#### Abstract

A series of purines have been synthesized and the compounds have been tested for their inhibitory activity against CK2. Some of them have shown an interesting activity, demonstrating that this purine-based scaffold can be considered as a new starting point for the design of CK2 inhibitors. They are readily synthesized by S-alkylation followed by N9-alkylation of 6mercaptopurine. Docking studies have allowed us to identify ligand-CK2 interactions that account for the molecular recognition process, and help to further optimize this family of compounds as CK2 inhibitors.

Keywords: CK2, purines, antitumor, docking

## Introduction

Protein kinase CK2 (formerly casein kinase 2) participates in the regulation of great number of fundamental cellular processes in eukaryotic cells. A considerable part of the cellular phosphoproteome can be associated with the catalytic activity of CK2. This ubiquitously expressed protein kinase regulates crosstalk among multiple signaling pathways critical for cell differentiation, proliferation, and survival. ${ }^{1}$ CK2 is a tetramer composed of two catalytic subunits, CK2 $\alpha$ and CK2 2 ', and two regulatory, CK2 $\beta$ subunits. According to genetic studies performed in yeast, knockout of CK2 $2 \alpha$ and CK2 $\alpha^{\prime}$ results in lethality, providing evidence for an essential role of CK2 for survival. ${ }^{2,3}$ Furthermore, knockout of CK2 $\alpha$ ' in mice results in viable animals with defects in spermatogenesis, ${ }^{4}$ and knockout of CK2 $\beta$ results in embryonic lethality, revealing the functional importance of this subunit. ${ }^{5}$ A number of experimental data indicates
that elevated CK2 activity is functionally linked to different cancer types. ${ }^{6,7}$ Cancer cells with activated CK2 signaling pathways show distinct features such as enhanced growth and survival, as well as rapid adaptation to stress. CK2 is involved in oncogenesis by regulation of various oncogenes, tumor suppressor proteins, and protection of antiapoptotic proteins from caspasemediated cleavage. ${ }^{8}$ Moreover, CK2 overexpression is an unfavorable prognostic marker in acute myeloid leukemia, prostate and lung cancer. ${ }^{9-11}$ Additionally, several viral proteins have been shown to be CK2 substrates, indicating a role for this enzyme in viral infections. ${ }^{12-15}$ Therefore, the pharmacological inhibition of CK2 appears as a promising strategy in order to better understand its various cellular functions. Various classes of ATP-site directed inhibitors of CK2 have been reported (Figure 1). TBB 1, ${ }^{16}$ DMAT 2, ${ }^{17,18}$ and ellagic acid 3, ${ }^{19}$ with $\mathrm{IC}_{50}$ values of $0.9,0.14$ and $0.04 \mu \mathrm{M}$, respectively, are representative of this class of inhibitors.

However, none of the already described CK2 inhibitors fulfill the requirements for successful clinical settings, and the design of new CK2 inhibitors is desired to effectively suppress different pathologies, such as cancer.

## Results and Discussion

In this work a series of purines with different substitutions at positions 6, 7 and 9 were synthesized. The first step in the synthesis of purine $\mathbf{8}$ was the alkylation of commercially available 6 -chloro- 9 H -purin-2-amine 4 with 1 -iodopropane in the presence of NaH . In this reaction, an $8: 1$ mixture of $\mathbf{5 : 6}$ regioisomers was obtained, which had to be separated by column chromatography. The major isomer 5 was used in the synthesis of 7 by reaction with ethyl 2 mercaptoacetate and $\mathrm{NaOCH}_{3} / \mathrm{MeOH}$. Basic hydrolysis of 7 gave carboxylic acid 8, which was finally obtained with an overall 53\% yield (Scheme 1).

Scheme 1. Reagents and conditions: (a) 1-iodopropane, NaH , DMF, $0{ }^{\circ} \mathrm{C}$; (b) $\mathrm{HSCH}_{2} \mathrm{CO}_{2} \mathrm{Et}$, $\mathrm{NaOMe} / \mathrm{MeOH}, \mathrm{H}_{2} \mathrm{O}$ cat., $70^{\circ} \mathrm{C}$; (c) $\mathrm{NaOH}, \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}$

Compound 6 was reacted with ethyl 2-mercaptoacetate to obtain 9, which was also biologically evaluated. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of 7 and 9 showed signals for the aromatic proton at 7.62 and 7.78 ppm , respectively. In order to avoid the time-consuming chromatography separation of regioisomers 5 and 6, and to improve the yield of the process, an alternative pathway for the synthesis of $\mathbf{8}$ was developed (Scheme 2). Thus, 6-thioguanine $\mathbf{1 0}$ was S alkylated by reaction with 1 equivalent of methyl bromoacetate, in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ to yield ester 11 in $64 \%$ yield (A method). In this reaction the amount of methyl bromoacetate must be carefully controlled, as an excess of the alkylating agent brings about the formation of polyalkylated compound $\mathbf{1 2}$, which is the only product when 2 equivalents are used. Hydrolysis of $\mathbf{1 2}$ gave 13, which was also tested for its activity against CK2. An alternative for the synthesis of $\mathbf{1 1}$ is the reaction between 6 -chloro- 9 H -purin-2-amine $\mathbf{4}$ and ethyl 2-mercaptoacetate (B method). Although the yield of the reaction is similar, the lower price of the starting material makes it advantageous compared to the previous method.

Scheme 2. Reagents and conditions: (a) methyl bromoacetate (2 equiv.), $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF; (b) $\mathrm{NaOH}, \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}$; (c) methyl bromoacetate (1 equiv.), $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF; (d) $\mathrm{HSCH}_{2} \mathrm{CO}_{2} \mathrm{Me}$, $\mathrm{NaOMe} / \mathrm{MeOH}, \mathrm{H}_{2} \mathrm{O}$ cat., $70^{\circ} \mathrm{C}$; (e) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{I}, \mathrm{K}_{2} \mathrm{CO}_{3}$, DMF

Spectroscopic data for compounds 7 and $\mathbf{8}$ synthesized following this pathway are identical to those from the sample obtained by the route described in Scheme 1, and these spectral data confirm our previous structural assignment for isomers $\mathbf{5}$ and $\mathbf{6}$. This synthetic route allowed us the access to a series of esters $\mathbf{1 4 - 2 3}$, differently substituted at $\mathrm{N}-9$, by reaction of $\mathbf{1 1}$ with the corresponding alkyl bromide. Hydrolysis in basic conditions of the esters gave the corresponding acids 24-34 (Scheme 3).

Scheme 3. Reagents and conditions: (a) R-X, $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF; (b) $\mathrm{NaOH} \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}$.

Amides 35 and 36 were obtained following the method A (Scheme 2) using chloroacetamide instead of methyl bromoacetate (Scheme 4).

Scheme 4. Reagents and conditions: (a) $\mathrm{ClCH}_{2} \mathrm{CONH}_{2}, \mathrm{~K}_{2} \mathrm{CO}_{3}$, DMF; (b) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{I}, \mathrm{K}_{2} \mathrm{CO}_{3}$, DMF.

Selected compounds, listed in Table 1, were tested using the CK2 radiometric assay. The assays were performed at $10 \mu \mathrm{M}$ concentration of the appropriate compound in the presence of catalytic subunit CK2 $\alpha$ and $\left[\gamma-{ }_{-}^{32} \mathrm{P}\right]$ ATP. The kinase activity was measured as the quantity of ${ }^{32} \mathrm{P}$ incorporated into substrate.

Table 1. Remaining CK2 activity after treatment with a $10 \mu \mathrm{M}$ solution of purine derivatives

| Compound | $\mathrm{R}^{1}$ | $\mathrm{R}^{2}$ | Activity [\%] |

[^0]In general, ester and amide functionalities in $\mathrm{R}^{1}$ were found to achieve better activity (compounds 15, 20, 35, 7, and 36), although the presence of polar groups in $\mathrm{R}^{2}$ (compounds $\mathbf{1 2}$, and 13) leads to the decrease in the activity (Table 1). The best inhibitions were obtained with short alkyl or alkoxy chains at $\mathrm{R}^{2}$ (compounds 7,15 , and 36 ). The absence of $\mathrm{R}^{2}$ group leads to the active compound 35. Carboxylic acid derivatives are less active although, again, the absence of substituents in $\mathrm{R}^{2}$ leads to the active compound 34 .

Molecular modeling was performed with the aim of revealing the potential interactions that govern the recognition and the binding of this family of compounds into CK2. The automated docking calculations of selected compounds into the CK2 (PDB code: 1DAW) were performed using Glide 5.5 (Grid-based Ligand Docking with Energetics) in extra precision mode and following the protocol described in the Experimental Section.

We selected 14 compounds bearing different functional groups at $\mathrm{R}^{1}$ position: esters $\mathbf{7 , 1 5}$, 16, 17, 22, and 23; carboxylic acids 8, 13, 26, 27, 29 and 33; and amides 35, and 36. In order to estimate the ability of these compounds to mimic ATP adenosine (ANP), a post-docking step was performed by carrying out root-mean-square deviation (RMSD) calculations for junction carbons C-4 and C-5, using ANP as reference molecule (Table 2).

Table 2. RMSD values for selected compounds with reference to ANP

| Compound | RMSD $[\AA]$ | Compound | RMSD $[\AA]$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{1 7}$ | 0.69 | $\mathbf{3 6}$ | 1.22 |
| $\mathbf{1 5}$ | 0.87 | $\mathbf{1 3}$ | 1.66 |
| $\mathbf{2 6}$ | 1.05 | $\mathbf{3 5}$ | 1.84 |
| $\mathbf{2 7}$ | 1.08 | $\mathbf{2 9}$ | 4.48 |
| $\mathbf{8}$ | 1.08 | $\mathbf{2 2}$ | 5.18 |
| $\mathbf{7}$ | 1.18 | $\mathbf{2 3}$ | 5.28 |
| $\mathbf{1 6}$ | 1.21 | $\mathbf{3 3}$ | 8.03 |

All compounds were predicted to be able to form stable complexes with CK2 and occupying the ANP binding site. Among all predicted binding orientations, the representatives that better mimicked the adenosine ring by establishing hydrophobic interactions with key residues like $\mathrm{Ile}^{66}, \mathrm{Met}^{163}, \mathrm{Val}^{53}$, $\mathrm{Ile}^{174}$ or $\mathrm{Val}^{116}$ were selected (ligands with RMSD values from 0.69 to 1.84 $\AA$, see Table 2). Figure 2 shows the docked complex predicted for compound 15, which is the purine derivative with the highest inhibitory activity of all the synthesized compounds, inside CK2, superimposed with ANP. Significant differences were found for compounds with an aromatic ring as $\mathrm{R}^{2}(\mathbf{2 2}, \mathbf{2 3}, \mathbf{2 9}$, and $\mathbf{3 3}$, see Table 2) that led to higher RMSD values. This fact could be pointing to the loss of adenosine mimicking ability. In spite of this fact, only compound 29 showed a complete loss of activity.

Figure 2. Predicted mode of binding of 15 (light yellow) superimposed to crystallographic ANP (brick red) inside CK2 (PDB code: 1DAW).

A second common feature was found for ligands with low RMSD values. Binding poses showed that the $R^{2}$ chain is pointing towards the entrance of the ATP binding pocket, establishing hydrophobic interactions with $\mathrm{Val}^{45}, \mathrm{Tyr}^{115}$ and $\mathrm{Ile}^{66}$ side chains. On the opposite side of the binding pocket, ester, acid or amide $\mathrm{R}^{1}$ groups are located, establishing electrostatic interactions with Lys ${ }^{68}$ or Asp ${ }^{175}$ side chains (Figure 3). Additionally, compounds 8, 13, 15, 17, 26, and 27 are able to establish hydrogen bonds with Lys ${ }^{68}$ side chain and the backbone nitrogen of Asp ${ }^{175}$. In a few cases those hydrogen bonds are found with Lys ${ }^{43} 7,16$.

Figure 3. Predicted mode of binding of $\mathbf{1 5}$ (pink carbons) with key residues (white carbons) of the ATP binding pocket inside CK2 (PDB code: 1DAW).

## Conclusions

Novel purine-based scaffolds are proposed as promising CK2 inhibitors. They are readily synthesized by S-alkylation followed by N9-alkylation of 6-mercaptopurine. Docking studies have allowed us to identify ligand-CK2 interactions that account for the molecular recognition process, and can help to further optimize this family of compounds as CK2 inhibitors.

## Experimental Section

General. Melting points (uncorrected) were determined on a Stuart Scientific SMP3 apparatus. Infrared (IR) spectra were recorded with a Perkin-Elmer 1330 infrared spectrophotometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data were recorded on a Bruker $300-\mathrm{AC}$ instrument. Chemical shifts ( $\delta$ ) are expressed in parts per million relative to internal tetramethylsilane; coupling constants $(J)$ are in hertz. Mass spectra were run on a Bruker Esquire 3000 spectrometer. Elemental analyses (C, H, N, S) were performed on a LECO CHNS-932 apparatus at the Microanalyses Service of the University Complutense of Madrid; unless otherwise stated all reported values are within $\pm 0.4 \%$ of the theoretical compositions. Thin-layer chromatography (TLC) was run on Merck silica gel 60 F-254 plates. Unless stated otherwise, starting materials used were high-grade commercial products.

Alkylation of 6-chloro-9H-purin-2-amine (4). To a solution of 6-chloro-9H-purin-2-amine 4 $(509 \mathrm{mg}, 3 \mathrm{mmol})$ in dry DMF $(20 \mathrm{ml})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(120 \mathrm{mg}, 3 \mathrm{mmol})$. After stirring for 30 min , 1-iodopropane was added and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 5 h . Then, the solution was concentrated in vacuum and the solid obtained was suspended in $\mathrm{H}_{2} \mathrm{O}$ and extracted with DCM. The extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, evaporated to dryness, and the residue was chromatographed on silica gel ( $\mathrm{DCM}: \mathrm{MeOH} 60: 1$ to $25: 1$ ) to give 5 ( $475 \mathrm{mg}, 75 \%$ ) and 6 ( $62 \mathrm{mg}, 10 \%$ ) as white solids.
6-Chloro-9-propyl-9H-purin-2-amine (5). IR: 3390, 3300, 3150, 2960, $2925 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.94\left(\mathrm{t}, J=7.40 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.84-1.93\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 4.03(\mathrm{t}, J=7.14 \mathrm{~Hz}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{~N}$ ), $5.29\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) 7.75(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 11.1,22.9,45.4,125.2$, 142.4, 151.1, 153.8, 159.0. 6-Chloro-7-propyl-7H-purin-2-amine (6) IR: 3400, 3320, 3150, 2970, 2920, $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (DMSO-d $d_{6}$ : $\delta 0.83\left(\mathrm{t}, J=7.35 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.74-1.87\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 4.24(\mathrm{t}, J=6.72 \mathrm{~Hz}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{~N}$ ), 6.65 (bs, $2 \mathrm{H}, \mathrm{NH}_{2}$ ) 8.38 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{ArH}$ ). ${ }^{13} \mathrm{C}$ NMR (DMSO- $d_{6}$ ): $\delta 10.6,24.1,47.7,114.8$, 142.2, 149.5, 159.9, 164.3. MS (ESI): m/z 324.20 [M+Na] ${ }^{+}$. Anal. Calcd. for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{ClN}_{5}$ : C, 45.40; H, 4.76; N, 33.09. Found: C, 45.22; H, 4.78; N, 32.86.

Methyl [(2-amino-9-propyl-9H-purin-6-yl)sulfanyl]acetate (7). Method A. To a solution of 5 ( $379 \mathrm{mg}, 1.8 \mathrm{mmol}$ ) and $\mathrm{NaOCH}_{3}(1 \mathrm{~g}, 18 \mathrm{mmol})$ in $\mathrm{MeOH}(15 \mathrm{ml})$, ethyl sulfanylacetate $(0.79$ $\mathrm{ml}, 7.2 \mathrm{mmol})$ and $\mathrm{H}_{2} \mathrm{O}(0.1 \mathrm{ml})$ were added. The reaction mixture was heated at $70^{\circ} \mathrm{C}$ for 6 h in a sealed tube. The solution was concentrated in vacuum, suspended in $\mathrm{H}_{2} \mathrm{O}$ and extracted with DCM. The extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, evaporated to dryness and the residue was chromatographed on silica gel (hexane:AcOEt 1:4) to give $7(359 \mathrm{mg}, 71 \%)$ as a white solid, mp 104.7-106.5 ${ }^{\circ} \mathrm{C}$ (AcOEt/hexane). IR: 3480, 3280, 3160, 3085, 2920, 1720, $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.91\left(\mathrm{t}, J=7.50 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.77-1.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.72\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{O}\right) 3.98(\mathrm{t}, J$ $\left.=7.14 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~N}\right) 4.05\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~S}\right), 4.88\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) 7.62(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 10.8,22.7,30.3,44.7,52.4,125.0,140.1,150.6,158.5,158.6,169.5 . \mathrm{MS}(\mathrm{ESI}): m / z$
$282.00[\mathrm{M}+\mathrm{H}]^{+}, 303.99[\mathrm{M}+\mathrm{Na}]^{+}$. Anal. Calcd. for $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{~N}_{5} \mathrm{O}_{2} \mathrm{~S}: \mathrm{C}, 46.96 ; \mathrm{H}, 5.37$; $\mathrm{N}, 24.89 ; \mathrm{S}$, 11.40. Found: C, 46.85; H, 5.25; N, 24.76; S, 11.41.

Methyl [(2-amino-7-propyl-7H-purin-6-yl)sulfanyl]acetate (9). The same method described above was used for the synthesis of $\mathbf{9}$. Thus, from $\mathbf{6}$ ( $195 \mathrm{mg}, 0.92 \mathrm{mmol}$ ), $\mathrm{NaOCH}_{3}$ ( $515 \mathrm{mg}, 9.2$ mmol ) and ethyl sulfanylacetate $(0.41 \mathrm{ml}, 3.68 \mathrm{mmol})$ and after chromatography (AcOEt:MeOH 25:1) compound 9 ( $82 \mathrm{mg}, 32 \%$ ) was obtained as a white solid, mp 155.1-156.3 ${ }^{\circ} \mathrm{C}$ (AcOEt). IR: $3480,3280,3150,1720 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.87\left(\mathrm{t}, J=7.7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.79-1.91(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{CH}_{2}$ ), 3.71 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{O}$ ), $4.04\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~S}\right), 4.17$ (t, J=7.7 Hz, 2H, CH2N), 5.22 (bs, 2H, $\mathrm{NH}_{2}$ ) 7.78 (s, $1 \mathrm{H}, \mathrm{ArH}$ ). ${ }^{13} \mathrm{C}$ NMR (DMSO- $d_{6}$ ): $\delta 10.6,24.6,30.3,48.3,52.5,116.0,147.7$, $150.4,159.4,161.3,169.2$. MS (ESI): $m / z 282.44[\mathrm{M}+\mathrm{H}]^{+}, 304.11[\mathrm{M}+\mathrm{Na}]^{+}$. Anal. Calcd. for $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{~N}_{5} \mathrm{O}_{2} \mathrm{~S}$ : C, 46.96; H, 5.37; N, 24.89; S, 11.40. Found: C, 47.08; H, 5.39; N, 24.90; S, 11.45.

Methyl [(2-amino-9H-purin-6-yl)sulfanyl]acetate (11). Method A. To a solution of 6thioguanine 10 ( $334 \mathrm{mg}, 2 \mathrm{mmol}$ ) in DMF ( 5 ml ), was added $\mathrm{K}_{2} \mathrm{CO}_{3}(285 \mathrm{mg}, 2 \mathrm{mmol})$. After 30 min methyl bromoacetate ( $306 \mathrm{mg}, 2 \mathrm{mmol}$ ) was added and the mixture was stirred for 2 h . The solution was concentrated in vacuum, solved in $\mathrm{DCM}: \mathrm{MeOH} 3: 1$ and the insoluble residue was removed by filtration. The organic layer was concentrated in vacuum and purified by chromatography on silicagel (DCM:MeOH 20:1 to $10: 1$ ) to give 11 ( $307 \mathrm{mg}, 64 \%$ ) as a yellowish solid mp. 200.1-203.5 ${ }^{\circ} \mathrm{C}$.
Method B. To a solution of 6-chloro-9H-purin-2-amine $4(5.1 \mathrm{~g}, 30 \mathrm{mmol})$ in $\mathrm{MeOH}(30 \mathrm{ml})$, were added $\mathrm{NaOCH}_{3}(8.1 \mathrm{~g}, 150 \mathrm{mmol})$, ethyl sulfanylacetate ( $6.6 \mathrm{ml}, 60 \mathrm{mmol}$ ) and $\mathrm{H}_{2} \mathrm{O}(0.5$ $\mathrm{ml})$. The reaction mixture was heated for 4 h at $80^{\circ} \mathrm{C}$ in a sealed tube. After completion of the reaction, the solution was concentrated in vacuum, the residue was solved in DCM:MeOH 3:1. The insoluble salts were removed by filtration and the organic layer was concentrated in vacuum and purified by chromatography on silica gel ( $\mathrm{AcOEt}: \mathrm{MeOH} 25: 1$ ) to give $\mathbf{1 1}(3.95 \mathrm{~g}, 55 \%)$ as a white solid, mp 200.1-203.5 ${ }^{\circ} \mathrm{C}$ (AcOEt). IR: 3480, 3360, $1730 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (DMSO- $d_{6}$ ): $\delta$ $3.66\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3} \mathrm{O}\right), 4.21\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~S}\right), 6.36\left(\mathrm{sa}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) 7.93(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH}) .{ }^{13} \mathrm{C}$ NMR (DMSO-d $d_{6}$ ) $\delta 29.7,52.4,123.7,139.2,152.0,157.0,159.5,169.6 .[\mathrm{M}+\mathrm{Na}]^{+}$. ## General procedure for the alkylation of purines at $\mathrm{N}-9$ using $\mathrm{K}_{2} \mathrm{CO}_{3}$ as a base

To a suspension of the purine ( 1 equiv) in DMF was added $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( 1.5 equiv.). After 30 min of stirring at room temperature the respective alkyl bromide or chloride was added (1.1 to 2.0 equiv.). The mixture was stirred until no evolution of reaction was observed ( $8-24 \mathrm{~h}$ ). The solution was concentrated in vacuum, the residue suspended in $\mathrm{H}_{2} \mathrm{O}$ and extracted with DCM. The extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, evaporated to dryness and the residue was chromatographed on silica gel.
Methyl [(2-amino-9-propyl-9H-purin-6-yl)sulfanyl]acetate (7). Method B. From 11 (720 mg, $3 \mathrm{mmol})$ in DMF $(15 \mathrm{ml}), \mathrm{K}_{2} \mathrm{CO}_{3}(500 \mathrm{mg}, 3 \mathrm{mmol})$ and 1-iodopropane ( $0.29 \mathrm{ml}, 3 \mathrm{mmol}$ ). Reaction time: 2h. Chromatographed using hexane:AcOEt 1:5 as eluent. Compound 7 ( 365 mg ,
$31 \%$ ) was obtained as a white solid showing the same spectroscopic data as the sample obtained by A Method (see above).
Methyl \{[2-amino-9-(2-methoxy-2-oxoethyl)-9H-purin-6-yl]sulfanyl\}acetate (12). From 6thioguanine (10) ( $167 \mathrm{mg}, 1 \mathrm{mmol}$ ) in DMF ( 5 ml ), $\mathrm{K}_{2} \mathrm{CO}_{3}(142 \mathrm{mg}, 1 \mathrm{mmol})$ and methyl bromoacetate ( $0.19 \mathrm{ml}, 2 \mathrm{mmol}$ ). Reaction time: 2h. Chromatographed using (DCM:MeOH 60:1 to $25: 1$ ) as eluent. Compound 12 ( $223 \mathrm{mg}, 72 \%$ ) was obtained as a white solid, $\mathrm{mp} 155.2-157.1$ ${ }^{\circ} \mathrm{C}(\mathrm{EtOH})$. IR: 3410, 3320, 3200, 2980, 2910, $1720 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 3.74\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $3.76\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 4.07\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~S}\right) 4.82\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{~N}\right) 4.93\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right) 7.69(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH})$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 30.7,43.6,52.7,52.9,124.9,140.3,155.0,158.9,159.5,167.6,169.7$. $[\mathrm{M}+\mathrm{Na}]^{+}$. MS (ESI): m/z 334.17 [M+Na] ${ }^{+}$. Anal. Calcd. for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{5} \mathrm{O}_{4} \mathrm{~S}: \mathrm{C}, 42.44 ; \mathrm{H}, 4.21$; N , 22.50; S, 10.30. Methyl \{[2-amino-9-(2-hydroxyethyl)-9H-purin-6-yl]sulfanyl\}acetate (14). A slight modification of the general procedure was used. Thus, to a solution of $\mathbf{1 1}(400 \mathrm{mg}, 1.67 \mathrm{mmol})$ in DMF $(10 \mathrm{ml})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(346 \mathrm{mg}, 2.51 \mathrm{mmol})$. After 30 min , 2-bromoethanol ( 0.24 $\mathrm{ml}, 3.34 \mathrm{mmol}$ ) was added and the mixture was stirred overnight. The solution was concentrated in vacuum, the residue was solved in $\mathrm{DCM}: \mathrm{MeOH} 3: 1$, the insoluble salts were removed by filtration. The organic layer was concentrated in vacuum and the residue was recrystallized from EtOH and water to obtain $14(279 \mathrm{mg}, 59 \%)$ as a white solid, $\mathrm{mp} 150.5-152.0^{\circ} \mathrm{C}$. ## General procedure for ester hydrolysis in basic conditions

The ester (1 equiv) was solved in a mixture of THF and NaOH aqueous solution (1.5 to 3.0 equiv) and stirred at room temperature until all starting material was disappeared. The solution was concentrated in vacuum, the residue dissolved in $\mathrm{H}_{2} \mathrm{O}$ and acidified with 1 N HCl until a solid appeared, which was filtered and characterized as the corresponding acid.
[(2-Amino-9-propyl-9H-purin-6-yl)sulfanyl]acetic acid (8). From 7 ( $300 \mathrm{mg}, 1.07 \mathrm{mmol}$ ), THF ( 3 ml ) and $\mathrm{NaOH}(3.2 \mathrm{ml}, 1.61 \mathrm{mmol}, 0.5 \mathrm{~N})$, compound $8(265 \mathrm{mg}, 93 \%)$ was obtained as a white solid, mp 201.7-203.5 (EtOH/ $\left.\mathrm{H}_{2} \mathrm{O}\right)(\mathrm{dec})\left(\mathrm{lit}^{21} 200{ }^{\circ} \mathrm{C}\right.$ dec). ## Determination of CK2 activity

The reaction mixture $(50 \mu \mathrm{l}$ ) for determination of CK2 (apoenzyme CK2 $\alpha$ from www.proteinkinase.de) activity contained: peptide substrate ( $40 \mu \mathrm{M}$, RRRADDSDDDDD from SIGMA); Tris- $\mathrm{HCl} \mathrm{pH} 7,5(20 \mathrm{mM}) ; \mathrm{MgCl}_{2}(10 \mathrm{mM}), \gamma\left[{ }^{32} \mathrm{P}\right]$ ATP $(100 \mu \mathrm{M})$ and the appropriate compound $(10 \mu \mathrm{M})$ in $1 \%$ DMSO. After 10 min of incubation at $37{ }^{\circ} \mathrm{C}, 10 \mu \mathrm{l}$ of the assay mixture was spotted onto a square ( $1 \mathrm{~cm} \times 1 \mathrm{~cm}$ ) of Watman P81 paper, and allowed to dry. Next square was immersed in cold $0,5 \%$ phosphoric acid, and washed 3 times during 10 min . Then the squares were washed with $96 \% \mathrm{EtOH}$ and allowed to dry. The radioactivity was quantified using a BECKMAN LS6500. The activity was calculated as the percentage of incorporated ${ }^{32} \mathrm{P}$ (measured in scintillation counter).

## Molecular modeling studies

Molecular docking of selected compounds to the X-ray structure of CK2 (PDB code: 1DAW) was carried out using the Glide $5.5^{23}$ software in extra-precision (XP) ${ }^{24,25}$ mode using Glidescore for ligand ranking. Maestro $9 \cdot 0 \cdot 211^{26}$ was employed as the graphical user interface. The 2005 implementation of the OPLS-AA force field and a van der Waals radii scale factor of 1.0/0.8 was used for receptor and ligand respectively.
Ligands were prepared using Lig-Prep 2.3 as implemented in Maestro. The target protein was prepared using the protein preparation wizard in Maestro 9.0.211. PDB code 1DAW was used as target protein which corresponds to the 3D structure of protein kinase CK2 in complex with ANP (phosphoaminophosphonic acid-adenylate ester). Water molecules were removed. Hydrogen atoms were added and a minimization was performed until the RMSD value of all heavy atoms was within $0.3 \AA^{3}$ of the crystal structure. The binding pocket was identified by placing a 20 A cube around the geometrical center of ANP.

## Acknowledgements

This work was supported by the Spanish Ministry of Education (SAF2008-00945) and Fundación Universitaria San Pablo CEU (PC8-09). Grant to J. M. Z. from Fundación Universitaria San Pablo CEU is also acknowledged. We thank EADS-CASA for fellowships to M.M. and R.S.
