quo

first and by itself in itself, the same *ratio* of *that in which something is*—and according to the same—would have to befit also the *ratio* of *that which is in it*. Whence, one and the other—namely, the container as much as the contained—would have to be the other.

For example, *flask* would be *vessel* and *wine*—and *wine* would be *wine* and *flask*—if something should be first and by itself in itself.<sup>51</sup> Whence, once this is posited—namely, that *wine* should be *wine* and *flask*, and that *flask* should be *wine* and *flask*—, if someone should say that one of them would be in the other—for example, the wine in the flask—, it follows that the wine would be received in the flask not insofar as it is wine but insofar as *wine* is *flask*. Wherefore, if it befits the flask to be in the flask first and by itself—because something is posited to be in itself first and by itself—, it follows that something could be said to be in the flask only insofar as it itself is the flask. And in this way, if the wine is said to be in the flask, it follows that to be in the flask befits the wine not insofar as *wine* is *wine*, but insofar as *wine* is *flask*. But this is unbecoming (*inconueniens*).

Whence, it is manifest that *that in which* (*id in quo* < ἐν ᾧ) and *that which in this* (*quod in hoc* < ἐν τούτῳ) is according to a diverse *ratio* (*secundum alteram rationem*), for the *ratio* of *that which is in something* is other than (the *ratio*) of *that in which something is*.<sup>52</sup>

### 29.8. Something Cannot Be *First and by Accident* in Itself

ARISTOTLE also shows that nothing can be first (*primo*) in itself by accident (*secundum accidens*).<sup>53</sup>

Something is said to be in something by accident when it is in it on account of something else that exists in it.<sup>54</sup> For example, if we should say that a man is in the sea because he

---

est aliquid, et ratio eius quod est in eo. Unde oportet quod utrumque, scilicet tam continens quam contentum, sit utrumque.”

<sup>51</sup> *In Physic.* 4, l. 4, n. 8 (cf. ARISTOTLE, *Physica* Δ.3, 210b11–16): “ut puta quod amphora sit vas et vinum, et vinum sit vinum et amphora, si primo et per se contingit aliquid esse in seipso. Unde hoc posito, scilicet quod vinum sit amphora et vinum, et amphora sit vinum et amphora, si quis dicat quod alterum eorum sit in altero, ut puta vinum in amphora, sequitur quod vinum recipiatur in amphora non in quantum vinum est, sed in quantum vinum est illa, scilicet amphora. Quare, si esse in amphora primo et per se convenit amphorae ex eo quod ponitur aliquid primo et per se in seipso esse, sequitur quod nihil possit dici esse in amphora, nisi in quantum ipsum est amphora. Et sic, si vinum dicatur esse in amphora, sequitur quod esse in amphora competit vino, non secundum quod vinum est vinum, sed secundum quod vinum est amphora. Et eadem ratione, si amphora recipiat vinum, recipiet ipsum non in quantum amphora est amphora, sed in quantum amphora est vinum. Hoc autem est inconueniens.”

<sup>52</sup> *In Physic.* 4, l. 4, n. 8 (cf. ARISTOTLE, *Physica* Δ.3, 210b16–17): “Unde manifestum est, quod secundum alteram rationem est *id in quo*, et *quod in hoc*. Alia est enim ratio eius quod est in aliquo, et eius in quo est aliquid. Non potest ergo per se et primo aliquid esse in seipso.”

<sup>53</sup> *In Physic.* 4, l. 4, n. 9 (cf. ARISTOTLE, *Physica* Δ.3, 210b18–22): “ostendit [Philosophus] quod non sit aliquid primo in seipso etiam secundum accidens.”

<sup>54</sup> *In Physic.* 4, l. 4, n. 9: “Dicitur enim aliquid esse in aliquo secundum accidens, quando est in eo propter aliquid aliud in eo existens; ut si dicamus hominem esse in mari, quia est in navi, quae est in mari: in hac tamen primo dicitur esse, idest non propter partem.”

is in a ship that is in the sea, he is nonetheless said to be in the former (i.e., in the ship) first—that is, not on account of a part.

Therefore, if something could be in itself first—not indeed by itself but by accident—, it follows that it would be in itself on account of something else being in it.<sup>55</sup>

In this way, it follows that two bodies would be in the same (< δύο ἐν ταύτῳ ἔσται): namely, the body that is in it, and the very same that is in itself.<sup>56</sup> Thus, the flask will be in itself by accident if the flask itself—whose nature is to receive something—should be in itself, and again, that of which it is receptive—namely, the wine. Therefore, both the flask and the wine would be in the flask, if on account of the wine being in the flask it follows that the flask is in itself—and in this way, two bodies would be in the same.

### 29.9. Contained in a Genus

Something is contained **in a genus** in two modes:<sup>57</sup>

**1. Simply, by itself and properly** (*simpliciter et proprie, per se et proprie*), as a species is contained under a genus (e.g., as *two* is contained in *number*, or *man* in *animal*); and those things that receive the predication of the genus (e.g., as the first part of a line).<sup>58</sup>

**2. By reduction** (*per reductionem*), either:<sup>59</sup>

**(a)** As the principles of a genus are reduced to their genus.<sup>60</sup>

For example, matter and (substantial) form are reduced to the genus of substance as principles.<sup>61</sup> Likewise, unit and point are reduced to the genus of quantity as principles, even though neither is a quantity (i.e., the unit is the principle of any number, but not itself a number; and the point is the principle of the line, but not itself a continuous quantity).

---

<sup>55</sup> *In Physic.* 4, l. 4, n. 9: “Si igitur contingat aliquid esse in seipso primo, non per se quidem, sed per accidens, sequitur quod sit in seipso propter hoc quod aliquid aliud sit in ipso.”

<sup>56</sup> *In Physic.* 4, l. 4, n. 9 (cf. ARISTOTLE, *Physica* Δ.3, 210b18–21): “Et sic sequitur quod duo corpora sint in eodem, scilicet illud corpus quod est in eo, et ipsummet quod est in seipso. Sic enim amphora erit in seipsa per accidens, si ipsa amphora, cuius natura est ut recipiat aliquid, sit in seipsa, et iterum illud cuius est receptivum, scilicet vinum: ergo in amphora erit et amphora et vinum, si propter hoc quod vinum est in amphora, sequitur amphoram esse in seipsa: et sic duo corpora essent in eodem.”

<sup>57</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 3: “in genere continetur aliquid dupliciter.” *STh* I, q. 3 a. 5 co.: “aliquid est in genere dupliciter.”

<sup>58</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 3: “vel per se et proprie, sicut species, et ea quae recipiunt praedicationem generis.” *STh* I, q. 3 a. 5 co.: “Uno modo simpliciter et proprie; sicut species, quae sub genere continentur.”

<sup>59</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 3: “vel per reductionem.” *STh* I, q. 3 a. 5 co.: “Alio modo, per reductionem.”

<sup>60</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 3: “sicut principia generis.” *STh* I, q. 3 a. 5 co.: “sicut principia.”

<sup>61</sup> *In Sent.* 1, d. 28 q. 1 a. 1 ad 3: “ut materia et forma ad substantiam; et unitas et punctus ad quantitatem; quamvis neutrum sit quantitas.” *STh* I, q. 3 a. 5 co.: “sicut punctus et unitas reducuntur ad genus quantitatis, sicut principia.”

(b) As a privation is reduced to the genus of its habit (*habitus*, i.e., possession; ► 42.11).<sup>62</sup>

For example, *blindness* (i.e., the privation of sight, is reduced to the possession of sight).<sup>63</sup>

### 29.10. In a Genus by Reduction

A principle that is reduced to some genus does not extend beyond that genus, as the point is the principle only of continuous quantity, and the unit (is the principle only) of discrete quantity (i.e., number).<sup>64</sup> Whence, principles are homogeneous to (i.e., of the same genus as) those things that are from them (► 28.6).<sup>65</sup>

Likewise, the last (*ultimum*) that is something of a thing (*aliquid rei*) is not reduced into another genus.<sup>66</sup> Rather, it is in the same genus either by itself (*per se*), as the last part of a line (is in the genus of *line*), or by reduction (*per reductionem*), as the (last) point (is reduced) to (the genus of) line (as its terminus).

Everything that is imperfect falls under the same genus with the perfect: not indeed as a species, but by reduction, as first matter is in the genus of substance.<sup>67</sup> Hence, the imperfect is reduced to the perfect.<sup>68</sup> And if there is something imperfect in some genus, something perfect is found in that genus before it according to the order of nature, for the perfect is prior in nature to the imperfect.<sup>69</sup>

### 29.11. In a Genus as Perfect vs. as Imperfect

It is manifest that in all genera something can be in two (modes): either as perfect or as imperfect.<sup>70</sup> The reason of this is because privation-habit is the first contrariety that is preserved in all contraries (► 43.9).<sup>71</sup> Whence, since all genera are divided by contrary differences, in all genera there must be a perfect and an imperfect.

---

<sup>62</sup> *STh* I, q. 3 a. 5 co.: “sicut [...] privationes, [...] et omnis privatio, reducitur ad genus sui habitus.”

<sup>63</sup> *STh* I, q. 3 a. 5 co.: “sicut [...] caecitas.”

<sup>64</sup> *STh* I, q. 3 a. 5 co.: “principium quod reducitur in aliquod genus, non se extendit ultra genus illud, sicut punctum non est principium nisi quantitatis continuae, et unitas quantitatis discretiae.”

<sup>65</sup> *In Metaph.* 12, l. 4 §2460: “Cum enim principia sint homogenea his quae sunt ab eis [...].”

<sup>66</sup> *In Sent.* 2, d. 27 q. 1 a. 1 ad 1: “ultimum quod est aliquid rei, non reducitur in aliud genus, sed est in eodem genere, vel per se, sicut ultima pars lineae, vel per reductionem, sicut punctus ad lineam.”

<sup>67</sup> *In Physic.* 3, l. 1, n. 7: “omne autem quod est imperfectum, sub eodem genere cadit cum perfecto, non quidem sicut species, sed per reductionem (sicut materia prima est in genere substantiae).”

<sup>68</sup> *In Physic.* 3, l. 5, n. 17: “imperfectum reducitur ad perfectum.”

<sup>69</sup> *ScG* 2, 91 n. 5: “Si est aliquid imperfectum in aliquo genere, invenitur ante illud, secundum naturae ordinem, aliquid in genere illo perfectum: perfectum enim natura prius est imperfecto.”

<sup>70</sup> *In Physic.* 3, l. 1, n. 8 (cf. ARISTOTLE, *Physica* Γ.1, 201a3–9): “Manifestum est enim quod in omnibus generibus contingit aliquid esse dupliciter, vel sicut perfectum, vel sicut imperfectum.”

<sup>71</sup> *In Physic.* 3, l. 1, n. 8: “Cuius ratio est, quia privatio et habitus est prima contrarietas, quae in omnibus contrariis salvatur, ut in X *Metaphys.* dicitur. Unde, cum omnia genera dividantur contrariis differentiis, oportet in omnibus generibus esse perfectum et imperfectum.” Cf. *In Metaph.* 10, l. 6, §§2036–8 (cf. ARISTOTLE, *Metaphysica* I.4, 1055a33–35)

For example, in substance, something is as form, and something as privation.<sup>72</sup> In quality, something is as white, which is perfect, and something as black, which is as imperfect. In quantity, something is a perfect quantity and something imperfect. In place, something is above, which is as perfect, and something below, which is as imperfect; or light and heavy, which are placed in (the genus of) *where (ubi)* by reason of (their natural) inclination.

The contrariety of differences that is in every genus is considered according to the common root of contrariety, which is excellence and defect, into which opposition all contraries are reduced, for all differences dividing some genus are related in such a way that one of them is as abundant and another as deficient in respect of the other.<sup>73</sup> Because of this, ARISTOTLE says that the definitions of things are like numbers, whose species vary by addition or subtraction of a unit (► 16.7).

However, it is not necessary that in whatever genus there be contrariety according to the proper ratio of *this* and *that* species, but only according to the common ratio of excellence and defect.<sup>74</sup> Since contraries are those that are maximally distant, contrariety must be found in any genus: (i.e.), that there be found two maximally distant termini between which all of those that are in that genus fall.

However, this (contrariety between extreme termini) would not suffice for there to be motion in that genus unless it were possible to traverse continuously from one extreme into another.<sup>75</sup> Therefore, in some genera these two conditions (i.e., extreme contrariety, and continuity) are lacking.

This is evident in numbers,<sup>76</sup> for although all species of numbers differ according to excellence and defect, nonetheless, two maximally distant extremes cannot be taken in

---

<sup>72</sup> *In Physic.* 3, l. 1, n. 8 (cf. ARISTOTLE, *Physica* Γ.1, 201a3–8): “sicut in substantia aliquid est ut forma, et aliquid ut privatio; et in qualitate aliquid est ut album quod est perfectum, et aliquid ut nigrum, quod est quasi imperfectum; et in quantitate, aliquid est quantitas perfecta et aliquid imperfecta; et in loco aliquid est sursum, quod est quasi perfectum, et aliquid deorsum, quod est quasi imperfectum; vel leve et grave, quae ponuntur in ubi, ratione inclinationis.”

<sup>73</sup> *In Physic.* 5, l. 3, n. 5: “contrarietas differentiarum, quae est in omnibus generibus, attenditur secundum communem radicem contrarietatis, quae quidem est excellentia et defectus, ad quam oppositionem omnia contraria reducuntur, ut in primo huius habitum est. Omnes enim differentiae dividentes aliquod genus, hoc modo se habent, quod una earum est ut abundans, et alia ut deficiens respectu alterius. Propter quod Aristoteles dicit in VIII Metaphys., quod definitiones rerum sunt sicut numeri, quorum species variantur per additionem et subtractionem unitatis.”

<sup>74</sup> *In Physic.* 5, l. 3, n. 5: “Non tamen oportet quod in quolibet genere sit contrarietas secundum propriam rationem huius et illius speciei; sed solum secundum communem rationem excellentiae et defectus. Quia enim contraria sunt quae maxime distant, oportet quod in quocumque genere invenitur contrarietas, quod inveniatur duo termini maxime distantes, inter quos cadunt omnia quae sunt illius generis.”

<sup>75</sup> *In Physic.* 5, l. 3, n. 5: “Nec hoc sufficeret ad hoc quod in illo genere esset motus, nisi de uno extremo in aliud contingeret continue pervenire. In quibusdam ergo generibus hae duae conditiones desunt.”

<sup>76</sup> *In Physic.* 5, l. 3, n. 5: “ut patet in numeris. Quamvis enim omnes species numerorum differant secundum excellentiam et defectum; tamen non est accipere duo extrema maxime distantia in illo genere: est enim accipere minimum numerum, scilicet dualitatem, non tamen maximum. Similiter inter

that genus, for a minimum number—namely, two—can be taken, but not a maximum. Moreover, among the species of numbers there is no continuity, for any species of number is formally perfected by a unit, which is indivisible, and non-continuous to another unit.

Likewise, also, in the genus of substance.<sup>77</sup> If one takes *that which substance is*, there is nothing contrary to it; but if formal differences in the genus of substance are taken, contrariety is found in them, for there are forms of diverse species differing from each other according to excellence and defect, insofar as one form is more noble than another. And because of this, there can be diverse affections caused from diverse forms.

However, one form of a species, according to its proper *ratio*, does not have contrariety to another.<sup>78</sup> Firstly, because, in substantial forms, the maximum distance between any two forms is not considered in such a way that from one of them we could only come orderly (into another) through a mean: rather, matter, when it loses one form, can indifferently receive diverse forms without order. Whence, when one element comes to be from another, it is not necessary for there to be a transit through a mean element.

Secondly,<sup>79</sup> since the substantial (act of) being (*esse substantiale*) of anything is *in something* indivisible, some (kind of) continuity cannot be considered in substantial forms in such a way that there could be continuous motion from one form into another according to the remission of one form and the intension of another.

## 29.12. In a Genus by Itself and Simply vs. by Another and According to Something

Whatever is in any genus by itself and simply (*per se et simpliciter*) is prior to that which is (in the genus) by another and according to something (*per aliud et secundum quid*).<sup>80</sup>

---

species numerorum non est continuitas; quia quaelibet species numerorum formaliter perficitur per unitatem, quae indivisibilis est, et alteri unitati non continua.”

<sup>77</sup> *In Physic.* 5, l. 3, n. 5: “Et similiter etiam est in genere substantiae. Sunt enim formae diversarum specierum ab invicem differentes secundum excellentiam et defectum, inquantum una forma est nobilior alia; et propter hoc ex diversis formis possunt causari diversae passiones.” *Ibid.*, l. 11, n. 15: “Si enim accipiatur ipsum quod est substantia, nihil est ei contrarium: si vero accipiantur formales differentiae in genere substantiae, contrarietas in eis invenitur.”

<sup>78</sup> *In Physic.* 5, l. 3, n. 5: “tamen una forma speciei secundum propriam suam rationem non habet contrarietatem ad aliam. Primo quidem quia in formis substantialibus non attenditur maxima distantia inter aliquas duas formas, ita quod ab una earum non veniatur ordinatim nisi per media: sed materia dum exiit una forma, potest indifferenter recipere diversas formas absque ordine. Unde Aristoteles dicit in II de generatione, quod cum ex terra fit ignis, non oportet quod fiat transitus per media elementa.”

<sup>79</sup> *In Physic.* 5, l. 3, n. 5: “Secundo quia, cum esse substantiale cuiuslibet rei sit in aliquo indivisibili, non potest aliqua continuitas attendi in formis substantialibus, ut motus continuus possit esse de una forma in aliam secundum remissionem unius formae et intensionem alterius.” As St. Thomas says in the same place, that there is no motion in substance can also be proven because the subject of a substantial form is a being in potency only. *Ibid.*: “possit et alia ratione probari quod motus non est in substantia, quam supra posuit: quia scilicet subiectum formae substantialis est ens in potentia tantum.”

<sup>80</sup> *In Metaph.* 7, l. 1, §1248 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a15–20): “Quod est per se et simpliciter in unoquoque genere, est prius eo quod est per aliud et secundum quid.” *Quodlibet* 1, q. 10 a. 1 co.: “necesse est enim ut id quod est per se, sit causa in unoquoque genere.”

The one that is the principle in any genus is (in the genus) not by accident (*per accidens*) but by itself (*per se*), for everything that is by accident, is reduced to that which is by itself as to a principle.<sup>81</sup>

---

<sup>81</sup> *STh* I-II, q. 19 a. 2 co.: “Illud autem unum quod est principium in quolibet genere, non est per accidens, sed per se, quia omne quod est per accidens, reducitur ad id quod est per se, sicut ad principium.”

## 30. Being

We began this part with the aim of determining what a principle is. However, as AVICENNA says, principle is not universally a principle of being; for, if it should be a principle of being universally, it would be a principle of itself (i.e., since any principle is itself a being): rather, there is no principle of being universally; for a principle is a principle of a caused being; whence, principle is (in general) a principle of some being.<sup>1</sup> Thus, having determined what a principle is and what kinds of principles there are, we seek now to determine what kind of being a principle is—and what kind of one, since it is a one (► 27.8).

### 30.1. Being (*ens*)

**Being** (*ens* = τὸ ὄν) signifies *that which is* (*quod est*).<sup>2</sup>

Even though *being* signifies *that which is*, it does not signify that the thing is or is not, for it does not principally signify the composition that is conveyed in (the verb) *is* (*est*): rather, it co-signifies it insofar as it signifies a thing that has (an act of) being (*significat rem habentem esse*).<sup>3</sup> Whence, such a co-signification does not suffice in respect of truth or falsity, since the composition in which truth and falsity consists can only be understood insofar as it joins (*innectit*) the extreme (terms) of the composition (► 19.1).

### 30.2. Common Being (*ens commune*)

**Common being** (*ens commune*) is *that (being) to which no addition is made*.<sup>4</sup>

However, it does not belong to the *ratio* of *common being* that addition *cannot* be made to it.<sup>5</sup> This is similar to how the difference *rational* is not added to common *animal* in its

---

<sup>1</sup> AVICENNA, *The Metaphysics of The Healing*, 10, 16–19: “المبدأ ليس مبدأ للموجود كله، ولو كان مبدأ للموجود كله” Cf. AVICENNA, *Liber de philosophia prima*, 1.2, 58–62: “principium non est principium omnium entium [sic]. Si enim principium omnium entium esset principium, tunc esset principium sui ipsius; ens autem in se absolute non habet principium; sed habet principium unumquodque esse quod scitur [sic]. Principium igitur est principium aliquibus entibus.”

<sup>2</sup> *In Peri.* 1, l. 5, 363: “‘ens’ nichil est aliud quam ‘quod est’.”

<sup>3</sup> *In Peri.* 1, l. 5, 355–376 (cf. ARISTOTLE, *De interpretatione* 3, 16b23–25): “ut magis sequamur uerba Aristotilis, considerandum est quod ipse dixerat quod uerbum non significat rem esse uel non esse; addit autem quod non solum uerbum non significat rem esse uel non esse, set nec ipsum ‘ens’ significat rem esse uel non esse, et hoc est quod dicit: «nichil est,» idest non significat aliquid esse. Et tamen maxime uidebatur de hoc quod dico ‘ens’, quia ‘ens’ nichil est aliud quam ‘quod est’, et sic uidetur <et> rem significare, per hoc quod dico <‘quod’, et esse, per hoc quod dico> ‘est’. Et si quidem hec dictio ‘ens’ significaret esse principaliter sicut significat rem que habet esse, procul dubio significaret aliquid esse; set ipsam compositionem, que importatur in hoc quod dico ‘est’, non principaliter significat, set consignificat eam in quantum significat rem habentem esse; unde talis consignificatio compositionis non sufficit ad ueritatem uel falsitatem, quia compositio in qua consistit ueritas et falsitas non potest intelligi nisi secundum quod innectit extrema compositionis.”

<sup>4</sup> *De potentia*, q. 7 a. 2 ad 6: “ens commune est [ens] cui non fit additio.” *In Sent.* 1, d. 8 q. 4 a. 1 ad 1: “ens commune est sine additione.”

<sup>5</sup> *De potentia*, q. 7 a. 2 ad 6: “ens commune est cui non fit additio, de cuius tamen ratione non est ut ei additio fieri non possit [...]. Sicut et animali communi non fit additio, in sua ratione, rationalis differentiae;

*ratio*, and yet it does not belong to the *ratio* of *animal* that no addition can be made to it, for this belongs to the *ratio* of *irrational animal*, which is a species of *animal*.

If the condition *without addition* were to be included in the understanding of *common being*, no addition could ever be made to it, since it would be against its *ratio*.<sup>6</sup> Hence, (this *being*) is common because it does not convey (*non dicit*) in its *ratio* some addition, yet addition can be made to it, so that it would be determined to (some) *proper (being)*.

Likewise, common *animal* is said (to be) *without reason* because neither *to have reason* nor *not to have (reason)* belongs to its understanding.<sup>7</sup> On the other hand, ass is said to be *without reason* because in its understanding is included the negation of *reason*, and it is determined by this (negation) according to a proper difference.

That must be perfect in itself which cannot receive addition (► 23.1; therefore, common being is imperfect).<sup>8</sup> Every common is preserved in (every) proper, where addition is made to it (therefore, the ratio of *common being* is preserved in every proper being).

As ARISTOTLE shows, all beings are reduced to something one: common being (< [τὸ ὄν ἢ ὄν καθόλου καὶ οὐ κατὰ μέρος]).<sup>9</sup>

Since the being that is first by community is the same by essence (in respect) of whatever thing, it exceeds no proportion.<sup>10</sup> Hence, it is known in the cognition of anything.

---

non tamen est de ratione eius quod ei additio fieri non possit; hoc enim est de ratione animalis irrationalis, quae est species animalis." *In Sent.* 1, d. 8 q. 4 a. 1 ad 1: "aliquid esse sine additione dicitur dupliciter. Aut de cuius ratione est ut nihil sibi addatur [...]. Aut ita quod non sit de ratione ejus quod fiat sibi additio, neque quod non fiat, et hoc modo ens commune est sine additione."

<sup>6</sup> *In Sent.* 1, d. 8 q. 4 a. 1 ad 1: "In intellectu enim entis non includitur ista conditio, sine additione; alias nunquam posset sibi fieri additio, quia esset contra rationem ejus; et ideo commune est, quia in sui ratione non dicit aliquam additionem, sed potest sibi fieri additio ut determinetur ad proprium."

<sup>7</sup> *In Sent.* 1, d. 8 q. 4 a. 1 ad 1: "sicut etiam animal commune dicitur esse sine ratione, quia de intellectu ejus non est habere rationem, neque non habere; asinus autem dicitur sine ratione esse, quia in intellectu ejus includitur negatio rationis, et per hoc determinatur secundum differentiam propriam."

<sup>8</sup> *In Sent.* 1, d. 8 q. 4 a. 1 ad 1: "aliquid esse sine additione dicitur dupliciter. Aut de cuius ratione est ut nihil sibi addatur: et sic dicitur de Deo: hoc enim oportet perfectum esse in se ex quo additionem non recipit; nec potest esse commune, quia omne commune salvatur in proprio, ubi sibi fit additio. Aut ita quod non sit de ratione ejus quod fiat sibi additio [...]. Unde patet quod negationes dictae de Deo, non designant in ipso aliquam compositionem." *De potentia*, q. 7 a. 2 ad 6: "esse divinum est esse cui non fit additio, et de eius ratione est ut ei additio fieri non possit; unde divinum esse non est esse commune." As St. Thomas explains, common being is the proper effect of the highest cause: namely, of God. *STh I-II*, q. 66 a. 5 ad 4: "ens commune est proprius effectus causae altissimae, scilicet Dei." *De veritate*, q. 10 a. 12 ad s.c. 10: "Deus non solum cognoscitur in effectu iustitiae, sed in aliis etiam suis effectibus; unde, dato quod ab aliquo non cognoscatur ut iustus, non sequitur quod nullo modo cognoscatur. Nec potest esse quod nullus eius effectus cognoscatur, cum eius effectus sit ens commune, quod incognitum esse non potest."

<sup>9</sup> *In Metaph.* 11, l. 3, §2195 (cf. ARISTOTLE, *Metaphysica* K.3, 1060b31–32): "ostendit [Philosophus] quod omnia entia reducuntur ad aliquod unum commune ens."

<sup>10</sup> *De veritate*, q. 10 a. 11 ad 10: "ens quod est primum per communitatem, cum sit idem per essentiam cuiuslibet rei, nullius proportionem excedit; et ideo in cognitione cuiuslibet rei ipsum cognoscitur."

### 30.3. Being (esse)

**Being** (esse = τὸ εἶναι) is said in two (or rather three) modes:<sup>11</sup>

1. The **quiddity** or **nature** itself of the thing (*ipsa quidditas vel natura rei*) is said (to be a) *being* (► 18.3, footnote 5).<sup>12</sup>

For example, it is said that a definition is *a speech that signifies what the being is (oratio significans quid est esse)*, for a definition signifies the quiddity of a thing.<sup>13</sup>

2. The **act itself of the essence** (*ipse actus essentiae*) is said (to be a) *being*.<sup>14</sup>

For example, *living (vivere, i.e., to live)* is the *being* of living things (*esse viventibus*): not (their) second act, which is an operation (e.g., to reproduce), but (their) first act.<sup>15</sup>

3. **That which signifies the truth of the composition in propositions** (*quod significat veritatem compositionis in propositionibus*) is said to be a *being* insofar as *is (est)* is said to be a copula (i.e., a link between subject and predicate in a proposition; ► 19.1).<sup>16</sup>

According to this (mode), (being, esse) is in the understanding that composes and divides insofar as its complement (is concerned), but is founded in the being of the thing that is the act of the essence (i.e., *being* in mode ¶3 is founded on *being* in mode ¶2; and the copula is a sign of that which completes, perfects the composition found in a proposition).<sup>17</sup>

### 30.4. Division of Being: by Itself vs. by Accident

As ARISTOTLE says, *being (ens = τὸ ὄν)* is said *by itself (per se, secundum se = καθ' αὐτό)* and *by accident (per accidens, secundum accidens = κατὰ συμβεβηκός)*.<sup>18</sup> This division

<sup>11</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “esse dicitur dupliciter. Uno modo [...]. Alio modo [...]. Tertio modo [...].”

<sup>12</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “Uno modo dicitur esse ipsa quidditas vel natura rei.”

<sup>13</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “sicut dicitur quod definitio est oratio significans quid est esse; definitio enim quidditatem rei significat.”

<sup>14</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “Alio modo dicitur esse ipse actus essentiae.”

<sup>15</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “sicut vivere, quod est esse viventibus, est animae actus; non actus secundus, qui est operatio, sed actus primus.”

<sup>16</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “Tertio modo dicitur esse quod significat veritatem compositionis in propositionibus, secundum quod est dicitur copula.”

<sup>17</sup> *In Sent.* 1, d. 33 q. 1 a. 1 ad 1: “et secundum hoc est in intellectu componente et dividente quantum ad sui complementum; sed fundatur in esse rei, quod est actus essentiae.”

<sup>18</sup> *In Metaph.* 5, l. 9, §885 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a7–8): “Philosophus distinguit [...] ens in ens per se et per accidens. [...] Dicit ergo, quod ens dicitur quoddam secundum se, et quoddam secundum accidens. Sciendum tamen est quod illa divisio entis non est eadem cum illa divisione qua dividitur ens in substantiam et accidens. Quod ex hoc patet, quia ipse postmodum, ens secundum se dividit in decem praedicamenta, quorum novem sunt de genere accidentis. Ens igitur dividitur in substantiam et accidens, secundum absolutam entis considerationem, sicut ipsa albedo in se considerata dicitur accidens, et homo substantia.”

of *being* is not the same as the division into *substance* and *accident*. This is evident because, in the latter mode, ARISTOTLE divides *being by itself* (*ens secundum se*) into ten categories, of which nine concern the genus of *accident*. Therefore, *being* is divided into *substance* and *accident* according to an absolute consideration of *being*, as *whiteness* (*albedo*) itself, considered in itself (*in se*), is said (to be an) *accident*, and *man* (considered in itself is said to be a) *substance*.

Here, *being by accident* is to be taken by a comparison of accident to substance.<sup>19</sup> This comparison is signified by the verb *is* (*est*) in *man is white*, whence the whole *man is white* is a being by accident.

Hence, it is evident that the division of *being* into *by itself* and *by accident* is considered insofar as something is predicated of something (either) *by itself* or *by accident* (► 17.9), while the division of *being* into *substance* and *accident* is considered insofar as *this something*, in its nature, is either a substance or an accident.<sup>20</sup>

ARISTOTLE distinguishes the mode of being by itself: first, the being that is outside the soul, which is the perfect being and is distinguished into ten categories; secondly, he posits another mode of being according as it is only in the mind; thirdly, he divides being by potency and act (► 32.6).<sup>21</sup>

### 30.5. Division of Being by Itself: Common Being vs. Being of *Ratio*

As ARISTOTLE says, *being* (*ens* = τὸ ὄν and *esse* = τὸ εἶναι) is said by itself in two modes:<sup>22</sup>

1. Insofar as *being* (*ens*) signifies **the entity of a thing** (*significat entitatem rei*),<sup>23</sup> i.e., the essence of a thing existing outside the soul, whose being (*esse*) pertains to the nature

<sup>19</sup> *In Metaph.* 5, l. 9, §885: “Sed ens secundum accidens prout hic sumitur, oportet accipi per comparationem accidentis ad substantiam. Quae quidem comparatio significatur hoc verbo, est, cum dicitur, homo est albus. Unde hoc totum, homo est albus, est ens per accidens.”

<sup>20</sup> *In Metaph.* 5, l. 9, §885: “Unde patet quod divisio entis secundum se et secundum accidens, attenditur secundum quod aliquid praedicatur de aliquo per se vel per accidens. Divisio vero entis in substantiam et accidens attenditur secundum hoc quod aliquid in natura sua est vel substantia vel accidens.”

<sup>21</sup> *In Metaph.* 5, l. 9, §889: “distinguit [Philosophus] modum entis per se: et circa hoc tria facit. Primo distinguit ens, quod est extra animam, per decem praedicamenta, quod est ens perfectum. Secundo ponit alium modum entis, secundum quod est tantum in mente [...]. Tertio dividit ens per potentiam et actum.”

<sup>22</sup> *In Metaph.* 5, l. 9, §889 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a22–23): “distinguit [Philosophus] modum entis per se: et circa hoc tria facit. Primo distinguit ens, quod est extra animam, [...]. Secundo ponit alium modum entis, secundum quod est tantum in mente [...]. Tertio dividit ens per potentiam et actum [...].” *De ente*, c. 1, 1–3: “sicut in V Methaphisice Philosophus dicit, ens per se dupliciter dicitur.” *De potentia*, q. 7 a. 9 co.: “ens rationis dividitur contra ens divisum per decem praedicamenta ut patet V Metaph.” *STh* I, q. 48 a. 2 ad 2: “sicut dicitur in V Metaphys., ens dupliciter dicitur.” *In Sent.* 3, d. 6 q. 2 a. 2 co.: “secundum Philosophum 5 Metaph., esse duobus modis dicitur.” *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Philosophus ostendit quod ens multipliciter dicitur.” *In Sent.* 3, d. 37 q. 1 a. 2 ad 3: “ens dicitur dupliciter.”

<sup>23</sup> *De ente*, c. 1, 3–4: “uno modo quod diuiditur per decem genera.” *De potentia*, q. 7 a. 9 co.: “ens divisum per decem praedicamenta.” *STh* I, q. 48 a. 2 ad 2: “Uno modo, secundum quod significat entitatem rei,

of the thing. And this *being* (*ens*, *esse*) is divided into ten predicaments—that is, categories or (supreme) genera—not, however, univocally, for *being* (*esse*) does not pertain to all (genera) according to the same *ratio*: rather, (it pertains) to substance by itself; and to the other (genera), diversely.

In this mode, only that is said (to be a) *being* which posits something in the thing.<sup>24</sup> Hence, in this mode, *being* is convertible with *thing*; and no privation is a being. Whence, blindness and such (privations and negations) are not beings, for *being* in this mode signifies something existing in nature, whether it is a substance, as man, or an accident, as a color.

In this mode, (the act of) being (*esse*) is in the thing and is the act of the being (*actus entis*) that results from the principles of the thing, as glowing (*lucere*) is the act of the lucent (*actus lucentis*).<sup>25</sup> Sometimes, however, *being* (*esse*) is taken for *essence* (*essentia*), according to which the thing is, for its principles have customarily been signified by the act, as a potency or a habit (e.g., by *sight* we understand either the potency of seeing or its act; and by *prudence* we understand either the habit or its act; ► 30.3).

**2. The being of *ratio* (*ens rationis*; ► 21.7),** which is only in the mind, signifies the truth of propositions and consists in composition, whose note is the verb *is* (*est*) according as it is a copula.<sup>26</sup> This is the *being* (*ens*) whereby one responds to the question “is it?”

In this mode, *everything of which an affirmative proposition can be formed* can be said (to be a) *being* (*ens*), even if it posits nothing in the thing.<sup>27</sup> Thus, privations and negations

---

prout dividitur per decem praedicamenta.” *In Sent.* 3, d. 6 q. 2 a. 2 co.: “Alio modo dicitur esse, quod pertinet ad naturam rei, secundum quod dividitur secundum decem genera.” *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Uno enim modo dicitur ens quod per decem genera dividitur.” *In Sent.* 3, d. 37 q. 1 a. 2 ad 3: “Uno modo quod significat essentiam rei extra animam existentis.” *Quodlibet* 2, q. 2 a. 1 co.: “Sed verum est quod hoc nomen ens, secundum quod importat rem cui competit huiusmodi esse, sic significat essentiam rei, et dividitur per decem genera; non tamen univoce, quia non eodem ratione competit omnibus esse; sed substantiae quidem per se, aliis autem aliter.”

<sup>24</sup> *De ente*, c. 1, 11–13: “Sed primo modo non potest dici ens nisi quod aliquid in re ponit; unde primo modo cecitas et huiusmodi non sunt entia.” *STh* I, q. 48 a. 2 ad 2: “et sic convertitur cum re. Et hoc modo, nulla privatio est ens.” *In Sent.* 3, d. 34 q. 1 a. 1 co.: “et sic ens significat aliquid in natura existens; sive sit substantia, ut homo; sive accidens, ut color.”

<sup>25</sup> *In Sent.* 3, d. 6 q. 2 a. 2 co.: “et hoc quidem esse est in re, et est actus entis resultans ex principiis rei, sicut lucere est actus lucentis. Aliquando tamen sumitur esse pro essentia, secundum quam res est: quia per actus consueverunt significari eorum principia, ut potentiae vel habitus.”

<sup>26</sup> *De ente*, c. 1, 4–5: “alio modo quod significat propositionum ueritatem.” *De potentia*, q. 7 a. 9 co.: “ens rationis.” *STh* I, q. 48 a. 2 ad 2: “Alio modo dicitur ens, quod significat ueritatem propositionis, quae in compositione consistit, cuius nota est hoc uerbum est, et hoc est ens quo respondetur ad quaestionem an est.” *In Sent.* 3, d. 6 q. 2 a. 2 co.: “Uno modo secundum quod significat ueritatem propositionis, secundum quod est copula.” *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Alio modo dicitur ens, quod significat ueritatem propositionis.” *In Sent.* 3, d. 37 q. 1 a. 2 ad 3: “Alio modo secundum quod significat ueritatem propositionis.”

<sup>27</sup> *De ente*, c. 1, 5–11: “Horum autem differentia est quia secundo modo potest dici ens omne illud de quo affirmatiua propositio formari potest, etiam si illud in re nichil ponat; per quem modum priuationes et negationes entia dicuntur: dicimus enim quod affirmatio est opposita negationi, et quod cecitas est in oculo.” *STh* I, q. 48 a. 2 ad 2: “Et sic caecitatem dicimus esse in oculo, vel quamcumque aliam

are said (to be) *beings*: we say that affirmation *is* opposed to negation; and that blindness *is* in the eye; or (that) whatever other privation (*is* in a subject). Likewise, in this mode, deformity is said *to be* (*esse*): not because it has a being (*esse*) in the thing, but because the intellect composes a privation with a subject, as (though it were) some form.

Whence, just as from the composition (*ex compositione*) of a form toward a subject or toward matter (*ad subjectum vel ad materiam*) some substantial or accidental being (*esse substantiale vel accidentale*) results (*relinquitur*), so too by some being (*esse*) the intellect signifies the composition of privation with a subject.<sup>28</sup> But this being (*esse*) is only a being of *ratio* (*esse rationis*), for in the thing it is rather a non-being (*non esse*).

In this mode, *being* (*esse*, i.e., to be) and *is* (*est*) also signify the composition or division of a proposition that the intellect discovers (*adinvenit*) and makes (*facit*) in composing and dividing.<sup>29</sup> Whence, ARISTOTLE says that *being* (*esse*) signifies *that* something said *is true* (*quia verum* = ὅτι ἀληθές). Whence, the truth of a proposition can be said (to be) the truth of a thing through a cause, for a statement (*oratio*) is true or false *because* a thing is or is not. Thus, when we say that something is, we signify that a proposition is true; and when we say that it is not, we signify that it is not true. And this (happens) either by affirming or by negating: by affirming, as when we say, “Socrates is white” because this is true; by negating, as when (we say), “Socrates is not white” because it is true: namely, that he is not white. Likewise, we say that the diameter (of the square) is not commensurable with the side because this is false: namely, that it is not incommensurable.

This being (*esse*) is not in the thing but in the mind, which conjoins a predicate with a subject.<sup>30</sup> Whence, as AVERROES says, being (*ens*) in this mode is an accidental predicate

---

privationem.” *In Sent.* 3, d. 37 q. 1 a. 2 ad 3: “et sic deformitas dicitur esse, non propter hoc quod in re esse habeat, sed quia intellectus componit privationem cum subjecto, sicut formam quamdam.”

<sup>28</sup> *In Sent.* 3, d. 37 q. 1 a. 2 ad 3: “Unde sicut ex compositione formae ad subjectum vel ad materiam, relinquitur quoddam esse substantiale vel accidentale; ita etiam intellectus compositionem privationis cum subjecto per quoddam esse significat. Sed hoc esse non est nisi esse rationis, cum in re potius sit non esse.”

<sup>29</sup> *In Metaph.* 5, l. 9, §895 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a31–35): “ponit [Philosophus] alium modum entis, secundum quod esse et est, significant compositionem propositionis, quam facit intellectus componens et dividens. Unde dicit, quod esse significat veritatem rei. Vel sicut alia translatio melius habet quod esse significat quia aliquid dictum est verum. Unde veritas propositionis potest dici veritas rei per causam. Nam ex eo quod res est vel non est, oratio vera vel falsa est. Cum enim dicimus aliquid esse, significamus propositionem esse veram. Et cum dicimus non esse, significamus non esse veram; et hoc sive in affirmando, sive in negando. In affirmando quidem, sicut dicimus quod Socrates est albus, quia hoc verum est. In negando vero, ut Socrates non est albus, quia hoc est verum, scilicet ipsum esse non album. Et similiter dicimus, quod non est diameter incommensurabilis lateri quadrati, quia hoc est falsum, scilicet non esse ipsum non commensurabilem.” St. Thomas relays two readings here, preferring that of William of MOERBEKE. *In Sent.* 3, d. 34 q. 1 a. 1 co.: “prout dicitur, quod affirmatio est vera, quando significat esse de eo quod est; et negatio, quando significat non esse de eo quod non est; et hoc ens compositionem significat, quam intellectus componens et dividens adinvenit.”

<sup>30</sup> *In Sent.* 3, d. 6 q. 2 a. 2 co.: “et sic, ut Commentator ibidem dicit, ens est praedicatum accidentale; et hoc esse non est in re, sed in mente, quae conjungit praedicatum cum subjecto, ut dicit Philosophus in

in the way that everything that is other than the essence of the thing is said (to be an) *accident* (► 26.7).<sup>31</sup> Wherefrom, the *being* (*esse*) that pertains to the question “is it?” is an accident. Thus, AVERROES says that the proposition “Socrates is” pertains to an accidental predicate—insofar as it conveys the entity of a thing or the truth of a proposition.

### 30.6. Common Being and Being of *Ratio* Related

Whatever (things) are said (to be) *beings* (*entia*) according to the first mode (i.e., insofar as *being* signifies the essence of a thing existing outside the mind), are beings according to the second mode (i.e., beings of *ratio*), for everything that has a natural being (*naturale esse*) in things (*in rebus*) can be signified to be (*esse*) by an affirmative proposition, as when we say, “color *is*,” or “man *is*.”<sup>32</sup>

However, not all those that are beings according to the second mode are beings according to the first, for an affirmative proposition is formed concerning a privation or concerning blindness when we say “blindness *is*,” and nonetheless blindness is not something in the nature of things (*in rerum natura*): rather, it is the removal of some being.<sup>33</sup> Hence, also privations and negations are said to be (*esse*) beings (*entia*) according to this second mode, but not according to the first.

*Being* (*ens*) is predicated diversely according to each of these modes, for, taken according to the first mode, it is a substantial predicate, and it pertains to the question “what is it?”; but according to the second mode, it is an accidental predicate, as AVERROES says in the same place, and pertains to the question “is it?”<sup>34</sup>

The second mode is compared to the first as effect to cause: because something in the nature of things is, there follows the truth or falsity in a proposition, which the intellect signifies by the verb *is* insofar as it is the verbal copula. However, since the intellect

---

6 Metaph.” *Quodlibet* 2, q. 2 a. 1 co.: “cum omne quod est praeter essentiam rei, dicatur accidens; esse quod pertinet ad quaestionem an est, est accidens. Et ideo Commentator dicit in V Metaphysic., quod ista propositio, Socrates est, est de accidentali praedicato, secundum quod importat entitatem rei, vel veritatem propositionis.”

<sup>31</sup> See AVERROES, *tafsir ma ba’d at-tabi’at*, Comm. 14 on Book V, Tome VI, 560.3–561.4.

<sup>32</sup> *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Quaecumque ergo dicuntur entia quantum ad primum modum, sunt entia quantum ad secundum modum: quia omne quod habet naturale esse in rebus, potest significari per propositionem affirmativam esse; ut cum dicitur: color est, vel homo est.”

<sup>33</sup> *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Non autem omnia quae sunt entia quantum ad secundum modum, sunt entia quantum ad primum: quia de privatione, ut de caecitate, formatur una affirmativa propositio, cum dicitur, caecitas est; nec tamen caecitas aliquid est in rerum natura; sed est magis alicujus entis remotio: et ideo etiam privationes et negationes dicuntur esse entia quantum ad secundum modum, sed non quantum ad primum.”

<sup>34</sup> *In Sent.* 3, d. 34 q. 1 a. 1 co.: “Ens autem secundum utrumque istorum modorum diversimode praedicatur: quia secundum primum modum acceptum, est praedicatum substantiale, et pertinet ad quaestionem quid est: sed quantum ad secundum modum, est praedicatum accidentale, ut Commentator ibidem dicit, et pertinet ad quaestionem an est.” Again, in AVERROES, *tafsir ma ba’d at-tabi’at*, Comm. 14 on Book V, Tome VI, 560.3–561.4.

considers something that in itself is a non-being (*non ens*) as (though it were) some being (*quoddam ens*), as (happens in the case of) negation and others such (e.g., privation), hence, sometimes it is said of something in this second mode and not in the first.<sup>35</sup>

Thus, that blindness *is*, is said in the second mode because the proposition by which something is said to be blind is true; but it is not said to be true in the first mode, for blindness does not have some being (*esse*) in things: rather, it is the privation of some being.<sup>36</sup> However, it may happen to anything that something is truly affirmed of it in voice or in understanding, for a thing is not referred to science: rather, the contrary (►28.11).

The being (*esse*) that each thing has in its nature is substantial.<sup>37</sup> Hence, when one says, “Socrates *is*,” if taken in the first mode, it is (predicated) of a substantial predicate, for being (*ens*) is higher (*superius*) in respect of any being, as *animal* in respect of *man*. If taken, on the other hand, in the second mode, it is (predicated) of an accidental predicate.

### 30.7. Being and Essence

The name *essence* (*essentia*), which is not determined to some genus and is therefore most common (*communissimum*), is taken from *being* (*esse*).<sup>38</sup> However, it is not taken from *being* (*non sumitur ab ente*) in the second mode (i.e., insofar as it is a being of *ratio*), for in this mode, some (things) are said (to be) *beings* (*entia*) which do not have an essence, as is evident of privations (e.g., blindness).<sup>39</sup> Rather, *essence* is taken from *being* according to the first mode (i.e., insofar as *being* signifies the entity of a thing). Whence, AVERROES says that *being* (*ens* = هوية *huwīya*, موجود *mawǧūd*) in the first mode is what signifies the essence of the thing (*essentia rei* = ذات الشيء *dāt aš-šay*).<sup>40</sup>

<sup>35</sup> *In Metaph.* 5, l. 9, §896: “Sciendum est autem quod iste secundus modus comparatur ad primum, sicut effectus ad causam. Ex hoc enim quod aliquid in rerum natura est, sequitur veritas et falsitas in propositione, quam intellectus significat per hoc verbum est prout est verbalis copula. Sed, quia aliquid, quod est in se non ens, intellectus considerat ut quoddam ens, sicut negationem et huiusmodi, ideo quandoque dicitur esse de aliquo hoc secundo modo, et non primo.”

<sup>36</sup> *In Metaph.* 5, l. 9, §896: “Dicitur enim, quod caecitas est secundo modo, ex eo quod vera est propositio, qua dicitur aliquid esse caecum; non tamen dicitur quod sit primo modo vera. Nam caecitas non habet aliquod esse in rebus, sed magis est privatio alicuius esse. Accidit autem unicuique rei quod aliquid de ipsa vere affirmetur intellectu vel voce. Nam res non refertur ad scientiam, sed e converso.”

<sup>37</sup> *In Metaph.* 5, l. 9, §896: “Esse vero quod in sui natura unaquaeque res habet, est substantiale. Et ideo, cum dicitur, Socrates est, si ille est primo modo accipiatur, est de praedicato substantiali. Nam ens est superius ad unumquodque entium, sicut animal ad hominem. Si autem accipiatur secundo modo, est de praedicato accidentali.”

<sup>38</sup> *STh* I, q. 29 a. 1 ad 4: “convenientius fuit quod in definitione personae, quae est singulare alicuius generis determinati, uteretur [nomen] naturae, quam essentiae, quae sumitur ab esse, quod est communissimum.”

<sup>39</sup> *De ente*, c. 1, 14–20: “Nomen igitur essentiae non sumitur ab ente secundo modo dicto: aliqua enim hoc modo dicuntur entia quae essentiam non habent, ut patet in privationibus; sed sumitur essentia ab ente primo modo dicto. Vnde Commentator in eodem loco dicit quod ens primo modo dictum est quod significat essentiam rei.”

<sup>40</sup> See AVERROES, *tafsir ma ba’d at-tabī’at*, Comm. 14 on Book V, Tome VI, 561.5–7: “ولكن ينبغي ان تعلم “بالجملة ان اسم الهوية التي تدل على ذات الشيء غير اسم الهوية التي تدل على الصادق وكذلك اسم الموجود الذي يدل على ذات

And since, in this mode, *being* is divided into ten genera, *essence* must signify something common to all natures (*aliquid commune omnibus naturis*) whereby diverse beings are placed in diverse genera and species (*per quas diversa entia in diversis generibus et speciebus collocantur*): for example, *humanity* is the essence of man, and so on.<sup>41</sup>

### 30.8. Addition to *Being*

As AVICENNA says, *being* (*ens* = موجود *mawǧūd*) is what the intellect conceives first as most known, and that into which (the intellect) resolves all other conceptions.<sup>42</sup> Whence, all other conceptions of the intellect must be taken by addition to *being*.

However, some (*ratios*) cannot be added to *being* as extraneous according to the mode whereby a difference is added to a genus (e.g., the predicable genus *animal* + *rational*), or an accident to a subject (e.g., the subject genus *surface* + a *boundary*, ► 14.2), because any nature is essentially a being.<sup>43</sup> Whence, ARISTOTLE also proves that *being* cannot be a genus. Yet, some (*ratios*) are said to be added over *being* insofar as they express a mode of being itself that the name *being* does not express. This can occur in two modes:

1. Such that the expressed mode would be **some special mode of being**, for there are diverse degrees of entity (*gradus entitatis*) according to which diverse modes of being (*modi essendi*) are taken; and the diverse genera of things are taken on a par with these modes (*iuxta hos modos*).<sup>44</sup> Thus, *substance* does not add over *being* some difference that would designate some nature added over being: rather, by the name of *substance* is

---

”الشئ هو غير الموجود الذي يدل على الصادق. For AVERROES’s own explanation of the two renderings of *being* in Arab translations, see *ibid.*, 557.5–15 (هوية), 557.16–558.1 (موجود), and 558.1–6 (هوية) compared to (موجود).

<sup>41</sup> *De ente*, c. 1, 20–25: “Et quia, ut dictum est, ens hoc modo dictum diuiditur per decem genera, oportet ut essentia significet aliquid commune omnibus naturis per quas diuersa entia in diuersis generibus et speciebus collocantur, sicut humanitas est essentia hominis, et sic de aliis.”

<sup>42</sup> *De veritate*, q. 1 a. 1 co., 100–105: “illud autem quod primo intellectus concipit quasi notissimum, et in quod conceptiones omnes resoluit, est ens, ut Avicenna dicit in principio suae Metaphysicae. Unde oportet quod omnes aliae conceptiones intellectus accipiantur ex additione ad ens.” Cf. Simone VAN RIET (ed.), *Avicenna Latinus: Liber de philosophia prima sive scientia divina*, 3 vols. (Leiden: Brill, 1977), I.5 A29, vol. 1, 31: “Dicemus igitur quod res [الشئ *aš-šay*] et ens [الموجود *al-mawǧūd*] et necesse [الضروري *aḍ-ḍarūrī*] talia sunt statim imprimuntur in anima prima impressione, quae non acquiritur ex aliis notioribus se, sicut credulitas quae habet prima principia, ex quibus ipsa provenit per se, et est alia ab eis, sed propter ea.”

<sup>43</sup> *De veritate*, q. 1 a. 1 co., 106–114: “Sed enti non possunt addi aliqua quasi extranea per modum quo differentia additur generi, vel accidens subiecto, quia quaelibet natura est essentialiter ens; unde probat etiam Philosophus in III Metaphys., quod ens non potest esse genus, sed secundum hoc aliqua dicuntur addere super ens, in quantum exprimunt modum ipsius entis qui nomine entis non exprimitur, quod dupliciter contingit.”

<sup>44</sup> *De veritate*, q. 1 a. 1 co., 114–123: “Uno modo ut modus expressus sit aliquis specialis modus entis. Sunt enim diversi gradus entitatis, secundum quos accipiuntur diversi modi essendi, et iuxta hos modos accipiuntur diversa rerum genera: substantia enim non addit super ens aliquam differentiam, quae designet aliquam naturam superadditam enti, sed nomine substantiae exprimitur specialis quidam modus essendi, scilicet per se ens; et ita est in aliis generibus.”

expressed a special mode of being—namely, *being by itself* (*per se ens*); and (the same) is so in the other genera.

2. Such that the mode expressed would be **a general mode that follows upon every being**.<sup>45</sup> And this mode can be taken in two modes:

(a) Insofar as (the general mode) follows upon whichever being **in itself** (*ens in se*; ► 30.9).<sup>46</sup>

(b) Insofar as (the general mode) follows upon one being **in order to another** (*in ordine ad aliud*; ► 30.10).<sup>47</sup>

### 30.9. Addition to *Being Following Being in Itself: Thing and One*

This mode (whereby something added to *being* expresses a general mode that follows upon whichever being in itself) is twofold, for something is expressed in being either affirmatively or negatively:<sup>48</sup>

#### 1. Affirmatively

Nothing is found affirmatively said in absolute that can be taken in every being except its *essence*, according to which it is said to be (*esse dicitur*; or, is said [to be a] *being*).<sup>49</sup> And in this way, the name **thing** (*res*) is imposed. Thus, just as the name *man* (i.e., *human being*) is imposed from the quiddity or nature of man, so the name *thing* is imposed from quiddity alone (i.e., from the quiddity of *being*, the *that which in that which is*).

The name *thing*, according to AVICENNA, differs from *being* in this: that being (*ens*) is taken from the act of being (*ab actu essendi*), whereas the name *thing* expresses the quiddity or essence of a being.<sup>50</sup>

---

<sup>45</sup> *De veritate*, q. 1 a. 1 co., 124–126: “Alio modo ita quod modus expressus sit modus generalis consequens omne ens; et hic modus dupliciter accipi potest.”

<sup>46</sup> *De veritate*, q. 1 a. 1 co., 126–128: “uno modo secundum quod consequitur unumquodque ens in se.”

<sup>47</sup> *De veritate*, q. 1 a. 1 co., 128–129: “alio modo secundum quod consequitur unum ens in ordine ad aliud.”

<sup>48</sup> *De veritate*, q. 1 a. 1 co., 129–131: “Si primo modo [sc., secundum quod modus expressus sit modus generalis consequens unumquodque ens in se], hoc est dupliciter quia vel exprimitur in ente aliquid affirmative vel negative.”

<sup>49</sup> *De veritate*, q. 1 a. 1 co., 131–135: “Non autem invenitur aliquid affirmative dictum absolute quod possit accipi in omni ente, nisi essentia eius, secundum quam esse dicitur; et sic imponitur hoc nomen res.” *In Metaph.* 4, l. 2, §553: “hoc nomen homo, imponitur a quidditate, sive a natura hominis; et hoc nomen res imponitur a quidditate tantum.”

<sup>50</sup> *De veritate*, q. 1 a. 1 co., 135–139: “in hoc differt [hoc nomen res] ab ente, secundum Avicennam in principio *Metaphysicae*, quod ens sumitur ab actu essendi, sed nomen rei exprimit quidditatem vel essentiam entis.” *In Metaph.* 4, l. 2, §553: “hoc vero nomen ens, imponitur ab actu essendi.” See AVICENNA, *The Metaphysics of The Healing*, 24, 1–13. Cf. AVICENNA, *Liber de philosophia prima*, 1.6, 34.45–61.

## 2. Negatively

The negation that follows upon every being in absolute is *non-division*.<sup>51</sup> And this is what the name **one** expresses, for one is nothing other than *undivided being* (► 38).

Since that which has an essence—and a quiddity through that essence—is the same as that which is in itself undivided, these three—*thing*, *being*, and *one*—signify altogether the same, but according to diverse *ratios*.<sup>52</sup>

### 30.10. Addition to *Being* Following an Order to Another: *Something, True, Good*

The mode according to an order of one to another can be twofold:<sup>53</sup>

#### 1. According to the division of one (being) from another

This is what the name **something** (*aliquid*) expresses, for *something* is said (to be), as it were, *some-other thing* (*aliud quid*).<sup>54</sup> Whence, just as *being* is said (to be) *one* insofar as it is *undivided in itself*, so *something* is said insofar as it is *divided from others*.

#### 2. According to an agreement (*secundum convenientiam*) of one being to another

This can only be if something is taken that would naturally agree with every being.<sup>55</sup> And this is the soul, which in some way is all things, as ARISTOTLE says.<sup>56</sup> However, in the soul there is a cognitive power (*vis cognitiva*) and an appetitive power (*appetitiva*). Thus,

**(a)** The name **true** (*verum*) expresses the agreement of being to intellect,<sup>57</sup> for all cognition comes to its perfection (*perficitur*) by the assimilation of the knower to the thing known

---

<sup>51</sup> *De veritate*, q. 1 a. 1 co., 139–142: “negatio autem consequens omne ens absolute, est indivisio; et hanc exprimit hoc nomen unum: nihil aliud enim est unum quam ens indivisum.” *In Metaph.* 4, l. 2, §553: “hoc nomen unum, ab ordine vel indivisione [imponitur]. Est enim unum ens indivisum.”

<sup>52</sup> *In Metaph.* 4, l. 2, §553: “Idem autem est quod habet essentiam et quidditatem per illam essentiam, et quod est in se indivisum. Unde ista tria, res, ens, unum, significant omnino idem, sed secundum diversas rationes.”

<sup>53</sup> *De veritate*, q. 1 a. 1 co., 142–144: “Si autem modus entis accipiatur secundo modo, scilicet secundum ordinem unius ad alterum, hoc potest esse dupliciter.”

<sup>54</sup> *De veritate*, q. 1 a. 1 co., 145–150: “Uno modo secundum divisionem unius ab altero; et hoc exprimit hoc nomen aliquid: dicitur enim aliquid quasi aliud quid; unde sicut ens dicitur unum, in quantum est indivisum in se, ita dicitur aliquid, in quantum est ab aliis divisum.”

<sup>55</sup> *De veritate*, q. 1 a. 1 co., 150–156: “Alio modo secundum convenientiam unius entis ad aliud; et hoc quidem non potest esse nisi accipiatur aliquid quod natum sit convenire cum omni ente: hoc autem est anima, quae quodam modo est omnia, ut dicitur in III De anima. In anima autem est vis cognitiva et appetitiva.” See ARISTOTLE, *De anima* Γ.8, 431b21–23: “ἡ ψυχὴ τὰ ὄντα πῶς ἐστι πάντα. ἢ γὰρ αἰσθητὰ τὰ ὄντα ἢ νοητὰ, ἔστι δ’ ἡ ἐπιστήμη μὲν τὰ ἐπιστητὰ πῶς, ἢ δ’ αἴσθησις τὰ αἰσθητὰ”; cf. *In De anima* 3, c. 7, 15–21: “*anima quodam modo est omnia: omnia enim que sunt aut sunt sensibilia aut intelligibilia, anima autem est quodam modo et sensibilia et intelligibilia, quia in anima est sensus et intellectus siue sciencia, sensus autem quodam modo est ipsa sensibilia et intellectus intelligibilia siue sciencia scibilia.*”

<sup>56</sup> ARISTOTLE, *De anima* Γ.8, 431b21: “ἡ ψυχὴ τὰ ὄντα πῶς ἐστι πάντα.” Cf. *In De anima* 3, c. 7, 13–36.

<sup>57</sup> *De veritate*, q. 1 a. 1 co., 159–166: “convenientiam vero entis ad intellectum exprimit hoc nomen verum. Omnis autem cognitio perficitur per assimilationem cognoscentis ad rem cognitam, ita quod assimilatio

(*per assimilationem cognoscentis ad rem cognitam*), such that the said assimilation is a cause of cognition, as sight knows color because it is disposed according to the species of color.

Therefore, the first comparison of being to intellect is such that being would agree with understanding.<sup>58</sup> This concordance (*concordia*) is called *adequacy* (*adaequatio*) of intellect and thing, and the *ratio* of *true* comes to its perfection (*perficitur*, i.e., is completed, reaches its terminus) in this. Hence, this is what *true* adds over *being*: namely, an agreement (*conformitas*) or adequacy of thing and intellect; and the cognition of a thing follows upon this agreement. Thus, the entity of a thing precedes the *ratio* of *true*, while cognition is an effect of truth.

**(b)** The name **good** (*bonum*) expresses the agreement (*convenientia*) of being to appetite.<sup>59</sup> Whence, ARISTOTLE says that **good** is *that which all desire* (*quod omnia appetunt* = οὐ πᾶντ' ἐφίεται).

Since *good* is *that which all desire*, and this (i.e., *that which all desire*) has the *ratio* of *end*, it is evident that *good* conveys the *ratio* of *end*.<sup>60</sup> However, the *ratio* of *good* presupposes the *ratio* of *efficient cause* and the *ratio* of *formal cause*, for that which is first in causing is last in the thing caused (►10.13).

**(c)** **Good** and **beautiful** (*pulchrum*) are the same in subject, since they are founded on the same thing: namely, on form.<sup>61</sup> And because of this, the good is praised as beautiful. They

---

dicta est causa cognitionis, sicut visus per hoc quod disponitur secundum speciem coloris, cognoscit colorem.”

<sup>58</sup> *De veritate*, q. 1 a. 1 co., 166–176: “prima ergo comparatio entis ad intellectum est ut ens intellectui concordet, quae quidem concordia adaequatio intellectus et rei dicitur, et in hoc formaliter ratio veri perficitur. Hoc est ergo quod addit verum super ens, scilicet conformitatem, sive adaequationem rei et intellectus, ad quam conformitatem, ut dictum est, sequitur cognitio rei: sic ergo entitas rei praecedat rationem veritatis, sed cognitio est quidam veritatis effectus.”

<sup>59</sup> *De veritate*, q. 1 a. 1 co., 156–159: “Convenientiam ergo entis ad appetitum exprimit hoc nomen bonum, unde in principio Ethicorum dicitur quod «bonum est quod omnia appetunt».” Cf. *In Ethic.* 1, l. 1, 150–160 (cf. ARISTOTLE, *Ethica Nicomachea* A.1, 1094a3) “considerandum est quod bonum numeratur inter prima, adeo quod secundum Platonicos bonum est prius ente, sed secundum rei veritatem bonum cum ente convertitur. Prima autem non possunt notificari per aliqua priora, sed notificantur per posteriora, sicut causae per proprios effectus. Cum autem bonum proprie sit motivum appetitus, describitur bonum per motum appetitus, sicut solet manifestari vis motiva per motum. Et ideo dicit [Philosophus] quod philosophi bene enuntiaverunt bonum esse id quod omnia appetunt.”

<sup>60</sup> *STh* I, q. 5 a. 4 co.: “cum bonum sit quod omnia appetunt, hoc autem habet rationem finis; manifestum est quod bonum rationem finis importat. Sed tamen ratio boni praesupponit rationem causae efficientis, et rationem causae formalis. Videmus enim quod id quod est primum in causando, ultimum est in causato.”

<sup>61</sup> *STh* I, q. 5 a. 4 ad 1: “Ad primum ergo dicendum quod pulchrum et bonum in subiecto quidem sunt idem, quia super eandem rem fundantur, scilicet super formam, et propter hoc, bonum laudatur ut pulchrum. Sed ratione differunt. Nam bonum proprie respicit appetitum, est enim bonum quod omnia appetunt. Et ideo habet rationem finis, nam appetitus est quasi quidam motus ad rem. Pulchrum autem respicit vim cognoscitivam, pulchra enim dicuntur quae visa placent.”

differ, however, in *ratio*, since *good* properly has a regard to appetite, for *good* is *that which all desire*. And thus, it has the *ratio* of *end*, for the (act of the) appetite is as some motion towards the thing. *Beautiful*, on the other hand, has a regard to a cognitive virtue, for those (things) that please sight are said (to be) *beautiful*.

Whence, the beautiful consists in due proportion, since sense delights in duly proportioned things as (delighting) in (things that are) its like, for also sense—as every cognitive virtue—is some (sort of) reason (*ratio quaedam est*).<sup>62</sup> And since cognition comes to be through assimilation (*per assimilationem*), and likeness (*similitudo*) has a regard to form, the beautiful properly pertains to the formal cause.

### 30.11. *Being* and *One* are not *Genera*

No category is predicated of those (species) that are contained under another category.<sup>63</sup> Nor is (a category) universally predicated of those that follow in common (*communiter*) upon *being*, which are *act* and *potency*, *perfect* and *imperfect*, *prior* and *posterior*, and such others. And it is impossible to use *being* (*ens*) as one *ratio* and one nature, for *being* is not a genus (that is, properly speaking; ►27.1): rather, it is said in multiple (modes) of diverse (natures), while one genus or one species has (only) one nature.<sup>64</sup>

*Being* cannot be contracted (*contrahi*) into something determinate in the same mode in which a genus is contracted into species by differences.<sup>65</sup> We see that differences added to a genus diversify it, and yet they are outside (*praeter*) its essence or substance, for differences do not participate (in) a genus, as ARISTOTLE says in his *Topics*.

(ARISTOTLE explains therein that the definition of **to participate** [τὸ μετέχειν] is *to receive* [τὸ ἐπιδέχασθαι = *recipere*] *the ratio of that which is participated* [τὸν τοῦ μετεχομένου λόγον].<sup>66</sup> Thus, it is evident that species participate in genera, not genera in species, for

<sup>62</sup> *Sth* I, q. 5 a. 4 ad 1: “Unde pulchrum in debita proportione consistit, quia sensus delectatur in rebus debite proportionatis, sicut in sibi similibus; nam et sensus ratio quaedam est, et omnis virtus cognoscitiva. Et quia cognitio fit per assimilationem, similitudo autem respicit formam, pulchrum proprie pertinet ad rationem causae formalis.”

<sup>63</sup> *In Post. an.* 1, l. 27, 188–193: “nullum predicamentum predicatur de hiis que continentur sub alio predicamento, neque etiam uniuersaliter predicatur de hiis que communiter consequuntur ens, que sunt actus et potencia, perfectum et imperfectum, prius et posterius, et alia huiusmodi.”

<sup>64</sup> *In Metaph.* 1, l. 9, §139: “Sed in hoc decipiebantur [antiqui naturales], quia utebantur ente quasi una ratione et una natura sicut est natura alicuius generis; hoc enim est impossibile. Ens enim non est genus, sed multipliciter dicitur de diversis. Et ideo in primo Physicorum dicitur quod haec est falsa, ens est unum: non enim habet unam naturam sicut unum genus vel una species.”

<sup>65</sup> *In Metaph.* 5, l. 9, §889: “Sciendum est enim quod ens non potest hoc modo contrahi ad aliquid determinatum, sicut genus contrahitur ad species per differentias. Nam differentia, cum non participet genus, est extra essentiam generis.” Ibid. 1, l. 9, §138: “Sicut etiam videmus quod differentiae aduenientes generi diversificant ipsum, quae tamen sunt praeter substantiam eius. Non enim participant differentiae genus, ut dicitur quarto Topicorum.”

<sup>66</sup> See ARISTOTLE, *Topica* Δ.1, 121a11–13: “ὄρος δὲ τοῦ μετέχειν τὸ ἐπιδέχασθαι τὸν τοῦ μετεχομένου λόγον. δῆλον οὖν ὅτι τὰ μὲν εἶδη μετέχει τῶν γενῶν, τὰ δὲ γένη τῶν εἰδῶν οὐ· τὸ μὲν γὰρ εἶδος ἐπιδέχεται

a species receives the *ratio* of the genus, whereas a genus does not receive the *ratio* of the species. And it is likewise evident that differences do not participate in the genus, for that which participates in a genus is always either a species or an individual; ►26.2.)

(If differences should participate in a genus), the genus would belong to their substance (i.e., to their essence).<sup>67</sup> And there would be an absurdity (*nugatio*) in a definition if, having posited a genus, a difference should be added, if the genus belonged to its substance, as there would be an absurdity if species were added. Also, (if differences should participate in a genus) a difference would differ in nothing from a species.

Likewise, that something should be added (*superveniat, per additionem*) to the ratio of *being* whereby it would be diversified is unintelligible, for that which is added to *being* must be extraneous to *being*, and what is outside the substance or essence of being must be *non-being*, which is nothing, and (nothing) cannot diversify or be a difference of *being*.<sup>68</sup>

Thus, *one* (*unum*) and *being* (*ens*), which are the most common (universals) of all, for they are predicated of all things, cannot be genera.<sup>69</sup> ARISTOTLE proves this so: since a difference added to a genus constitutes a species (►13.16), it is impossible for a species without a genus or for a genus without a species to be predicated of a difference. As he says, a species is not predicated of the proper differences of a genus (►30.12), nor a genus without a species (►30.13), because a genus is predicated of differences insofar as they are in a species.<sup>70</sup> But no difference can be taken of which *being* and *one* are not

---

τὸν τοῦ γένους λόγον, τὸ δὲ γένος τὸν τοῦ εἶδους οὔ.” Ibid. Δ.2, 122b20–24, “οὐδὲ δοκεῖ μετέχειν ἡ διαφορὰ τοῦ γένους· πᾶν γὰρ τὸ μετέχον τοῦ γένους ἢ εἶδος ἢ ἄτομόν ἐστιν, ἡ δὲ διαφορὰ οὔτε εἶδος οὔτε ἄτομόν ἐστιν. δῆλον οὖν ὅτι οὐ μετέχει τοῦ γένους ἡ διαφορὰ, ὡστ’ οὐδὲ τὸ περὶ τὸν εἶδος ἂν εἴη ἀλλὰ διαφορὰ, ἐπειδὴ οὐ μετέχει τοῦ γένους.”

<sup>67</sup> In *Metaph.* 1, l. 9, §138: Aliter genus esset de substantia differentiae, et in definitionibus esset nugatio, si posito genere, adderetur differentia, si de eius substantia esset genus, sicut esset nugatio si species adderetur. In nullo etiam differentia a specie differret.”

<sup>68</sup> In *Metaph.* 1, l. 9, §138: “non potest intelligi quod ad rationem entis aliquid superveniat per quod diversificetur: quia illud quod supervenit enti, oportet esse extraneum ab ente. Quod autem est huiusmodi, est nihil. [...] Ea vero quae sunt praeter substantiam entis, oportet esse non ens, et ita non possunt diversificare ens.” Ibid. 5, l. 9, §889: “Nihil autem posset esse extra essentiam entis, quod per additionem ad ens aliquam speciem entis constituat: nam quod est extra ens, nihil est, et differentia esse non potest. Unde in tertio huius probavit Philosophus, quod ens, genus esse non potest.” *STh* I, q. 3 a. 5 co.: “Ostendit autem Philosophus in III *Metaphys.*, quod ens non potest esse genus alicuius, omne enim genus habet differentias quae sunt extra essentiam generis; nulla autem differentia posset inveniri, quae esset extra ens; quia non ens non potest esse differentia.”

<sup>69</sup> In *Metaph.* 3, l. 8, §§432-433 (cf. ARISTOTLE, *Metaphysica* B.3, 998b17–22): “communissima omnium sunt unum et ens, quae de omnibus praedicantur. [...] Quod autem ens et unum non possint esse genera, probat [Philosophus] tali ratione. Quia cum differentia addita generi constituat speciem, de differentia praedicari non poterit nec species sine genere, nec genus sine speciebus.”

<sup>70</sup> In *Metaph.* 3, l. 8, §433 (cf. ARISTOTLE, *Metaphysica* B.3, 998b22–28): “Et ideo dicit [Philosophus], quod de propriis differentiis generis non praedicatur species, nec genus sine speciebus, quia scilicet genus praedicatur de differentiis secundum quod sunt in speciebus. Nulla autem differentia potest accipi de qua non praedicatur ens et unum, quia quaelibet differentia cuiuslibet generis est ens et est una, alioquin non posset constituere unam aliquam speciem entis. Ergo impossibile est quod unum et ens sint genera.”

predicated, because whatever difference of whichever genus is a *being* and is *one*—otherwise, (a difference) could not constitute some *one* species of *being*. Therefore, it is impossible for *one* and *being* to be genera.

### 30.12. A Species Cannot be Predicated of a Difference

That a species cannot be predicated of a difference—except perhaps by accident—is evident for two (reasons):<sup>71</sup>

1. A difference is in more (things) than a species, as PORPHYRY consigns.<sup>72</sup>

(PORPHYRY explains that a difference is often considered in many species: for example, *quadruped* is considered in many animals different in species; but a species is only in individuals, which are under the species.)<sup>73</sup>

2. Since a difference is posited in the definition of a species, a species could only be predicated by itself (*per se*) of the difference if the difference were understood to be the subject of the species, as *number* is the subject of *even*, in whose definition it is posited; but this is not how (a difference) is related (to a substantial species): rather, a difference is some form of a species.<sup>74</sup>

(In other words, every number is either even or odd; whence, *number* is posited as a proper subject in the definition of *even*, which is a property of *number* but not a species, since species of numbers are, for example, *two* and *three*.<sup>75</sup> On the other hand, *rational* is not the subject of *man*, but a [part of the substantial] form of *man*.)

### 30.13. A Genus Cannot be Predicated of a Difference

A genus taken alone (*per se*; ► 17.6) cannot be predicated of a difference according to predication by itself (*per se*; ► 17.8) because:<sup>76</sup>

---

<sup>71</sup> *In Metaph.* 3, l. 8, §433: “Quod autem species de differentia praedicari non possit, patet ex duobus. [...] Non ergo posset species praedicari de differentia, nisi forte per accidens.”

<sup>72</sup> *In Metaph.* 3, l. 8, §433: “Primo quidem, quia differentia in plus est quam species, ut Porphyrius tradit.”

<sup>73</sup> See PORPHYRY, *Isagoge et in Aristotelis categorias commentarium*, ed. Adolf BUSSE, *Commentaria in Aristotelem Graeca*, (Berlin: Reimer, 1887), 18.19–21: “ἡ μὲν διαφορά ἐπὶ πλείονων πολλάκις εἰδῶν θεωρεῖται, ὡς τὸ τετράπουν ἐπὶ πλείστων ζῶων τῷ εἶδει διαφερόντων, τὸ δὲ εἶδος ἐπὶ μόνων τῶν ὑπὸ τὸ εἶδος ἀτόμων ἐστίν.” Cf. BOETHIUS’s translation in *ibid.*, 46–47: “differentia quidem in pluribus saepe speciebus consideratur, quemadmodum quadrupes in pluribus animalibus specie differentibus, species vero in solis his quae sub specie sunt individuus est.”

<sup>74</sup> *In Metaph.* 3, l. 8, §433: “Secundo, quia cum differentia ponatur in definitione speciei, non posset species praedicari per se de differentia, nisi intelligeretur quod differentia esset subiectum speciei, sicut numerus est subiectum paris, in cuius definitione ponitur. Hoc autem non sic se habet; sed magis differentia est quaedam forma speciei.”

<sup>75</sup> See ARISTOTLE, *Topica* Δ.2, 122b18–20: “Καὶ εἰ τὴν διαφοράν εἰς τὸ γένος ἔθηκεν, οἷον τὸ περιπτόν ὅπερ ἀριθμόν. Διαφορὰ γὰρ ἀριθμοῦ τὸ περιπτόν, οὐκ εἶδος ἐστίν.”

<sup>76</sup> *In Metaph.* 3, l. 8, §433: “Similiter etiam nec genus per se sumptum, potest praedicari de differentia praedicatione per se.”

1. A genus is not posited in the definition of a difference, since a difference does not participate (in) a genus (► 26.2), as ARISTOTLE says.<sup>77</sup>

2. Nor is a difference posited in the definition of a genus.<sup>78</sup>

Therefore, a genus is in no mode predicated of a difference.<sup>79</sup> It is predicated, however, of that which has a difference: that is, of a species, which has a difference in act (whereas the genus has all differences and species in potency, as matter has all termini and forms).

### 30.14. *Being is Said According to Prior and Posterior*

As ARISTOTLE says, *being* (*ens* = τὸ ὄν), or *that which is* (*quod est*), is said in multiple modes (*dicitur multipliciter* = λέγεται πολλαχῶς).<sup>80</sup> It is not, however, said equivocally, but in respect to one (*ad unum* = πρὸς ἓν): not indeed to one that is one only in ratio, but that is one as *some one nature* (*una quaedam natura* < πρὸς... μίαν τινὰ φύσιν).<sup>81</sup>

As in the above examples (concerning how *healthy* is said in multiple modes but in respect to one end, and *medical* is said in multiple modes but in respect to one efficient cause; ► 20.9), so *being* is said in multiple (modes).<sup>82</sup> Hence, every *being* is said in respect to one first. However, this *first* is not an end or an efficient (cause), as in the aforesaid examples, but a subject.

1. Some are said (to be) *beings* (*entia vel esse*) because they have (an act of) being (*esse*) by themselves, as substances (*substantiae* = οὐσίαι), which are said (to be) *beings* (*entia*) principally and priorly.<sup>83</sup>

2. Others (are said to be beings) because they are affections or properties of substance (*passiones sive proprietates substantiae* = πάθη οὐσίας).<sup>84</sup>

---

<sup>77</sup> *In Metaph.* 3, l. 8, §433: “Non enim genus ponitur in definitione differentiae, quia differentia non participat genus, ut dicitur in quarto Topicorum.” See ARISTOTLE, *Topica* Δ.2, 122b20–24, just quoted.

<sup>78</sup> *In Metaph.* 3, l. 8, §433: “Nec etiam differentia ponitur in definitione generis.”

<sup>79</sup> *In Metaph.* 3, l. 8, §433: “ergo nullo modo per se genus praedicatur de differentia. Praedicatur tamen de eo quod habet differentiam, idest de specie, quae habet differentiam in actu.”

<sup>80</sup> *In Metaph.* 4, l. 1, §535 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003a33): “Dicit ergo [Philosophus] primo, quod ens sive quod est, dicitur multipliciter.”

<sup>81</sup> *In Metaph.* 4, l. 1, §536 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003a33–34): “dicit [Philosophus] quod ens etsi dicatur multipliciter, non tamen dicitur aequivoce, sed per respectum ad unum; non quidem ad unum quod sit solum ratione unum, sed quod est unum sicut una quaedam natura. Et hoc patet in exemplis infra positis.”

<sup>82</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b5–6): “Et sicut est de praedictis, ita etiam et ens multipliciter dicitur. Sed tamen omne ens dicitur per respectum ad unum primum. Sed hoc primum non est finis vel efficiens sicut in praemissis exemplis, sed subiectum.”

<sup>83</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b6–7): “Alia enim dicuntur entia vel esse, quia per se habent esse sicut substantiae, quae principaliter et prius entia dicuntur.”

<sup>84</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b7): “Alia vero quia sunt passiones sive proprietates substantiae, sicut per se accidentia uniuscuiusque substantiae.”

3. Some (others) are said (to be) *beings* (*entia*) because they are a way toward substance (*via ad substantiam* = ὁδὸς εἰς οὐσίαν), as generations and motions.<sup>85</sup>

4. Others are said (to be) *beings* because they are corruptions (*corruptiones* = φθοραί) of substance, for corruption is a way toward non-being, just as generation is a way toward substance.<sup>86</sup>

5. Since corruption is terminated at a privation, just as generation (is terminated) at a form, also privations (*privationes* = στερήσεις) of substantial forms are themselves fittingly (*convenienter*) are said (to be) *beings* (*esse dicuntur*; or, are said to be).<sup>87</sup>

6. Again, qualities or accidents (*qualitates vel accidentia* = ποιότητες) are said (to be) *beings* (*dicuntur entia*) because they are active or generative of a substance (*activa vel generativa substantiae* = ἢ ποιητικὰ ἢ γεννητικὰ οὐσίας) or of those (beings) which are said in respect of substance according to any of the aforesaid relations (*eorum quae <secundum aliquam habitudinem praedictarum> ad substantiam dicuntur* = τῶν πρὸς τὴν οὐσίαν λεγομένων), or according to any other (relation).<sup>88</sup>

7. Also, negations (*negationes* = ἀποφάσεις) of those that have a relation to substance, or of substances themselves, are said (to be) *beings*.<sup>89</sup> Whence we say that non-being *is* non-being, which would not be said if *to be* would not in some mode belong to negation.

### 30.15. Reduction to Four Modes of Being

The aforesaid modes of being can be reduced to four:<sup>90</sup>

1. **Negation** and **privation** (►42.1), which is the weakest (mode), is only in reason (*in ratione*).<sup>91</sup> We say that this is in reason because reason busies itself with them as though they were some (kind) of beings while it affirms and negates something of them.

<sup>85</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b7): “Quaedam autem dicuntur entia, quia sunt via ad substantiam, sicut generationes et motus.”

<sup>86</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b7–8): “Alia autem entia dicuntur, quia sunt corruptiones substantiae. Corruptio enim est via ad non esse, sicut generatio via ad substantiam.”

<sup>87</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b8): “Et quia corruptio terminatur ad privationem, sicut generatio ad formam, convenienter ipsae etiam privationes formarum substantialium esse dicuntur.”

<sup>88</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b8–9): “Et iterum qualitates vel accidentia quaedam dicuntur entia, quia sunt activa vel generativa substantiae, vel eorum quae secundum aliquam habitudinem praedictarum ad substantiam dicuntur, vel secundum quamcumque aliam.”

<sup>89</sup> *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b9–10): “Item negationes eorum quae ad substantiam habitudinem habent, vel etiam ipsius substantiae esse dicuntur. Unde dicimus quod non ens est non ens. Quod non diceretur nisi negationi aliquo modo esse competeret.”

<sup>90</sup> *In Metaph.* 4, l. 1, §540: “Sciendum tamen quod praedicti modi essendi ad quatuor possunt reduci.”

<sup>91</sup> *In Metaph.* 4, l. 1, §540: “Nam unum eorum quod est debilissimum, est tantum in ratione, scilicet negatio et privatio, quam dicimus in ratione esse, quia ratio de eis negociatur quasi de quibusdam entibus, dum de eis affirmat vel negat aliquid.”

2. According as **generation, corruption, and motion** are said (to be) *beings*.<sup>92</sup> These have something mixed of privation and negation, for motion (*motus*) is an imperfect act (*actus imperfectus*). This (mode) is proximate in weakness to the first.

3. (According as), for example, qualities, quantities, and properties of substance (are said to be beings).<sup>93</sup> Although this mode has nothing mixed of non-being, it has, however, a weak being because (such beings are) **not by themselves but in another**.

4. That which has an (act of) being (*esse*) in nature without mixture of privation and has a firm and solid (act of) being, as existing **by itself**: for example, substances.<sup>94</sup> This fourth genus is the most perfect.

To this (fourth genus) the others are referred as to a first and principal (mode of being), for qualities and quantities are said (to be) *beings* (*dicuntur esse*; or, are said to be) insofar as they are in a substance (*inquantum insunt substantiae*); motions and generations, insofar as they tend toward a substance or toward something of the aforesaid (e.g., toward some accident); privations and negations, insofar as they remove something of the aforesaid three (modes of being).<sup>95</sup>

### 30.16. The Parts of Common Being

**Common being** is divided:

1. Into **act** and **potency** (► 31).<sup>96</sup> This division is as a mean between the equivocal and the univocal. It does not distinguish the genera of beings, for potency and act are found

---

<sup>92</sup> *In Metaph.* 4, l. 1, §541: “Aliud autem huic proximum in debilitate est, secundum quod generatio et corruptio et motus entia dicuntur. Habent enim aliquod admixtum de privatione et negatione. Nam motus est actus imperfectus, ut dicitur tertio Physicorum.”

<sup>93</sup> *In Metaph.* 4, l. 1, §542: “Tertium autem dicitur quod nihil habet de non ente admixtum, habet tamen esse debile, quia non per se, sed in alio, sicut sunt qualitates, quantitates et substantiae proprietates.”

<sup>94</sup> *In Metaph.* 4, l. 1, §543: “Quartum autem genus est quod est perfectissimum, quod scilicet habet esse in natura absque admixtione privationis, et habet esse firmum et solidum, quasi per se existens, sicut sunt substantiae.”

<sup>95</sup> *In Metaph.* 4, l. 1, §543: “Et ad hoc sicut ad primum et principale omnia alia referuntur. Nam qualitates et quantitates dicuntur esse, inquantum insunt substantiae; motus et generationes, inquantum tendunt ad substantiam vel ad aliquid praedictorum; privationes autem et negationes, inquantum remouent aliquid trium praedictorum.”

<sup>96</sup> *In Physic.* 3, l. 1, n. 6 (cf. ARISTOTLE, *Physica* Γ.1, 200b26–27): “ens dividitur per potentiam et actum. Et haec quidem divisio non distinguit genera entium: nam potentia et actus inveniuntur in quolibet genere.” *Ibid.*, l. 2, n. 3: “unumquodque genus dividitur per potentiam et actum.” cf. ARISTOTLE, *Physica* Γ.1, 201a9–11: “διηρημένον δὲ καθ’ ἕκαστον γένος τοῦ μὲν ἐντελεχείᾳ τοῦ δὲ δυνάμει.” *In Sent.* 2, d. 42 q. 1 a. 3 co.: “ens dividitur [...] in ens actu et in ens potentia: et haec divisio est quasi media inter aequivocum et univocum.” *ScG* 2, 56 n. 10: “Forma et materia in eodem genere continentur: omne enim genus per actum et potentiam dividitur.” *Ibid.* 3, 7 n. 8: “Ens per actum et potentiam dividitur.” *In Metaph.* 3, l. 3, §361: “ens dividitur [...] per actum et potentiam.” *De potentia*, q. 3 a. 8 ad 12: “substantia dividitur per potentiam et actum, sicut et quodlibet aliud genus.” *Q. d. de anima*, a. 12 co.: “unumquodque genus dividitur per potentiam et actum.” *De sub. sep.*, c. 8, 17–18: “genus substantiae, sicut et alia genera, dividitur per potentiam et actum.”

in whatever genus, including substance. Thus, (substantial) form and matter are contained in the same genus (i.e., *substance*), for every genus is divided into act and potency.

2. Into the ten (highest) **genera, predicaments, categories** (► 33), i.e., substance and the nine genera of accidents: quantity, quality, etc.<sup>97</sup>

3. (Into) **one** and **many** (► 38).<sup>98</sup> One and many are accidents by themselves (i.e., properties, affections) of *being* insofar as it is *being*, and are among the first differences of *being*.

---

<sup>97</sup> *In Physic.* 3, l. 1, n. 6 (cf. ARISTOTLE, *Physica* Γ.1, 200b27–28): “Secunda divisio est prout ens dividitur secundum decem genera: quorum unum est *hoc aliquid*, idest substantia, aliud *quantum* vel *quale*, aut aliquod aliorum praedicamentorum.” *In Metaph.* 8, l. 1, §1682: “ens commune [...] dividitur per substantiam et novem genera accidentium.” *In Sent.* 2, d. 42 q. 1 a. 3 co.: “ens dividitur in substantiam et accidens.”

<sup>98</sup> *In Sent.* 1, d. 24 q. 1 a. 4 co.: “unum et multa dividunt ens commune.” *ScG* 1, 54 n. 3: “Per se autem accidentia entis, in quantum est ens, sunt unum et multa, ut probatur in IV *Metaph.*” *STh* I, q. 30 a. 3 co.: “ens dividitur per unum et multa.” *In Metaph.* 3, l. 3, §361: “ens dividitur per unum et multa.” *In Sent.* 1, d. 24 q. 1 a. 3 co.: “unum, et multa sunt de primis differentiis entis, secundum quod ens dividitur in unum et multa et in actum et in potentiam.”

## 31. Potency

*In order to clarify the division of being into act and potency, we treat first of potency.*

### 31.1. Act and Potency Follow Upon Common Being

As ARISTOTLE says, in one mode, *being* is divided insofar as it is said (to be a) substance, quantity or quality, which is to divide *being* into the ten categories (► 33); and in another mode, insofar as it is divided into potency (*per potentiam* < κατὰ δύναμιν) and act ([*per*] *actum* < κατὰ... ἐντελέχειαν) or operation ([*per*] *operationem* < κατὰ τὸ ἔργον), from which the name *act* (*actus*; ► 32) has been derived.<sup>1</sup>

The principal intention of metaphysics is (to treat) of potency and act insofar as they follow upon common being, for potency and act are found not only in mobile (things), but in many others.<sup>2</sup> However, it is necessary to determine first about mobile things, of which *potency* is most properly (*maxime proprie* = μάλιστα κυρίως) said, even if it is not the present intention, because through this we arrive at other potencies.

### 31.2. The First Potency in the Order of Cognition

The name **potency** (*potentia* = δύναμις; in Arabic, *quwwah* قوة and its synonyms) was first imposed to signify *the power of man* (*potestas hominis*), insofar as we say that some men are powerful (*potentes*), as AVICENNA says; and then it was transferred to natural things.<sup>3</sup>

That seems to be powerful (*potens*, capable, able) among men who can do of others what he wants without impediment; and his potency is diminished insofar as he can be impeded.<sup>4</sup> The potency of some natural—or even voluntary—agent is impeded insofar as it can be affected by something (*inquantum potest pati ab aliquo*).

---

<sup>1</sup> *In Metaph.* 9, l. 1, §1769 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1045b32–35): “ens dividitur uno modo secundum quod dicitur quid, scilicet substantia, aut quantitas, aut qualitas, quod est dividere ens per decem praedicamenta: alio modo secundum quod dividitur per potentiam et actum vel operationem, a qua derivatum est nomen actus.”

<sup>2</sup> *In Metaph.* 9, l. 1, §1770 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1045b35–1046a2): “[oportet determinare] primo de potentia quae maxime dicitur proprie, non tamen utile est ad praesentem intentionem. Potentia enim et actus, ut plurimum, dicuntur in his quae sunt in motu, quia motus est actus entis in potentia.” Ibid., §1772: “licet potentia quae est in rebus mobilibus maxime proprie dicatur, non tamen hoc solum dicitur potentia, ut dictum est. Et utilis est ad praesentem intentionem, non quasi de ea principaliter intendatur, sed quia per eam in alias potentias devenimus.” Ibid., §1770: “principalis intentio huius doctrinae non est de potentia et actu secundum quod sunt in rebus mobilibus solum, sed secundum quod sequuntur ens commune.”

<sup>3</sup> *In Sent.* 1, d. 42 q. 1 a. 1 co.: “nomen potentiae primo impositum fuit ad significandum potestatem hominis, prout dicimus aliquos homines esse potentes, ut Avicenna dicit, et deinde etiam translatum fuit ad res naturales.” AVICENNA attributes this to animals first. Cf. AVICENNA, *The Metaphysics of The Healing*, 130, 9–11: “إن لفظة القوة وما يرادفها قد وضعت أول الشيء للمعنى في الحيوان، الذي يمكنه بها أن تصدر عنه أفعال شاقة من...” *Liber de philosophia prima*, 4.2, 193.72–75.

<sup>4</sup> *In Sent.* 1, d. 42 q. 1 a. 1 co.: “Videtur autem in hominibus esse potens qui potest facere quod vult de aliis sine impedimento; et secundum quod impedi potest, sic minuitur potentia ejus. Impeditur autem potentia alicujus vel naturalis agentis vel etiam voluntarii, inquantum potest pati ab aliquo.”

Thus, *not being able of being affected* (*non posse pati*) belongs to the *ratio* of *potency* according to its first imposition.<sup>5</sup> Whence, also that which cannot be affected, even if it can do nothing, is said (to be) potent (or capable, able): for example, (that) is said (to be) *hard* which has the potency of not being cut up.

*Potency* is said from *act* (► 32).<sup>6</sup> And *act* is twofold: namely, first (*act*), which is a form; and second (*act*), which is an operation. And just as it seems from the common understanding of men (that) the name *act* was first attributed to the operation, for in this way almost all understand *act*, from thence it was secondly transferred to form insofar as form is the principle and end of operation.

Whence, likewise, *potency* is twofold:<sup>7</sup> (1) an active one, to which an *act* responds, which is the operation; and to this the name *potency* seems to have been attributed first; (2) the passive *potency* to which the first *act* responds, which is form, to which likewise the name *potency* seems to have been secondarily devolved. And since something is affected only by reason of a passive *potency*, so, too, something acts only by reason of the first *act*, which is the form, for the name *act* derives to it first from *action*, as has been said.

Hence, to be the first *potency* does not benefit matter in respect of the principal signification of *potency*, because *potency* was first imposed to signify the principle of action.<sup>8</sup> However, it was secondly transferred to this: that also that which receives the action of an agent would be said to have a *potency*; and this is the passive *potency*, so that just as *action* or *operation*—in which the active *potency* is completed—responds to *active potency*, so, too, that which responds to *passive potency* as (its) perfection and complement would be said (to be its) *act*. Therefrom, every form is said (to be an) *act*—even separated forms themselves.

---

<sup>5</sup> *In Sent.* 1, d. 42 q. 1 a. 1 co.: “Unde de ratione potentiae, quantum ad primam impositionem sui, est non posse pati. Unde etiam illud quod non potest pati, etsi nihil possit agere, dicimus potens; sicut dicitur durum quod habet potentiam ut non secetur.”

<sup>6</sup> *De potentia*, q. 1 a. 1 co.: “potentia dicitur ab actu: actus autem est duplex: scilicet primus, qui est forma; et secundus, qui est operatio: et sicut videtur ex communi hominum intellectu, nomen actus primo fuit attributum operationi: sic enim quasi omnes intelligunt actum; secundo autem exinde fuit translatum ad formam, in quantum forma est principium operationis et finis.”

<sup>7</sup> *De potentia*, q. 1 a. 1 co.: “Unde et similiter duplex est potentia: una activa cui respondet actus, qui est operatio; et huic primo nomen potentiae videtur fuisse attributum: alia est potentia passiva, cui respondet actus primus, qui est forma, ad quam similiter videtur secundo nomen potentiae devolutum. Sicut autem nihil patitur nisi ratione potentiae passivae, ita nihil agit nisi ratione actus primi, qui est forma. Dictum est enim, quod ad ipsum primo nomen actus ex actione devenit.”

<sup>8</sup> *In Sent.* 1, d. 42 q. 1 a. 1 ad 1: “esse primam potentiam non convenit materiae secundum principalem significationem potentiae: quia, ut dictum est, in corp. art., potentia primo imposita est ad significandum principium actionis; sed secundo translatum est ad hoc ut illud etiam quod recipit actionem agentis, potentiam habere dicatur; et haec est potentia passiva; ut sicut potentiae activae respondet operatio vel actio, in qua completur potentia activa; ita etiam illud quod respondet potentiae passivae, quasi perfectio et complementum, actus dicatur. Et propter hoc omnis forma actus dicitur, etiam ipsae formae separatae.”

### 31.3. Modes of Potency or Power

ARISTOTLE posits four modes in which the name **potency** or **power** (*potentia vel potestas* = δύναμις) is said:<sup>9</sup>

**1. Active potency** (► 31.4): the principle of motion and of (per)mutation (i.e., change) in another insofar as it is another (*principium motus et mutationis [sive permutationis] in alio inquantum est aliud* = ἡ... ἀρχὴ κινήσεως ἢ μεταβολῆς ἢ ἐν ἑτέρῳ ἢ ἢ ἕτερον), which is the ratio of active potency.<sup>10</sup>

**2. Passive potency** (► 31.5): the principle of motion or of mutation from another insofar as it is another (*principium motus vel mutationis ab altero inquantum est aliud* = [ἡ ἀρχὴ κινήσεως ἢ μεταβολῆς] ἡ... ὑφ' ἑτέρου ἢ ἢ ἕτερον).<sup>11</sup> And this is the passive potency, according to which the patient (i.e., that which undergoes a motion or change) is affected by something (*patiens aliquid patitur* = τὸ πάσχον πάσχει τι).

**3. The principle of producing** something, not in any mode but **well** (*principium faciendi aliquid <non quocumque modo, sed> bene* = ἡ [ἀρχὴ] τοῦ καλῶς τοῦτ' ἐπιτελεῖν; ► 31.6) or according to that which man disposes (*aut secundum praevoluntatem, idest secundum quod homo disponit* = ἢ κατὰ προαίρεσιν).<sup>12</sup>

**4. All habits, forms or dispositions** (*habitus sive formae vel dispositiones* = ἕξεις) whereby (*quibus* = καθ' ὅς) some (things) are said (to be) or are rendered altogether (*omnino* = ὅλως) **incapable** of being affected (*impassibilia* = ἀπαθη), or of being set in motion (*immobilia* <ἀμετάβλητα), or not easily (*non de facili* = μὴ ῥαδίως) capable of being set in motion (*mobilia* = εὐμετακίνητα), **for worse** (*in peius* = ἐπὶ τὸ χεῖρον; ► 31.7).<sup>13</sup>

<sup>9</sup> *In Metaph.* 5, l. 14, §954 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a15–32): “distinguit [Philosophus] hoc nomen potentia vel potestas. [...] ostendit quot modis dicitur potentia. [...] distinguit hoc nomen, potentia. [...] ponit modos potentiae.” Ibid., §955: “Ponit ergo in prima parte quatuor modos potentiae vel potestatis.”

<sup>10</sup> *In Metaph.* 5, l. 14, §955 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a15–16): “Quorum primus est, quod potentia dicitur principium motus et mutationis in alio inquantum est aliud.” Ibid. §976 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1020a4–6): “Patet igitur, quod propria definitio potentiae primo modo dictae est principium permutationis in alio inquantum est aliud, quod est ratio potentiae activae.”

<sup>11</sup> *In Metaph.* 5, l. 14, §956 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a20–21): “Secundum modum ponit [Philosophus...] Dicit, quod quodam alio modo dicitur potestas principium motus vel mutationis ab altero inquantum est aliud. Et haec est potentia passiva, secundum quam patiens aliquid patitur.”

<sup>12</sup> *In Metaph.* 5, l. 14, §959 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a23–24): “Tertium modum ponit [Philosophus...] Dicit, quod alia potestas dicitur, quae est principium faciendi aliquid non quocumque modo, sed bene, aut secundum «praevoluntatem,» idest secundum quod homo disponit. Quando enim aliqui progrediuntur vel loquuntur, sed non bene, aut non secundum quod volunt, dicuntur non posse loqui aut progredi. Et similiter est in pati. Dicitur enim aliquid posse pati illud quod bene potest pati. Sicut dicuntur aliqua ligna combustibilia, quia de facili comburuntur, et incombustibilia, quae non possunt de facili comburi.”

<sup>13</sup> *In Metaph.* 5, l. 14, §960 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a26–28): “Quartum modum ponit [Philosophus...] Dicit, quod etiam potestates dicuntur omnes habitus sive formae vel dispositiones, quibus aliqua dicuntur vel redduntur omnino impassibilia, vel immobilia, aut non de facili mobilia in peius.”

### 31.4. Active Potency

There is some principle of motion or mutation in that which is mutated: namely, matter itself; or some formal principle from which motion arises (*ad quod consequitur motus*), as downward and upward motion arises from the form of the heavy and of the light.<sup>14</sup>

However, such a principle cannot be said (to be an) *active potency*, to which that motion pertains, for everything that is in motion is set in motion by another (*omne quod movetur ab alio movetur*).<sup>15</sup> Nor does something set itself in motion—except through parts, insofar as one of its parts sets another in motion.

Therefore, potency, insofar as it is *the principle of motion in that in which it is*, is not comprehended under active potency but rather under passive potency.<sup>16</sup> Thus, heaviness in a heavy element is not a principle in such a way that (a heavy element) should set (something else) in motion, but rather in such a way that (a heavy element) would (itself) be set in motion.

*Potency conveys (importat) the ratio of principle of action.*<sup>17</sup> Whence, whatever might be that which is a principle of acting (*principium agendi*) is said (to be a) *potency*, such as heat and coldness.

Therefore, an active potency of motion must be in (something) other than that which is set in motion, as the building power is not in that which is built but rather in the builder.<sup>18</sup>

The medicinal art, on the other hand, although it is an active potency, for the physician cures through it, can nonetheless be in something that is healed not insofar as it is healed but by accident, insofar as the physician and that which is healed happens to be the same.<sup>19</sup>

---

<sup>14</sup> *In Metaph.* 5, l. 14, §955: “Est enim quoddam principium motus vel mutationis in eo quod mutatur, ipsa scilicet materia: vel aliquod principium formale, ad quod consequitur motus, sicut ad formam gravis vel levis sequitur motus sursum aut deorsum.”

<sup>15</sup> *In Metaph.* 5, l. 14, §955: “Sed huiusmodi principium non potest dici de potentia activa, ad quam pertinet motus ille. Omne enim quod movetur ab alio movetur. Neque aliquid movet seipsum nisi per partes, inquantum una pars eius movet aliam, ut probatur in octavo Physicorum.”

<sup>16</sup> *In Metaph.* 5, l. 14, §955: “Potentia igitur, secundum quod est principium motus in eo in quo est, non comprehenditur sub potentia activa, sed magis sub passiva. Gravitatis enim in terra non est principium ut moveat, sed magis ut moveatur.”

<sup>17</sup> *In Sent.* 1, d. 42 q. 1 a. 1 ad 2: “potentia importat, ut dictum est, in Resp. ad primum, rationem principii actionis; unde quidquid sit illud quod est principium agendi, potentia dicitur, sicut calor et frigus, et huiusmodi.”

<sup>18</sup> *In Metaph.* 5, l. 14, §955 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a16–17): “Potentia igitur activa motus oportet quod sit in alio ab eo quod movetur, sicut aedificativa potestas non est in aedificato, sed magis in aedificante.”

<sup>19</sup> *In Metaph.* 5, l. 14, §955 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a17–18): “Ars autem medicinalis, quamvis sit potentia activa, quia per eam medicus curat, contingit tamen quod sit in aliquo sanato, non inquantum est sanatum, sed per accidens, inquantum accidit eidem esse medicum et sanatum.”

In this mode, therefore, a power is—universally speaking—said in one mode (to be) *the principle of mutation or of motion in another insofar as it is another*.<sup>20</sup>

### 31.5. Passive Potency

Just as every agent acts on something other than itself (*omne agens, in aliud a se agit*), and every mover sets in motion something other than itself (*omne movens, aliud a se movet*), so every patient is affected by another (*omne patiens, ab alio patitur*) and everything that is set in motion is set in motion by another (*omne motum, ab alio movetur*).<sup>21</sup> Thus, that principle by which it befits something to be moved or to be affected is said (to be a) *passive potency* (*potentia passiva*).

However, to be **capable of being affected** (< δύνατον... παθεῖν) by another is said in two modes:<sup>22</sup> **(a)** sometimes, something is said to be capable of being affected by whatever it can undergo, whether it is good or bad; **(b)** sometimes, on the other hand, something is said to be capable of being affected not because it can be affected by something bad, but because it can be affected by something (that is) most excellent: for example, we do not say that someone is powerful if he can be overcome; but we say that he is powerful if he can be taught or be assisted. This is so because to be capable of being affected by some defect is sometimes attributed to impotence; and not to be capable of being affected by the same is attributed to potency.

### 31.6. The Principle of Acting or of Being Affected Well

When some (persons) walk or speak, but not well or not as they will, they are said not to be able to walk or to speak.<sup>23</sup> And it is likewise in being affected, for something is said to

---

<sup>20</sup> *In Metaph.* 5, l. 14, §955 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a19–20): “Sic igitur universaliter loquendo, potestas dicitur uno modo principium mutationis aut motus in alio, in quantum est aliud.”

<sup>21</sup> *In Metaph.* 5, l. 14, §956 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a20–21): “Sicut enim omne agens et movens, aliud a se movet, et in aliud a se agit; ita omne patiens, ab alio patitur: et omne motum, ab alio movetur. Illud enim principium, per quod alicui competit ut moveatur vel patiat ab alio, dicitur potentia passiva.”

<sup>22</sup> *In Metaph.* 5, l. 14, §957 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a21–23): “Posse autem pati ab alio dicitur dupliciter. Aliquando quidem, quicquid sit illud, quod aliquid potest pati, dicimus ipsum esse possibile ad illud patiendum, sive sit bonum, sive malum. Aliquando vero non dicitur aliquid potens ex eo quod potest pati aliquod malum, sed ex hoc quod potest pati aliquod excellentius. Sicut, si aliquis potest vinci, non dicimus potentem; sed si aliquis potest doceri vel adiuvari, dicimus eum potentem. Et hoc ideo, quia posse pati aliquem defectum quandoque attribuitur impotentiae; et posse non pati idem, attribuitur potentiae.” St. Thomas consigns an alternative reading that concerns only those things that are affected by something that is contrary to its nature. *Ibid.*, §958: “Alia tamen litera habet, aliquando autem non secundum omnem passionem, sed utique in contrarium. Quod quidem sic debet intelligi. Improperie enim dicitur pati, quicquid recipit aliquam perfectionem ab aliquo, sicut intelligere dicitur quoddam pati. Proprie autem pati dicitur quod recipit aliquid cum sui transmutatione ab eo quod est ei naturale. Unde et talis passio dicitur esse abiiciens a substantia. Hoc autem non potest fieri nisi per aliquod contrarium. Unde, quando aliquid patitur, secundum quod est contrarium suae naturae vel conditioni, proprie pati dicitur. Secundum quod etiam aegritudines passiones dicuntur. Quando vero aliquis recipit id quod est ei conveniens secundum suam naturam, magis dicitur perfici quam pati.”

<sup>23</sup> *In Metaph.* 5, l. 14, §959 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a24–26): “Quando enim aliqui progrediuntur vel loquuntur, sed non bene, aut non secundum quod volunt, dicuntur non posse loqui aut

be capable of being affected which can be affected well. For example, some (pieces of) wood are said (to be) *combustible* because they are easily combustible; and (those are said to be) *incombustible* which cannot easily be burned.

### 31.7. Impassibility, Resistance

That (some things) should be changed for the worse, as when they are broken into pieces, bent, crumbled, or are in any way corrupted, is not in bodies by some potency.<sup>24</sup> Rather, (this is in bodies) by some impotency and (through) a defect of some principle that cannot resist that which corrupts (it), for something is corrupted only because that which corrupts (it) overcomes it, which indeed happens due to the weakness of its own virtue.

(This resistance to corruption) happens to those (things) that cannot be affected by such defects or (are) hardly or gradually (capable of being affected)—that is, are slowly or moderately affected—because of (their own, proper) potency and because they have some perfection such that they *are not overcome by contraries*.<sup>25</sup>

### 31.8. Active and Passive Potencies Compared

As ARISTOTLE says, the potency of producing and of being affected is in some mode one potency, and in some mode (it is) not (one potency).<sup>26</sup>

It is one potency if the order of one to the other is considered, for one is said by respect to the other.<sup>27</sup> Thus, something can be said to have a potency of being affected (either) because it has by itself the potency to be affected or because it has the potency that another should be affected by it. And in the latter mode, the active potency is the same as

---

progredi. Et «similiter est in pati.» Dicitur enim aliquid posse pati illud quod bene potest pati. Sicut dicuntur aliqua ligna combustibilia, quia de facili comburuntur, et incombustibilia, quae non possunt de facili comburi.”

<sup>24</sup> *In Metaph.* 5, l. 14, §960 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a28–30): “Quod enim in peius mutantur, sicut quod frangantur, vel curventur, vel conterantur, vel qualitercumque corrumpantur, non inest corporibus per aliquam potentiam, sed magis per impotentiam et defectum alicuius principii, quod corrumpenti resistere non potest. Nunquam enim corrumpitur aliquid nisi propter victoriam corrumpentis supra ipsum. Quod quidem contingit ex debilitate propriae virtutis.”

<sup>25</sup> *In Metaph.* 5, l. 14, §960 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a30–32): “Illis vero, quae non possunt tales defectus pati, «aut vix aut paulatim,» idest tarde vel modicum patiuntur, accidit eis propter potentiam, et in eo quod habent «aliquo modo posse,» idest cum quadam perfectione, ut non superentur a contrariis.” St. Thomas adds an example from the *Categories*, *ibid.*: “Et per hunc modum dicitur in Praedicamentis, quod durum vel sanativum significat potentiam naturalem non patiendi a corrumpentibus. Molle autem et aegrotativum impotentiam.”

<sup>26</sup> *In Metaph.* 9, l. 1, §1781 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a19–28): “Ex praedictis quamdam veritatem circa praedictas potentias manifestat [Philosophus]; et dicit, quod potentia faciendi et patiendi est quodammodo una potentia, et quodammodo non.”

<sup>27</sup> *In Metaph.* 9, l. 1, §1781 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a19–21): “Una quidem est, si consideretur ordo unius ad aliam; una enim dicitur per respectum ad alteram. Potest enim dici aliquid habens potentiam patiendi, quia ipsum habet per se potentiam ut patiatur, vel eo quod habet potentiam ut aliud patiatur ab ipso. Et hoc secundo modo potentia activa est idem cum passiva: ex eo enim quod aliquid habet potentiam activam, habet potentiam ut patiatur aliud ab ipso.”

the passive, for something has the potency that another should be affected by it because it has an active potency.

On the other hand, if these two potencies—namely, active and passive—should be considered according to the subject in which they are, then the active potency is other than the passive (potency), for the passive (potency) is in the patient, since the patient is affected due to some principle that exists in it.<sup>28</sup> And in this mode, (this potency) is matter, for passive potency is nothing other than the principle of being affected by another.

For example, to be burned is some (kind of) being affected.<sup>29</sup> And the material principle due to which something is apt to be burned is that which makes it combustible (lit., *pingue vel crassum*). Whence, the potency itself is in the combustible (thing) as passive.

Likewise, that which yields to the thing that touches in such a way that it should receive some impression—e.g., as wax or something of this sort—is as such impressionable (*frangibile*).<sup>30</sup>

It is likewise in other (things) that are affected insofar as there is in them some principle of being affected, which is said (to be a) *passive potency*, while the active (potency) is in the agent, as heat is in the heater, and the building art is in the builder.<sup>31</sup>

### 31.9. Nothing is Affected by Itself

Since the active and the passive potency are in diverse (subjects), it is evident that nothing is affected by itself insofar as something is naturally apt to act or to be acted upon.<sup>32</sup>

However, something can be affected by itself by accident, as a physician heals himself not (insofar as (he is) a physician but (insofar as (he is) sick).<sup>33</sup> Hence, something is not

---

<sup>28</sup> *In Metaph.* 9, l. 1, §1782 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a22–24): “Si autem considerentur hae duae potentiae, activa scilicet et passiva, secundum subiectum, in quibus sunt, sic est alia potentia activa et alia passiva. Potentia enim passiva est in patiente, quia patiens patitur propter aliquod principium in ipso existens, et huiusmodi est materia. Potentia autem passiva nihil aliud est quam principium patiendi ab alio.”

<sup>29</sup> *In Metaph.* 9, l. 1, §1782 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a24–25): “Sicut comburi quoddam pati est; et principium materiale propter quod aliquid est aptum combustioni, est pingue vel crassum. Unde ipsa potentia est in combustibili quasi passiva.”

<sup>30</sup> *In Metaph.* 9, l. 1, §1782 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a25): “Et similiter illud quod sic cedit tangenti ut impressionem quamdam recipiat, sicut cera vel aliquid huiusmodi, in quantum tale est frangibile.”

<sup>31</sup> *In Metaph.* 9, l. 1, §1782 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a25–28): “Et similiter est in aliis, quae patiuntur, secundum quod in eis est principium quoddam patiendi, quod dicitur potentia passiva. Potentia vero activa est in agente, ut calor in calefactivo, et ars aedificativa in aedificante.”

<sup>32</sup> *In Metaph.* 9, l. 1, §1783 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a28–29): “Et quia potentia activa et passiva in diversis sunt, manifestum est quod nihil patitur a seipso, in quantum aliquid est aptum natum agere vel pati.”

<sup>33</sup> *In Metaph.* 9, l. 1, §1783: “Per accidens autem aliquid pati contingit a seipso; sicut medicus sanat seipsum, non ut medicum, sed sicut infirmum. Ideo autem non patitur aliquid a seipso, quia per se

affected by itself because, speaking by itself, one of the aforesaid principles—and not the other—is in something one and the same: the principle of being acted upon is not in that in which the principle of acting is, except by accident, as has been said.

### 31.10. Reduction to Active Potency

As ARISTOTLE says, *potency* (*potentia* = ἡ δύναμις) and *to be able* (*posse* = τὸ δύνασθαι) are said in multiple (modes). This multiplicity is a multiplicity of equivocation in respect of some modes; but in respect of some (others, it is a multiplicity) of analogy.<sup>34</sup> Thus, some are said to be possible or impossible because they have some principle in themselves; and this, according to some modes, insofar as all are said (to be) powerful (*potentiae*, i.e., capable, able) not equivocally but analogically. Some (others), however, are said (to be) possible (*possibilia*) or powerful (*potentia*) not due to some principle that they would have in themselves; and in these, *potency* is said equivocally.

As ARISTOTLE says, potencies are reduced to one species (< πρὸς τὸ αὐτὸ εἶδος), for whichever of them is some principle (< πᾶσαι ἀρχαί τινές εἰσι), and all potencies so said are reduced to some principle (< πρὸς πρώτην μίαν) from which all others are said.<sup>35</sup> And this is the active principle, which is the principle of transmutations (< ἀρχὴ μεταβολῆς) in another insofar as it is another (< ἐν ἄλλω ἢ ἢ ἄλλο).

ARISTOTLE says this (i.e., ἐν ἄλλω ἢ ἢ ἄλλο, *in another insofar as it is another*) because it is possible for an active principle to simultaneously be in the mobile or affected (thing) itself (*in ipso mobili vel passo*), as when something moves itself, for it is not the mover and the (thing) moved (*movens et motum*), (or) the agent and the patient (*agens et patiens*), according to the same.<sup>36</sup> Whence, he says that the principle that is said (to be an) *active potency* is the principle of transmutation in another insofar as it is another, since even if

---

loquendo, alicui uni et eidem inest unum dictorum principiorum et non aliud. Cui enim inest principium agendi, non inest principium patiendi, nisi secundum accidens, ut dictum est.”

<sup>34</sup> *In Metaph.* 9, l. 1, §1773 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a4–7): “Dicit ergo [Philosophus] primo, quod determinatum est in aliis, scilicet quinto huius, quod multipliciter dicitur potentia et posse. Sed ista multiplicitas quantum ad quosdam modos est multiplicitas aequivocationis, sed quantum ad quosdam analogiae. Quaedam enim dicuntur possibilia vel impossibilia, eo quod habent aliquod principium in seipsis; et hoc secundum quosdam modos, secundum quos omnes dicuntur potentiae non aequivoce, sed analogice. Aliqua vero dicuntur possibilia vel potentia, non propter aliquod principium quod in seipsis habeant; et in illis dicitur potentia aequivoce.”

<sup>35</sup> *In Metaph.* 9, l. 1, §1776 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a9–11): “considerandum est de potentiis, quae reducuntur ad unam speciem, quia quaelibet earum est principium quoddam, et omnes potentiae sic dictae reducuntur ad aliquod principium ex quo omnes aliae dicuntur. Et hoc est principium activum, quod est principium transmutationis in alio in quantum est aliud.”

<sup>36</sup> *In Metaph.* 9, l. 1, §1776: “Et hoc dicit [Philosophus], quia possibile est quod principium activum simul sit in ipso mobili vel passo, sicut cum aliquid movet seipsum; non tamen secundum idem est movens et motum, agens et patiens. Et ideo dicitur quod principium quod dicitur potentia activa, est principium transmutationis in alio in quantum est aliud; quia etsi contingat principium activum esse in eodem cum passo, non tamen secundum quod est idem, sed secundum quod est aliud.”

the active principle should be in the same (subject) as the affected (subject), (it is) not, however, (in it) insofar as it is the same but insofar as it is another.

It is evident that other potencies are reduced to that principle which is said (to be the) *active potency*, for that is said in another mode (to be a) passive potency (< τοῦ παθεῖν... δύναμις) which is *the principle (by) which something is set in motion by another insofar as it is another* (< ἀρχὴ μεταβολῆς παθητικῆς ὑπ' ἄλλου ἢ ἢ ἄλλο). And ARISTOTLE says this because, even if the same (subject) should be affected by itself, (it would) not (be affected), however, according to the same but according to another. This potency is reduced to the first active potency because the affection (*passio*) is caused by an agent (*ab agente causatur*). Therefrom, also passive potency is reduced to active (potency).<sup>37</sup>

In another mode, the habit of impassibility (*habitus impassibilitatis* = ἐξίς ἀπαθείας) is said (to be a) *potency*: that is, some disposition from which something has its not being capable of suffering a transmutation into the worse (*in deterius* = ἐπὶ τὸ χεῖρον).<sup>38</sup> This is what cannot be affected by corruption (< φθορᾶς) from another insofar as it is another: namely, from a principle of transmutation (< ὑπ' ἀρχῆς μεταβλητικῆς) that is an active principle.

It is manifest that either of these modes is said by comparison to something that exists in us in respect of an affection (*ad passionem*), in which one is said (to be a) *potency* due to a principle from which something is capable of not being affected, while in the other (it is said to be a potency) due to a principle from which something can be affected.<sup>39</sup> Whence, since affection depends on action, the definition of the first potency—to wit, the active—must be posited in the definition of one and of the other of those modes. And these two are reduced to the first—namely, to the active potency—as to a prior.

Again, in another mode, (some things) are said (to be) *potencies* not only due to an order in respect of producing and being affected (*solum per ordinem ad facere et pati* < ἢ τοῦ

---

<sup>37</sup> *In Metaph.* 9, l. 1, §1777 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a11–13): “Et quod ad illud principium quod dicitur potentia activa, reducuntur aliae potentiae, manifestum est. Nam alio modo dicitur potentia passiva, quae est principium quod aliquid moveatur ab alio, in quantum est aliud. Et hoc dicit [Philosophus], quia etsi idem patiat a seipso, non tamen secundum idem, sed secundum aliud. Haec autem potentia reducitur ad primam potentiam activam, quia passio ab agente causatur. Et propter hoc etiam potentia passiva reducitur ad activam.”

<sup>38</sup> *In Metaph.* 9, l. 1, §1778 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a13–15): “Alio modo dicitur potentia quidam habitus impassibilitatis «eius quae est in deterius,» id est dispositio quaedam ex qua aliquid habet quod non possit pati transmutationem in deterius, et hoc est quod non possit pati corruptionem ab alio «in quantum est aliud,» scilicet a principio transmutationis quod est principium activum.”

<sup>39</sup> *In Metaph.* 9, l. 1, §1779 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a15–16): “Manifestum est autem quod uterque istorum modorum dicitur per comparisonem alicuius existentis in nobis ad passionem. In quorum uno dicitur potentia propter principium ex quo aliquis potest non pati; in alio autem propter principium ex quo quis potest pati. Unde, cum passio ab actione dependeat, oportet quod in definitione utriusque illorum modorum ponatur definitio «potentiae primae,» scilicet activae. Et ita istae duae reducuntur ad primam, scilicet ad potentiam activam sicut ad priorem.”

μόνον ποιῆσαι ἢ τοῦ παθεῖν), but due to an order in respect of that which is well (*ad hoc quod est bene* < τοῦ καλῶς) in one and in the other.<sup>40</sup>

For example, we say that someone is capable of walking not because he should be able to walk in whatever mode but because he would walk well.<sup>41</sup> And conversely, we say of one who limps that he cannot walk.

Likewise, we say (that) wood (is) *combustible* because it can easily be burned, while we say (that) green wood, which cannot easily be burned, (is) *incombustible*.<sup>42</sup>

Whence, it is manifest that the *ratios* of the first potencies, which are said to act (►31.4) or to be acted upon (►31.5) simply (*simpliciter*), are included in the definition of those potencies that are said in respect of acting or being acted upon well, as *acting* (*agere*) is included in *acting well* (*bene agere*); and *being affected* (*pati*) is included in *being affected well* (*bene pati*).<sup>43</sup>

Whence, it is manifest that all these modes of potencies are reduced to one first: namely, to the active potency.<sup>44</sup> And hence, it is evident that the multiplicity (of *potency*) is not according to equivocation but according to analogy (i.e., it is not a multiplicity caused by a division according to *things signified* but by a division according to *multiple modes* of signifying, in which one is prior to, and is contained in the *ratio* of, the others; ►20.12).

### 31.11. Possible, Capable

As ARISTOTLE says, **possible, capable** (*possibile... et potens* = δυνατόν) is said in as many modes as *potency* is said.<sup>45</sup> Thus, he posits two modes of *possible* that correspond to the aforesaid modes of *potency* (to wit, according to active potency, ►31.12; and according to passive potency, ►31.13).<sup>46</sup>

<sup>40</sup> *In Metaph.* 9, l. 1, §1780 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a16–19): “Iterum alio modo dicuntur potentiae non solum per ordinem ad facere et pati, sed per ordinem ad hoc quod est bene in utroque.”

<sup>41</sup> *In Metaph.* 9, l. 1, §1780: “sicut dicimus aliquem potentem ambulare, non quod possit ambulare quoquo modo, sed eo quod possit bene ambulare. Et e converso dicimus esse de claudicante, quod non possit ambulare.”

<sup>42</sup> *In Metaph.* 9, l. 1, §1780: “Similiter dicimus ligna combustibilia eo quod comburi possint de facili. Ligna vero viridia, quae non de facili comburuntur, dicimus incombustibilia.”

<sup>43</sup> *In Metaph.* 9, l. 1, §1780: “Unde manifestum est quod in definitione harum potentiarum, quae dicuntur respectu bene agere vel pati, includuntur rationes primarum potentiarum, quae dicebantur simpliciter agere et pati: sicut in bene agere includitur agere; et pati, in eo quod est bene pati.”

<sup>44</sup> *In Metaph.* 9, l. 1, §1780: “Unde manifestum est, quod omnes isti modi potentiarum reducuntur ad unum primum, scilicet ad potentiam activam. Et inde patet quod haec multiplicitas non est secundum aequivocationem, sed secundum analogiam.”

<sup>45</sup> *In Metaph.* 5, l. 14, §961 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a32–33): “Dicit ergo [Philosophus], quod, cum potentia tot modis dicatur, possibile etiam et potens pluribus modis dicitur.”

<sup>46</sup> *In Metaph.* 5, l. 14, §961 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a32–b15): “Ponit [Philosophus] modos possibilis correspondentes praedictis modis potestatis.”

### 31.12. Possible, Capable According to Active Potency

To the first mode of potency (i.e., active potency; ►31.4) respond two modes of the possible, for something is said (to be) *capable to act* (*potens agere*) according to an active potency in two (modes):<sup>47</sup>

**1. Because it acts by itself immediately:** that which has in itself the active principle (of motion or) of mutation (*quod habet [motus] principium <activum> [aut] mutationis* = τὸ ἔχον κινήσεως ἀρχὴν ἢ μεταβολῆς) in itself.<sup>48</sup>

For example, that which causes another to be still (*stativum vel sistitivum, idest id quod facit aliud stare* = τὸ στατικόν), is said to be potent (*potens* = δυνατόν) to stop something else, diverse from itself (*aliquid aliud diversum ab eo < aliquid in altero aut in quantum alterum* = ἐν ἑτέρῳ ἢ ἢ ἕτερον).<sup>49</sup>

**2. Because it acts by means of another,** to which it communicates its potency, as a king acts through a governor: when it does not operate immediately, but *another has from it such a power* (*aliud habet ab eo talem potestatem* < ἐὰν ἔχη τι αὐτοῦ ἄλλο δύναμιν τοιαύτην), so that it could immediately act.<sup>50</sup>

### 31.13. Possible, Capable According to Passive Potency

According to the mode that responds to passive potency (►31.5), that is said (to be) **possible** or **capable** which can be mutated into something, whatever that may be (*quod potest mutari in aliquid, quicquid sit illud* = ἐὰν ἔχη μεταβάλλειν ἐφ' ὅτιοῦν): namely, whether it could be mutated into the worse or into the better (*in peius, sive in melius* = εἴτ' ἐπὶ τὸ χεῖρον εἴτ' ἐπὶ τὸ βέλτιον).<sup>51</sup>

According to this, something is said (to be) *corruptible* (*corruptibile* = φθειρόμενον) because it can be corrupted (*potest corrumpi* < δυνατόν εἶναι φθειρεσθαι), which is to

---

<sup>47</sup> *In Metaph.* 5, l. 14, §961: “Primo autem modo potestatis respondent duo modi possibilis. Secundum potestatem enim activam aliquid dicitur potens agere dupliciter. Uno modo, quia ipse per seipsum agit immediate. Alio modo, quia agit mediante altero, cui potentiam suam communicat, sicut rex agit per ballivum.”

<sup>48</sup> *In Metaph.* 5, l. 14, §961 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a33–34): “Uno quidem modo, quod habet principium activum mutationis in seipso.”

<sup>49</sup> *In Metaph.* 5, l. 14, §961 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a34–35): “sicut stativum vel sistitivum, idest id quod facit aliud stare, dicitur esse potens ad sistendum aliquid aliud diversum ab eo. Alio vero modo, quando ipse non immediate operatur, sed aliud habet ab eo talem potestatem, ut possit immediate agere.”

<sup>50</sup> *In Metaph.* 5, l. 14, §961 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019a35–b1): “Alio vero modo, quando ipse non immediate operatur, sed aliud habet ab eo talem potestatem, ut possit immediate agere.”

<sup>51</sup> *In Metaph.* 5, l. 14, §962 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b1–3): “Secundo ponit [Philosophus] secundum modum respondentem secundo modo potentiae, idest potentiae passivae; dicens, quod alio modo a praedicto dicitur possibile sive potens, quod potest mutari in aliquid, quicquid sit illud; scilicet sive possit mutari in peius, sive in melius.”

mutate into the worse; or *in corruptible* (*non corruptibile*) because it would be impossible for it to be corrupted.<sup>52</sup>

That which can be affected must have in itself some disposition (*dispositio* = διάθεσις), called *passive potency*, that would be the cause and principle of such an affection.<sup>53</sup>

However, the principle of affections can be in something passible (*inesse alicui passibili*, i.e., in something that is capable of being affected) in two modes:<sup>54</sup>

**1. Because it has something** (*quod habet aliquid* = τῷ ἔχειν τι).<sup>55</sup> For example, it is possible for man to be affected by illness because of the abundance of some inordinate fluid.

**2. Because it is deprived** (*quod privatur* = τῷ ἐστερηθῆναι) **of something** that can be incompatible with (*posset repugnare*) the affection.<sup>56</sup> For example, man would be said (to be) *capable of being affected by illness* (*potens infirmari*) due to the subtraction of strength and natural virtue.

Indeed, the following two must be (found) in anything that is capable of being affected (*in quolibet potente pati*), for something is affected only:<sup>57</sup> (¶1) if there is in it a subject that is receptive of a disposition or form that is induced by the affection; and (¶2) if there is in the patient a weakness of virtue to resist the action of the agent.

### 31.14. Reduction to Habit

The above two modes of the principle of being affected (► 31.13) can be reduced to one, since privation can be signified as a habit.<sup>58</sup> In this way, it would follow that to be deprived

---

<sup>52</sup> *In Metaph.* 5, l. 14, §962 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b3–4): “Et secundum hoc, aliquid dicitur corruptibile, quia potest corrumpi, quod est in peius mutari: vel non corruptibile, quia potest non corrumpi, si sit impossibile illud ipsum corrumpi.”

<sup>53</sup> *In Metaph.* 5, l. 14, §963 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b4–5): “Oportet autem illud, quod est possibile ad aliquid patiendum, habere in se quamdam dispositionem, quae sit causa et principium talis passionis; et illud principium vocatur potentia passiva.”

<sup>54</sup> *In Metaph.* 5, l. 14, §963: “Principium autem passionis potest inesse alicui passibili dupliciter.”

<sup>55</sup> *In Metaph.* 5, l. 14, §963 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b5–6): “Uno modo per hoc, quod habet aliquid; sicut homo est possibilis pati infirmitatem propter abundantiam alicuius inordinati humoris in ipso.”

<sup>56</sup> *In Metaph.* 5, l. 14, §963 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b6–7): “Alio vero modo est aliquid potens pati per hoc, quod privatur aliquo, quod posset repugnare passioni; sicut si homo dicatur potens infirmari propter subtractionem fortitudinis et virtutis naturalis.”

<sup>57</sup> *In Metaph.* 5, l. 14, §963: “Et haec duo oportet esse in quolibet potente pati. Nunquam enim aliquid pateretur, nisi esset in eo subiectum, quod esset receptivum dispositionis, vel formae, quae per passionem inducitur; et nisi esset debilitas virtutis in patiente ad resistendum actioni agentis.”

<sup>58</sup> *In Metaph.* 5, l. 14, §963 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b6–7): “Et haec duo oportet esse in quolibet potente pati. Nunquam enim aliquid pateretur, nisi esset in eo subiectum, quod esset receptivum dispositionis, vel formae, quae per passionem inducitur; et nisi esset debilitas virtutis in patiente ad resistendum actioni agentis.”

would be *to have a privation*. And in this way, either mode will (consist) in *having* something.

That privation can be signified as a habit (*habitus*, i.e., possession insofar as *possession* signifies *the act of possessing*) and as something had (*aliquid habitum*, i.e., a possession insofar as *possession* signifies *that which is possessed*) happens because *being* (*ens* = τὸ ὄν) is said equivocally (*aequivoce dicitur* = ὁμωνύμως... λεγόμενον), and according to one mode, both privation and negation can be signified as a habit.<sup>59</sup> Hence, we can universally say that it would be possible for something to be affected because it has in itself some habit and some principle of affection, since *to be deprived* would also be *to have something*, if there should be a privation.

### 31.15. Other Modes of the Possible, Capable

(ARISTOTLE adds two more modes according to which something is said to be *possible* or *capable*.)

3. *Insofar as it does not have the power or principle of being corrupted by another insofar as it is another.*<sup>60</sup> That is, something is said to be potent or vigorous because it cannot be overcome from the exterior in order to be corrupted.

This mode corresponds to the fourth mode of *potency*, according as *potency* was said to be in something that cannot be corrupted or to be mutated into the worse (► 31.7).<sup>61</sup>

4. *Only insofar as something happens to come to be or not to come to be—or also, because it happens to come to be well.*<sup>62</sup> This is according to the aforesaid modes that pertain to acting and to being affected. Thus, just as the potent is said to act because it can act well and easily or because it can act simply, likewise, the potent (can) be affected and corrupted because it can easily be affected by this.

---

<sup>59</sup> *In Metaph.* 5, l. 14, §964 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b8–10): “Quod autem privatio possit significari ut habitus, et ut aliquid habitum, ex hoc contingit, quod ens aequivoce dicitur. Et secundum unum modum et privatio et negatio dicitur ens, ut habitum est in principio quarti [§§564ss]. Et sic sequitur quod etiam negatio et privatio possunt significari ut habitus. Et ideo possumus universaliter dicere, quod aliquid possibile sit pati propter hoc quod habet in se quemdam habitum et quoddam principium passionis; cum etiam privari sit habere aliquid, si contingat privationem habere.”

<sup>60</sup> *In Metaph.* 5, l. 14, §965 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b10–11): “*Tertium modum* ponit [Philosophus] hic [...]. Dicit ergo, quod alio modo dicitur possibile vel potens, in quantum non habet potestatem vel principium aliquod ad hoc quod corrumpatur. Et hoc dico ab alio in quantum est aliud; quia secundum hoc aliquid dicitur potens et vigorosum, quod ab exteriori vinci non potest, ut corrumpatur.”

<sup>61</sup> *In Metaph.* 5, l. 14, §965: “et respondet quarto modo potentiae, secundum quod potentia dicebatur inesse alicui, quod non potest corrumpi, vel in peius mutari.”

<sup>62</sup> *In Metaph.* 5, l. 14, §966 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b11–13): “*Quartum modum* ponit [Philosophus...]. Dicit ergo, quod secundum praedictos modos, qui pertinent ad agendum vel patiendum, potest dici aliquid potens vel ex eo solum, quod aliquid accidit fieri vel non fieri, vel ex eo quod accidit etiam bene fieri. Sicut etiam dicitur potens agere, quia potest bene et faciliter agere, vel quia potest agere simpliciter. Et similiter potens pati et corrumpi, quia de facili hoc pati potest.”

This mode responds to the third mode of *potency*, according as *potency* was said in respect of acting or being affected well (► 31.6).<sup>63</sup>

This mode of power is found also in inanimate things such as musical instruments, for some lyre is said to be capable of sounding because it sounds well, while (it is said of) another (that it) cannot sound because it does not sound well.<sup>64</sup>

### 31.16. Impotence and Impossibility

Impotence (*impotentia* = ἀδυναμία), since it is contrary to the aforesaid potency, and the impossible (*impossibile* = ἀδύνατον), which is said according to such an impotence, is the privation of the aforesaid potency.<sup>65</sup> ARISTOTLE says this to differentiate (*impotence*) from *impossible*, which signifies some mode of falsity, and is not said according to some impotence, just as *possible* is not said according to some potency.

Since privation and habit (i.e., possession) are of the same and according to the same, it is necessary for potency and impotence to be of the same and according to the same.<sup>66</sup> Hence, impotence is said in as many modes as its opposite, *potency*.

### 31.17. Impotence

As ARISTOTLE says, the common *ratio* of **impotence** (*impotentia* = ἀδυναμία) is *the privation of potency* (*privatio potentiae* = στέρησις δυνάμεως).<sup>67</sup>

However, two (things) are required for the *ratio* of *privation*:<sup>68</sup>

1. The removal of the habit (i.e., possession) of the opposite (*remotio habitus oppositi*).<sup>69</sup> And potency is that which is opposed to impotence; whence, since potency is some

---

<sup>63</sup> *In Metaph.* 5, l. 14, §966: “respondet tertio modo potentiae, secundum quem dicebatur potentia ad bene agendum vel patiendum.”

<sup>64</sup> *In Metaph.* 5, l. 14, §966 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b13–15): “Et iste modus potestatis etiam invenitur in rebus inanimatis ut in organis, idest in lyra et musicis instrumentis. Dicitur enim quod aliqua lyra potest sonare, quia bene sonat; alia non potest sonare, quia non bene sonat.”

<sup>65</sup> *In Metaph.* 9, l. 1, §1784 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a29–31): “*Determinat* [Philosophus] *de impotentia*; dicens, quod impotentia, quia est contraria dictae potentiae, et impossibile, quod dicitur secundum huiusmodi impotentiam, est privatio praedictae potentiae. Hoc autem dicit ad differentiam impossibilis, quod significat aliquem modum falsitatis, quod non dicitur secundum aliquam impotentiam sicut nec possibile secundum aliquam potentiam.”

<sup>66</sup> *In Metaph.* 9, l. 1, §1784: “Quia enim privatio et habitus sunt eiusdem et secundum idem, necesse est quod potentia et impotentia sint eiusdem et secundum idem. Et ideo quot modis dicitur potentia, tot modis dicitur impotentia sibi opposita.”

<sup>67</sup> *In Metaph.* 5, l. 14, §967 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b15–16): “ostendit [Philosophus] communem rationem huius nominis impotentia. [...] Dicit ergo primo, quod impotentia est privatio potentiae.”

<sup>68</sup> *In Metaph.* 5, l. 14, §967: “Ad rationem autem privationis duo requiruntur.”

<sup>69</sup> *In Metaph.* 5, l. 14, §967: “quorum primum est remotio habitus oppositi. Id autem, quod opponitur impotentiae, est potentia. Unde, cum potentia sit quoddam principium, impotentia erit sublatio quaedam talis principii, qualis dicta est esse potentia.”

principle, impotence will be some annulling (*sublatio*) of such a principle as potency has been said to be.

2. Privation properly said is about a determinate subject and a determinate time (►42.7); and it is improperly taken without the determination of a subject or of a time.<sup>70</sup> Thus, only that is properly said (to be) *blind* which is naturally apt to have vision, and when it is naturally (apt) to have vision.

Said in this mode, *impotence* conveys (*dicit*) the removal of potency either: **(a)** *universally* (*omnino, idest universaliter = ὁλως*): namely, such that every removal of potency would be said (to be an) *impotence*, whether (the subject) is naturally apt to have it or not; or it conveys the removal (of potency) in that which is naturally apt to have it, whenever; or **(b)** only *when it is naturally apt to have it*.<sup>71</sup>

Thus, *impotence* is not likewise taken when we say that a child cannot beget and when (we say the same of someone who) simultaneously (is) a (grown) man and a eunuch.<sup>72</sup> Indeed, a child is said (to be) *impotent to beget* because the subject is (naturally) apt to beget, but not at that time. On the other hand, a eunuch man is said (to be) *impotent to beget* because he should be (naturally) apt (to beget) at that time but cannot (beget) because he lacks the active principle of generation. Whence, the *ratio* of *privation* is maximally preserved here.

On the other hand, a mule or a stone is said (to be) *impotent to beget* because it cannot (beget), nor does it have the (natural) aptitude in the existing subject.<sup>73</sup>

### 31.18. The Modes of Impotence

ARISTOTLE shows in how many modes *impotence* is said through the opposite to the modes of *potency*.<sup>74</sup> For just as potency is twofold—namely, active and passive, and

---

<sup>70</sup> *In Metaph.* 5, l. 14, §967: “Secundum quod requiritur, est quod privatio proprie dicta sit circa determinatum subiectum et determinatum tempus. Improperie autem sumitur absque determinatione subiecti et temporis. Non enim caecum proprie dicitur nisi quod est aptum natum habere visum, et quando est natum habere visum.”

<sup>71</sup> *In Metaph.* 5, l. 14, §968 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b16–18): “Impotentia autem sic dicta dicit remotionem potentiae, «aut omnino,» idest universaliter, ut scilicet omnis remotio potentiae impotentia dicatur, sive sit aptum natum habere, sive non: aut dicitur remotio in eo quod est aptum natum habere quandocumque, aut solum tunc quando aptum natum est habere.”

<sup>72</sup> *In Metaph.* 5, l. 14, §968 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b16–19): “Non enim similiter accipitur impotentia, cum dicimus puerum non posse generare, et cum virum et eunuchum simul. Puer enim dicitur impotens generare, quia subiectum est aptum ad generandum, non tamen pro illo tempore. Vir autem eunuchus dicitur impotens ad generandum, quia pro illo tempore esset quidem aptus, non tamen potest, quia caret principiis activis generationis. Unde hic magis salvatur ratio privationis.”

<sup>73</sup> *In Metaph.* 5, l. 14, §968: “Mulus autem vel lapis dicitur impotens ad generandum, quia non potest nec etiam habet aptitudinem in subiecto existentem.”

<sup>74</sup> *In Metaph.* 5, l. 14, §969 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b19–21): “Dat intelligere [Philosophus] *impotentiae modos* per oppositum ad modos potentiae. Sicut enim potentia est duplex, scilicet activa et

again, each of them (is a potency) to act or to be affected *simply* or to act or to be affected *well*—so, too, there is an opposite impotence according to either.<sup>75</sup>

Thus, there is an active potency to set (something) in motion simply (< μόνον κινητικῆ) or well (< καλῶς κινητικῆ); and a passive potency to being set in motion simply or well.

### 31.19. Impossible

As ARISTOTLE shows, **impossible** (*impossibile* = ἀδύνατον) is said in multiple modes.<sup>76</sup>

1. Insofar as some impossible (things) have the aforesaid impotence that is **opposed to potency**.<sup>77</sup> And such a mode is divided into four (modes), as (is) impotence too.

2. Due to an **incompatibility** (*repugnantia*) of the terms **in a proposition**, rather than due to the privation of some potency.<sup>78</sup>

Since *to be able* (*posse*) is said in order to being (*in ordine ad esse*), just as not only that which is in the nature of things is said (to be a) *being* (*ens*), but (also what is) according to the composition of a proposition (► 30.5), insofar as there is in it the true and the false, so, too, *possible* and *impossible* is said not only due to the potency or impotency of the thing, but due to the truth or the falseness of composition or division in propositions.<sup>79</sup>

Whence, that is said (to be) **impossible** *whose contrary is of necessity true* (*cuius contrarium est verum de necessitate* = οὐ τὸ ἐναντίον ἐξ ἀνάγκης ἀληθές).<sup>80</sup>

For example, that the diameter of the square should be commensurable with its side is impossible because such (a thing) is false whose contrary—(in this case), that it is not

---

passiva: et iterum utraque aut ad agendum et patiendum simpliciter, aut ad bene agendum et patiendum; ita secundum utramque potentiam est impotentia opposita. Et «solum mobili et bene mobili» idest potentiae activae, quae est ad movendum simpliciter, vel bene movendum: et potentiae passivae, quae est ad moveri simpliciter, vel bene moveri.”

<sup>75</sup> In *Metaph.* 5, l. 14, §967 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b15–19): “ostendit [Philosophus] quot modis dicitur impotentia. [...] ostendit quot modis dicatur [...]”

<sup>76</sup> In *Metaph.* 5, l. 14, §970 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b21–35): “Ostendit [Philosophus] quot modis dicitur impossibile [...]. Primo distinguit modos impossibilis.”

<sup>77</sup> In *Metaph.* 5, l. 14, §970 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b21–22): “Primo dicit [Philosophus], quod uno modo dicuntur aliqua impossibilia secundum quod habent impotentiam praedictam, quae opponitur potentiae. Et huiusmodi modus in quatuor dividitur, sicut et impotentia.”

<sup>78</sup> In *Metaph.* 5, l. 14, §971 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b22–27): “ponit [Philosophus] alium modum, quo dicuntur aliqua impossibilia, non propter privationem alicuius potentiae, sed propter repugnantiam terminorum in propositionibus.”

<sup>79</sup> In *Metaph.* 5, l. 14, §971 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b22–24): “Cum enim posse dicatur in ordine ad esse, sicut ens dicitur non solum quod est in rerum natura, sed secundum compositionem propositionis, prout est in ea verum vel falsum; ita possibile et impossibile dicitur non solum propter potentiam vel impotentiam rei: sed propter veritatem et falsitatem compositionis vel divisionis in propositionibus.”

<sup>80</sup> In *Metaph.* 5, l. 14, §971 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b23–24): “Unde impossibile dicitur, cuius contrarium est verum de necessitate.”

commensurable—is not only true but also necessary.<sup>81</sup> Therefore, to be commensurable is false of necessity—and this is the impossible (in this mode).

### 31.20. To Be Able and Not to Be Able

*To be able (posse)* conveys (*importat*) a mean respect between *potent* and *possible*, just as *to know* (conveys a mean respect) between *knower* and *knowable*.<sup>82</sup>

Hence, something can be negated *to be able* (in two modes).<sup>83</sup>

1. From the part of the potent.
2. From the part of the possible.

### 31.21. The Impossible by Itself

From the part of the possible itself, the *impossible by itself (impossibile per se)* is that which cannot in any mode have the *ratio* of *possible*.<sup>84</sup>

Indeed, every potency is toward being (*ad esse*) or toward non-being (*ad non esse*), as the potency that is toward corrupting.<sup>85</sup> Whence, that cannot be possible which cannot have the *ratio* of *being* or of *non-being*.

Hence, simultaneously being (*esse*) and not being (*non esse*) is impossible in itself, for that which is a being (*ens*) and a non-being (*non ens*) is neither a being nor a non-being, which lacks the *ratio* of *possible*.<sup>86</sup>

Thus, something is impossible in itself if the contrary of the predicate is in the definition of the subject: for example, a non-rational man; or a triangle that does not have three lines, for whoever posits a triangle posits that it has three lines, and this is to simultaneously have and not have three (lines).<sup>87</sup>

---

<sup>81</sup> *In Metaph.* 5, l. 14, §971 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b24–27): “ut diametrum quadrati esse commensurabilem eius lateri, est impossibile, quia hoc tale est falsum, cuius contrarium non solum est verum, sed etiam necessarium, quod quidem est non commensurabilem esse. Et propter hoc esse commensurabilem est falsum de necessitate, et hoc est impossibile.”

<sup>82</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “posse importat respectum medium inter potentem et possibile, sicut scire inter scientem et scibile.”

<sup>83</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “et ideo aliquid posse potest negari ex parte potentis, et aliquid ex parte possibilis.”

<sup>84</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “ex parte ipsius possibilis, quod nullo modo rationem possibilis habere potest: et hoc dicimus impossibile esse per se. Et cuiusmodi sit hoc, investigandum est.”

<sup>85</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “Sciendum igitur, quod omnis potentia vel est ad esse vel ad non esse, sicut potentia quae est ad corrumpendum. Unde quidquid non potest habere rationem entis vel non entis, illud non potest esse possibile.”

<sup>86</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “et ideo hoc quod est idem simul esse et non esse, est in se impossibile: quia quod est ens et non ens, neque est ens neque non ens.”

<sup>87</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “nullum eorum possit in quibus contrarium praedicati est in definitione subjecti, ut quod faciat hoc, scilicet hominem non esse rationalem, vel triangulum non habere tres lineas.”

From this, it moreover follows that something is impossible in itself if opposites should simultaneously be in the same (subject), for in the definition of one contrary is the privation of the other, and negation is in the definition of privation as the prior is in the posterior.<sup>88</sup>

### 31.22. Possible

The **possible** (*possibile* = δυνατόν) that is the contrary of the impossible in the second mode (► 31.19) is *that whose contrary is not of necessity false* (*cuius contrarium non est de necessitate falsum* < ὅταν μὴ ἀναγκαῖον ᾖ τὸ ἐναντίον ψευδὸς εἶναι).<sup>89</sup>

Thus, (in this mode) that is said to be in potency (*in potentia* < δυνατόν) which, if posited to be in act, nothing impossible follows (*quod si ponatur esse actu, nihil impossibile sequitur* < *hoc cui si extiterit actus cuius dicitur habere potentiam, nichil erit impossibile* = τοῦτο ὧν ἐὰν ὑπάρξη ἢ ἐνέργεια οὐ λέγεται ἔχειν τὴν δύναμιν, οὐθὲν ἔσται ἀδύνατον).<sup>90</sup>

For example, something impossible does not happen if one should say that it is possible for someone to be seated if he is posited to be seated, because not to be seated—which is its opposite—is not of necessity false.<sup>91</sup> (It is) likewise (the case) of being set in motion or setting (something else) in motion, and other such (possible things).

Therefrom, it is evident that this mode of the **possible** is divided into three modes:<sup>92</sup>

**1. That which is false but not of necessity** (*quod falsum est, sed non ex necessitate* < τὸ μὴ ἐξ ἀνάγκης ψευδὸς σημαίνει).<sup>93</sup> For example, that a man should be seated when he is not seated, since its opposite is not of necessity true.

---

In hoc ipso enim quod ponitur triangulus, ponitur tres lineas habere: unde hoc est simul habere tres et non habere.”

<sup>88</sup> *In Sent.* 1, d. 42 q. 2 a. 2 co.: “Et ex hoc ulterius sequitur quod non possit facere esse aliqua opposita simul in eodem; quia in definitione unius contrarii est privatio alterius, et in definitione privationis est negatio, sicut prius est in posteriori.”

<sup>89</sup> *In Metaph.* 5, l. 14, §972 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b27–29): “Manifestat [Philosophus] quid sit possibile oppositum impossibili secundo modo dicto. Impossibile enim opponitur possibili secundo modo dicto, sicut dictum est. Dicit ergo, quod possibile contrarium huic secundo impossibili est, cuius contrarium non est de necessitate falsum.”

<sup>90</sup> *In Metaph.* 9, l. 3, §1804 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a24–26): “Ostendit [Philosophus] quid sit esse in potentia, et quid esse in actu. Et primo quid sit esse in potentia, dicens, quod id dicitur esse in potentia, quod si ponatur esse actu, nihil impossibile sequitur.”

<sup>91</sup> *In Metaph.* 9, l. 3, §1804 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a26–29): “Ut si dicatur, aliquem possibile est sedere, si ponatur ipsum sedere non accidit aliquid impossibile. Et similiter de moveri et movere, et de aliis huiusmodi.” *In Metaph.* 5, l. 14, §972 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b29–30): “sicut sedere hominem est possibile, quia non sedere, quod est eius oppositum, non est de necessitate falsum.”

<sup>92</sup> *In Metaph.* 5, l. 14, §973 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b30–33): “Ex quo patet, quod ille modus possibilis in tres modos dividitur.”

<sup>93</sup> *In Metaph.* 5, l. 14, §973 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b30–32): “Dicitur enim uno modo possibile quod falsum est, sed non ex necessitate: sicut hominem sedere dum non sedet, quia eius oppositum non est verum ex necessitate.”

**2. That which is true but not of necessity** (*quod est verum, sed non de necessitate < τὸ ἀληθὲς εἶναι*), since its opposite is not of necessity false.<sup>94</sup> For example, (it is possible) for Socrates to be seated while he is seated.

**3. That which is proximate to being true, even if it is not true** (*quia licet non sit verum, tamen contingit in proximo verum esse < τὸ ἐνδεχόμενον ἀληθὲς εἶναι*).<sup>95</sup>

However, just as the impossible taken in the second mode (i.e., due to an incompatibility of the terms in a proposition; ►31.19, ¶2) is not said according to some impotence, so, too, these modes of the possible are not said according to some potency, but according to likeness, or according to the mode of the true and the false.<sup>96</sup>

### 31.23. Reduction of the Possible and the Impossible to Active Potency

ARISTOTLE reduces all the modes of the possible and the impossible into one first (mode). He says that (those things that) are said (to be) possible according to potency (*secundum potentiam* = κατὰ δύναμιν) are all said in respect to one first potency (*per respectum ad unam primam potentiam* < πρὸς τὴν πρώτην [μίαν]), which is the first active potency: that is, the principle of mutation in another insofar as it is another (►31.4), for all others are said (to be) *possible* in respect of this potency.<sup>97</sup>

Thus, something is said (to be) *possible* because something else has an active potency to (affect) it, according to which it is said (to be) *possible* according to passive potency.<sup>98</sup>

Some (other things) are said (to be) *possible* in that something else does not have such a potency in it.<sup>99</sup> For example, those are said (to be) *powerful* (*potentia*) which cannot be corrupted by external agents.

---

<sup>94</sup> *In Metaph.* 5, l. 14, §973 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b32): “Alio modo dicitur possibile quod est verum, sed non de necessitate, quia eius oppositum non est falsum de necessitate, sicut Socratem sedere dum sedet.”

<sup>95</sup> *In Metaph.* 5, l. 14, §973 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b32–33): “Tertio modo dicitur possibile, quia licet non sit verum, tamen contingit in proximo verum esse.”

<sup>96</sup> *In Metaph.* 5, l. 14, §974: “Sicut autem impossibile secundo modo acceptum non dicitur secundum aliquam impotentiam, ita et modi possibilis ultimo positi, non dicuntur secundum aliquam potentiam, sed secundum similitudinem, vel secundum modum veri et falsi.”

<sup>97</sup> *In Metaph.* 5, l. 14, §975 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b35–1020a2): “*Reducit omnes modos possibilis et impossibilis ad unum primum*: et dicit, quod possible, quae dicuntur secundum potentiam, omnia dicuntur per respectum ad unam primam potentiam, quae est prima potentia activa, de qua supra dictum est, quod est principium mutationis in alio in quantum est aliud. Nam omnia alia possible dicuntur per respectum ad istam potentiam.”

<sup>98</sup> *In Metaph.* 5, l. 14, §975 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1020a2–3): “Aliquid enim dicitur possibile per hoc, quod aliquid aliud habet potentiam activam in ipsum, secundum quod dicitur possibile secundum potentiam passivam.”

<sup>99</sup> *In Metaph.* 5, l. 14, §975 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1020a6): “Quaedam vero dicuntur possible in non habendo aliquid aliud talem potentiam in ipsa: sicut quae dicuntur potentia, quia non possunt corrumpi ab exterioribus agentibus.”

Some (other things) are said (to be) *powerful (potentia)* because they have a potency to act or to be affected well or easily.<sup>100</sup>

And just as all possible (things) that are said according to some potency are reduced to one first potency, so all impossible (things), which are said according to some impotency, are reduced to one first impotency, which is the opposite of the first potency.<sup>101</sup>

Therefore, it is evident that the proper definition of *potency* said in the first mode (*propria definitio potentiae primo modo dictae* < ὁ κύριος ὅρος τῆς πρώτης δυνάμεως) is *the principle of permutation in another insofar as it is another (principium permutationis in alio in quantum est aliud* < ἀρχὴ μεταβλητικὴ ἐν ἄλλῳ ἢ ἢ ἄλλο), which is the *ratio* of **active potency**.

### 31.24. *Potency Metaphorically Taken*

In some things, *potency* is not said due to some principle (that is) had (in them), but due to some likeness.<sup>102</sup> For example, as ARISTOTLE shows, *potency (potentia = δύναμις, i.e., power)* is said in geometry according to a metaphor (*metaphorice, secundum metaphoram = κατὰ μεταφοράν*).

Thus, it is said (in geometry) that the *potency (potentia)* of some line is its square; and it is said that a line is capable (of producing) its square (*potest in suum quadratum*), for a square is produced from a line—which is the root of the square—drawn into itself.<sup>103</sup> Hence, in geometry, the square of a line is said (to be the) *potency* of the line due to this likeness: just as that which is in act is produced from that which is in potency, so from drawing some line into itself results its square (*ex ductu alicuius lineae in seipsam, resultat quadratum ipsius*; i.e., since geometers imagine that a moved line produces a surface; and, should it be evenly moved along the same length, it would produce a square).

---

<sup>100</sup> *In Metaph.* 5, l. 14, §975 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1020a3–4): “Quaedam vero potentia «in sic habendo,» idest in hoc quod habent potentiam, ut bene aut faciliter agant vel patientur.”

<sup>101</sup> *In Metaph.* 5, l. 14, §976 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1020a4): “Et sicut omnia possibile, quae dicuntur secundum aliquam potentiam, reducuntur ad unam primam potentiam; ita omnia impossibile, quae dicuntur secundum aliquam impotentiam, reducuntur ad unam primam impotentiam, quae est opposita primae potentiae.”

<sup>102</sup> *In Metaph.* 9, l. 1, §1774 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a7–8): “Dicit ergo [Philosophus] quod de modis potentiae illi praetermittendi sunt ad praesens, secundum quod potentia dicitur aequivoce. In quibusdam enim dicitur potentia non propter aliquod principium habitum, sed propter similitudinem quamdam, sicut in geometricis.” *In Metaph.* 5, l. 14, §974 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b33–34): “Ostendit [Philosophus] quomodo potentia sumatur metaphorice; et dicit, in geometria dicitur potentia secundum metaphoram.”

<sup>103</sup> *In Metaph.* 9, l. 1, §1774: “Dicitur enim potentia alicuius lineae esse quadratum eius; et dicitur quod linea potest in suum quadratum. [...] Ex linea etiam, quae est radix quadrati, ducta in seipsam fit quadratum.” *In Metaph.* 5, l. 14, §974 (cf. ARISTOTLE, *Metaphysica* Δ.12, 1019b34–35): “Potentia enim lineae in geometria dicitur quadratum lineae per hanc similitudinem: quia sicut ex eo quod est in potentia fit illud quod est in actu, ita ex ductu alicuius lineae in seipsam, resultat quadratum ipsius.”

In a like mode, it can be said in (respect of) numbers that three is capable (of producing) nine (*ternarius potest in novenarium*), which is its square, because it produces (*facit*) nine due to its being drawn into itself (*eo quod ex ductu eius in seipsum; novenarius consurgit ex ductu ternarii in seipsum*), for thrice three produces nine.<sup>104</sup>

Whence, the root of a square has some likeness with the matter from which a thing comes to be (*ex qua fit res; ► 14.8*). Therefrom, due to some likeness, (some quantity) is said (to be) capable (of producing) a square (*potens in quadratum*), just as matter (is said to be) capable (of producing) a thing (*potens in rem*).<sup>105</sup>

Likewise, in logical (things), we say that some (things) are possible or impossible not because of some potency but because—in some mode—they are or are not, for (those things) are said (to be) **possible** (*possibilia*) whose opposites can be true (*quorum opposita contingit esse vera; ► 31.22*, second mode); and **impossible** (*impossibilia*), whose opposites cannot be true (*quorum opposita non contingit esse vera; ► 31.19*).<sup>106</sup> This diversity is due to the habitude of the predicate to the subject, which (predicate) is sometimes incompatible with the subject (*repugnans subiecto*), as in impossible (things), but sometimes not, as in possible (things).

---

<sup>104</sup> *In Metaph.* 9, l. 1, §1774: “Et simili modo potest dici in numeris, quod ternarius potest in novenarium quod est quadratum eius, eo quod ex ductu eius in seipsum facit novenarium. Ter enim tria novem faciunt. [...] Et similiter est in numeris.” <sup>104</sup> *In Metaph.* 5, l. 14, §974: “Sicut si diceremus, quod ternarius potest in novenarium, quia novenarius consurgit ex ductu ternarii in seipsum. Nam ter tria sunt novem.”

<sup>105</sup> *In Metaph.* 9, l. 1, §1774: “Unde radix quadrati habet aliquam similitudinem cum materia, ex qua fit res. Et propter hoc per quamdam similitudinem dicitur potens in quadratum, sicut dicitur materia potens in rem.”

<sup>106</sup> *In Metaph.* 9, l. 1, §1775 (cf. ARISTOTLE, *Metaphysica* Θ.1, 1046a8–9): “Similiter in logicis dicimus aliqua esse possibile et impossibile, non propter aliquam potentiam, sed eo quod aliquo modo sunt aut non sunt. Possibilia enim dicuntur, quorum opposita contingit esse vera. Impossibilia vero, quorum opposita non contingit esse vera. Et haec diversitas est propter habitudinem praedicati ad subiectum, quod quandoque est repugnans subiecto, sicut in impossibilibus; quandoque vero non, sicut in possibilibus.”

## 32. Act

*Having determined what potency is, we turn our attention to its correlative act.*

### 32.1. Act Cannot Be Defined

ARISTOTLE responds to the tacit question of showing through definition what *act* is by saying that *act* is among the first, simple (principles); and one must not seek a definition of everything, for the first, simple (principles) cannot be defined, since one ought not to proceed infinitely in definitions.<sup>1</sup> Whence, *act* cannot be defined. However, it is possible to manifest what we want to say—that is, what *act* is—by induction through examples in singular (things).

### 32.2. Manifesting Act by Induction

As ARISTOTLE says, **act** (*actus* = ἐνέργεια) is when the thing is (*quando res est < existere rem* = τὸ ὑπάρχειν τὸ πρᾶγμα) but not such as it is when it is in potency (*nec tamen ita est sicut quando est in potentia < non ita sicut dicimus potentia* = μὴ οὕτως ὥσπερ λέγομεν δυνάμει).<sup>2</sup>

Thus, before wood is carved, we say that the image of Mercury is in wood in potency and not in act; but if it has been carved, then the image of Mercury is said to be in act in wood.<sup>3</sup>

Likewise, in a whole continuum, its part (is in potency), for a part—for example, a half—is in potency insofar as it is possible for that part to be removed from the whole through the division of the whole; but once the whole has been divided, that part will already be in act.<sup>4</sup>

Likewise, one who (scientifically) knows (*sciens*) and is not exploring (*non speculans*), is capable of considering (even though he should be) without (actual) consideration, while *to explore* or *to consider* is *to be* in act.<sup>5</sup>

---

<sup>1</sup> *In Metaph.* 9, l. 5, §1826 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a35–37): “Respondet [Philosophus] quaestioni tacitae. Posset enim aliquis quaerere ab eo, ut ostenderet quid sit actus per definitionem. Sed ipse respondet dicens, quod inducendo in singularibus per exempla manifestari potest illud quod volumus dicere, scilicet quid est actus, «et non oportet cuiuslibet rei quaerere terminum,» idest definitionem. Nam prima simplicia definiri non possunt, cum non sit in definitionibus abire in infinitum. Actus autem est de primis simplicibus; unde definiri non potest.”

<sup>2</sup> *In Metaph.* 9, l. 5, §1825 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a30–32): “Primo [Philosophus] ostendit quid est actus; dicens, quod actus est, quando res est, nec tamen ita est sicut quando est in potentia.”

<sup>3</sup> *In Metaph.* 9, l. 5, §1825 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a32–33): “Dicimus enim in ligno esse imaginem Mercurii potentia, et non actu, antequam lignum sculpatur; sed si sculptum fuit, tunc dicitur esse in actu imago Mercurii in ligno.”

<sup>4</sup> *In Metaph.* 9, l. 5, §1825 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a33): “Et similiter in aliquo toto continuo pars eius. Pars enim, puta medietas, est in potentia, in quantum possibile est ut pars illa auferatur a toto per divisionem totius; sed diviso toto, iam erit pars illa in actu.”

<sup>5</sup> *In Metaph.* 9, l. 5, §1825 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a34–35): “Et similiter sciens et non speculans, est potens considerare sine consideratione; sed hoc scilicet speculari sive considerare, est esse in actu.”

### 32.3. The Analogy of Act

What *act* is can be seen through the proportion of some two (things) to each other (< τὸ ἀνάλογον συνορᾶν).<sup>6</sup>

For example, (we can induce what *act* is) if we take the proportion of the builder (which is in act) to the buildable (which is in potency); of the one who is awake (which is in act) to the one who is asleep (which is in potency); of the one who sees (which is in act) to the one who has his eyes closed although he has a seeing power (which is in potency); of that which is formed through art (which is in act) from formless matter (which is in potency); and of that which is prepared or elaborated (which is in act) to that which is not prepared or elaborated (which is in potency).<sup>7</sup>

Of those (things) that differ in this way, one part will be act and the other (will be) potency (< ταύτης δὲ τῆς διαφορᾶς θατέρω μορίῳ ἔστω ἡ ἐνέργεια ἀφωρισμένη θατέρω δὲ τὸ δυνατόν).<sup>8</sup> And so, proportionately, from particular examples, we can come to know what *act* is and (what) *potency* (is).

### 32.4. Modes of the Analogy of Act

ARISTOTLE shows that *act* is said diversely and posits two diversities:<sup>9</sup>

1. An act or an operation is said (to be an) *act*.<sup>10</sup> However, not all (things) are said to be in act (*actu* = ἐνεργεῖα) likewise (*similiter* = ὁμοίως) but diversely. And this diversity can be considered according to diverse proportions (< τῷ ἀνάλογον):

(a) As *a* is in *b*, so *c* is in *d* (*sicut hoc est in hoc, ita hoc in hoc* < ὡς τοῦτο ἐν τούτῳ... τὸ δ' ἐν τῷδε).<sup>11</sup> For example, just as sight is *in* the eye, so hearing is *in* the ear.

<sup>6</sup> *In Metaph.* 9, l. 5, §1827 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a37): “per proportionem aliquorum duorum adinvicem, potest videri quid est actus.”

<sup>7</sup> *In Metaph.* 9, l. 5, §1827 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048a37–b4): “Ut si accipiamus proportionem aedificantis ad aedificabile, et vigilantis ad dormientem, et eius qui videt ad eum qui habet clausos oculos cum habeat potentiam visivam, et eius «quod segregatur a materia,» idest per operationem artis vel naturae formatur, et ita a materia informi segregatur [ad illud quod non est segregatum a materia informi]; et similiter per separationem eius quod est praeparatum, ad illud quod non est praeparatum, sive quod est elaboratum ad id quod non est elaboratum.” Text in braces added following a footnote in the edition used.

<sup>8</sup> *In Metaph.* 9, l. 5, §1827 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b4–6): “quorumlibet sic differentium altera pars erit actus, et altera potentia. Et ita proportionaliter ex particularibus exemplis possumus venire ad cognoscendum quid sit actus et potentia.”

<sup>9</sup> *In Metaph.* 9, l. 5, §1828 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b6–17): “Ostendit [Philosophus], quod diversimode dicatur actus. Et ponit duas diversitates.”

<sup>10</sup> *In Metaph.* 9, l. 5, §1828 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b6–7): “quarum prima [diversitas] est, quod actus dicitur vel actus, vel operatio. Ad hanc diversitatem actus insinuandam dicit primo, quod non omnia dicimus similiter esse actu, sed hoc diversimode. Et haec diversitas considerari potest per diversas proportionem.”

<sup>11</sup> *In Metaph.* 9, l. 5, §1828 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b7–8): “Potest enim sic accipi proportio, ut dicamus, quod sicut hoc est in hoc, ita hoc in hoc. Utpote visus sicut est in oculo, ita auditus in aure.”

Thus, just as motion (*motus*) is the act of the mobile itself (*actus ipsius mobilis*) insofar as it is a mobile (*inquantum mobile est*), so being (*esse*) is the act of the existent (*actus existentis*) insofar as it is a being (*inquantum ens est*; ► 32.7).<sup>12</sup>

The comparison of *form to matter* is taken by this mode of proportion, for form is said to be *in matter* (< ὡς οὐσία πρὸς τινα ὕλην; ► 14.8).<sup>13</sup>

**(b)** As *a* is **to** *b*, so *c* is **to** *d* (*sicut habet se hoc ad hoc, ita hoc ad hoc* < ὡς τοῦτο... πρὸς τοῦτο, τὸ δ[ἐ] πρὸς τόδε).<sup>14</sup> For example, as (the power of) sight is *to* (the act of) seeing, so (is the power of) hearing *to* (the act of) hearing (*sicut se habet visus ad videndum, ita auditus ad audiendum*).

The comparison of *motion to motive potency*, or of any *operation to operative power* is taken by this mode of proportion (< ὡς κίνησις πρὸς δύναμιν).<sup>15</sup>

**2.** The infinite (*infinitum* = τὸ ἄπειρον), the void (*inane sive vacuum* = τὸ κενόν), and other (things) that are of such a mode are said to be in potency and in act diversely from many other beings.<sup>16</sup>

For example, that which sees (*videns*), that which walks (*vadens*), and that which is visible (*visibile* = τὸ ὁρώμενον, are said to be in potency and in act diversely), for sometimes it befits (*convenit*) such (a thing) to be simply (*simpliciter* = ἀπλῶς) in potency only or in act only, as that which is visible (is) in act only when it is seen (< ὅτι ὁρᾶται); and in potency, only when it can be seen (< ὅτι ὁρᾶσθαι δυνατόν) and is not seen.<sup>17</sup>

On the other hand, the infinite is not said (to be) *in potency* in such a way that it would sometimes be separated in act only.<sup>18</sup> Rather, act and potency are distinguished in *ratio*

---

<sup>12</sup> *In Sent.* 1, d. 19 q. 2 a. 2 co.: “Sicut autem motus est actus ipsius mobilis inquantum mobile est; ita esse est actus existentis, inquantum ens est.”

<sup>13</sup> *In Metaph.* 9, l. 5, §1828 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b9): “Et per hunc modum proportionis accipitur comparatio substantiae, idest formae, ad materiam; nam forma in materia dicitur esse.”

<sup>14</sup> *In Metaph.* 9, l. 5, §1829 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b7–8): “Alius modus proportionis est, ut dicamus quod sicut habet se hoc ad hoc, ita hoc ad hoc; puta sicut se habet visus ad videndum, ita auditus ad audiendum.”

<sup>15</sup> *In Metaph.* 9, l. 5, §1829 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b8): “Et per hunc modum proportionis accipitur comparatio motus ad potentiam motivam, vel cuiuscumque operationis ad potentiam operativam.”

<sup>16</sup> *In Metaph.* 9, l. 5, §1830 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b9–11): “Ponit [Philosophus] aliam diversitatem actus; dicens, quod infinitum, et inane sive vacuum, et quaecumque huiusmodi sunt, aliter dicuntur esse in potentia et actu, quam multa alia entia.”

<sup>17</sup> *In Metaph.* 9, l. 5, §1830 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b11–14): “Utputa videns, et vadens, et visibile. Huiusmodi enim convenit aliquando simpliciter esse vel in potentia tantum, vel in actu tantum; sicut visibile in actu tantum, quando videtur, et in potentia tantum, quando potest videri et non videtur.”

<sup>18</sup> *In Metaph.* 9, l. 5, §1831 (cf. ARISTOTLE, *Metaphysica* Θ.6, 1048b14–17): “Sed infinitum non ita dicitur in potentia, ut quandoque sit separatum in actu tantum. Sed actus et potentia distinguuntur ratione et cognitione in infinito. Puta in infinito secundum divisionem dicitur esse actus cum potentia simul, eo quod

and in cognition in the infinite. For example, in the infinite according to division, there is said to simultaneously be act with potency, since it never lacks the potency of dividing, for when it is divided in act, there is still an ulterior divisible in potency. And act is never separated from potency—namely, in such a way that the whole should sometimes be divided in act and would not be further divisible in potency.

### 32.5. The First Act in the Order of Cognition

The name **act** (*actus* = ἐνέργεια), which is posited to signify entelechy (*entelechia* = ἐντελέχεια) and perfection (*perfectio*)—that is, *form* and other such (things) as are any operations—comes (< ἐλήλυθε), as (far as) the origin of the appellation (is concerned), above all (*maxime* = μάλιστα), from motions (*ex motibus* = ἐκ τῶν κινήσεων).<sup>19</sup>

Indeed, since names are signs of intelligible conceptions, we first impose names upon those (things) that we understand first, even if they should be posterior according to the order of nature.<sup>20</sup> And, among other acts, motion, which sensibly appears to us (► 8.10), is maximally known (*notus*, or, knowable) and apparent to us (< δοκεῖ... ἡ ἐνέργεια μάλιστα ἢ κίνησις εἶναι). Hence, the name *act* was first imposed to it, and has been derived from motion into other things.

Because of this, *to be set in motion* (*moveri*) is not attributed to in-existent (things), even though some other predicates are attributed to in-existent (things).<sup>21</sup>

Thus, we say that non-beings are understandable or suitable for being opined (*intelligibilia vel opinabilia* = διανοητά), or even desirable (*concupiscibilia* = ἐπιθυμητά).<sup>22</sup> Indeed, something befits even *being* and *non-being* by analogy, since non-being itself is analogically said (to be a) *being* (► 30.14).<sup>23</sup>

---

nunquam deficit potentia dividendi: quando enim dividitur in actu, adhuc est ulterius divisibile in potentia. Nunquam autem separatur actus a potentia, ut scilicet quandoque sit totum divisum in actu, et non sit ulterius divisibile in potentia.”

<sup>19</sup> *In Metaph.* 9, l. 3, §1805 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a30–31): “Ostendit [Philosophus] quid sit esse in actu; et dicit, quod hoc nomen actus, quod ponitur ad significandum entelechiam et perfectionem, scilicet formam, et alia huiusmodi, sicut sunt quaecumque operationes, veniunt maxime ex motibus quantum ad originem vocabuli.”

<sup>20</sup> *In Metaph.* 9, l. 3, §1805 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a32): “Cum enim nomina sint signa intelligibilium conceptionum, illis primo imponimus nomina, quae primo intelligimus, licet sint posteriora secundum ordinem naturae. Inter alios autem actus, maxime est nobis notus et apprensus motus, qui sensibiliter a nobis videtur. Et ideo ei primo impositum fuit nomen actus, et a motu ad alia derivatum est.”

<sup>21</sup> *In Metaph.* 9, l. 3, §1806 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a32–34): “Et propter hoc moveri non attribuitur non existentibus; licet quaedam alia praedicata non existentibus attribuantur.”

<sup>22</sup> *In Metaph.* 9, l. 3, §1806 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a34): “Dicimus enim non entia esse intelligibilia vel opinabilia, aut etiam concupiscibilia.”

<sup>23</sup> *De veritate*, q. 2 a. 11 ad 5: “etiam enti et non enti aliquid secundum analogiam convenit, quia ipsum non ens, ens dicitur analogice, ut patet in IV Metaphysic.” *In Metaph.* 4, l. 1, §539 (cf. ARISTOTLE, *Metaphysica* Γ.2, 1003b9–10): “dicimus quod non ens est non ens. Quod non diceretur nisi negationi aliquo modo esse competeret.”

However, we do not say that (inexistent things) are set in motion (*mota* = κινούμενα), because *to be set in motion* signifies to be *in act* (*actu* = ἐνεργεία), which is evidently false (of non-beings).<sup>24</sup> Thus, even though some non-beings are in potency, they are not, however, said to be (*non dicuntur esse*; or, they are not said [to be] *beings*) because they are not in act.

### 32.6. Division of *Being* into *Act* and *Potency*

ARISTOTLE posits the distinction of *being* (► 30) into *act* and *potency* saying that *being* and *to be* (*ens et esse* < τὸ εἶναι... καὶ τὸ ὄν) signify (*significant* = σημαίνει) something that may be said or uttered (*dicibile vel effabile* = ῥητόν) **in potency** (*in potentia* = δυνάμει) and **in act** (*in actu* = ἐντελεχεία).<sup>25</sup>

We should note that some (things) *can be* even if they are not, while others *are*.<sup>26</sup> Those (things) that can be are said to be *in potency* (*potentia*), while that which already is, is said to be *in act* (*actu*).

Being (*ens*) in potency is as a mean between pure non-being and being in act.<sup>27</sup> Those (things) that naturally come to be (*naturaliter fiunt*), do not come to be from non-being simply, but from being in potency. Whence, it is not necessary for those that come to be, to preexist in act.

In all the terms that signify the ten categories (i.e., *substance, quantity, quality, etc.*), something is said (to be) *in act* and something (is said to be) *in potency*.<sup>28</sup> Therefrom, each category is divided by act and potency, for any one genus is divided by act and potency, which are among the first differences of *being*.

<sup>24</sup> *In Metaph.* 9, l. 3, §1806 (cf. ARISTOTLE, *Metaphysica* Θ.3, 1047a35–b2): “sed non dicimus ea esse mota. Quia, cum moveri significet esse actu, sequeretur quod non entia actu essent actu; quod patet esse falsum. Etsi enim quaedam non entia sint in potentia, tamen ideo non dicuntur esse, quia non sunt in actu.”

<sup>25</sup> *In Metaph.* 5, l. 9, §897 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a35–b1): “ponit [Philosophus] distinctionem entis per actum et potentiam; dicens, quod ens et esse significant aliquid dicibile vel effabile in potentia, vel dicibile in actu.”

<sup>26</sup> *De prin. nat.* §1, 1–8: “Nota quod quoddam potest esse licet non sit, quoddam uero est. Illud quod potest esse dicitur esse potentia, illud quod iam est dicitur esse actu.”

<sup>27</sup> *In Physic.* 1, l. 9, n. 3: “Ens enim in potentia est quasi medium inter purum non ens et ens in actu. Quae igitur naturaliter fiunt, non fiunt ex simpliciter non ente, sed ex ente in potentia; non autem ex ente in actu [...]. Unde quae fiunt non oportet praeexistere actu, [...] sed potentia tantum.”

<sup>28</sup> *In Metaph.* 5, l. 9, §897 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017b1–3): “In omnibus enim praedictis terminis, quae significant decem praedicamenta, aliquid dicitur in actu, et aliquid in potentia. Et ex hoc accidit, quod unumquodque praedicamentum per actum et potentiam dividitur.” *In Physic.* 3, l. 1, n. 6 (cf. ARISTOTLE, *Physica* Γ.1, 200b26–27): “ens dividitur per potentiam et actum. Et haec quidem divisio non distinguit genera entium: nam potentia et actus inveniuntur in quolibet genere.” *Ibid.*, l. 2, n. 3: “unumquodque genus dividitur per potentiam et actum. Potentia autem et actus, cum sint de primis differentiis entis, naturaliter priora sunt motu: et his utitur Philosophus ad definiendum motum.” Cf. ARISTOTLE, *Physica* Γ.1, 201a9–10: “διηρημένου δὲ καθ’ ἕκαστον γένους τοῦ μὲν ἐντελεχείᾳ τοῦ δὲ δυνάμει.”

And just as in the things that are outside the soul something is said (to be) in act and something (is said to be) *in potency*, so in the acts of the soul and (in) privations, which are things of *ratio* (or of reason, *res rationis*) only.<sup>29</sup>

Thus, someone is said *to (scientifically) know (scire)* because he can use (*potest uti*) science (*scientia*) and because he uses (it).<sup>30</sup> Likewise, (something is said to be) *at rest (quiescens = ἡρεμοῦν)* because (the act of) resting (*quiescere < ἡρεμία*) is in (*inest = ὑπάρχει*) it already and because it can rest (*quiescere = ἡρεμεῖν*).

This is so not only in accidents, but also in substances.<sup>31</sup> Thus, we say that the image of Mercury is in stone in potency. And a half line is said to be in potency in a line, for whichever part of a continuum is potentially in the whole—which line is posited among substances according to the opinion of those who posit mathematical things to be substances, which (opinion) ARISTOTLE rejects. Also, a grain is said to be in potency when it is not yet perfect, as when it is unripe.

### 32.7. Being and Its Act of Being

The perfections of all (things) pertain to the perfection of being, for all things are perfect insofar as they have (an act of) being (*esse*) in some mode.<sup>32</sup>

Thus, the (act of) being taken universally (*in universali acceptum*) can extend to infinite (things).<sup>33</sup>

The (act of) being of man is terminated at the species of man, since it is received in the nature of the human species.<sup>34</sup> And this is likewise (the case) concerning the (act of) being of a horse or whatever creature.

However, since two (principles) ought to be considered in a thing—namely, the nature or quiddity of the thing, and its (act of) being (*esse*)—, in all univocal (things) the community

---

<sup>29</sup> *In Metaph.* 5, l. 9, §897: “Et sicut in rebus, quae extra animam sunt, dicitur aliquid in actu et aliquid in potentia, ita in actibus animae et privationibus, quae sunt res rationis tantum.”

<sup>30</sup> *In Metaph.* 5, l. 9, §897 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017b3–6): “Dicitur enim aliquis scire, quia potest uti scientia, et quia utitur: similiter quiescens, quia iam inest ei quiescere, et quia potest quiescere.”

<sup>31</sup> *In Metaph.* 5, l. 9, §897 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017b6–8): “Et non solum hoc est in accidentibus, sed etiam in substantiis. Etenim Mercurium, idest imaginem Mercurii dicimus esse in lapide in potentia, et medium lineae dicitur esse in linea in potentia. Quaelibet enim pars continui est potentialiter in toto. Linea vero inter substantias ponitur secundum opinionem ponentium mathematica esse substantias, quam nondum reprobaverat [Philosophus]. Frumentum etiam quando nondum est perfectum, sicut quando est in herba, dicitur esse in potentia.”

<sup>32</sup> *STh* I, q. 4 a. 2 co.: “Omnium autem perfectiones pertinent ad perfectionem essendi, secundum hoc enim aliqua perfecta sunt, quod aliquo modo esse habent.”

<sup>33</sup> *De potentia*, q. 1 a. 2 co.: “esse in universali acceptum ad infinita se potest extendere.”

<sup>34</sup> *De potentia*, q. 1 a. 2 co.: “Esse enim hominis terminatum est ad hominis speciem, quia est receptum in natura speciei humanae; et simile est de esse equi, vel cuiuslibet creaturae.”

must be according to the *ratio* of the nature (*secundum rationem naturae*), and not according to being (*non secundum esse*), because one (act of) being is only in one thing.<sup>35</sup>

Whence, the habit (i.e., possession) of humanity (*habitus humanitatis*) is not in two human beings according to the same (act of) being (*secundum idem esse*).<sup>36</sup> And whenever the form signified by the name is the (act of) being itself, it cannot befit it (*convenire*) univocally—on account of which, also, *being* (*ens*) is not univocally predicated.

### 32.8. Composition of Act and Potency

The composition of act and potency is in more (things) than the composition of form and matter.<sup>37</sup> Whence, *matter* and *form* divide *natural substance*, while *potency* and *act* divide *common being*. And because of this, whatever (properties) follow upon potency and act as such (*inquantum huiusmodi*)—for example, *to receive* and *to be received* (►26), and *to perfect* and *to be perfected* (►23)—are common to material substances and created immaterial (substances). On the other hand, whatever (affections) are proper to matter and form as such—for example, *to be generated* and *to be corrupted*, and other such—these are proper to material substances, and in no mode befit created immaterial substances.

Hence, in substances composed from matter and form, there is a twofold composition of act and potency:<sup>38</sup>

1. The composition of substance itself, which is composed from matter and form.

That which is the act (*actus* = ἐντελέχεια) of something is the *ratio* and form (*ratio et forma* < λόγος; ►9.5) of that which is in potency (*eius quod est in potencia* = τοῦ δυνάμει ὄντος).<sup>39</sup>

<sup>35</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “cum in re duo sit considerare: scilicet naturam vel quidditatem rei, et esse suum, oportet quod in omnibus univocis sit communitas secundum rationem naturae, et non secundum esse; quia unum esse non est nisi in una re.”

<sup>36</sup> *In Sent.* 1, d. 35 q. 1 a. 4 co.: “unde habitus humanitatis non est secundum idem esse in duobus hominibus: et ideo quandocumque forma significata per nomen est ipsum esse, non potest univoce convenire, propter quod etiam ens non univoce praedicatur.”

<sup>37</sup> *ScG* 2, 54 n. 10: “compositio actus et potentiae est in plus quam compositio formae et materiae. Unde materia et forma dividunt substantiam naturalem: potentia autem et actus dividunt ens commune. Et propter hoc quaecumque quidem consequuntur potentiam et actum inquantum huiusmodi, sunt communia substantiis materialibus et immaterialibus creatis: sicut recipere et recipi, perficere et perfici. Quaecumque vero sunt propria materiae et formae inquantum huiusmodi, sicut generari et corrumpi et alia huiusmodi, haec sunt propria substantiarum materialium, et nullo modo conveniunt substantiis immaterialibus creatis.”

<sup>38</sup> *ScG* 2, 54 n. 9: “In substantiis autem compositis ex materia et forma est duplex compositio actus et potentiae: prima quidem ipsius substantiae, quae componitur ex materia et forma; secunda vero ex ipsa substantia iam composita et esse, quae etiam potest dici ex quod est et esse; vel ex quod est et quo est.”

<sup>39</sup> *In De anima* 2, c. 7, 182–183 (cf. ARISTOTLE, *De anima* B.4, 415b14–15): “id quod est actus alicuius est ratio et forma eius quod est in potencia.”

2. The composition from the substance itself already composed and (the act of) being (*esse*), which can also be said (to be a composition) from *that which is (quod est)* and (the act of) *being (esse)*; or from *that which is* and *whereby it is (quo est)*.

However, (the act of) being (*esse*) itself is compared to the form itself as act (to potency).<sup>40</sup> Wherefrom, in composites from matter and form, form is said to be the principle of being (*principium essendi*), because it is the complement of substance, whose act is being itself, just as the transparent is to air the principle of shining because it makes it the proper subject of light (► 15.24).

### 32.9. Substantial vs. Accidental Act and Potency of Being

The (formal act of) being (*esse*) of any one thing is divided into two (modes): the essential or substantial being of the thing (*esse essentialia rei, sive substantiale*), which is *being simply (esse simpliciter)*, as *being a man*; and accidental being (*esse accidentale*), which is *being something (esse aliquid)*: for example, *being white* (► 15).<sup>41</sup>

Something is in potency in relation to one and the other (act of) being (i.e., substantial and accidental).<sup>42</sup> For example, something is in potency of being a man, as the sperm and (the ovum), and something is in potency of being white, as man.

Both what is in potency in relation to substantial being and that which is in potency to accidental being can be said (to be) *matter*, as the sperm (in respect) of man, and man (in respect) of whiteness.<sup>43</sup>

However, they differ in this: that the matter that is in potency to substantial being is said (to be) *matter from which (materia ex qua)*, while that which is in potency to accidental being is said to be *matter in which (materia in qua; ► 14.8)*,<sup>44</sup> for accident is compared to subject as act to potency.<sup>45</sup>

---

<sup>40</sup> ScG 2, 54 n. 5: “ad ipsam etiam formam comparatur ipsum esse ut actus. Per hoc enim in compositis ex materia et forma dicitur forma esse principium essendi, quia est complementum substantiae, cuius actus est ipsum esse: sicut diaphanum est aeri principium lucendi quia facit eum proprium subiectum luminis.”

<sup>41</sup> *De prin. nat.* §1, 1–8: “duplex est esse, scilicet esse essentialia rei sive substantiale, ut hominem esse, et hoc est esse simpliciter; est autem aliud esse accidentale, ut hominem esse album, et hoc est esse aliquid.” ScG 2, 26 n. 2: “esse hoc [sc., esse formale uniuscuiusque rei] dividitur per esse substantiae et esse accidentis.”

<sup>42</sup> *De prin. nat.* §1, 9–12: “Ad utrumque esse est aliquid in potentia: aliquid enim est in potentia ut sit homo, ut sperma et sanguis menstruus, aliquid est in potentia ut sit album, ut homo.” St. Thomas, based on the natural science of antiquity, refers to the menstrual blood instead of the ovum.

<sup>43</sup> *De prin. nat.* §1, 12–16: “Tam illud quod est in potentia ad esse substantiale quam illud quod est in potentia ad esse accidentale potest dici materia, sicut sperma hominis et homo albedinis.”

<sup>44</sup> *De prin. nat.* §1, 16–19: “sed in hoc differt quia materia que est in potentia ad esse substantiale dicitur materia ex qua, que autem est in potentia ad esse accidentale dicitur materia in qua.”

<sup>45</sup> *De potentia*, q. 7 a. 4 co.: “accidens comparatur ad subiectum sicut actus ad potentiam.”

Just as everything that is in potency can be said (to be) *matter*, so everything from which something has (its act of) being (*esse*) can be said (to be a) *form*, whichever (act of) being that may be, whether substantial or accidental.<sup>46</sup>

For example, a man (can be said to be matter) when he is in potency of becoming white in act by whiteness, and sperm (can be said to be matter) because it is in potency of becoming a man in act by the soul.<sup>47</sup>

And since the form makes (something) to in act, hence the form is said to be an act: that which makes (something) be substantial in act is (said to be) a substantial form, while that which makes (something) be accidental in act is said to be an accidental form.<sup>48</sup>

### 32.10. Act is Better Than Potency in Good Things

Divided into potency and act, *being* is more common than *perfect being*, for *being in potency* is *being according to something (secundum quid)* and imperfect.<sup>49</sup>

In good (things), act is better than potency.<sup>50</sup> This is manifest because that which is in potency is the same that exists in potency in respect to contraries.

For example, that which can convalesce can (also) fall ill and is simultaneously in potency to one and to the other.<sup>51</sup> And this is so because the potency of one and of the other—of convalescing and of being afflicted, of resting and of moving—is the same, as is also that of other opposites.

One contrary preexists in the other according to potency, for the cold is in potency in the hot, but not in act, for nothing is made from nothing.<sup>52</sup>

---

<sup>46</sup> *De prin. nat.* §1, 36–39: “Sicut autem omne quod est in potentia potest dici materia, ita omne a quo aliquid habet esse, quodcumque esse sit, siue substantiale siue accidentale, potest dici forma.”

<sup>47</sup> *De prin. nat.* §1, 39–42: “sicut homo cum sit potentia albus fit actu albus per albedinem, et sperma cum sit potentia homo fit actu homo per animam.”

<sup>48</sup> *De prin. nat.* §1, 42–46: “Et quia forma facit esse in actu, ideo forma dicitur esse actus; quod autem facit actu esse substantiale est forma substantialis, et quod facit actu esse accidentale dicitur forma accidentalis.”

<sup>49</sup> *In Metaph.* 5, l. 9, §889: “dividit [Philosophus] ens per potentiam et actum: et ens sic divisum est communius quam ens perfectum. Nam ens in potentia, est ens secundum quid tantum et imperfectum.”

<sup>50</sup> *In Metaph.* 9, l. 10, §1883 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a4–6): “Postquam comparavit Philosophus actum et potentiam secundum prius et posterius, hic comparat ea secundum bonum et malum; et circa hoc duo facit. Primo dicit quod in bonis, actus est melior potentia. Quod quidem manifestum est ex hoc, quod id quod est potentia, est idem in potentia existens ad contraria.”

<sup>51</sup> *In Metaph.* 9, l. 10, §1883 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a6–10): “Sicut quod potest convalescere, hoc potest infirmari, et simul est in potentia ad utrumque. Et hoc ideo quia eadem est potentia utriusque, convalescendi et laborandi, et quiescendi et movendi et aliorum huiusmodi oppositorum.”

<sup>52</sup> *In Physic.* 1, l. 9, n. 4: “Dicebat enim [Antiqui] quod contraria fiunt ex alterutris: videmus enim ex calido fieri frigidum et e converso. Et ex hoc concludebat quod, cum ex nihilo nihil fiat, quod unum contrariorum praeexistit in altero. Quod quidem est verum secundum potentiam, nam frigidum est potentia in calido:

Moreover, that which is in act reduces something of its genus from potency into act.<sup>53</sup>

In this way, it is evident that something (i.e., the proper subject) is simultaneously capable of contraries, even if contraries cannot simultaneously be in act.<sup>54</sup> Therefore, of contraries separated one from the other, one is good, as the healthy, while the other is bad, as the ill, for in contraries, one is as deficient, which pertains to the bad.

Hence, that which is good in act is only good, while potency is likewise had in respect of one and of the other: namely, *according to something (secundum quid)*, which is *being in potency (esse in potentia)*; but it has neither simply (*simpliciter*), which is being in act (*esse in actu*).<sup>55</sup> It remains, therefore, that act is better than potency, since that which is simply and purely good is better than that which is good according to something and conjoined to the bad.

### 32.11. Act is Worse Than Potency in Bad Things

As ARISTOTLE shows, on the contrary, in bad (things), act is worse than potency, for that which is bad simply (*simpliciter*), and is not related to the bad according to something (*secundum quid*), is worse than that which is bad according to something and which is had (in respect) to the bad and to the good.<sup>56</sup> Whence, since potency (in respect) to the bad does not yet have the bad except according to something, it remains that the bad act is worse than the potency (in respect) to the bad; and the same is (in respect) to the good, for the potency that is (in respect) to contraries is the same.

ARISTOTLE concludes from the aforesaid that the bad is not some nature apart from (*praeter*) other things that are good according to nature,<sup>57</sup> for the bad itself is posterior to

---

non autem actu, ut Anaxagoras aestimabat, propter hoc quod nesciebat accipere esse in potentia, quod est esse medium inter purum non esse et esse actu.”

<sup>53</sup> *Q. d. de anima*, a. 20 ad 11: “id quod est in actu, reducit aliquid sui generis de potentia in actum.”

<sup>54</sup> *In Metaph.* 9, l. 10, §1883 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a10–14): “Et ita patet quod aliquid simul potest contraria, licet contraria non possint simul esse actu. Contrariorum igitur utrumque seorsum, est hoc quidem bonum, ut sanum, aliud vero malum, ut infirmum. Nam semper in contrariis unum est ut deficiens, quod ad malum pertinet.”

<sup>55</sup> *In Metaph.* 9, l. 10, §1884 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a14–15): “Sic igitur quod est bonum in actu, est tantum bonum. Sed potentia se habet similiter «ad utrumque,» scilicet secundum quid; quod est esse in potentia. Habet autem neutrum simpliciter, quod est esse in actu. Relinquitur igitur quod actus est melior potentia; quia quod est simpliciter et pure bonum, est melius eo quod est secundum quid bonum, et coniunctum malo.”

<sup>56</sup> *In Metaph.* 9, l. 10, §1885 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a15–17): “Ostendit [Philosophus] quod e contrario *in malis est actus peior potentia*: et circa hoc tria facit. Primo *ostendit propositum ex ratione supra inducta*; quia id quod est simpliciter malum, et non secundum quid se habens ad malum, est peius eo quod est secundum quid malum, et quod se habet ad malum et ad bonum. Unde, cum potentia ad malum nondum habeat malum nisi secundum quid (et eadem est ad bonum, nam idem est potentia quod est ad contraria), relinquitur quod actus malus est peior potentia ad malum.”

<sup>57</sup> *In Metaph.* 9, l. 10, §1886 (cf. ARISTOTLE, *Metaphysica* Θ.9, 1051a17–19): “*Concludit* [Philosophus] *ex dictis quod ipsum malum non est quaedam natura praeter res alias, quae secundum naturam sunt bonae.*”

potency according to (the order of) nature, since it is worse and more removed (*elongatum*) from the perfection of nature. Whence, since potency cannot be (something) other apart from a thing, much less (can) the bad itself (be something apart from a thing).

---

Nam ipsum malum secundum naturam est posterius quam potentia, quia est peius et magis elongatum a perfectione naturae. Unde, cum potentia non possit esse alia praeter res, multo minus ipsum malum.”

## 33. The Categories

We examine here the division of being into the ten highest genera (also called categories or predicaments), and how substance is the first being among them.

### 33.1. Analogical Division into Categories

*Being* is divided into ten categories not univocally, as a genus (is divided) into species, but according to a diverse mode of being (*secundum diversum modum essendi*; ► 13.6).<sup>1</sup>

However, the modes of being are proportional to the modes of predicating, for those (predicates) are said to be by themselves (*secundum se*) which signify whatever figures of predication—and by predicating something of something else, we say that *this is that*.<sup>2</sup> Indeed, in any one mode of predicating, *to be* (*esse*) must signify the same. For example, when we say, “man is an animal,” *is* signifies *substance*; and when we say, “a man is white,” (*is*) signifies *quality*; and so on, such that, of those that are predicated, some signify *the what* (*quid* < τὰ τί ἐστι σημαίνει), i.e., the substance; others, *the how* (*quale* < τὰ ποιόν, i.e., quality); others *the how much* (*quantum* < τὰ ποσόν, i.e., quantity); and likewise of the others (i.e., τὰ πρός τι, τὰ ποιεῖν ἢ πάσχειν, τὰ πού, τὰ ποτέ...)<sup>3</sup>

<sup>1</sup> *In Physic.* 3, l. 5, n. 15: “ens dividitur in decem praedicamenta non univoce, sicut genus in species, sed secundum diversum modum essendi.”

<sup>2</sup> *In Physic.* 3, l. 5, n. 15: “Modi autem essendi proportionales sunt modis praedicandi. Praedicando enim aliquid de aliquo altero, dicimus hoc esse illud.”

<sup>3</sup> *In Metaph.* 5, l. 9, §889 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a22–27): “Dicit ergo [Philosophus] primo, quod illa dicuntur esse secundum se, quaecumque significant figuras praedicationis.” Ibid., §890: “Quia igitur eorum quae praedicantur, quaedam significant quid, idest substantiam, quaedam quale, quaedam quantum, et sic de aliis; oportet quod unicuique modo praedicandi, esse significet idem; ut cum dicitur homo est animal, esse significat substantiam. Cum autem dicitur, homo est albus, significat qualitatem, et sic de aliis.” As St. Thomas explains, ARISTOTLE removes a possible objection, according to which someone could believe that those predications in which the verb “is” is not apposed would not pertain to the predication of being, as when one says, “the man walks.” Thus, he says that in all such predications something is signified to be, for any verb is resolved in the verb *to be* and a participle. For example, it differs in nothing to say, “a man is convalescent” and “a man convalesces.” Whence, it is evident that being is said in as many modes as predication is made. Ibid., §893 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a27–30): “Quia vero quaedam praedicantur, in quibus manifeste non apponitur hoc verbum est, ne credatur quod illae praedicationes non pertineant ad praedicationem entis, ut cum dicitur, homo ambulat, ideo consequenter hoc removet, dicens quod in omnibus huiusmodi praedicationibus significatur aliquid esse. Verbum enim quodlibet resolvitur in hoc verbum est, et participium. Nihil enim differt dicere, homo convalescens est, et homo convalescit, et sic de aliis. Unde patet quod quot modis praedicatio fit, tot modis ens dicitur.” St. Thomas also refutes AVICENNA, who says that those predicates that are in the genus of accident—for example, when we say *white* and *musical*—principally signify substance; and posteriorly, accident, for *white*, as ARISTOTLE says in his *Categories*, signifies quality only, and the name *white* signifies a subject from the consequent (*ex consequenti*) insofar as it signifies *whiteness* by the mode of an accident. Whence, from the consequent, it must include a subject in its *ratio*, for the “to be” of an accident is “to be in.” Hence, although whiteness signifies an accident, (it does) not (signify an accident) by the mode of an accident, but by the mode of a substance. Whence, in no mode does it co-signify a subject, for if it should signify a subject, then accidental predicates would not be posited by ARISTOTLE under *being by itself* but under *being by accident*, since the whole that *white man* is, is a being according to accident. Ibid., §894: “Nec est verum quod Avicenna dicit, quod praedicata, quae sunt in generibus accidentis, principaliter significant substantiam, et per posterius accidens, sicut hoc quod dico album et musicum. Nam album ut in praedicamentis dicitur, solam qualitatem significat. Hoc autem nomen album significat subiectum ex consequenti, in quantum significat albedinem per modum

Therefore, *being* must be contracted to diverse genera according to a diverse mode of predicating that follows upon a diverse mode of being, for in as many modes as some being is predicated, in that many modes is it signified to be.<sup>4</sup> Therefrom, the ten genera into which *being* is first divided are said to be ten **predicaments** (*praedicamenta* = κατηγορίαι, i.e., categories) because they are distinguished following the diverse modes of predicating.

Now every predication is made in three modes, for a predicate can be related to a subject in three modes:<sup>5</sup>

1. When the predicate is **what the subject is** (*id quod est subiectum*) because that which is predicated of the subject pertains to its essence (► 33.2).<sup>6</sup>
2. When the predicate is taken insofar as it is **in the subject** (*inest subiecto*) because that which is predicated of the subject is not of its essence but inheres it (► 33.3).<sup>7</sup>
3. When the predicate is taken from that which is **outside the subject** (*extra subiectum*) because something extrinsic is predicated of it by denomination (► 33.4).<sup>8</sup>

### 33.2. When the Predicate is the Subject

In this mode, the predicate is what the subject is because that which is predicated of the subject pertains to its essence.<sup>9</sup> According to this, the category of **substance** is taken, for

---

accidentis. Unde oportet, quod ex consequenti includat in sui ratione subiectum. Nam accidentis esse est inesse. Albedo enim etsi significet accidens, non tamen per modum accidentis, sed per modum substantiae. Unde nullo modo consignificat subiectum. Si enim principaliter significaret subiectum, tunc praedicata accidentalialia non ponerentur a philosopho sub ente secundum se, sed sub ente secundum accidens. Nam hoc totum, quod est homo albus, est ens secundum accidens.”

<sup>4</sup> *In Metaph.* 5, l. 9, §890 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a23–24): “Unde oportet, quod ens contrahatur ad diversa genera secundum diversum modum praedicandi, qui consequitur diversum modum essendi; quia quoties ens dicitur, idest quot modis aliquid praedicatur, toties esse significatur, idest tot modis significatur aliquid esse. Et propter hoc ea in quae dividitur ens primo, dicuntur esse praedicamenta, quia distinguuntur secundum diversum modum praedicandi.” *In Physic.* 3, l. 5, n. 15: “unde et decem genera entis dicuntur decem praedicamenta.”

<sup>5</sup> *In Metaph.* 5, l. 9, §891: “Sciendum enim est quod praedicatum ad subiectum tripliciter se potest habere.” *In Physic.* 3, l. 5, n. 15: “Tripliciter autem fit omnis praedicatio.”

<sup>6</sup> *In Metaph.* 5, l. 9, §891: “Uno modo cum est id quod est subiectum.” *In Physic.* 3, l. 5, n. 15: “Unus quidem modus est, quando de aliquo subiecto praedicatur id quod pertinet ad essentiam eius.”

<sup>7</sup> *In Metaph.* 5, l. 9, §891: “Secundo modo ut praedicatum sumatur secundum quod inest subiecto.” *In Physic.* 3, l. 5, n. 15: “Alius autem modus est quo praedicatur de aliquo id quod non est de essentia eius, tamen inhaeret ei.”

<sup>8</sup> *In Metaph.* 5, l. 9, §891: “Tertio modo ut praedicatum sumatur ab eo quod est extra subiectum.” *In Physic.* 3, l. 5, n. 15: “Tertius autem modus praedicandi est, quando aliquid extrinsecum de aliquo praedicatur per modum alicuius denominationis.”

<sup>9</sup> *In Metaph.* 5, l. 9, §891: “Uno modo [praedicandi] cum [praedicatum] est id quod est subiectum, ut cum dico, Socrates est animal. Nam Socrates est id quod est animal. Et hoc praedicatum dicitur significare substantiam primam, quae est substantia particularis, de qua omnia praedicantur.” *In Physic.* 3, l. 5, n. 15: “Unus quidem modus est, quando de aliquo subiecto praedicatur id quod pertinet ad essentiam eius, ut cum dico Socrates est homo, vel homo est animal; et secundum hoc accipitur praedicamentum substantiae.”

this predicate is said to signify first substance (► 15.2), which is the particular substance of which all (predicates) are predicated: for example, when we say, “Socrates is an animal,” for Socrates is that which is animal, or “man is an animal,” (for man is also that).

### 33.3. When the Predicate Inheres in the Subject

In this mode, the predicate is taken insofar as it is in the subject because that which is predicated of the subject is not of its essence but inheres it (*inhaeret ei*).<sup>10</sup> This predicate is in (the subject) either:

1. **By itself and absolutely** (*per se et absolute*), whether:

(a) As *following upon matter*; and in this way, it is (the category) **quantity** (*quantitas* = ποσόν), for quantity properly follows upon matter.<sup>11</sup>

(b) As *following upon form*; and in this way, it is (the category) **quality** (*qualitas* = ποιόν).<sup>12</sup> Whence, also, qualities are founded upon quantity, as color (is founded) on surface, and figure (is founded) on lines or on surfaces.

2. **Not absolutely** (*non absolute*), but **in respect to another** (*in respectu ad aliud, per respectum ad alterum*), and in this way, it is the category **relation** (*relatio, ad aliquid* = πρὸς τι).<sup>13</sup> Thus, when we say, “the man is a father,” what is predicated of the man is not something absolute, but a respect that is in it (*ei inest*) to something (*ad aliquid*) extrinsic.

### 33.4. When the Predicate is Outside the Subject

The third mode of predication occurs when something extrinsic is predicated of something by mode of some denomination, for in this way are extrinsic accidents predicated of substances.<sup>14</sup> Indeed, we do not say that *man is whiteness*, but that *man is white*.

---

<sup>10</sup> *In Metaph.* 5, l. 9, §892: “Secundo modo ut praedicatum sumatur secundum quod inest subiecto: quod quidem praedicatum, vel inest ei per se et absolute [...] vel inest ei non absolute, sed in respectu ad aliud.” *In Physic.* 3, l. 5, n. 15: “Alius autem modus est quo praedicatur de aliquo id quod non est de essentia eius, tamen inhaeret ei.”

<sup>11</sup> *In Metaph.* 5, l. 9, §892 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a26): “ut consequens materiam, et sic est quantitas.” *In Physic.* 3, l. 5, n. 15: “Quod quidem vel se habet ex parte materiae subiecti, et secundum hoc est praedicamentum quantitatis (nam quantitas proprie consequitur materiam: unde et Plato posuit magnum ex parte materiae).”

<sup>12</sup> *In Metaph.* 5, l. 9, §892 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a25): “vel ut consequens formam, et sic est qualitas.” *In Physic.* 3, l. 5, n. 15: “aut consequitur formam, et sic est praedicamentum qualitatis (unde et qualitates fundantur super quantitatem, sicut color in superficie, et figura in lineis vel in superficiebus).”

<sup>13</sup> *In Metaph.* 5, l. 9, §892 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a26): “quod quidem praedicatum [...] inest ei non absolute, sed in respectu ad aliud, et sic est ad aliquid.” *In Physic.* 3, l. 5, n. 15: “Quod quidem [...] se habet per respectum ad alterum, et sic est praedicamentum relationis (cum enim dico homo est pater, non praedicatur de homine aliquid absolutum, sed respectus qui ei inest ad aliquid extrinsecum).”

<sup>14</sup> *In Physic.* 3, l. 5, n. 15: “Tertius autem modus praedicandi est, quando aliquid extrinsecum de aliquo praedicatur per modum alicuius denominationis: sic enim et accidentia extrinseca de substantiis praedicantur; non tamen dicimus quod homo sit albedo, sed quod homo sit albus.”

To be denominated from something extrinsic is found:<sup>15</sup>

**1. Commonly**, in some mode, in everything.<sup>16</sup> Since something caused is denominated and measured from something external, something is found to be commonly denominated from something extrinsic either:

(a) According to the *ratio* of **cause** (► 33.5; 9).

(b) According to the *ratio* of **measure** (► 33.6; 28).

**2. Specially**, in some mode, in those (things) that pertain only to men (► 33.7).

### 33.5. Common Extrinsic Denomination According to the *Ratio* of Cause

Since the genera of causes are four (► 9.2), and two of them are parts of the essence—namely, matter and form (► 15.8)—, the predication that can be made according to these two pertains to the category of substance: for example, if we say that *man is rational* (i.e., according to its form), and that *man is corporeal* (i.e., according to its matter; ► 14.17).<sup>17</sup>

The final cause, in turn, does not cause something apart from the agent, for the end has the *ratio* of cause (only) insofar as it moves the agent (► 9.8).<sup>18</sup>

Therefore, the agent cause alone remains (as that) from which something can be denominated as from an external (cause).<sup>19</sup> And in this mode, that from which the category is taken would be *according to something in a subject* of which it is predicated.

**1.** Insofar as something is denominated *from the agent cause*, (this) is the category of **affection** (*passio, pati* = πάσχειν), for to be affected is nothing other than *to receive (suscipere) something* from an agent.<sup>20</sup> And this is *according to the terminus*, for an affection is terminated in the affected subject (*in subiectum patiens terminatur*).

---

<sup>15</sup> *In Physic.* 3, l. 5, n. 15: “Denominari autem ab aliquo extrinseco invenitur quidem quodammodo communiter in omnibus, et aliquo modo specialiter in iis quae ad homines pertinent tantum.”

<sup>16</sup> *In Physic.* 3, l. 5, n. 15: “Communiter autem invenitur aliquid denominari ab aliquo extrinseco, vel secundum rationem causae, vel secundum rationem mensurae; denominatur enim aliquid causatum et mensuratum ab aliquo exteriori.”

<sup>17</sup> *In Physic.* 3, l. 5, n. 15: “Cum autem quatuor sint genera causarum, duo ex his sunt partes essentiae, scilicet materia et forma: unde praedicatio quae posset fieri secundum haec duo, pertinet ad praedicamentum substantiae, utpote si dicamus quod homo est rationalis, et homo est corporeus.”

<sup>18</sup> *In Physic.* 3, l. 5, n. 15: “Remanet igitur sola causa agens a qua potest denominari aliquid sicut ab exteriori.”

<sup>19</sup> *In Physic.* 3, l. 5, n. 15: “Causa autem finalis non causat seorsum aliquid ab agente: intantum enim finis habet rationem causae, in quantum movet agentem. Remanet igitur sola causa agens a qua potest denominari aliquid sicut ab exteriori.” *In Metaph.* 5, l. 9, §892: “Alio modo ut id a quo sumitur praedicamentum, secundum aliquid sit in subiecto, de quo praedicatur.”

<sup>20</sup> *In Physic.* 3, l. 5, n. 15: “Sic igitur secundum quod aliquid denominatur a causa agente, est praedicamentum passionis, nam pati nihil est aliud quam suscipere aliquid ab agente.” *In Metaph.* 5, l.

2. Conversely, insofar as the agent cause is denominated *from the effect*, (this) is the category of **action** (*actio, agere* = ποιεῖν), for action is an act in another *from an agent*.<sup>21</sup> And this is *according to the principle*, for the principle of action (*actionis principium*) is in a subject (i.e., in the agent).

### 33.6. Common Extrinsic Denomination According to the *Ratio of Measure*

A measure is either intrinsic or extrinsic (► 28.7).<sup>22</sup> Intrinsic (measures are), for example, the longitude, latitude, and profundity of each (corporeal) thing. Something is denominated from these as from an intrinsic inherent (► 33.3); whence, it pertains to the category of *quantity* (► 34).

On the other hand, external measures are *time* and *place*.<sup>23</sup> Therefore, the category is:

1. **When** (*quando* = ποτέ), insofar as something is denominated from *time*.
2. **Where** (*ubi* = πού), insofar as (something) is denominated from *place*.
3. **Situation** (*situs* = τὸ κεῖσθαι; not the *site* that is a difference of quantity; ► 34.19), also insofar as (something) is denominated from *place*, but which adds an *order of the parts in a place* over *where*.<sup>24</sup> This (order) was not necessary to be added from the part of time, since *an order of parts in time* is conveyed in the *ratio* of *time*, for **time** is *the number of motion according to prior and posterior* (*numerus motus secundum prius et posterius*).

### 33.7. Special Extrinsic Denomination

There is something special in men.<sup>25</sup> In other animals, nature gave sufficiently those (parts) that pertain to the conservation of life, such as horns for their defense, a tough and

---

9, §892 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a26): “Si vero secundum terminum, sic praedicabitur ut in pati. Nam passio in subiectum patiens terminatur.” Cf. *In De anima* 2, c. 26, 164–167.

<sup>21</sup> *In Physic.* 3, l. 5, n. 15: “secundum autem quod e converso denominatur causa agens ab effectu, est praedicamentum actionis, nam actio est actus ab agente in aliud.” *In Metaph.* 5, l. 9, §892 (cf. ARISTOTLE, *Metaphysica* Δ.7, 1017a26): “Et si quidem secundum principium, sic praedicatur ut agere. Nam actionis principium in subiecto est.”

<sup>22</sup> *In Physic.* 3, l. 5, n. 15: “Mensura autem quaedam est extrinseca et quaedam intrinseca. Intrinseca quidem sicut propria longitudo uniuscuiusque et latitudo et profunditas: ab his ergo denominatur aliquid sicut ab intrinseco inhaerente; unde pertinet ad praedicamentum quantitatis.”

<sup>23</sup> *In Physic.* 3, l. 5, n. 15: “Exteriores autem mensurae sunt tempus et locus: secundum igitur quod aliquid denominatur a tempore, est praedicamentum quando; secundum autem quod denominatur a loco, est praedicamentum ubi et situs, quod addit supra ubi ordinem partium in loco. [...] Sic igitur aliquid dicitur esse quando vel ubi per denominationem a tempore vel a loco.” *In Metaph.* 5, l. 9, §892: “Tertio modo ut praedicatum sumatur ab eo quod est extra subiectum [...]. Si autem sit mensura eius, cum mensura extrinseca sit vel tempus vel locus, sumitur praedicamentum vel ex parte temporis, et sic erit quando: vel ex loco, et sic erit ubi, non considerato ordine partium in loco, quo considerato erit situs.” Cf. ARISTOTLE, *Categoriae* 4, 2a2–3; 9, 11b9–10.

<sup>24</sup> *In Physic.* 3, l. 5, n. 15: “Hoc autem non erat necessarium addi ex parte temporis, cum ordo partium in tempore in ratione temporis importetur: est enim tempus numerus motus secundum prius et posterius.”

<sup>25</sup> *In Physic.* 3, l. 5, n. 15: “Est autem aliquid speciale in hominibus. In aliis enim animalibus natura dedit sufficienter ea quae ad conservationem vitae pertinent, ut cornua ad defendendum, corium grossum et

wooly hide as a covering, and claws or the like for proceeding without harm. And since such animals are said (to be) armed, dressed, or shod, they are not denominated from something extrinsic in some mode, but from some of their parts. Hence, these refer in them to the category of substance: for example, if it should be said that man is endowed with hands or feet.

Such (parts), however, could not be given to man by nature both because they would not befit the subtlety of its complexion and because of the multiform operations that befit man insofar as it has reason, to which some determinate instruments could not be adapted by nature.<sup>26</sup> Instead of all (these), however, there is in man reason, by which he prepares exterior (things) for himself which are intrinsic to other animals. Whence, when man is said (to be) armed, dressed, or shod, (this) is denominated from something extrinsic that has neither the *ratio* of *cause* nor (the *ratio*) of *measure*.

And hence, there is a special category, called **habitus** (*habitus* = τὸ ἔχειν), as when we say, “Socrates is shod” or “[Socrates is] clothed.”<sup>27</sup>

However, it ought to be considered that this category is also attributed to other animals not insofar as they are considered in their nature, but insofar as they come to be used by men, as when we say that a horse is caparisoned, saddled, or armed.<sup>28</sup>

### 33.8. Being Simply vs. According to Something

**Being simply** (*simpliciter ens*) can be understood in two modes:<sup>29</sup>

1. As **substance**, insofar as it signifies *that which is first among all the categories of being* (► 33.10).<sup>30</sup>

---

pilosum ad tegendum, ungulas vel aliquid huiusmodi ad incedendum sine laesione. Et sic cum talia animalia dicuntur armata vel vestita vel calceata, quodammodo non denominantur ab aliquo extrinseco, sed ab aliquibus suis partibus. Unde hoc refertur in his ad praedicamentum substantiae: ut puta si diceretur quod homo est manuatus vel pedatus.”

<sup>26</sup> *In Physic.* 3, l. 5, n. 15: “Sed huiusmodi non poterant dari homini a natura, tum quia non conveniebant subtilitati complexionis eius, tum propter multiformitatem operum quae conveniunt homini in quantum habet rationem, quibus aliqua determinata instrumenta accommodari non poterant a natura: sed loco omnium inest homini ratio, qua exteriora sibi praeparat loco horum quae aliis animalibus intrinseca sunt. Unde cum homo dicitur armatus vel vestitus vel calceatus, denominatur ab aliquo extrinseco, quod non habet rationem neque causae, neque mensurae.”

<sup>27</sup> *In Physic.* 3, l. 5, n. 15: “unde est speciale praedicamentum, et dicitur habitus.” *In Metaph.* 5, l. 9, §892: “Tertio modo ut praedicatum sumatur ab eo quod est extra subiectum: et hoc dupliciter. Uno modo ut sit omnino extra subiectum: quod quidem si non sit mensura subiecti, praedicatur per modum habitus, ut cum dicitur, Socrates est calceatus vel vestitus.” Cf. ARISTOTLE, *Categoriae* 15, 15b17.

<sup>28</sup> *In Physic.* 3, l. 5, n. 15: “Sed attendendum est quod etiam aliis animalibus hoc praedicamentum attribuitur, non secundum quod in sua natura considerantur, sed secundum quod in hominis usum veniunt; ut si dicamus equum phaleratum vel sellatum seu armatum.”

<sup>29</sup> *In De gen.* 1, l. 6 n. 5: “*simpliciter ens* potest intelligi dupliciter.”

<sup>30</sup> *In De gen.* 1, l. 6 n. 5: “uno modo ut significat id quod est primum inter omnia praedicamenta entis, prout scilicet simpliciter ens dicitur de substantia.”

(In this mode), **being simply** is *that which has (an act of) being (quod habet esse)*, while **being according to something** (is) *that which is in another*.<sup>31</sup>

Only individuals in the genus of substance are perfect in themselves, for accidents only have (an act of) being (*esse*) that depends upon substance.<sup>32</sup> However, any accident adds some (act of) being to substance itself (e.g., being white, being large, etc.).

2. As **universal being** itself (*ipsum ens universale*), which comprehends all categories (i.e., as an equivalent of *common being*; ► 30.2).<sup>33</sup>

Thus, for example, by *non-being simply* one can understand either (1) *that which is not a substance*; or (2) *that which in no mode is a being*.<sup>34</sup>

### 33.9. Knowing the Nature of Being Through Substance

ARISTOTLE shows through (the following) reason that he who intends to treat of being must treat (somehow) of substance alone: that which is first among beings as *being (ens) simply (simpliciter)* and not *according to something (secundum quid)* sufficiently demonstrates the nature of being; and substance is of such a mode; therefore, it suffices (in order) to know the nature of being (in order) to determine (the truth) concerning substance (► 33.17).<sup>35</sup> In order to do this, he shows: **(1)** that substance is the first being (► 33.10); **(2)** how (substance) is said (to be) *first* (► 33.13).

### 33.10. Substance is the First Being

As has been said, *being (ens = τὸ ὄν)* is said in multiple modes (*dicitur multipliciter = λέγεται πολλαχῶς*),<sup>36</sup> for some *being*—namely, *substance*—signifies *what (something) is*

---

<sup>31</sup> *STh* I-II, q. 26 a. 4 co.: “ens simpliciter est quod habet esse, ens autem secundum quid quod est in alio.”

<sup>32</sup> *In Sent.* 1, d. 3 q. 2 a. 3 co.: “perfecta sunt in se [...] tantum individua in genere substantiae. Accidentia autem non habent esse, nisi dependens a substantia [...]. Tamen, cum secundum quodlibet accidens addatur aliquod esse ipsi substantiae [...]”

<sup>33</sup> *In De gen.* 1, l. 6 n. 5: “alio modo secundum quod simpliciter ens dicitur ipsum ens universale, quod omnia praedicamenta comprehendit.”

<sup>34</sup> *In De gen.* 1, l. 6 n. 5: “Et hoc modo *simpliciter non ens* potest dici vel quod non est substantia, vel quod nullo modo est ens.”

<sup>35</sup> *In Metaph.* 7, l. 1, §1246 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a10–15): “Primo ostendit [Philosophus] quod intendens tractare de ente, de sola substantia debet tractare *per rationem*. [...] Intendit ergo in prima parte talem rationem ponere. Illud quod est primum inter entia quasi ens simpliciter et non secundum quid, sufficienter demonstrat naturam entis: sed substantia est huiusmodi; ergo sufficit ad cognoscendum naturam entis determinare de substantia. Circa hoc autem duo facit. Primo ostendit, quod *substantia sit primum ens*. Secundo ostendit quomodo dicatur primum [...]”

<sup>36</sup> *In Metaph.* 7, l. 1, §1247 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a10–13): “Primo *proponit* [Philosophus] *intantum* quod ens dicitur multipliciter, ut dictum est in quinto libro, in quo diviserat quoties dicuntur huiusmodi nomina, quia quoddam ens significat «quid est et hoc aliquid,» idest substantiam; ut per quid, intelligatur essentia substantiae, per hoc aliquid suppositum, ad quae duo omnes modi substantiae reducuntur, ut in quinto est habitum. Illud vero significat qualitatem vel quantitatem, aut aliquid aliorum praedicamentorum.”

(*quid est* = τί ἐστὶ)—that is, the essence of a substance—and *this something* (*hoc aliquid* = τόδε τι)—that is, the suppositum—, to which two (modes) all the modes of *substance* are reduced (► 15.2), while (some other *being*) signifies *quality*, *quantity*, or something of the other categories.

Now, since *being* is said in as many modes, it is evident that among all beings the first is *what (something) is*—that is, the *being* that signifies *substance*.<sup>37</sup>

ARISTOTLE proves this using the following reason: that which is by itself (*per se*) and simply (*simpliciter*) in any one genus, is prior to that which is by another (*per aliud*) and according to something (*secundum quid*); and substance is *being simply and by itself*, while all genera other than substance are beings *according to something* and *by substance*; therefore, substance is the first among beings.<sup>38</sup>

(In other words, by *being* we ought to understand a *genus in common*, insofar as it is a whole that embraces and contains many *beings* in its commonality; ► 27.1.<sup>39</sup> Evidently, *being* is not a genus *properly* said, as though—in *being*—the same essence would be predicated of many beings; ► 30.11. Consequently, the division of *common being* is by analogy, for the nature of *being* is not equally participated by all beings; ► 27.2. Necessarily, therefore, *being* is predicated according to a perfect *ratio* only of one of the beings into which *common being* is divided—namely, *substance*—, while it is predicated of the other beings imperfectly and according to something [*secundum quid*]. Indeed), that which is maximally and most truly in any genus is the cause of those that are after it in that genus, as ARISTOTLE says (► 27.4; footnote 27).<sup>40</sup> Therefore, substance, which is first in the genus of *being* (*primum in genere entis*), (and) most truly and maximally has an

---

<sup>37</sup> *In Metaph.* 7, l. 1, §1247 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a13–15): “Et cum ens tot modis dicatur, palam est quod inter omnia entia, primum est quod quid est, idest ens quod significat substantiam.”

<sup>38</sup> *In Metaph.* 7, l. 1, §1248 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a15–b2): “Probat [Philosophus] propositum; et utitur tali ratione. Quod est per se et simpliciter in unoquoque genere, est prius eo quod est per aliud et secundum quid. Sed substantia est ens simpliciter et per seipsam: omnia autem alia genera a substantia sunt entia secundum quid et per substantiam: ergo substantia est prima inter alia entia.”

<sup>39</sup> We find in other places the same *genus of being* used explicitly by St. Thomas in other works. For example, *In Sent.* 1, d. 13 q. 1 a. 4 ad 2: “negatio termini infiniti non est negatio in aliquo genere determinato, sed tantum **in genere entis**; et ideo potest dici de omni ente cui non convenit affirmatio: sed negatio quae negat in aliquo genere determinato [sc., *privatio*], non potest dici extra illud genus.” *De veritate*, q. 27 a. 4 ad 4: “sacramenta non operantur ad gratiam per virtutem propriae formae: sic enim operarentur ut per se agentia; sed operantur per virtutem principalis agentis, scilicet Dei, in eis existentem. Quae quidem virtus non habet esse completum in natura, sed est quid incompletum **in genere entis**; quod patet ex hoc quod instrumentum movet in quantum movetur.” Emphasis is ours.

<sup>40</sup> *De ente*, c. 6, 50–58: “quia illud quod dicitur maxime et verissime in quolibet genere est causa eorum que sunt post in illo genere, sicut ignis qui est in fine caliditatis est causa caloris in rebus calidis, ut in II Methaphysice dicitur: ideo substantia que est primum in genere entis, verissime et maxime essentiam habens, oportet quod sit causa accidentium que secundo et quasi secundum quid rationem entis participant.”

essence (►18), must be the cause of accidents, which participate in the *ratio* of *being* secondarily (*secundario*) and as according to something (*quasi secundum quid*).

ARISTOTLE manifests the minor (premise, namely, that substance is *being simply and by itself*, while all genera other than substance are beings according to something and by substance) in two (ways):<sup>41</sup> (1) from the mode of speaking or predicating (►33.11); (2) through some sign (concerning accidents abstractly signified; ►33.12).

### 33.11. Substance is the First Being in Predication

As ARISTOTLE says, it is evident that substance is the first of beings from this: that when we say of some qualitative being (*de aliquo quale*) *what* it is, we say that it is either *good* or *bad*, for this signifies *quality*, which is other than *substance* or *quantity*.<sup>42</sup> On the other hand, *tri-cubit* signifies *quantity*, and *man* signifies *substance*. Hence, when we say *how* (*quale*) something is, we do not say that it is *tri-cubit* or that it is a *man*. But when we say of something *what* it is, we do not say that it is *white* or *hot*, which signify *quality*; nor (do we say) *tri-cubit*, which signifies *quantity*; but *man*, or *god*, which signify *substance*.

Whence, it is evident that those (predicates) that signify *substance* convey (*dicunt*) *what* something is absolutely (*absolute*), while those that predicate *quality* do not convey *what* absolutely is that of which it is predicated, but *how* (*quale quid*).<sup>43</sup> It is (had) likewise in *quantity* and in the other genera.

Whence, it is evident that substance itself is said by reason of itself (*ratione suiipsius*), since those (predicates) that signify *substance* absolutely, signify *what* this is.<sup>44</sup> On the other hand, the other (genera) are said (to be) *beings* not because they themselves should

---

<sup>41</sup> *In Metaph.* 7, l. 1, §1249 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a15–20): “Minorem autem dupliciter manifestat [Philosophus]. Primo ex ipso modo loquendi sive praedicandi.” Ibid., §1252 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a20–30): “Probat idem per quoddam signum.”

<sup>42</sup> *In Metaph.* 7, l. 1, §1249 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a15–18): “Minorem [...] manifestat [Philosophus...] dicens, quod ex hoc palam est quod substantia sit primum entium, quia quando dicimus de aliquo quale quid sit, dicimus ipsum esse aut bonum aut malum. Haec enim significant qualitatem, quae aliud est a substantia et quantitate. Tricubitus autem significat quantitatem, et homo significat substantiam. Et ideo quando dicimus quale est aliquid, non dicimus ipsum esse tricubitus neque hominem. Sed quando dicimus quid est de aliquo, non dicimus ipsum esse album, nec calidum, quae significant qualitatem; nec tricubitus, quod significat quantitatem; sed hominem aut Deum, quae significant substantiam.”

<sup>43</sup> *In Metaph.* 7, l. 1, §1250 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a18–20): “Ex quo patet quod illa quae significant substantiam, dicunt quid est aliquid absolute. Quae autem praedicant qualitatem, non dicunt quid est illud de quo praedicatur absolute, sed quale quid. Et simile est in quantitate, et aliis generibus.”

<sup>44</sup> *In Metaph.* 7, l. 1, §1251 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a18–20): “Et ex hoc patet quod ipsa substantia dicitur ens ratione suiipsius, quia absolute significantia substantiam significant quid est hoc. Alia vero dicuntur entia, non quia ipsa habeant secundum se aliquam quidditatem, quasi secundum se entia, cum non ita dicant absolute quid: sed eo quod «sunt talis entis,» id est eo quod habent aliquam habitudinem ad substantiam quae est per se ens; quia non significant quidditatem; in quantum scilicet quaedam sunt qualitates talis entis, scilicet substantiae, et quaedam quantitates, et aliae passiones, vel aliquid aliud tale, quod significatur per alia genera.”

have some quiddity according to themselves, as (though they were) beings according to themselves, since they would not convey something absolutely in this way, but because they have some habitude (i.e., relation) to substance, which is being by itself, since they do not signify quiddity: to wit, insofar as some are qualities of such a being—namely, substance—, and some (are) quantities, and other affections, or some other such thing that is signified by the other genera.

Therefore, *being* is said diversely, according to prior and posterior (*secundum prius et posterius*), of the ten genera of the categories, as **quantity** is said from its being *the measure of substance*; **quality**, insofar as it is *the disposition of substance*; and so on.<sup>45</sup>

### 33.12. The Case of Accidents Abstractly Signified

As ARISTOTLE says, since other beings are beings only insofar as they are referred to substance, a doubt could arise concerning other beings signified in abstract, when they do not signify with some habitude to substance, whether they should be beings or non-beings: namely, whether *to walk* (*vadere* = τὸ βαδίζειν), *to heal* (*sanare* = τὸ ὑγιαίνειν), *to be seated* (*sedere* = τὸ καθῆσθαι), and each one of these (predicates) that are signified abstractly should be a being or a non-being.<sup>46</sup> And this is (what happens) likewise in other such (predicates) that are signified in abstract, whether they should signify by the mode of action, as the aforesaid, or not, such as *whiteness* (*albedo*) and *blackness* (*nigredo*).

Therefore, accidents signified abstractly (*in abstracto*) seem to be non-beings, since none of them is naturally apt (*aptum natum*) to be according to itself (*secundum se esse*).<sup>47</sup> Quite on the contrary, however, the (act of) being (*esse*) of any of them is *to be in another* (*alteri inesse*), and it is not possible for any of them to be separated from substance.

---

<sup>45</sup> *De ente*, c. 6, 133–138: “ens diuersimode secundum prius et posterius dicitur de decem generibus predicamentorum, sicut dicitur quantitas ex eo quod est mensura substantie et qualitas secundum quod est dispositio substantie, et sic de aliis, secundum Philosophum in IX Methaphisice.” This refers us to ARISTOTLE, *Metaphysica* Θ.1, 1045b27–32: “Περὶ μὲν οὖν τοῦ πρώτως ὄντος καὶ πρὸς ὃ πάσαι αἱ ἄλλαι κατηγορίαι τοῦ ὄντος ἀναφέρονται εἴρηται, περὶ τῆς οὐσίας. κατὰ γὰρ τὸν τῆς οὐσίας λόγον λέγεται τᾶλλα ὄντα, τὸ τε ποσὸν καὶ τὸ ποιὸν καὶ τᾶλλα τὰ οὕτως λεγόμενα: πάντα γὰρ ἔξει τὸν τῆς οὐσίας λόγον, ὡσπερ εἴπομεν ἐν τοῖς πρώτοις λόγοις.” Cf. *ibid.* Γ.2, 1003a33–b10.

<sup>46</sup> *In Metaph.* 7, l. 1, §1252 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a20–22): “Probat [Philosophus] idem *per quoddam signum*. Quia enim alia entia non sunt entia nisi secundum quod referuntur ad substantiam, ideo potest esse dubitatio de aliis entibus in abstracto significatis, quando non significant cum aliqua habitudine ad substantiam: utrum sint entia vel non entia, scilicet utrum vadere, sanare et sedere et unumquodque istorum in abstracto significatorum sit ens aut non ens. Et similiter est in aliis talibus, quae in abstracto significantur; sive significantur per modum actionis, ut praedicta, sive non, ut albedo sive nigredo.”

<sup>47</sup> *In Metaph.* 7, l. 1, §1253 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a23–25): “Pro tanto autem videntur accidentia in abstracto significata esse non entia, quia nihil ipsorum est aptum natum secundum se esse; immo cuiuslibet eorum esse est alteri inesse, et non est possibile aliquid eorum separari a substantia; et ideo quando significantur in abstracto quasi sint secundum se entia et a substantia separata, videtur quod sint non entia. Licet modus significandi vocum non consequatur immediate modum essendi rerum, sed mediante modo intelligendi; quia intellectus sunt similitudines rerum, voces autem intellectuum, ut dicitur in primo Perihermenias.” The reference is to ARISTOTLE, *De interpretatione* 1, 16a3–8.

Hence, when they are signified abstractly as though they should be beings by themselves (*secundum se entia*) and separated from substance, they seem to be non-beings. However, the mode of signifying that belongs to voices does not immediately follow upon the mode of being of things; rather, (they signify) by means of the mode of understanding, since understandings are the likenesses of things, and voices (are the likenesses) of understandings, as ARISTOTLE says.

Even though the mode of being of accidents should not be such that they would be by themselves but only that they would be in (a subject, *ut insint*), however, the intellect can understand them by themselves, since it is naturally apt (*natus*) to divide those that are conjoined according to nature.<sup>48</sup> And hence, abstract names of accidents signify beings that certainly inhere (substances), even though they should not signify them by the mode of inherent (things). On the other hand, *non-beings* would be signified by such names if (accidents) should not be in a thing (*in re*, i.e., if they should not *really* inhere).

And since these (accidents) signified abstractly seem (to be) non-beings, the concrete names of accidents seem more to be beings, for *the walker* (*vadens* = τὸ βαδίζον), *the sitting* (*sedens* = τὸ καθήμενον), and *the healing* (*sanans* = τὸ ὑγιαίνον) seem more to be something among beings, since something is determined for them as a subject by the signification itself of the names, insofar as they are signified in concretion (in respect) to a subject—and this subject is a substance.<sup>49</sup>

Hence, any one of such names that signify an accident concretely (*in concreto*) seem to convey (*importare*) the category of substance: not indeed in such a way that the category of substance should be a part of the signification of such names, for *white* signifies only quality, as ARISTOTLE says; but insofar as names of such a mode signify accidents as inhering a substance (*ut inhaerentia substantiae*).<sup>50</sup> Thus, *the good* or *the sitting* is not said without substance, for they signify a concrete accident of a substance.

---

<sup>48</sup> *In Metaph.* 7, l. 1, §1254: “Licet autem modus essendi accidentium non sit ut per se sint, sed solum ut insint, intellectus tamen potest ea per se intelligere, cum sit natus dividere ea quae secundum naturam coniuncta sunt. Et ideo nomina abstracta accidentium significant entia quae quidem inhaerent, licet non significant ea per modum inhaerentium. Essent autem significata per huiusmodi nomina non entia, si non inessent in re.”

<sup>49</sup> *In Metaph.* 7, l. 1, §1255 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a23–25): “Et quia ista in abstracto significata videntur non entia, magis videntur entia nomina accidentium concreta. Magis autem videtur «aliquid entium esse vadens et sedens et sanans» quia determinatur eis aliquod subiectum per ipsam nominis significationem, in quantum significantur in concretionem ad subiectum. Hoc autem subiectum est substantia.”

<sup>50</sup> *In Metaph.* 7, l. 1, §1255 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a25–29): “Et ideo unumquodque talium nominum, quae significant accidens in concreto, «apparet in tali categoria,» idest videtur importare praedicamentum substantiae; non ita quod praedicamentum substantiae sit pars significationis talium nominum (album enim, ut in praedicamentis dicitur, solam qualitatem significat); sed in quantum huiusmodi nomina significant accidentia ut inhaerentia substantiae. Bonum autem aut sedens non dicitur «sine hoc,» idest sine substantia. Significat enim accidens concretum substantiae.”

And since accidents do not seem (to be) beings insofar as they are signified according to themselves but only insofar as they are signified in concretion (in reference) to substance, it is evident that each of the other beings are beings on account of (*propter*) substance.<sup>51</sup>

And from this, it is further apparent that substance is the first being (*primum ens* = τὸ πρῶτως ὄν); and being simply (*ens simpliciter* = ὄν ἀπλῶς) and not being according to something («*non ens <secundum> aliquid*,» *idest secundum quid* = οὐ τὶ ὄν), as happens in accidents, for *to be white* is not *to be* simply but (to be) *according to something* (*secundum quid*).<sup>52</sup>

This is evident because when the white begins to be, we do not say that it *begins to be* simply but that it *begins to be white*.<sup>53</sup> Yet, when Socrates begins to be a man, it is said simply that he *begins to be*. Whence, it is evident that *to be a man* signifies *to be* simply, while *to be white* signifies *to be* according to something.

### 33.13. Modes in Which Substance Is First

ARISTOTLE shows how substance is said to be first; and since *first* is said in multiple modes (► 8.12), substance is first among all beings in three modes: namely, according to time (► 33.14), according to definition (► 33.15), and according to cognition (► 33.16).<sup>54</sup>

### 33.14. First According to Time

That (substance) should be first in time (in respect) of the other (categories) is proven from this: that none of the other categories is separable (*separabile* = χωριστόν) from substance, and (that) substance alone is separable from the others, for no accident is found without substance, but some substance is found with an accident.<sup>55</sup> And thus, it is

---

<sup>51</sup> *In Metaph.* 7, l. 1, §1256 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a29–30): “Et quia accidentia non videntur entia prout secundum se significantur, sed solum prout significantur in concrezione ad substantiam, palam est quod singula aliorum entium sunt entia propter substantiam.”

<sup>52</sup> *In Metaph.* 7, l. 1, §1256 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a30–31): “Et ex hoc ulterius apparet, quod substantia est «primum ens, et ens simpliciter, et non ens secundum aliquid,» idest secundum quid, sicut est in accidentibus. Esse enim album non est simpliciter esse, sed secundum quid. Quod ex hoc patet, quia cum incipit esse albus, non dicimus quod incipiat esse simpliciter, sed quia incipiat esse albus. Cum enim Socrates incipit esse homo, dicitur simpliciter quod incipit esse. Unde patet quod esse hominem significat esse simpliciter. Esse autem album significat esse secundum quid.”

<sup>53</sup> *In Metaph.* 7, l. 1, §1256: “Quod ex hoc patet, quia cum incipit esse albus, non dicimus quod incipiat esse simpliciter, sed quia incipiat esse albus. Cum enim Socrates incipit esse homo, dicitur simpliciter quod incipit esse. Unde patet quod esse hominem significat esse simpliciter. Esse autem album significat esse secundum quid.”

<sup>54</sup> *In Metaph.* 7, l. 1, §1257 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a31–33): “Ostendit [Philosophus] quomodo substantia dicatur primum; et dicit quod cum hoc quod dico primum dicatur multis modis, ut in quinto est habitum, tribus modis substantia est prima inter omnia entia: scilicet secundum cognitionem, et secundum definitionem et secundum tempus.”

<sup>55</sup> *In Metaph.* 7, l. 1, §1257 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a33–34): “Et quod sit prima tempore aliis, ex hoc probatur, quod nullum aliorum praedicamentorum est separabile a substantia, sola autem substantia est separabilis ab aliis: nullum enim accidens invenitur sine substantia, sed aliqua substantia

evident that (it is) not (the case that) whenever there is a substance there is an accident, but on the contrary. Therefore, substance is prior in time.

### 33.15. First According to Definition

That substance should be first also according to definition is evident because the definition of substance must be posited in the definition of any accident: just as *nose* is posited in the definition of *snub* (► 15.19; 17.5; 17.8; 18.4), so in the definition of any accident is posited its proper subject.<sup>56</sup> Hence, just as *animal* is prior to *man* in definition because the definition of *animal* is posited in the definition of *man*, so *substance* is prior to *accidents* in definition for the same reason (► 14.1).

Thus, all other categories of being (*praedicamenta entis*) refer to substance as to a first being.<sup>57</sup> This is evident because all accidents have the *ratio* of *substance*, for the proper subject must be posited in the definition of any accident, as *nose* is posited in the definition of *snub*.

### 33.16. First According to Cognition

That substance should be prior also in the order of cognition is evident, for that is first according to cognition which is more known (*notum*, or knowable) and manifests the thing more; and any one thing is more known when its substance is known than when its quantity or (its) quality is known.<sup>58</sup> Thus, we reckon (*putamus*) that we maximally know singulars when it is known *what* man or fire is, rather than when we know *how* it is, *how much* (it is), *where* (it is), or (what it is) according to some other category.

---

invenitur sine accidente. Et sic patet, quod non quodcumque est substantia, est accidens, sed e contrario: et propter hoc substantia est prior tempore.”

<sup>56</sup> *In Metaph.* 7, l. 1, §1258 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a34–36): “Et quod etiam sit prima secundum definitionem, patet, quia in definitione cuiuslibet accidentium oportet ponere definitionem substantiae. Sicut enim in definitione simi ponitur nasus, ita in definitione cuiuslibet accidentis ponitur proprium eius subiectum; et ideo sicut animal est prius definitione quam homo, quia definitio animalis ponitur in definitione hominis, eadem ratione substantia est prior definitione accidentibus.”

<sup>57</sup> *In Metaph.* 9, l. 1, §1768: “Dicit ergo [Philosophus] primo, quod in praemissis dictum est de ente primo, ad quod omnia alia praedicamenta entis referuntur, scilicet de substantia. Et quod ad substantiam omnia alia referantur sicut ad ens primum, manifestat, quia omnia alia entia, scilicet qualitas, quantitas et huiusmodi dicuntur secundum rationem substantiae. Dicitur enim quantitas ex hoc quod est mensura substantiae, et qualitas ex hoc quod est quaedam dispositio substantiae; similiter in aliis. Et hoc patet ex hoc, quod omnia accidentia habent rationem substantiae, quia in definitione cuiuslibet accidentis oportet ponere proprium subiectum, sicut in definitione simi ponitur nasus.” Cf. ARISTOTLE, *Metaphysica* Θ.1, 1045b27–32: “Περὶ μὲν οὖν τοῦ πρώτως ὄντος καὶ πρὸς ὃ πᾶσαι αἱ ἄλλαι κατηγορίαι τοῦ ὄντος ἀναφέρονται εἴρηται, περὶ τῆς οὐσίας. κατὰ γὰρ τὸν τῆς οὐσίας λόγον λέγεται τᾶλλα ὄντα, τό τε ποσὸν καὶ τὸ ποιὸν καὶ τᾶλλα τὰ οὕτω λεγόμενα· πάντα γὰρ ἔξει τὸν τῆς οὐσίας λόγον, ὥσπερ εἵπομεν ἐν τοῖς πρώτοις λόγοις.”

<sup>58</sup> *In Metaph.* 7, l. 1, §1259 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028a36–b1): “Quod etiam sit prior ordine cognitionis, patet. Illud enim est primum secundum cognitionem, quod est magis notum et magis manifestat rem. Res autem unaquaeque magis noscitur, quando scitur eius substantia, quam quando scitur eius quantitas aut qualitas. Tunc enim putamus nos maxime scire singula, quando noscitur quid est homo aut ignis, magis quam quando cognoscimus quale est aut quantum, aut ubi, aut secundum aliquod aliud praedicamentum.”

Wherefore, concerning those (things) themselves that are in the categories of accidents, we know the singular (categories) when we know of each (of those things themselves that are in the categories) *what* it is.<sup>59</sup> For example, when we know *what* the qualified thing itself is (*quando scimus quid est ipsum quale*), we know *quality* (*scimus qualitatem*); and when we know *what* the quantum itself is (*quando scimus quid est ipsum quantum*), we know *quantity* (*scimus quantitatem*). For, just as the other categories only have (their act of) being (*esse*) because they are in a substance (*insunt substantiae*), so, too, they only have (their act of) being known (*cognosci*) insofar as they participate (in) something of the mode of cognition of substance—which is to know *what* (something) is.

### 33.17. Substance and Other Philosophers

ARISTOTLE shows that one ought to treat of substance alone also through the custom of other philosophers, for what is asked and questioned among philosophers then and now is *what* being is—and this is nothing other than to ask and to question *what the substance of things is*.<sup>60</sup>

Thus, some, as Parmenides and Melissus, said that this being—to wit, substance—is one and immobile.<sup>61</sup> Or mobile, as the ancient natural (philosophers) used to posit only one material principle of things, for they reckoned that only matter is substance. And in this way, it is evident that, since they should have posited one being on account of one material principle, by *one being* they would have understood *one substance*. On the other hand, some posited more beings than one—namely, those who posited multiple material principles, and consequently multiple substances of things. Of which some posited them (to be) finite, as Empedocles the four elements, while others (posited them to be) infinite, as Anaxagoras (posited) infinite like parts, and Democritus (posited) infinite indivisible bodies.

<sup>59</sup> *In Metaph.* 7, l. 1, §1259 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028b1–2): “Quare etiam de ipsis, quae sunt in praedicamentis accidentium, tunc scimus singula, quando de unoquoque scimus quid est. Sicut quando scimus quid est ipsum quale, scimus qualitatem, et quando scimus quid est ipsum quantum, scimus quantitatem. Sicut enim alia praedicamenta non habent esse nisi per hoc quod insunt substantiae, ita non habent cognosci nisi in quantum participant aliquid de modo cognitionis substantiae, quae est cognoscere quid est.”

<sup>60</sup> *In Metaph.* 7, l. 1, §1260 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028b2–4): “Ostendit [Philosophus] idem, scilicet quod de substantia sola est agendum, *ex consuetudine aliorum philosophorum*: dicens, quod cum sit quaesitum et semper dubitatum apud philosophos «et olim» quantum ad praeteritum, «et nunc» quantum ad praesens, quid est ens: hoc nihil aliud est quaerere et dubitare, quam quid est substantia rerum.”

<sup>61</sup> *In Metaph.* 7, l. 1, §1261 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028b4–6): “«Hoc enim ens,» scilicet substantiam, quidam dixerunt esse unum vel immobile, sicut Parmenides et Melissus, vel mobile, sicut antiqui naturales ponentes unum tantum materiale principium rerum. Solam autem materiam putabant ens esse substantiam. Et sic patet, quod cum ponerent unum ens propter unum materiale principium, per unum ens intelligebant unam substantiam. Quidam vero posuerunt plura entia quam unum, qui scilicet posuerunt plura principia materialia, et per consequens plures rerum substantias. Quorum quidam posuerunt ea finita, ut Empedocles quatuor elementa; quidam vero infinita, ut Anaxagoras infinitas partes consimiles, et Democritus infinita indivisibilia corpora.”

Thus, if other philosophers who treated of beings considered only substances, so must we theorize of substance *what* it should be.<sup>62</sup> And we say this *maximally* (*maxime* = μάλιστα) because we principally intend of this; and *first* (*primo* = πρῶτον) because through it others are known; and *alone* (*solum* = μόνον) because (the act of) determining (the truth) concerning substance alone causes all other (things) to be known (*de omnibus aliis notitiam facit*). And thus, in some mode, (metaphysics) determines (the truth) concerning substance (so to say, *alone*); and in some mode, not alone; and this is what ARISTOTLE signifies when he says, “as we might say” (*ut est dicere* = ὡς εἰπεῖν) or “so to say” (*ut [s]i ita dicatur*), which we are accustomed to say of those that are not true in every particular.

### 33.18. Impartible vs. Simple

*Simple* and *impartible* are the same in subject but differ in *ratio*; for something is said (to be) **impartible** by the privation of division: to wit, because (something) is *not divisible into many*.<sup>63</sup> And something is said (to be) **simple** by the privation of composition: to wit, because (something) is *not composed from many*.

### 33.19. Substance by Itself is Impartible

PROCLUS proves that substance standing by itself is indivisible thus: If the being that subsists by itself (*authypostatōn ens, id est per se subsistens* = αὐθυπόστατον ὄν) be partible (*partibile* = μεριστόν), it will constitute itself (as) partible, it will be reverted whole upon itself, and everything will be in everything itself; but this is impossible; therefore, the subsistent is impartible.<sup>64</sup>

<sup>62</sup> *In Metaph.* 7, l. 1, §1262 (cf. ARISTOTLE, *Metaphysica* Z.1, 1028b6–7): “Et ideo si alii philosophi tractantes de entibus attendebant ad solas substantias, et nobis etiam speculandum est «de sic ente,» id est de substantia quid ipsa sit. Et hoc inquam maxime, quia de hac principaliter intendimus. Et primo, quia per eam alia cognoscuntur «et solum, ut est dicere» quia de substantia sola determinando, de omnibus aliis notitiam facit. Et ita quodam modo solum de substantia determinat, et quodam modo non solum. Hoc autem significat cum dicit «ut est dicere» vel ut ita dicatur, quod consuevimus dicere de his quae non usquequaque sunt vera.” St. Thomas relays two renderings of ὡς εἰπεῖν here, where the first one, *ut est dicere*, is that of William of MOERBEKE, while *ut si ita dicatur* belongs to the *Traslatio Media*.

<sup>63</sup> *In De causis*, l. 7: “simplex et impartibile est idem subiecto, differunt autem ratione: nam impartibile dicitur aliquid per privationem divisionis, quia scilicet non est in multa divisibile; simplex autem dicitur aliquid per privationem compositionis, quia scilicet non est ex multis compositum.”

<sup>64</sup> *In De causis*, l. 7: “Primo ergo probatur quod substantia per se stans sit indivisibilis, secundo quod sit simplex. Primum autem melius probatur in libro Procli quam hic. Est enim haec eius probatio. *Si enim, inquit, partibile est, authypostatōn ens, id est per se subsistens, instituet partibile seipsum, et totum ipsum vertetur ad seipsum, et omne in omni seipso erit. Hoc autem impossibile. Impartibile ergo authypostatōn.*” Cf. PROCLUS, *The Elements of Theology*, 46.30–32: “Πάν τὸ αὐθυπόστατον ἀμερές ἐστὶ καὶ ἀπλοῦν. εἰ γὰρ μεριστόν, αὐθυπόστατον ὄν, ὑποστήσει μεριστόν ἑαυτό, καὶ ὅλον αὐτὸ στραφήσεται πρὸς ἑαυτὸ καὶ πᾶν ἐν παντὶ ἑαυτῷ ἔσται. τοῦτο δὲ ἀδύνατον. ἀμερές ἄρα τὸ αὐθυπόστατον.” St. Thomas shows that this proof is better than the one provided in the *Book of Causes*, which proceeds thus: That which befits something by itself befits any part of it, if it is partible. Therefore, if something should be partible standing by itself, any part of it would have to stand by itself, and in this way, it would not rest upon another to constitute the whole. However, as St. Thomas says, this proof is not efficacious for this purpose, since it is not necessary for anything that by itself befits some whole to befit its singular parts, for there is some whole of similar parts, such as air and water, and some (whole) of dissimilar (parts), as an animal and a house. *Ibid.*, “In hoc autem libro probatur sic. Illud quod convenit alicui per seipsum, convenit cuilibet parti eius, si sit partibile. Si igitur aliquid partibile sit stans per seipsum, oportebit quod quaelibet pars

To make this evident, one ought to consider that, here, something is taken (as) *standing by itself* (*stans per seipsum*) not by reason of the part—to wit, such that one part of it should stand through another as happens in material substances—but by reason of the whole—to wit, such that the whole would stand whole by itself.<sup>65</sup> Now any one thing is turned to that whereby it stands as an effect (is turned) to (its) cause; and it must be in it as in its foundation.

Therefore, if something partible should stand by itself, it would be necessary for any part of it to stand through whatever (other part) and whatever (part) would be founded in whatever (other part), which is impossible; since, in this way, it would follow that one and the same part of it would simultaneously be a cause and an effect in respect of the same, which is impossible.<sup>66</sup>

### 33.20. Substance by Itself is Simple

That that, which stands by itself should be simple—that is, not composed from many—is proven through a twofold reason:<sup>67</sup>

1. In every composite from multiple parts, it is necessary to posit some order of parts: to wit, such that one part of it should be better and another viler, for many (things) come into the constitution of one in some order, just as, also, a multitude proceeds from one in some order.<sup>68</sup>

Whence, we see that in the composition of natural bodies, form is standing prior to matter.<sup>69</sup> In the composition of a compound body, one element dominates (the others). In the composition of the parts of an animal, one limb is more principal than another. And in

---

eius stet per seipsam, et ita non innitetur alteri ad constitutionem totius. Haec autem probatio non est adeo efficax, quia non est necessarium quod quidquid per se convenit alicui toti conveniat singulis partibus eius. Est enim quoddam totum similitium partium ut aer et aqua, et quoddam dissimilium ut animal et domus.”

<sup>65</sup> *In De causis*, l. 7: “Ad cuius evidentiam considerandum est quod hic accipitur esse aliquid stans per seipsum non ratione partis, ut scilicet una pars eius stet per aliam sicut accidit in substantiis materialibus, sed ratione totius, ut scilicet totum stet per se totum. Unumquodque autem convertitur ad id per quod stat sicut effectus ad causam, et oportet quod sit in eo sicut in suo fundamento.”

<sup>66</sup> *In De causis*, l. 7: “Si ergo aliquid partibile sit stans per seipsum, oportebit quod quaelibet pars eius stet per quamlibet et quaelibet fundetur in qualibet; quod est impossibile, quia sic sequeretur quod una et eadem pars eius esset causa et effectus simul respectu eiusdem, quod est impossibile.”

<sup>67</sup> *In De causis*, l. 7: “Quod autem id quod est stans per seipsum sit simplex, id est non compositum ex multis, probatur duplici ratione.”
